THE
LONDON ENCYCLOPÆDIA.

1832

A is the first letter, and first vowel of the alphabet, in all the modern, and in most of the ancient languages; which place of eminence has been assigned to it on account of its simplicity, being little more than an opening of the mouth. It corresponds in order and power to the Hebrew *aleph* and the Greek *alpha*, signifying an ox or a leader, and expressing extensive usefulness, excellence and propriety; for which reason, according to Plutarch, it was placed at the head of all the letters of the Phœnician language. In the earlier ages of the Hebrews, Greeks, and Romans, before the introduction of arithmetical figures, this letter was used for the numeral 1; and its value in this respect is even yet retained in the calendar, where it is the first of the dominical letters, and in the commercial character for perfect and sea-worthy vessels, which are marked with the sign A 1. In Scripture the Greek alpha is applied to Christ as the beginner a first, in connexion with the omega, or last letter, to shew that he is also the finisher of all things. Rev. i. 8, 11, xxii. 13. Another mystical sense of the Greek A was to express the word *Απόλτι*, or a declaration of denouncing; but the Latin letter is called by Cicero a healthful character, because, in capital cases, a tablet covered with wax and marked with it denoted *absolvo*, I absolve, in contradistinction to C, which signified *condemno*, I condemn, and which the orator therefore terms a sorrowful character. An A was very extensively used as an abbreviation by the Romans, for which purpose it is also still employed; as in heraldry for *argent*, or silver; in algebra for a known quantity; in chemistry for *amalgama*, when treble; in medicine for *ana*, equal parts of each, and in several other instances, both in the arts and sciences.

1. A, taken materially, or for itself, is a noun; as a great A, a little a.

Truly were I great A, before I would be willing to be so abused, I should wish myself little a, a thousand times. *Wallis's Corrections of Hobbes.*

2. A, an article set before nouns of the singular number; a man, a tree, denoting the number *one*; as a man is coming, that is, *no more than one*; or an indefinite indication, as, a man may come this way, that is, *any* man. This article has no plural signification. Before a word beginning with a vowel it is written *an*; as, *an ox*, *n egg*, of which *a* is the contraction.

3. A is placed before a participle, or participial

VOL. I.

noun; and is considered by Wallis as a contraction of *at*, when it is put before a word denoting some action not yet finished; as, I am a walking. It also seems to be anciently contracted from *at* when placed before local surnames; as, Thomas a Becket. In other cases, it seems to signify *to*, like the French *à*.

A hunting Chloe went. *Prior.*

They go a begging to a bankrupt's door. *Dryden.*
May peace still slumber by these purling fountains,
Which we may every year

Find, when we come a fishing here. *Wotton.*
Now the men fell a rubbing of armour which a
great while had lain oiled. *Id.*

He will knap the spears a pieces with his teet. *More's Antid. Atom.*

Another falls a ringing a Pescennius Niger, and
judiciously distinguishes the sound of it to be modern. *Addison on Medals.*

4. A is used in burlesque poetry to lengthen out a syllable, without adding to the sense.

For cloves and nutmegs to the line-a .
And even for oranges to China. *Dryden.*

5. A is sometimes, in provincialisms, and in familiar writings, used by a barbarous corruption for *he*; as, will a come, for will he come.

6. A, in composition, seems to have sometimes the power of the French *a* in these phrases, *a-droit, a-gauche*, &c., and sometimes to be contracted from *at*; as *aside, uslope, usfoot, usleep, athirst, aware*.

I 'gin to be a-weary of the sun;
And wish the state o' the world were now undone. *Shakspeare.*

7. A is sometimes redundant; as, *arise, arouse, awake*: the same with rise, rouse, wake.

A, with the addition of the two Latin words *per se*, meaning *by itself*, is used by our elder writers to denote a *nowsuch*. It may have been adopted from the custom of the child's school, in which every letter, we may presume, was taught to be expressed *per se*.

AA (Peter Vander), a celebrated bookseller of Leyden, flourished in the beginning of the last century, and compiled many useful geographical works. He published an Atlas of 290 Charts (*Galerie Agreeable du Monde*, 66 vols. folio), editions of the *Thesaurus Antiquitatum Graecorum* and of the *Thesaurus Antiquitatum Italicorum*, and a Collection of Travels in Europe, 30 vols. 12mo. &c.

Aa, a river of Samogitia, Courland, which runs into the Gulf of Riga.

B

Aa, a river of France, which rises in the department of Pas de Calais, beyond Rumilly le Comte, near Taeroune, runs N. E. through Artois, and becomes navigable near St. Omers; whence it passes N. to Gravelines, below which it falls into the English Channel. At St. Omers, the Colme and an inferior branch separate from it.

Aa, a river in Westphalia, which rises near Munster, waters that city, and falls into the river Ems.

Aa, a river of Switzerland, which rises in Underwalden, and empties itself into the Lake of Lucerne: also a river of Underwalden, which falls into the Lake of Waldstaden opposite Gersau. This is likewise the name of a third river of Switzerland, which rises N. W. of Lucerne, and unites itself with the Aar, three miles S. W. of Brugg; and of a fourth in the canton of Zurich, which rises near Gruningen, and empties itself in the Greiffen.

Aa, a river of Dutch Brabant, rising on the borders of Guelderland, and running into the Dommel, near Bois le Duc. Also, a river of Overyssel, in Holland, falling into the Lake of Giter.

AABAM, or **AABAN**, a term used by some alchemists to signify *lead*.

AACH, a river in Suabia, which falls into the Lake of Constance.

AACH, a town in the circle of Suabia, situated near the source of the above river, and almost equidistant from the Danube, and the lake Constance. Also another river of Suabia, joining the Iller.

AAHUS, a small district of Germany, in the circle of Westphalia, and bishopric of Munster, containing twenty parishes and four towns.

AAHUS, the capital, has a good castle, and lies N. E. of Coesfeldt.

AAKIRKE, a town in the island of Bornholm, Denmark, with the rank and privileges of a city. The provincial court and synod are held in it.

AALBORG, or **AALBOURG**, a bishopric of Denmark, in North Jutland, length and breadth about 75 miles. It occupies the whole northern part of the peninsula, and contains several flourishing towns and noble manors. Population about 90,000.

AALBORG, the capital of the bishopric of that name, lies on the south coast of Lymfurt, on the confines of the bishopric of Wiburg. Next to Copenhagen and Odensee, it is the richest and most populous town in Denmark. The name signifies *Eel-town*, great quantities of eels being caught here. It has an exchange for merchants, a safe and deep harbour, (though the entrance near Hals is somewhat dangerous,) a considerable trade in corn, and herrings, and manufactures of soap, train oil, guns, pistols, saddles, and gloves. It was taken by the Swedes, in the years 1643 and 1658. Lon. 9. 46. E. lat. 57. N.

AALEN. See **AHLEN**.

AALTEN, a town of Bredevoort, in Dutch Guelderland, near Munster, containing 3500 inhabitants.

AAM, or **HAAM**, a liquid measure, used by the Dutch, containing 128 *mingles*, (a measure weighing nearly 36 ounces avoirdupois,) or 288 pints English, or 148 Paris measure.

AANCIE, in music, a name sometimes given to wind instruments and organ pipes, with reeds or tongues, as the clarionet, hautboy, &c.

AANES, in music, the tones and modes of the modern Greeks.

AAR, a small island in the Baltic.

AAR, a river of Germany, falling into the Rhine, near Sintzig.

AAR, a large river of Switzerland, which has its source in a lake, near Mount Schreckhorn, in the south of the canton of Berne, and running N. W. through the whole extent of the lakes of Brientz and Thun to Berne, takes a circuitous course to Soleurs; whence it flows E. to Arburg, and N. E. to Brugg; below which, being joined by the Reuss and Limmat, it falls into the Rhine, opposite Waldschut.

AARASSUS, in ancient geography, a town of Pisidia, in Asia, supposed to be the Anassus of Ptolemy.

AARCHET, in music, instruments played with a bow, as the violin and violincello.

AARGAU, **ARGOVIA**, or **ARGOU**, anciently one of the 45 districts or divisions of Switzerland, receiving its name from the Aar, and composing the German part of the canton of Berne, with part of Solothurn, Lucerne, and Underwalden. It now includes only that part of Berne which in 1798 was formed into a separate canton, having Arau for its capital; but received in 1803 the whole of Baden and the Frickthal, in addition to its territory. It is bounded by Zug and Zurich on the N. has the Rhine for its boundary E. the cantons of Solothurn and Basil W. and Zug S. containing 11 districts, and 48 jurisdictions. Population 132,763.

AARIHUS, a large diocese in N. Jutland, which extends from that of Wiburg to Categat, about 65 miles in length, and 33 in breadth. It is intersected by many excellent rivers, and lakes, abounding with fish, and adorned with a variety of large forests. It contains five towns, eight royal bailiwicks, and six counties. Population 135,000.

AARHUUS, or **ARHUSEN**, the capital of the bishopric of that name, lies between the sea and a lake, from which water is conveyed by a broad canal, that divides the town into two unequal parts. It is large and populous, and has six gates, two principal churches, two market places, an university, a free school, and a well-endowed hospital. It carries on a good trade in corn. The cathedral, which was begun in 1201, is 150 paces in length, 96 in breadth, and nearly 45 German ells in height.

AARON, Heb. a mountaineer, the brother of Moses, and first high priest of the Israelites, was great-grand-son of Levi by the father's side, and grandson by the mother's. His history being fully narrated in the Pentateuch, it needs only to be added here, that he died upon Mount Hor, in the 123d year of his age, being the 40th after the departure from Egypt; A. M. 2522, of the Julian period, 3262, and before the Christian æra, 1452. See **MOSSES** and **MAGICIAN**.

AARON, (St.) a British martyr, who suffered along with St. Julius, another native of Britain, under Dioclesian, about the same time with St. Alban, the British proto-martyr.

AB

AARON, of Alexandria, a learned presbyter and physician of the seventh century, in whose works the small-pox is first mentioned.

AARON, a market town of France, in the department of Mayenne, having extensive iron works.

AARON HARISCHON. See HARISCHON.

AARON, or HAROUN, AL RASCHID, a celebrated khalif of the Saracen empire, of whom many fabulous legends are told.

AARSENS, (Francis,) Lord of Someldyck and Spyck, was one of the greatest statesmen the United Provinces ever produced. Having been some years under M. Morinay, at the court of William I. prince of Orange, Barneveldt sent him, as agent for the States, to Paris, where he acquired for himself great reputation under Henry IV. Villeroi, &c. Being soon after invested with the character of ambassador, Henry gave him precedence next to the Venetian minister. He resided at the court of France 15 years, and was created a knight and a baron by the king; was afterwards ambassador at Venice; and to several princes in Germany and Italy: and in 1620, was appointed the first of three extraordinary ambassadors to England, where, in 1641, he settled the marriage between the princess Mary and prince William, the father of our William III. He died at a very advanced age.

AARSENS, (Peter,) a painter, called Long Peter, on account of his stature, born at Amsterdam in 1519. He was eminent in altar and kitchen pieces. A lady of Alekmaer offered 200 crowns to preserve one of his altar pieces, that was destroyed in the insurrection, in 1566.

AARTGEN, or **AERTGENS**, a painter of merit, the son of a wool-comber of Leyden, born in 1498. He studied painting under Engellrechtz, but was devoted to the bottle, and was drowned in 1564.

AASAR, in ancient geography, a town of Judæa, in the tribe of Judah, between Azotus and Ascalon. In St. Jerome's time it was a hamlet.

AAVORA, in natural history, the fruit of a large species of the palm tree, that grows in Africa and the West Indies. It is of the size of a hen's egg, and several are included in one shell.

AB, in the Hebrew calendar, the 11th month of the civil year and the 5th of the ecclesiastical. It answers to the moon, which begins in July and ends in August, and consists of 30 days. The Jews fast on the 1st of this month in memory of Aaron's death; on the 9th, because on that day, both the first and second temples were burnt; and on the 18th, because the sacred lamp in the sanctuary was that night extinguished, in the reign of Ahaz. The 9th of this month was also remarkable for the publication of Adrian's edict, which prohibited that unfortunate people, not only from continuing in Judæa, but even from looking back to Jerusalem to lament its desolation.

Ab, in the Syriac Calendar, is the last of the summer months. The eastern Christians called the first day of this month *Suum Miriam*, the fast of Mary, and fasted from that to the 15th, which they called *Fathr-Miriam*, the cessation of the fast of the Virgin.

Ab, at the beginning of the names of places,

ABA

generally shews that they have some relation to an abbey, as *Abingdon*.

ABA, or **ABAU**, **HANIFAH**. See HANIFAH.

ABA, **ABAS**, **ABOS**, or **ABUS**, in ancient geography, a mountain of Greater Armenia; Strabo says, the Euphrates and Araxes both rose in it, the former running eastward and the latter westward.

ABA, or **ABE**, in ancient geography, a town of Phocis in Greece, near Helicon, famous for an oracle of Apollo, older than that at Delphi; as well as for a rich temple, plundered and burnt by the Persians. See ABANTIS.

ABABDE, in geography, a tribe of the Bedouin Arabs, inhabiting, according to M. Burckhardt, that part of the west shore of the Arabian Gulf, which is south of the Kosseir, and in about the latitude of Derr. The country is mountainous, and the people faithless and barbarous.

ABABIL, or **ABABIL**, in mythology, a fabulous bird mentioned in the Koran, who, according to the Mahometan doctors, has a foot like that of a dog.

ABACA, in botany, an Indian plant, a native of the Philippine Islands. There are two species, the *white* and the *grey*. The former produces *lift*, of which very fine linen is made; the latter *he*, which is used for nothing but cordage.

ABACENUM, or **ABACENE**, in ancient geography, a town of Sicily, whose ruins are supposed to be those still lying near Trippi, a citadel on a high mountain, near Messina.

ABACAY, in natural history, a species of parrot in the Philippine Islands, called also Calan-

gay.
ABACH, or **WELTENBURG**, a market town in Lower Bavaria, seated on the Danube; nine miles from Ratisbon. It is defended by a citadel, and is remarkable for Roman antiquities, as well as for its mineral waters, which are celebrated for curing various diseases. Lon. 11. 56. E. lat. 48. 53. N.

ABACINARE, in archaeology, *Ital.* from *bacino*, a basin, or *bacio*, a dark place, a punishment, described by writers of the middle age, wherein the criminal was blinded, by holding a red hot basin, or hot irons before his eyes.

ABACISCUS, in ancient architecture, the square compartments of Mosaic pavements.

ABACISTA, *O. L.* an arithmetician.

ABACK', on back, backwards.

So that the white was aboue, as the folk y seye,
And drof the rede al *abak* out of the put ney
The rede, as for sorinessse, by turnede hym atten ende,
And asailde the wyte, and made hym *abae* wende.

R. Gloucester, p. 131.
But when they came where thou thy skill didst show,
They drew *abacke*, as half with shame confound.

Spenser's Pastoral, June.

A noble heart ought not the sooner yield,
Not shrink *abacke* for any weal or woe.

Mir. for May, p. 359.

Yet Albert new resources still prepares,
Conceals his grief, and doubles all his cares;

" Away there ! lower the mizen-yard on deck."
He calls, " and brace the foremost-yards *abacke*!"

Falconer's Shipreck.

ABACK, or **ABAKE**, in sea-language signifies

the situation of the sails, when their surfaces are flattened against the mast by the force of the wind. This may be either by a sudden change of the wind, or an alteration in the ship's course to avoid some imminent danger.

ABACO, one of the most considerable of the Bahama islands, lying in N. Lat. 26° 22' W. Long. 77° 14'. Some writers have conjectured that this was the first spot of the western world upon which Columbus touched. See **BAHAMA**.

ABACOCHEE, or **COOSEE**, a river of N. America, which rising in the S. W. territory, and flowing through Georgia, unites with the Oakfuskee, and forms the Alabama.

ABACOT, a cap of state, worn in ancient times by the kings of England, the upper part of which was in the form of a double crown.

ABACTED, from *abactus*, *L.* drawn away by stealth or violence.

ABACTUS, or **ABIGEATUS**, among ancient medical writers, an abortion procured by the force of medicines. See **MIDWIFERY**.

ABACUS, among the ancients, was a kind of cup-board or buffet. Livy, describing the luxury into which the Romans degenerated after the conquest of Asia, says they had their *abaci*, beds, &c. plated over with gold. See also *Juv. Sat.* iii. 203.

ABACUS, signified also a table covered with dust on which mathematicians drew their diagrams, and a draft or chess board, on which the ancients played games of chance. *Macrobi. v. Stuck. Ant. Conviv.* xi. 16.

The **ABACUS**, in architecture, Vitruvius tells us, was originally intended to represent a square tile laid over an urn, or rather over a basket.—An old woman of Athens happening to place a basket covered thus, over the root of an acanthus, the plant, shooting up the following spring, encompassed the basket all around, till meeting with the tile, it curled back in a kind of scroll. Calliclithachus, an ingenious sculptor, passing by, took the hint, and immediately executed a capital on this plan; representing the tile by the *abacus*, the leaves by the volutes, and the basket by the vase, or body of the capital.—The form of the abacus is not the same in all orders: in the Tuscan, Doric, and Ionic, it is generally square; but in the Corinthian and Composite, its four sides are arched inwards, and embellished in the middle with some ornament, as a rose or other flower. Seammozzi uses *abacus* for a concave moulding on the capital of the Tuscan pedestal; and Palladio calls the plinth above the echinus, or boulton, in the Tuscan and Doric orders, by the same name.

ABACUS is also the name of an ancient instrument for facilitating operations in arithmetic. It is variously contrived. That chiefly used in Europe is made by drawing any number of parallel lines at the distance of two diameters of one of the counters used in the calculation. A counter placed on the lowest line, signifies 1; on the 2d, 10; on the 3d, 100; on the 4th, 1000, &c. In the intermediate spaces, the same counters are estimated at one half of the value of the line immediately superior, viz. between the 1st and 2d, 5; between the 2d and 3d, 50, &c.

ABACUS, the *Chinese*. See **SWANPAN**.

ABACUS Pythagoricus, the multiplication table of Pythagoras, similar to the common one, which has also been attributed to him.

ABACUS Logisticus, is a rectangle triangle, whose sides, forming the right angle, contain the numbers from 1 to 60; and its area, the facts of each two of the numbers perpendicularly opposite. This is also called a *canon of sexagesimals*.

ABACUS & Palmule, in the ancient music, denote the machinery, whereby the strings of Polyplectra, or instruments of many strings, were struck with a plectrum made of quills.

ABACUS Harmonicus, is used by Kircher for the structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

ABACUS Major, in metallurgic operations, the name of a trough used in the mines, wherein the ore is washed.

ABACUS, *ἀβάζη*, Gr. Ben Jonson uses *aback* to denote simply a square surface.

In the centre or midst of the Pegan, there was an *aback* or square in which this elegy was written.
Jonson's Coronation Pageant.

ABADDON, the name which St. John in the Revelation gives to the angel of the bottomless pit. The inspired writer says, this word is Hebrew, and in Greek signifies *Ἄπολλυντος*, i. e. a *destroyer*. See Rev. ix. 11.

ABADE, or **SHECK ABADE**, a small town in Egypt.

ABADEH, a town of Persia, in the district of Fars, which is celebrated in the Persian civil wars of the last century. Its fortifications are in decay, but the neighbourhood is fruitful. Population 5000.

ABADIR, a title which the Carthaginians gave to gods of the first order. In the Roman mythology, it is the name of a stone which Saturn swallowed, by the contrivance of his wife Ops, believing it to be his new born son Jupiter: hence it ridiculously became the object of religious worship.

ABAE, or **ABA**. See **ABA**.

ABAF, *adv.* *abarzan*, *Sax.* behind. From the fore part of the ship, towards the stern; in opposition to *afore*.

ABAFT THE BEAM, in maritime affairs, signifies the position of an object somewhere between a line at right angles with the keel, and the points to which the ship's stern is directed.

ABAGI, a silver coin of Persia, worth about 36 sols, French money. Four chaouris, which are also called sains, make one abagi.

ABAGUN, in ornithology, an Ethiopian bird of great beauty, having a crested horn on its head, adding much to its appearance and giving it perhaps its name, which signifies *lordly abbot. Lobo.* 71.

ABAISANCE, *n. s.* from the French *abaisser*, to depress, to bring down. An act of reverence, a bow. *Obeysance* is considered by Skinner as a corruption of *abaisance*, but is now universally used.

ABAISIR, in chemistry, a name sometimes given to spodumene.

ABAISED, **ABAISSE'**, in heraldry, an epithet applied to the wings of eagles, &c. when the

tip looks downwards to the point of the shield, or when the wings are shut.

ABAISSE, or **ABAISSE**, in heraldry. See HERALDRY.

ABAITE, a river of Brazil in the Minas Geraes province, falling into the Francisco, near which was found the largest diamond ever discovered in the country.

ABAKA khan, the 18th emperor of the Moguls, a wise and clement prince, who is said to have been so far a Christian, as to have joined in keeping the feast of Easter, a short time before his death. He reigned 17 years.

ABAKANSKOI, or **ABANKANSK**, a town of Siberia, on the river Abakan. It was founded in 1707, and rebuilt in 1725. It has a garrison, and is provided with artillery. Population 1250. Lon. 91. 5. E. Lat. 53. 5. N.

ABALAK, a town in Siberia, sixteen miles from Tobolsk, celebrated for an image of the Virgin, which is visited by many pilgrims. Lon. 68. 20. E. Lat. 58. 11. N.

ABALIENATUS, in medicine, signifies that the part spoken of is in a state that requires amputation; and, when applied to the mind, denotes its total derangement.

ABALLABA, the ancient name of Appleby, in Westmoreland, remarkable as having been a Roman station. See APPLEY.

ABALUS, in ancient geography, supposed to be an island in the German Ocean, called by Timaeus, *Basilio*, and by Xenophon Lampsacenus, *Baltia*. Here, according to Pliny, amber dropped from the trees; and sacrifices were offered to the manes of the drowned if the body were lost.

ABALUS, the peninsula of Scandinavia.

ABANA, or **AMANA**, in ancient geography, a river of Phoenicia, called Chrysorrhœa, by the Greeks, which, rising from mount Hermon, washed the south and west sides of Damascus, and fell into the Phenician sea, north of Tripolis.

Scripture supplies a fine instance of the expression of *disdain*, in the reply of the Syrian General, Naaman, to the prophet Elisha, respecting this river: "Are not Abana and Pharpar, rivers of Damascus, better than all the waters of Israel? may I not wash in them and be clean?" 2 Kings v. 12.

ABANCAY, or **AVANCAY**, a province of Peru, bounded on the E. by the city of Cuzco; S. by the provinces of Cochabamba & Aimarez; W. by Andahuellas; and N. by Calcayleres. It is the jurisdiction of a corregidor, containing 17 settlements or towns, and a noble chain of mountains, which diversify the climate to almost every degree of temperature. Silver mines are found here; the sugar cane flourishes, as well as wheat, maize, and all grain, which, together with the hemp manufactured into cloth, is conveyed by the Apurimac to the Amazons. Abancay has also a fine breed of horned cattle.

ABAND', *v.* Sax. *Bannan*, *Abannan*,

ABAN'DON, *v. n.* past. part. *Abanned*.

ABAN'DONER, From this past participle is formed

ABAN'DONING, ed the verb *abandon*, signifying primarily to band

ABAN'DONMENT, for bind, or put in bondage. From this original

sense are derived to resign, quit, desert, forsake, reject, and repel.

And Vortigern enforce'd the kingdom to *aband*.

Spenser's Faerie Queene, II. x. 65.

All pleasures quite and joys he did *aband*,

Mir. for May, p. 172.

The barons of this land,

For him traualled sore, and brought him out of *bant*.

R. Brune, p. 201.

For he that

Yave whole his hart, in will and thought,

And to himself kepeth right nonght,

After this swift it is good reason

He yave his good in *aband*.

Chaucer, The Romaunt of the Rose.

Moris hir sonne was coroned,

Which so fer forth was *abandoned*,

To Christes feith, that men hym calle

Moris the christnes of all. *Gower*, b. II.

With women, which were *abandoned*

To werche. *Gower, Conf. Am.* b. 7.

If she be so *abandoned* to her sorrow,

As it is spoke, she never will admit me,

Shakespeare's Twelfth Night.

The passive Gods beheld the Greeks defile

Their temples, and *abandon* to the spoil

Their own abodes. *Dryden's Aeneid*.

Must he, whose altars on the Phrygian shore,

With frequent rites, and pure, avow'd thy power,

Be doom'd the worst of human ills to prove,

Unbless'd, *abandon'd* to the wrath of Jove?

Pope's Odyssey.

Oh! sacred, shadowy, cold, and constant queen,

Abandonner of revels, mute, contemplative!

Beaumont and Fletcher's two Noble Kinsmen.

See how he lies at random, carelessly diffused,

With languish'd head unpropt,

As one past hope, *abandon'd*,

And by himself given over.

Milton's Samson Agonistes.

She loses all her influence. Cities then

Attract us, and neglected nature pines

Abandon'd, as unworthy of our love.

Couper's Task.

When thus the helm of justice is *abandoned*, an universal *abandoning* of all other posts will succeed.

Burke.

ABANDUM, in old law, any thing that is sequestered, confiscated, or forfeited.

ABANGA, the name given by the black natives of the Island of St. Thomas, to the fruit of the ady or palm tree. The Portuguese call it *caryoces* and *cariosse*. See ADY.

ABANNEG, or **ABNET**, Heb. a girdle worn by the priests of the Jews.

ABANNITION, *n. s.* Lat. *abannitio*, an old punishment, of one or two year's banishment for manslaughter.

ABANO, a town of Italy near Padua, famous in ancient as well as modern times, for its hot baths. Population 3000.

ABANTIS or **ABANTIAS**, in ancient geography, an island in the Aegean sea, extending along the coast of Greece from the promontory Sunium in Attica, to Thessaly; and separated from Boeotia by a narrow strait called Euripus. It is known in history by the different names of Chalcis, Ellopia, Aonia, &c. It was afterwards called Eubœa, from a famous cave on the eastern coast of the island; and Maeris from its length. Its present name is Negropont. It derived the name Abantis from the **ABANTES**, a people

originally of Thrace, although some historians suppose they were Arabians who followed Cadmus. The Abantes are well known in history; Homer calls them οπισθεν Κορωντες from their wearing the hair long behind. They are also called Curetes, from cutting their hair short before.

ABANTIS, a country of Epirus. *Paus. lib. v. c. 22.*

ABAPTISTON, or **ANABAPTISTON**, in surgery, an ancient name for the perforating part of the instrument called a trepan.

ABARCA, or **ABAREA**, an ancient kind of shoe, used by the Spaniards, in travelling over mountains.

ABARIM, mountains which separated the territory of the Moabites and Ammonites from Canaan. Nebo and Pisgah were among them. Josephus says, they stood opposite to Jericho, and were the last station but one of the Israelites, before they took possession of Canaan.

ABARIS, the Hyperborean, a celebrated sage of antiquity, of whom a great number of fabulous stories are told; such as, that he received a present of a miraculous arrow from Apollo, with which he travelled without taking food; that he could foretell earthquakes, allay tempests, drive away the pestilence, &c. &c. Harpocration tells us, that the whole earth being infested with a deadly plague, Apollo ordered, that the Athenians should offer up prayers in behalf of all other nations; upon which, ambassadors were sent to Athens from different countries. Among these was Abaris, who, during this journey, renewed the alliance between his countrymen, and the inhabitants of the Isle of Delos. He also went to Lacedæmon, where he built a temple to Proserpine the Salutary. It is said that there is a Greek MS. of his epistles to Phalaris in the library of Augsburg.

ABARNARE, Sax. in Law. To discover to a magistrate any secret crime.

ABARNUS, **ABARNIS**, or **APARNIS**, in ancient geography, a city, country, and promontory of Pariana, near the Hellespont. Milesius calls it a promontory of Lampsacus. The Phocians are said to have given it the name of Abarnis from one of their countrymen, who built Lampsacus.

ABARTAMEN, in chemistry, a name for lead.

ABARTICULATION. *n. s.* from *ab*, from, and *articulus*, a joint, Lat. A good and apt construction of the bones, by which they move strongly and easily; or that species of articulation that has manifest motion.

ABARTICULATION, in anatomy, that species of articulation, that takes place in the joints of the arms, hands, thighs, &c. which is called also *Dearticulatio*, and *Diarthrosis*, to distinguish it from that sort of articulation, which admits of a very obscure motion, and is called *Synarthrosis*.

ABAS, a small weight used in Persia, for weighing pearls. It is one eighth less than the European carat.

ABAS, in the heathen mythology, the son of Hypothoön and Metanira, who entertained the goddess Ceres, and offered a sacrifice to her; but Abas, ridiculing the ceremony, and giving her

opprobrious language, she turned him into a water lizard. Also in ancient history, the 11th king of Argos, who built Abæ. A son of Eurydemus, killed by Æneas near Troy; a companion of Æneas killed in Italy; another lost in the storm which drove him to Carthage; a Latian chief who befriended him, and was killed by Lausus; and an author, quoted by Servius, who described Troy. *Virg. Aeneid.*

ABAS, in ancient geography, a river of Armenia, near which Pompey routed the Alban, also a mountain of Syria, near the sources of the Euphrates.

ABAS, in medicine, a name sometimes given to the epilepsy. See **TINEA**.

ABAS or **ABASTA**, in entomology, a species of the Bombyx of Fabricius, and of the Phalaena of Linnaeus, found in Surinam. It has brown, spreading wings, the hinder wings cinereous, and the ocellus of a reddish colour.

ABAS, Schah, the Great, 7th Sophi, or emperor of Persia, succeeded his father in 1585, at eighteen. The empire having been much reduced by the conquests of the Turks and Tartars, he recovered most of the provinces they had taken; but death put a period to his victories, in 1626, in the 62nd year of his age, and 44th of his reign. He transferred the seat of empire to Ispahan.

ABAS, II. Schah, the 9th Sophi of Persia, the son of Sefi, and grandson of Abas the Great, succeeded his father at thirteen, and was only eighteen years of age, when he retook the city of Candahar, and the whole province around it, from the Great Mogul, who had seized it in his father's reign; and he afterwards defended it against him, though he besieged it more than once, with an army of 300,000 men. He was a merciful prince, and openly protected the Christians. He died at thirty-seven years of age, in 1666.

ABASE', Fr. *abaisser*; Lat. *basis* or **ABAS'ING**, n. } Itabassus; Ital. *abbassare*; Span.

ABASE'MENT, abaxar. These are all to be referred to the Gr. *βασις*, the foot of a pillar. Hence it signifies, to lessen or keep under, to depress, to bring low, to degrade, to disgrace in a figurative and personal sense, says Johnson, which is the common use.

Our kynge hath do this thing amisse,
So to abesse his roialtee.
Gower.

And will she yet abuse her eyes on me,
That cropt the golden prime of this sweet prince,
And made her widow to a wofull bed?

Shakespeare's Rich. III. act i, sc. 2.

It is a point of cunning to wait upon him with whom you speak with your eye; yet with a demure abasing of it sometimes.

Lord Bacon's Essay on Cunning.

Her either cheek resembled blushing morn;
Or roses gules in field of lilies borne;
Twixt which an ivory wall so fair is raised,
That it is but abased when it's praised.

Drummond.

Behold every one that is proud, and abase him.

Jub xl. 11.

If the mind be curbed and humbled too much in children; if their spirits be abased and broken much, by too strict an hand over them; they lose all their vigour and industry.

Locke on Education.

There is an *abasement* because of glory ; and there is that lifteth up his head from a low estate.

Ecclesiasticus, xx. 11.

Heaven was to be earned only by penance and mortification ; by the austeries and *abasement* of a monk, not by the liberal, generous, and spirited conduct of a man. *Smith's Wealth of Nations*.

ABASCIA, or ABCAS, a country in Asia, tributary to Russia, surrounded by Mingrelia on the E. and S. by Circassia on the N. and W. and the Black Sea on the S.W. It has few towns, and they are of little consequence. Anacopia, Dandar, and Czekorni, are the chief. Great and Little Abcas are both included in the government of Caucasus, but the Russian authority in the heart of the country is but nominal.

The inhabitants called ABASCians, or ΑΒΚΗΑΣ, have the name of Christians, but nothing else. The men are robust and strong, and the women beautiful ; but they are so poor, thievish, and treacherous, that there is no trading with them, without the utmost caution. They even live in continual dread of each other, for the most powerful seize as many as they can of the poorer sort, especially the females, and sell them to the Turks. The tribe of Natukasch is the principal. Their commodities are furs, buck and tiger skins, linen yarn, box-wood and bees'-wax ; but their chief traffic lies in selling their own children. An Abascian prince lately (1807) carried his depredations far into the neighbouring governments, and was sometime captive in Russia, but he escaped. Their customs resemble those of the MINGRELIANS, which see.

ABASH', v. } of the same derivation as *abase*,

ABASH'MENT, } unless it comes from *abaw*, a verb peculiar to Chaucer, and which Barret translates, to be *abashed* or astonished. *Abash* is used by Gower as a substantive. It is to be distinguished, however, from the preceding article, as it is applied to the feelings of those who are *abased*, depressed, disgraced. It generally implies a sudden impression of shame which generates painful surprise and confusion. The substantive is used to signify the state of being confused, and the cause of confusion.

He stode al abashed, with colour wan and pale.

Chaucer's 2nd Tale.

The town restlesse with furie as I sought
Th' unlucky figure of Crēusae's ghost,
Of stature more than wont, stood fore mine eyen
Abashed then I waxe : therewith my heare
Gan start right up : my voice stuck in my throte.

Surrey.

Why, then, (you princes)
Do you with cheeks *abashed* behold our 'workes,
And think them shame, which are (indeed) nought
else,
But the protractiue trials of great Joue,
To find persistiue constancy in men.

Shakespeare's Tro. and Cressida.

They heard, and were *abash'd*, and up they sprung,
Upon the wing. *Milton's Paradise Lost.*
Silence was in the court at this rebuke :
Nor could the gods, *abash'd*, sustain their sovereign's
look.

Dryden's Fables.

She was afrayde ;
The ruddy shamefastness in her vysage fyll,

Which manner of *abashement* became her not yll.

Skelton's Poem, p. 38.

Methinks it may be some *abashment* to reason, and

that vast perfection to which some men would extol it, that it scarce knows what man or itself is.

Ellis's Knowledge of Divine Things.

ABAS/TIS, in ancient geography, a tract of Asiatic Mysia, in which the city of Ancyra was situated. *Strabo.*

ABASKI, a town of Circassia, 40 miles S. E. of Kopiel.

ABASSI, or ABASSIS, a silver coin, current in Persia, so named after Schah Abbas, II. equal to about a shilling of English money.

ABASSUS, in ancient geography, a town of the Greater Phrygia, on the confines of Galatia.

ABAT-CHAUVEE, a name given in Poitou, and other parts of France, to a species of very coarse wool.

ABATE, (A.) a Neapolitan painter of some eminence, who was employed in the Escorial. His boldness of colouring and shade was highly praised by Luca Giordano. *Abate* died in 1732.

ABATE', v. } *a.s. beatan*, to beat. The word
ABATE'MENT, } exists without the prefix *a*, as

ABA'TER, } *bate* ; but, in modern usage, it is more limited in its application. The verb is both active and neuter. It not only signifies to beat down, but to subtract, as in arithmetic. Thus it has grown to mean to lessen, diminish, contract, deject, and depress. It is employed technically in law and in horsemanship. In the one it is used in reference to a *nuisance*,—to get rid of it ; to a *castle*,—to beat it down or remove it ; to a *writ*—to defeat and overthrow it : in horsemanship, it implies the exact performance of any downward motion. Its general and popular usage is set forth in the following specimens.

The kyng did samen his men, to *abate* Gryflyn's pride,
And Harald tham betaught ageyn the Walsch to ride.

Chaucer's Personnes' Tak, p. 68.

And when the sunne hath eke the darke opprest,
And brought the day, it doth nothing *abate*
The trauailes of mine endlesse smart and paine.

Surrey.

Who can tell whether the divine wisdom, to *abate* the glory of those kings, did not reserve this work to be done by a queen, that it might appear to be his own immediate work. *Sir John Davies on Ireland.*

This iron world

Brings down the stoutest hearts to lowest state :
For misery doth bravest minds *abate*.

Spenser. M. Huberd's Tale.

Till at length

Your ignorance deliver you,
As most *abated* captives to some nation

That won you without blows.

Shakspeare's Coriolanus.

HEL. O weary night, O long and tedious night,
Abate thy hours, shine comforts from the East,
That I may backe to Athens by day-light.
From these that my poore company detest.

Shakspeare's Mid. N. Dream, act iii, sc. 2.
Will come a day (hear this, and quake ye potent
great ones)

When you yourselves shall stand before a judge,
Who in a pair of scales will weigh your actions,
Without *abatement* of one grain.

Beaumont and Fletcher's Plays.

Impiety of times, chastity's *abator*.

Daniel's Complaint of Rosamond.

If we could arrest time, and strike off the nimble
wheels of his chariot, and like Joshua, bid the sun
stand still, and make opportunity tarry as long as

we had occasion for it; this were something to excuse our delay, or at least to mitigate or abate the folly and unreasonableness of it. *Tillotson's Works.*

The law of works is that law, which requires perfect obedience, without remission or abatement.

Locke.

ABATELEMENT, in commerce, a sentence of prohibition from trade, issued by the French consuls against those who would not stand to their bargains, or who refused to pay their debts; it was required to be taken off before they could sue any person for payment.

ABATEMENT, in heraldry, a certain mark of degradation, inserted in the bearings of particular persons or families, called also diminutives, vel discernula armorum. Authors on this subject mention nine of these marks. See SELDEN, and GUIL. DISP. HERALD.

ABATEMENT, in commerce. See **DISCOUNT** and **REBATE**.

ABATIS, or **ABBATIS**, from *batum*, an old measure for corn, an ancient term for an officer of the stables, who had the care of the provender.

ABATIS, or **ABBATIS**, from *Abattre* to pull down, *Fr.* in fortification, a heap of large trees thrown together, to guard intrenchments, obstruct roads, and prevent the approaches of an enemy.

ABATOS, from *a* priv. and *βαίω* to go, i.e. inaccessible, in ancient geography, an island in the Lake Moeris, famous for its papyrus, and for being the burial place of Osiris. Hence sacred from profane intrusion.

ABATUTTA, or **ABUTUTTA**, in music, an Italian direction for continuing to beat the time as before.

ABAUZIT, (F.) a modern French writer and philosopher of some celebrity. He was born at Rezes, 1679; but sent off to Geneva, at two years of age, by his mother, a zealous protestant, to secure his education in that religion. He well rewarded her solicitude, becoming afterwards in this country the friend of Sir Isaac Newton, who complimented him by observing that he was "a fit judge between Leibnitz and himself." William III. wished him to remain in England, but he returned to become the librarian of the city of Geneva, in 1726. In 1730 he republished Spon's History of Geneva, with notes and dissertations, which was his chief work. Voltaire and Rousseau complimented him. He died 1767.

ABA-UJVÁR, a palatinate of Upper Hungary, on the W. of Thorn. It contains the four circles of Futzer, Kaschau, Siepschow, and Tscherchat: There are 40 catholic, and 41 reformed parishes; 18 of the Greek church, and 3 Lutheran, comprised in this palatinate, which is about 50 miles in length, and from 12 to 15 in breadth. Population 125,000.

ABA VI, or ABAY, i. e. the Father of waters, an Abyssinian name for the Bahr-el-Azergue, which they consider as the head of the Nile.

ABAVI, **ABAVO**, or **ABAVUM**, in botany, a large tree in Ethiopia, that bears a fruit like a gourd. It is a synonyme of the **ADANSONIA**, which see.

ABB, or ABB-YARN, *n.* *s.* the yarn on a weaver's warp: a term among clothiers.

ABBA, in ancient geography, a town of Africa, near Carthage.

AB'BA, n. In Chaldee and Syriac אָבָא, Father. Titles of honour and authority, first derived from the literal signification of the word.
In scripture *Abba* is once used.

As we see, In scripture *Apostol* is once used by Jesus Christ in prayer, and twice in the epistles, having in each place the explanation *πατήρ* annexed to it. In the eastern churches, it was given at a very early date to their bishops; —and *Baba*, *Papa*, *Pope*, had their origin from the same root.

ABBAT, or **ABBOT**, in the fourth and fifth centuries was gradually, and at last distinctively, applied to the heads of those religious orders who then began to exclude themselves from the world. For a particular account of these we refer our readers to the history of *Monachism* at large.—*Mosheim's Eccles. His.* &c.

And anon, after this *abbot*

Then spaken another;

I wode that thyn hede were of,

Though thou were my brother.

Chaucer's Coke's Tale of Gamelyn.

ABBACY, *n. s.* Lat. *abbatia*, the rights or privileges of an **ABBOT**, which see.

ABBADIE, (James,) an eminent protestant divine, born at Nay in Bearn, in 1654; educated under the famous La Placette, and afterwards at the university of Sedan; from whence he went into Holland and Germany, and became minister of the French church at Berlin. In 1690, he came into England, was minister of a French church in London, and was made dean of Killaloe in Ireland. He died at St. Mary-le-bone, 1727, aged 75. His writings, published in French, were, A Treatise on the Truth of the Christian Religion; The Art of Knowing one's Self; A Defence of the British Nation; The Deity of Jesus Christ essential to the Christian Religion; The History of the last Conspiracy in England, written by order of King William III.; and the Triumph of Providence and Religion, or the opening the Seven Seals by the Son of God.

ABBAISSEUR, in anatomy, a name given by Winslow and the French writers to one of the muscles of the eye, called by others the *deprimens* and *humilis*; and by Fabricius the *rectus inferior*.

ABBAS, the son of Abdalmothleb, and Mahomet's uncle. He at first opposed his nephew, but being taken prisoner at the battle of Bedir, in 623, (the 2d of the hegira,) and a great ransom being demanded, he represented that so large a sum would reduce him to poverty: but Mahomet, reminded him of the gold he had left with his mother at Mecca: whereupon Abbas, believing him to be really inspired, embraced his religion, became one of his chief officers, and saved his life, when in the utmost danger, at the battle of Honain. He afterwards commenced a doctor of the Mussulman law, and read lectures upon the Koran.

ABBATHY. See **ABBACY** and **ABBOT.**

ABBE, *n. s.* 1. In a monastic sense, the same with Abbot, which see.* This was also, before the revolution, the name of a kind of

secular clergyman, popular in France. The Abbé had many privileges in the church, without any fixed station: and rose occasionally to eminence both in the literary and political world.

The ABBESS has the same rights and authority over her nuns, that the Abbots regular have over their monks. Her sex does not allow her to perform the spiritual functions, annexed to the priesthood, wherewith the abbot is usually invested; but there are instances of some abbesses who commission a priest to act for them, and possess a kind of episcopal jurisdiction, exempt from the visitation of their diocesan, Martene, in his treatise on the rights of the church, observes, that some abbesses have formerly confessed their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity for checking it. However, St. Basil, in his Rule, allows the abbess to be present with the priest at the confession of her nuns.

ABBE-BOYLE. See BOYLE.

ABBERFORD, or ABERFORD, a parish and market-town, in the wapintake of Skyrack, W. Riding of Yorkshire, on the Cook, where the Roman highway crossed it. It is 16 miles S. W. from York, and 186 N. of London: market on Wednesday.

ABBEVILLE, a considerable town of France, the chief of an arrondissement, in the department of Somme, and late province of Picardy, seated in a pleasant valley, where the river Somme divides into several branches, and separates the town into two parts. It has 14 parish churches, and a collegiate one; the principal churches are St. George's and St. Giles's. It is partially fortified, being flanked with bastions, and surrounded by large ditches. Here is a good woollen manufactory, which was erected in 1665, by Van Robais, a Dutchman, whose family retain it. The cloths are said to be little inferior to those of England and Holland. They also manufacture sail cloth, coarse linens, and black and green soap, and carry on a good trade. It lies 15 miles E. from the British channel, 20 N. W. from Amiens, 22 S. of Calais, and 85 N. by W. of Paris. Population 30,000.

The arrondissement of ABBEVILLE extends to the English Channel, the Somme watering its whole extent, and falling into the sea near Crotoy. It contains the old counties of Ponthieu, and Vimeux and 114,000 inhabitants.

ABBEYS, *priories* and *monasteries*, differ little but in name. FAUCHET observes, that, in the early days of the French monarchy, dukes and counts were called *abbots*, and duchies and counties *abbey*s. Even some of their kings are mentioned in history under the former title. Monasteries were at first nothing more than religious houses, whither persons retired from the bustle of the world, to spend their time in solitude and devotion. But they soon degenerated from their original institution, and procured large privileges, exemptions, and riches. They prevailed greatly in Britain before the reformation; particularly in England: and as they increased in riches, so the state became poor: for the lands which these regulars possessed, were

in mortuo manu, i. e. could never revert to the lords who gave them. This inconvenience gave rise to the statutes against gifts in *mortmaine*, which prohibited donations to these religious houses: and Lord Coke tells us, that several lords, at their creation, had a clause in their grant, that the donor might give or sell his land to whom he would, (*exceptis viris religiosis et Judaeis*) excepting monks and Jews. Henry VIII. having appointed visitors to enquire into the lives of the monks and nuns, which were found in some places very disorderly: the abbots, perceiving their dissolution unavoidable, were induced to resign their houses to the king, who by that means became invested with the abbey lands: these were afterwards granted to different persons, whose descendants enjoy them at this day: they were then valued at £2,853,000 per annum. Though the suppression of religious houses, even considered in a political light only, was a great national benefit, it must be owned, that, at the time they flourished, they were not entirely useless. Abbeys or monasteries were then the repositories as well as the seminaries of learning; many valuable books and national records, as well as private evidences, have been preserved in their libraries; the only places wherein they could have been safely lodged in turbulent times; and many of those, which had escaped the ravages of the Danes, were destroyed with more than Gothic barbarity at the reformation. "Covetousness," says BALF, "was at that time so busy about private commodity, that public wealth, in that most necessary article of respect, was not anywhere regarded. A number of them who purchased these superstitious mansions, reserved of the library books, some to serve their jakes, some to scour the candlesticks, and some to rub their boots; some they sold to the grocer and soap-seller; and some they sent over sea to the bookbinders, not in small numbers, but in whole ships full; yea the universities of this realm are not clear of so detestable a fact. I know a merchant, that bought the contents of two noble libraries for 40s. price; a shame it is to be spoken!" See MONASTERY.

ABBEY-HOLM, a town in Cumberland, on the Waver, so called from an abbey built in it by David I. king of Scots. Abbey-holm stands on an arm of the Irish Sea, near Solway Firth, 309 miles from London, and 16 S. W. from Carlisle. It contains four townships, i. e. the Abbey, East Waver, Low Waver, and St. Cuthberts. The abbots of Holm Cultram, (the ancient name of this foundation) built a castle about 5 miles from the sea, as a depository for their books and papers in the border wars: considerable ruins of which remain.

ABBEY-LUBBER, *n. s.* See LUBBER. A slothful loiterer in a religious house, under pretence of retirement and authority.

This is no father Dominic; no huge overgrown *abbey-lubber*; this is but a diminutive sucking friar.

Dryd. Sp. Fr.

ABBIATI, (F.) an Italian historical painter of eminence, who was born in 1640, and died in 1715. He studied under Nouvolone.

ABBOT, or ABBAT, and ARCHIMANDRITE,

were titles at first indifferently assumed by the governors of the primitive monasteries. They were really distinguished from the clergy; though frequently confounded with them, because a degree above laymen. In those early days, the abbots were subject to the bishops and the ordinary pastors. Their monasteries being remote from cities, built in the farthest solitudes, they had no share in ecclesiastical affairs. They went on Sundays to the parish church with the rest of the people; or, if they were too remote, a priest was sent them to administer the sacraments; till at length they were allowed to have priests of their own. The abbot or archimandrite himself was usually the priest: but his function extended no farther than to the spiritual assistance of his monastery; and he remained still in obedience to the bishop. There being among the abbots several persons of learning, they made a vigorous opposition to the rising heresies of those times; which first occasioned the bishops to call them out of their deserts, and fix them about the suburbs of cities, and at length in the cities themselves: from which arose their degeneracy is to be dated. The abbots, now, soon wore off their former plainness and simplicity, and began to be looked on as prelates. They aspired at being independent of the bishops; and before me so insupportable, that some severe laws were made against them at the council of Chalcedon; notwithstanding this, in time many of them carried the point of independency, and got the appellation of *lord*, with other badges of the episcopate, particularly the mitre. Hence arose a new species of distinction between the abbots. Those were termed *mitred* abbots, who were privileged to wear the mitre, and exercised episcopal authority within their respective precincts, being exempted from the jurisdiction of the bishop. Others were termed *crosiered* abbots, from their bearing the crosier or pastoral staff. Others were styled *acumenical* or universal abbots, in imitation of the patriarch of Constantinople: while others were termed *cardinal* abbots, from their superiority over all other abbots. Among us, the mitred abbots were lords of parliament; and called abbots sovereign, and abbots general. And as there were lords abbots, so there were also lords priors, who had exempt jurisdiction, and were likewise lords of parliament. Some reckon 26 of these lords abbots and priors that sat in parliament. Sir EDWARD COKE says, that there were 27 parliamentary abbots, and two priors. In the parliament, 20 Rich. II. there were but 25 abbots and two priors; but in the summons to parliament, anno 4, Ed. III. more are named. At present, in the Roman catholic countries, the principal distinctions observed between abbots are those of *regular* and *commendatory*. The former take the vow and wear the habit of their order; whereas the latter are seculars, though they are obliged by their bulls to take orders when of proper age. Anciently the ceremony of creating an abbot consisted in clothing him with the habit, called *cuculus*, or cowl, putting the pastoral staff into his hand, and the shoes called *pedales* on his feet; but at present it is only a simple benediction, improperly called, by some, consecration.

ABBOT, (George,) archbishop of Canterbury was born 29th Oct. 1562, at Guildford in Surrey. He studied at Oxford, was chosen principal of University College in 1597, installed dean of Winchester in 1599, and thrice elected vice-chancellor of the University of Oxford, in 1600, 1603, and 1605. The translation of the Bible, now in use, being begun in 1604, by order of K. James, dean Abbot was one of the eight divines to whom the New Testament was committed. In 1608, he went to Scotland, to assist in bringing about an union between the kirk of Scotland and the church of England—a business which he conducted with so much moderation, as well as address, that the origin of all his after ferment may be traced to it. In December, 1609, he was consecrated bishop of Litchfield and Coventry; in January, 1610, bishop of London; and on the 2d November following, appointed to the archiepiscopal see. His enemies have ascribed this rapid accumulation of honours less to his merits, than to the flattering compliments he paid the king; by equalling him with several of the wisest and best monarchs of antiquity. In 1613, however, he opposed that favourite object of the king's, the divorce between lady Frances Howard, and Robert, earl of Essex; and in 1618, the royal declaration permitting Sunday sports, which he prohibited being read in the church. When his health began to decline, he went to Hampshire for recreation and being invited to a hunting match by Lord Zouch, he had the misfortune to kill the game-keeper by an arrow, which he shot at one of the deer from a cross bow. This accident affected the archbishop so much, that, besides settling an annuity of 20l. on the widow, he kept a monthly fast on Tuesday, the day when the misfortune happened, all his life afterwards. His enemies endeavouring, on this account, to lessen him in the king's favour, James smartly observed, that, "an angel might have miscarried in this sort." Ten commissioners were appointed to inquire into the matter, whose report entirely exculpated the archbishop from crime, but it was thought proper that a dispensation of pardon and restoration should pass the great seal. After this he seldom assisted at the council, but attended it during the king's last illness very constantly. And, although troubled with the gout, he performed the ceremony of crowning king Charles I. He was never, however, greatly in this monarch's favour, and the duke of Buckingham and Laud being his enemies, he was suspended from all his functions as primate, upon his refusing to license a sermon of Dr. Sibthorpe's, justifying a loan which the king had demanded. At the meeting of parliament he was restored, and died at Croydon, the 5th of August, 1633, aged 71. Archbishop Abbot was a man of great moderation, and wished that the clergy should attract esteem, by the purity of their manners, rather than by the dignity of their function. He partook of the stern Calvinism that so largely pervaded the minds of most of the protestant reformers; but was more remarkable in early life than afterwards for his high-churchmanship. Being, at the former period, asked 'Whether a protestant prince might assist the subjects of a

neighbouring state in resisting tyranny and oppression?" he answered—"No; for even tyranny was God's authority.' In latter life, he manfully opposed those extreme measures of Laud and his misguided sovereign, which brought the latter to the block. Dr. Southey, in his Book of the Church, speaks of him as "inclining to the puritans;" and as bringing the court of High Commission into disgrace by his great severity. We cannot reconcile these charges. Lord Clarendon, also, in the evident spirit of party, throws out some severe reflections against him, but Dr. Wellwood has done justice to his merits, in his Memoirs. He endowed a hospital at Guildford (where he was buried) with an income of £300 a year. He wrote various tracts of temporary interest, and "Six Latin Lectures on Divinity, at Oxford," 1598, 4to.; "Exposition of the Prophet Jonah," 4to. 1600; "A Brief Description of the whole World," 12mo. 1634; "Treatise on the Perpetual Visibility and Succession of the True Church," 4to. 1624; and a "History of the Massacre in the Valteline," inserted in Fox's Book of Martyrs.

ABBOT (Robert), bishop of Salisbury, elder brother to the archbishop, was born at Guildford, in 1560, studied at Oxford, took his degree of A. M. in 1582, and became a celebrated preacher. Upon his first sermon at Worcester, he was chosen lecturer in that city, soon after rector of All-saints; and John Stanhope, Esq. happening to hear him preach, immediately presented him to the rich living of Bingham, in Nottinghamshire. In 1597, he took the degree of D.D. and was appointed soon after, chaplain in ordinary to king James; who had such an opinion of him, that he ordered his book, *De Antichristo*, to be printed along with his own Commentary upon part or the Apocalypse. In 1609 he was elected master of Balliol college, a trust which he discharged with the utmost care. In 1615, he was appointed to the see of Salisbury, in which he exercised primitive diligence, visiting his diocese personally, and preaching weekly. He died of the stone, on the 2d of March, 1618, being one o. the five bishops which Salisbury had in six years. Dr. Fuller, speaking of the two brothers, says,— "that George was the more plausible preacher, Robert the greatest scholar; George the abler statesman; Robert the deeper divine: gravity did frown in George, and smile in Robert." He published several pieces; he also left behind him sundry manuscripts, which Doctor Corbet, his son-in-law, made a present of to the Bodleian library.

ABBOTS-BROMLEY, or **PAGET'S BROMLEY**, a town in the hundred of South Pirchill, Staffordshire, 6 miles E. from Stafford, and 129 N. W. from London. It has a weekly market on Tuesday, and three annual fairs for horses and cattle. On the dissolution of the monasteries it was given to Lord Paget, whence its modern name, which it bears in the county map, though it still retains its old name with regard to the fairs, and in the king's books.

ABBOTSURY, a market-town in Dorsetshire, so named from the abbey near it, founded as some say, by a steward of Canute the Great, others, by a Norman lady, about 1026; to which

Edward the Confessor, and William I. were both benefactors. It has a market on Thursday, a fair on the 10th of July, and lies eight miles S. W. of Dorchester, and 127 W. by S. from London.

ABBOTS-CASTLE, or **APEWOOD CASTLE**, an old fortification in Staffordshire, seven miles from Wolverhampton, on the north side of the road from Shrewsbury to London, situated on a lofty round promontory, and a steep ridge of hills; which extend a mile in length, and are supposed to have been one continued fortification of the ancient Britons.

ABBOTSFORD, a most romantic and picturesque estate, on the banks of the Tweed, about an hour's ride from Selkirk, of recent celebrity, but giving henceforth to everlasting fame, both as the creation and the residence of the greatest writer of his age, and one of the most considerable in point of genius among all the distinguished men of Scotland. Abbotsford and Sir Walter Scott are associated for ever. This beautiful 'romance in stone and lime,' as it has been quaintly denominated, will exhibit him to future generations in the most striking peculiarities of his mind and character. It will be visited by many a pilgrim of nature and poetry. It will become, nay, it has become already, the sanctuary and the shrine of enthusiastic adoration. It may be truly affirmed that no man, by the exercise of his mental powers alone, in the quiet pursuit of literature and literary eminence, ever awakened so deep, so striking, so universal an interest, as well to himself as to his works, as the wonderful laird of Abbotsford; an interest which is so far from diminution, that its sphere is perpetually extending, so that it may be truly affirmed, his name is gone forth to the ends of the earth.

Sir Walter became first generally known by what has been with great propriety described as an attempt to transfer the refinements of modern poetry to the matter and the manner of the ancient metrical romance. Enamoured of the lofty visions of Chivalry, and partial to the strains in which they were formerly embodied, the author of 'The Lay of the Last Minstrel' employed all the resources of his genius in endeavouring to recall them to the favor and admiration of the public, and in adapting to the taste of modern readers a species of poetry which was once the delight of the courtly, but which had long since ceased to gladden any other eyes than those of the scholar and the antiquary. In this difficult undertaking, if he did not succeed to the full satisfaction of the critics, he secured the favor of the whole reading population. His next great work, which made its appearance so soon after the first, established his fame in the species of composition to which he had at that time dedicated his genius, and which may fairly be considered as original; this was 'Marmion.' Then came, in all the fascinations of unrivaled beauty, 'The Lady of the Lake.' The Edinburgh Review, in noticing this most finished of Mr. Scott's productions, justly observed 'that, though living in an age unusually prolific of original poetry, he had manifestly outstripped all his competitors

in the race of popularity, and that he stood even then upon a height which no other writer had attained in the memory of any one then alive.'

It was even then asserted that nearly 30,000 copies of 'The Lay' had been disposed of in this country, and that the demand for 'Marmion' and 'The Lady of the Lake' had been still more considerable. This was in the year 1810. These three great poems, intended to work out the same principles and the same results by similar means, though sufficiently distinguished from each other, led to a critical investigation of Mr. Scott's peculiar and extraordinary merit, and to an analysis of his poetical character. It is evident that the charm of Sir Walter Scott's poetry is not in the story, or in a judicious and dextrous management of his materials, but in the inspirations of genius, which are every where breathed through his not very well compacted narrations; in the variety and brilliancy, rather than in the exquisite finish in its images and descriptions; and in its touching lightly on many passions, without raising any so high as to transcend the comprehension of ordinary mortals, or dwelling on it so long as to exhaust their patience. Confident in the force and originality of his own genius, he does not seem afraid to avail himself of common-places both of diction and sentiment, whenever they appeared to be beautiful or impressive. Using these however with the skill and spirit of an inventor, he has made use of that great treasury of characters, images, and expressions, which had been accumulated by the most celebrated of his predecessors; at the same time that the rapidity of his transitions, the novelty of his combinations, and the spirit and variety of his own thoughts and inventions, show plainly that he was a borrower from any thing but poverty, and took only what he could have given, if he had been born in an earlier generation. The great secret of his popularity, however, and the leading characteristics of his poetry, appear to consist evidently in this, that he has made more use of common topics and expressions than any original poet of later times; and at the same time displayed more genius and originality than any recent author, who has worked on the same materials. In the choice of his subjects, for example, he does not attempt to interest merely by fine observation or pathetic sentiment, but takes the assistance of a story, and enlists the reader's curiosity among his motives, for attention. Thus his characters are all selected from the most common *dramatis persona* of poetry—kings, warriors, knights, outlaws, nuns, minstrels, secluded damsels, wizards, and true lovers. He never ventures to carry us into the cottage of the peasant, like Crabbe or Cowper; nor into the bosom of domestic privacy, like Campbell; nor among creatures of the imagination, like Southey or Darwin. In the management of the passions, again, Sir Walter Scott appears to us to have pursued the same popular and comparatively easy course. He has raised all the most familiar and poetical emotions, by the most obvious aggravations, and in the most compendious and judicious way. He has dazzled the reader with the splendour, and even warmed him with the transient heat of various affections; but he has no where fairly kindled him with enthusiasm, or

melted him into tenderness. With regard to diction and imagery, too, it is quite obvious that Sir Walter has not aimed at writing in a pure, or a very consistent style. He seems to have been anxious only to strike, and to be easily and universally understood; and for this purpose to have culled the most glittering and conspicuous expressions of the most popular authors, and to have interwoven them in splendid confusion with his own nervous diction and irregular versification. There is nothing in Sir Walter Scott of the severe and majestic style of Milton, or of the terse and fine composition of Pope, or of the elaborate elegance and melody of Campbell, or even of the flowing and redundant diction of Southey. But there is a medley of bright images and glowing words set carelessly and loosely together; a diction tinged successively with the careless richness of Shakspeare, the harshness and antique simplicity of the old romances, the homeliness of vulgar ballads and anecdotes, and the sentimental glitter of the most modern poetry. Passing from the borders of the ludicrous to those of the sublime; alternately minute and energetic: sometimes artificial, and frequently negligent; but always full of spirit and vivacity, abounding in images that are striking, at first sight, to minds of every contexture; and never expressing a sentiment which it can cost the most ordinary reader any exertion to comprehend.

Such seem to be the leading qualities that contribute to Sir Walter Scott's popularity as a poet, and we may safely affirm that, where these are wanting, poetry is necessarily divested of much of its great aim—to please, to please the greatest number and for ever. But as some of the qualities we have enumerated, as peculiarly characteristic of Sir W. Scott, are obviously of a kind to diminish his merit, in the eyes of some fastidious judges, it is but fair to complete this view of his peculiarities, by a hasty notice of such of them as entitle him to unqualified admiration. And here it is impossible not to be struck with that vivifying spirit of strength and animation which pervades all the inequalities of his composition, and keeps constantly in the mind of the reader the impression of great power, spirit, and impressivity. There is nothing cold, creeping, or feeble, in all Sir Walter Scott's poetry: no laborious littleness, or pulling classical affectation. Allied to this inherent vigor and animation, and in a great degree derived from it, is that air of facility and freedom which adds so peculiar a grace to most of Sir Walter Scott's compositions. There is certainly no living poet whose works seem to come from him with so much ease, or who so seldom appears to labour, even in the most burdensome parts of his performance. It is owing partly to these qualities, and partly to the great variety of his style, that Sir Walter Scott is much less frequently tedious than any other bulky poet with whom we are acquainted. His store of imagery is so copious that he never dwells upon one long enough to produce weariness in the reader; and, even when he deals in borrowed or in tawdry wares, the rapidity of his transitions, and the transient glance with which he is satisfied as to each, leave the critic no time to be offended, and hurry him forward along with the enchanting multitude.

These we think are the general characteristics of Sir Walter Scott's poetry. Among his main peculiarities, we might notice his singular talent for description, and especially for the description of scenes abounding in *motion* or *action* of any kind. In this department, indeed, we conceive him to be almost without a rival, either among modern or ancient poets; and the character and process of his descriptions are as extraordinary as their effects are astonishing.

Another very striking peculiarity of Sir Walter Scott's poetry is the air of freedom and nature which he has contrived to impart to most of his distinguished characters, and with which no poet more modern than Shakspeare has ventured to represent personages of such dignity. We do not allude here merely to the genuine familiarity and homeliness of many of his scenes and dialogues, but to that air of gaiety and playfulness in which persons of high rank seem from time immemorial to have thought it necessary to array, not their courtesy only, but their generosity and their hospitality. This tone of good society Sir Walter has shed over his higher characters with great grace and effect; and has in this way not only made his representations much more faithful and true to nature, but has very agreeably relieved the monotony of that tragic solemnity which ordinary writers appear to think indispensable to the dignity of poetical heroes and heroines.

The Lady of the Lake was probably the last of Sir Walter Scott's poems that was worthy of his genius and unparalleled reputation. It is described, and we think justly, as combining more attractions than either the Lay or Marmion, and as being a far more regular and finished work. The vision of Don Roderick—Rokeby, and the Lord of the Isles—added nothing to Sir Walter Scott's reputation; they exhibit in succession fainter and fainter manifestations of the author's talents, and the world felt little regret when his muse ceased her biennial announcement of an increase in her very prolific family. Yet any one of the poems we have referred to would have set up an ordinary poet; nay, it would have placed him very nearly at the head of his brightest and most successful contemporaries; and, when taken together as the rapid creation of a single mind, they afford an astonishing illustration of its power. Of the four, though Rokeby was the last, and indicated a lamentable failing off, a critic truly remarked, 'after all the hyperbolical praises and hypercritical censures which have been lavished on Mr. Scott's talents, that mind must be indeed of extraordinary capacity which could in the course of about eight years produce four such poems as the Lay of the Minstrel, Marmion, The Lady of the Lake, and Rokeby.' The periodical minstrel who paid his regular visits and charmed all ears and all hearts, from John a Groat's house to the Land's end, at length suddenly disappeared.

One morn I missed him on the custom'd hill;
Along the heath and near his favorite tree;
Another came, nor yet beside the rill,
Nor up the lawn, nor at the wood was he.

The harp of the north was silent; and men wondered what had become of the mighty magician who had so long entranced them with his melody. Those who were intimately acquainted

with the bard well knew the irrepressible activity of his spirit, and that he could not repose in voluptuous indolence amidst the fragrant incense of the fame he had acquired—that it was impossible for his mind to relax its labor, which was in truth its highest enjoyment; and therefore they felt assured that, having renounced the lighter pursuits of literature, he was bending his power to the achievement of some noble performance that should rank his name among the loftiest of the sons of immortality. For many years this continued to be the general impression. In the mean time, the vacuum occasioned by Sir Walter's retirement was mysteriously filled up by a writer of novels and romances, who seemed destined in prose to outstrip all the poets of the age,—whose creations only wanted rhythm and the appropriate forms of versification to surpass the Southseys and the Scotts in their own particular walk of excellence, while he threw into shade and forgetfulness the class of authors whose province he had invaded with a success which made him at once the admiration and the envy of the world. The buzz went round—Who is he? A Scotsman certainly—but, beyond this, curiosity was utterly at fault; the secret was so well kept that the author of 'the Waverly novels,' as this most rich and marvellous series of works has since been denominated, was only talked of as 'the Great Unknown.' Some indeed imagined that performances of such transcendent merit, following each other in breathless succession, so that one was scarcely read before another was in circulation, must have been the joint production of two or three kindred minds. It seemed almost physically impossible that they could have been the labor of one. Yet this has since been proved to be the case—and that one, to the delight and pride of his admirers, is Sir Walter Scott.

The remarks which we have ventured to offer on the peculiarities of his poetry apply generally to his novels, only that in these he takes a wider range, and in addition develops other powers altogether so extraordinary in their combination that Sir Walter Scott will never have a rival in his own times; and it is questionable whether posterity will ever produce in all respects his equal. Speaking of the wonderful success of Waverly, the review before quoted observes—'the secret of this success, we take it, is merely that the author is a person of genius, and that he has, notwithstanding, had virtue enough to be true to nature throughout, and to content himself, even in the marvellous parts of his story, with copying from actual existences rather than from the phantasms of his own imagination. The charm which this communicates to all works that deal in the representation of human actions and characters is more readily felt than understood, and operates with unfailing efficacy even upon those who have no acquaintance with the originals from which the picture has been borrowed. There is a consistency in nature and truth, the want of which may always be detected in the happiest combinations of fancy, and the consciousness of their support gives a confidence and assurance to the artist which encourages him occasionally to risk a strength of coloring, and a boldness of drawing, upon which

he would scarcely have ventured in a sketch that was purely ideal.' The article concludes with something like an intimation that the unknown was at least suspected.

'There has been much speculation, says the critic, at least in this quarter of the island, about the author of this singular performance, and certainly it is not easy to conjecture why it is still anonymous. Judging by internal evidence, to which alone we pretend to have access, we should not scruple to ascribe it to the highest of those authors to whom it has been assigned by the sagacious conjectures of the public; and this at least we will venture to say, that, if it be indeed the work of an author hitherto unknown, Mr. Scott will do well to look to his laurels, and to rouse himself for a sturdier competitor than any he has yet had to encounter.'

Guy Mannering and The Antiquary followed, and sustained the high reputation of the author of Waverly, then known only under that enviable character; then were announced The Tales of my Landlord; then Rob Roy, which was immediately succeeded by the splendid and unrivalled performance, Ivanhoe; and then a multitude to which additions are made during the progress of each succeeding year; so that to enumerate, much less to notice them, would extend this article beyond all reasonable limits, and answer no good purpose, as they have been read in both hemispheres, and in every spot where the English tongue is written and understood. From this useless task we shall therefore refrain, and content ourselves with a discriminating view of the talents of Sir Walter in this new and delightful sphere of his labors and his fame. The first thing that cannot fail to astonish every body is the wonderful fertility of the writer, and the unexampled continuousness of his exertions. In the year 1822 the Edinburgh Review, in its article on the Fortunes of Nigel, takes occasion to say, 'our last particular notice we think was of Ivanhoe, in the end of 1819; and, in the two years that have since elapsed, we have had the Monastery, the Abbot, Kenilworth, the Pirates, and Nigel; one, two, three, four, five, large original works from the same fertile and inexhaustible pen. It is a strange manufacture! and, though depending entirely on invention and original fancy, really seems to proceed with all the steadiness and regularity of a thing that was kept in operation by industry and application alone; our whole fraternity, for example, with all the works of all other writers to supply them with materials, are not half so sure of bringing out their two volumes in the year as this one author, with nothing but his own genius to depend on, is of bringing out his six or seven.'

The same authority in various other articles furnishes us with the very best exhibitions of the characteristic features of that genius whose fertility and perseverance it pronounces to be so wonderful. 'In the period of little more than five years, the author has founded a new school of invention, and established and endowed it with nearly thirty volumes (this was in 1819) of the most animated and original composition that have enriched English literature for a century,—volumes that have cast sensibly into the shade all contemporary prose, and even

all recent poetry (except perhaps that inspired by the genius or the demon of Byron); and by their force of coloring and depth of feeling, by their variety, vivacity, magical facility, and living presentiment of character, have rendered conceivable to this later age the miracles of the mighty dramatist.' The critic had before alluded to the thirty-eight plays of Shakspeare, written in the brief space of his early manhood; and he goes on to observe, 'Shakspeare, to be sure, is more purely original; but it should not be forgotten that in his time there was much less to borrow, and that he too has drawn freely and largely from the sources that were open to him—at least for his Fable, and graver sentiments; for his wit and humor, as well as his poetry, are always his own.'

We subjoin the following, which is more comprehensive, and at the same time more definite, than any thing we have met with on the subject of this author's peculiar merits as a novelist. 'The author, whoever he is, has a truly graphic and creative power in the invention and delineation of characters, which he sketches with an ease, and colors with a brilliancy, and scatters about with a profusion which reminds us of Shakspeare himself; yet, with all this force and felicity in the representation of living agents, he has the eye of a poet for all the striking aspects of nature; and usually contrives, both in his scenery and in the groups with which it is enlivened, to combine the picturesque with the natural with a grace that has rarely been attained by artists so copious and rapid. His narrative in this way is kept constantly full of life, variety, and color; and is so interspersed with glowing descriptions, and lively allusions, and flying traits of sagacity and pathos, as not only to keep our attention continually awake, but to afford a pleasing exercise to most of our other faculties. The prevailing tone is very gay and pleasant; but the author's most remarkable, and perhaps his most delightful talent, is that of representing kindness of heart in unison with lightness of spirits and great simplicity of character, and of blending the expression of warm and generous and exalted affections with scenes and persons that are in themselves both lowly, and ridiculous. It is very honorable, we think, both to the author and to the readers among whom he is so extremely popular, that the great interest of his pieces is for the greater part a moral interest, that the concern we take in his characters is less on account of their adventures than of their amiableness, and that the great charm of his works is derived from the kindness of heart, the capacity of generous emotions, and the lights of native taste, which he ascribes so lavishly, and at the same time with such an air of truth and familiarity, even to the humblest of his favorites. With all his relish for the ridiculous, accordingly, there is no tone of misanthropy or even of sarcasm in his representations; but, on the contrary, a great indulgence and relenting towards those who are to be the objects of our disapprobation.' There is no keen or cold-blooded satire, no bitterness of heart or fierceness of resentment, in any part of his writings. His love of ridicule is little else than a love of

mirth, and savours throughout of the joyous temperament in which it appears to have its origin, while the buoyancy of a raised and poetical imagination lifts him continually above the region of mere jollity and good humour, to which a taste, by no means nice and fastidious, seems constantly in danger of sinking him. He is evidently a person of a very sociable and liberal spirit, with great habits of observation, who has ranged pretty extensively through the varieties of human life and character, and mingled with them all, not only with intelligent familiarity, but with a free and natural sympathy for all the diversity of their tastes, pleasures, and pursuits,—one who has kept his heart as well as his eyes open to all that has offered itself to engage them, and learned indulgence for human faults and follies, not only from finding kindred faults in their most intolerant censors, but also for the sake of the virtues by which they are often redeemed, and the sufferings by which they have still oftener been taught. The temper of his writings, in short, is precisely the reverse of those of our Laureates and Lakers, who, being themselves the most whimsical of mortals, make it a conscience to loathe and detest all with whom they happen to disagree, and labor to promote mutual animosity, and all manner of uncharitableness, among mankind, by referring every supposed error of taste, or peculiarity of opinion, to some hateful corruption of the heart and understanding. With all the indulgence, however, which we so justly ascribe to him, we are far from complaining of the writer before us for being too neutral and undecided on the great subjects which are most apt to engender excessive zeal and intolerance, and we are almost as far from agreeing with him as to most of these subjects. In politics it is sufficiently manifest that he is a decided tory; and we are afraid something of a latitudinarian both in morals and religion. It is rather remarkable, however, that with propensities decidedly aristocratical, the ingenious author has succeeded by far the best in the representation of rustic and homely characters; and not in the ludicrous or contemptuous representation of them, but by making them at once more natural and more interesting than they had ever been made before in any work of fiction; by showing them, not as clowns to be laughed at, or wretches to be pitied and despised, but as human creatures, with as many pleasures, and fewer cares than their superiors, with affections not only as strong, but often as delicate as those whose language is smoother, and with a vein of humor, a force of sagacity, and very frequently an elevation of fancy as high and as natural as can be met with among more cultivated beings.

Next to these we think he has found his happiest subjects, or at least displayed his greatest powers, in the delineation of the grand and gloomy aspects of nature, and of the dark and fierce passions of the heart. The natural gaiety of his temper does not indeed allow him to dwell long on such themes; but the sketches he occasionally introduces are executed with admirable force and spirit, and gave a strong impression both of the vigor of his imagination and the variety of his talents. It is only in the

third rank that we would place his pictures of chivalry and chivalrous character, his traits of gallantry, nobleness, and honor, and that bewitching assemblage of gay and gentle manners, with generosity, candor, and courage, which has long been familiar enough to readers and writers of novels, but has never before been represented with such an air of truth and so much ease and happiness of execution.'

It will be seen that the Edinburgh Reviewers, on more than one occasion, insinuated very strong suspicions of their knowledge of the author, from the internal evidence furnished by his works; they associated the name of Scott, both in their notice of Waverly and in that of Ivanhoe, in such a way with the productions under review, that no reader could possibly misunderstand what were their convictions on the subject. Still public curiosity was kept alive by positive assurances that Mr. Scott had repeatedly disclaimed the honor so earnestly and officiously thrust upon him. It was said that there was a kind of secret manufactory established in the north for getting up an annual story for the literary market under the presidency of a master mind; yet the secret was still profoundly kept, and conjecture was almost wearied, when disastrous events occurred in the commercial, and especially in the literary commercial world, that tore off the veil that had so long concealed the writer from the gaze of the public. The intelligence ran and rung from 'side to side' that it was no other than Sir Walter Scott: at the very moment when the accumulations of his life, and which placed him in a situation of almost noble independence, were reduced to nothing, he became the object of universal sympathy, wonder, and admiration.

We cannot be surprised that the residence of such a man, itself as much the creation of his genius as the works which have emanated from it, should excite great and earnest curiosity, and that it should be visited by men of every country, who from whatever motive are induced to cross the Tweed; and, in order in some measure to meet the cravings of that curiosity which cannot in this way be gratified, we conclude this article with the following narrative and description, which is from the pen of one of the poet's transatlantic admirers:—

'Some fifteen or sixteen years ago, as my friend informed me, there was not a more unlovely spot, in this part of the world, than that on which Abbotsford now exhibits all its quaint architecture and beautiful accompaniment of garden and woodland. A mean farm house stood on part of the site of the present edifice; a 'kale yard' bloomed where the stately embattled court yard now spreads itself; and for many thousand acres of flourishing plantations, half of which have all the appearance of being twice as old as they really are, there was but a single long straggling stripe of unthriving firs. The river, however, must needs remain *in statu quo*; and I will not believe that any place so near those clearest and sweetest of all waters could ever have been quite destitute of charms. The scene, however, was no doubt wild enough,—a naked moor—a few little turnip fields painfully reclaimed from it—a Scotch cottage—a Scotch farm yard, and some Scotch firs. It is

difficult to imagine a more complete contrast to the Abbotsford of 1825.

'Sir W. is, as you have no doubt heard, a most zealous agriculturist, and arboriculturist especially; and he is allowed to have done things with this estate, since it came into his possession, which would have been reckoned wonders, even if they had occupied the whole of a clever and skilful man's attention, during more years than have elapsed since he began to write himself Laird of Abbotsford. He has some excellent arable land on the banks of the Tweed, and towards the little town of Melrose, which lies some three miles from the mansion; but the bulk of the property is hilly country, with deep narrow dells interlacing it. Of this he has planted fully one half, and it is admitted on all hands that his rising forest has been laid out, arranged, and managed with consummate taste, care, and success—so much so, that the general appearance of Tweedside, for some miles, is already quite altered and improved by the graceful ranges of his woodland; and that the produce of these plantations must, in the course of twenty or thirty years more, add immensely to the yearly rental of the estate. In the mean time, the shelter afforded by the woods to the sheep walks reserved amidst them has prodigiously improved the pasturage, and half the surface ~~yield~~s already double the rent the whole was ~~ever~~ thought capable of affording, while in the old unprotected condition. All through those woods there are broad riding-ways, kept in capital order, and conducted in such excellent taste that we might wander for weeks amidst their windings without exhausting the beauties of the Poet's lounge. There are scores of charming waterfalls in the ravines, and near every one of them you find benches or bowers at the most picturesque points of view. There are two or three small mountain lakes included in the domain—one of them not so small neither, being, I should suppose, nearly a mile in circumference—and of these also every advantage has been taken. On the whole, it is already a very beautiful scene; and, when the trees have gained their proper dignity of elevation, it must be a very grand one. Amidst these woods, Mr. * * * * * tells me, the proprietor, when at home, usually spends many hours daily, either on his pony, or on foot, with axe and pruning knife in hand. Here is his *study*; he, it seems, like Jaques, is never at a loss to find 'books in trees.'

'The Muse nac poet ever fand her
Till by himselfe he learned to wander
Adown some trotting burn's meander,
An' no think lang,'

As Burns says; and one of his *burns*, by the by, is Huntley Burn, where Thomas of Freeldoun met the queen of Faëry. The rencontre, according to the old Rhymer himself, occurred beside 'The Eildon Tree.' That landmark has long since disappeared, but most of Sir Walter's walks have the Eildon Hills, in some one or other of their innumerable aspects, for background. But I am keeping you too long away from 'The Rooftree of Monkbarns,' which is situated on the brink of the last of a series of irregular hills, descending from the elevation of the Eildons, stepwise, to the Tweed. On all sides, except towards the river, the house connects itself with

the gardens (according to the old fashion, now generally condemned); so that there is no want of air and space about the habitation. The building is such a one, I dare say, as nobody but he would ever have dreamed of erecting; or, if he had, escaped being quizzed for his pains. Yet it is eminently imposing in its general effect; and, in most of the details, not only full of historical interest, but of beauty also. It is no doubt a thing of shreds and patches, but they have been combined by a masterly hand; and if there be some whimsicalities, that in an ordinary case might have called up a smile, who is likely now or hereafter to contemplate such a monument of such a man's peculiar tastes and fancies, without feelings of a far different order? Borrowing outlines and ornaments from every part of Scotland, a gateway from Linlithgow, a roof from Roslin, a chimneypiece from Melrose, a postern from the 'Heart of Midlothian,' &c. &c. &c., it is totally unlike any other building in the kingdom, as a whole; and that hole is, I have said, a beautiful and a noble whole—almost enough so to make me suspect that, if Sir Walter had been bred an architect, he might have done as much in that way as he has, *de facto*, in the woodman's craft, or (which they swear he is less vain of) the novelist's.

'By the principal approach you come very suddenly on the edifice—as the French would say, 'Vous tombez sur le château'; but this evil, if evil it be, was unavoidable, in consequence of the vicinity of a public road which cuts off the château and its *plaisance* from the main body of park and wood, making it a matter of necessity that what is called, in the improvement men's slang, 'the avenue proper,' should be short. It is but slightly curved, and you find yourself, a very few minutes after turning from the road, at the great gate already mentioned. This is a lofty arch rising out of an embattled wall of considerable height; and the *jougs*, as they are styled, those well known emblems of feudal authority, hang rusty at the side; this pair being *dit sur* relics from that great citadel of the old Douglasses, Thrive Castle, in Galloway. On entering, you find yourself within an enclosure of perhaps half an acre or better, two sides thereof being protected by the high wall above mentioned, all along which, inside, a trellised walk extends itself—broad, cool, and dark overhead with roses and honeysuckles. The third side, to the east, shows a screen of open arches of Gothic stonework, filled between with a net-work of iron, not visible until you come close to it, and affording therefore delightful glimpses of the gardens, which spread upwards with many architectural ornaments of turret, porch, urn, vase, and what not, after a fashion that would make the heart of old Price of the Picturesque to leap within him: this screen is a feature of equal novelty and grace, and, if ever the old school of gardening come into vogue again, will find abundance of imitators. It abuts on the eastern extremity of the house, which runs along the whole of the northern side (and a small part of the western) of the great enclosure. And, by the way, nothing can be more delightful than the whole effect of the said enclosure, in the still and solitary state in which I chanced to see it. There is room for a piece of the most

elaborate turf within it, and rosaries of all manner of shapes and sizes generally connect this green pavement with the roof of the trellis walk, a verdant cloister, over which appears the gray wall with its little turrets ; and over that, again, climb oak, elm, birch, and hazel, up a steep bank —so steep that the trees, young as they are, give already all the grand effect of a sweeping amphitheatre of wood. The back ground on that side is wholly forest ; on the east, garden loses itself in forest by degrees ; on the west there is wood on wood also, but with glimpses of the Tweed between ; and in the distance (some half a dozen miles off) a complete *sierra*, the ridge of the mountain between Tweed and Yarrow, to wit—its highest peak being that of Newark hill, at the bottom of which the old castle, where the ‘latest Minstrel sang,’ still exhibits some noble ruins.

‘Not being skilled in the technical tongue of the architects, I beg, leave to decline describing the structure of the house, farther than merely to say that it is more than 150 feet long in front, as I paced it ; was built at two different onsets ; has a tall tower at either end, the one not in the least like the other ; presents sundry *crowfooted*, alias zigzagged, gables to the eye ; a myriad of indentations and parapets and machicolated eaves ; most fantastic waterspouts ; labelled windows, not a few of them of painted glass ; groups of right Elizabethan chimneys ; balconies of divers fashions, greater and lesser ; stones carved with heraldries innumerable let in here and there in the wall ; and a very noble projecting gateway, a fac simile, I am told, of that appertaining to a certain dilapidated royal palace, which long ago seems to have caught in a particular manner the Poet’s fancy, as witness the stanza,—

Of all the palaces so fair,
Built for the royal dwelling,
Above the rest, beyond compare,
Linlithgow is excelling.

From the porchway, which is quite open to the elements in front, and adorned with some enormous petrefied staghorns overhead, you are admitted by a pair of folding doors at once into the hall, and an imposing *coup d’œil* the first glimpse of the Poet’s interior does present. The lofty windows, only two in number, being wholly covered with coats of arms, the place appears as dark as the twelfth century, on your first entrance from noon-day ; but the delicious coolness of the atmosphere is luxury enough for a minute or two ; and by degrees your eyes get accustomed to the effect of those ‘storied panes,’ and you are satisfied that you stand in one of the most picturesque of apartments. The hall is, I should guess, about forty feet long, by twenty in height and breadth. The walls are of richly carved oak, most part of it exceedingly dark, and brought, it seems, from the old palace of Dunfermline : the roof, a series of pointed arches of the same, each beam presenting, in the centre, a shield of arms richly blazoned : of these shields there are sixteen, enough to bear all the quarterings of a perfect pedigree, if the Poet could show them ; but on the material side (at the extremity) there are two or three blanks (of the same sort which made Louis le Grand unhappy) which have been covered with sketches of Cloudeiland, and equipped

with the appropriate motto, ‘*Nox alta velat*.’ The shields properly filled up are distinguished ones ; the descent of Scott and Harden on one side, and Rutherford of *that ilk* on the other ; all which matters, are they not written in the book of the chronicles of Douglas and Nisbet ? There is a doorway at the eastern end, over and round which the baronet has placed another series of escutcheons, which I looked on with at least as much respect : they are the memorials of his immediate personal connexions, the bearings of his friends and companions. All around the corneice of this noble room there runs a continued series of blazoned shields, of another sort still ; at the centre of one end, I saw the bloody heart of Douglas ; and, opposite to that, the royal lion of Scotland,—and between the ribs there is an inscription in black letter, which I, after some trials, read, and of which I wish I had had sense enough to take a copy. To the best of my recollection, the words are not unlike these : ‘These be the coat armories of the clannis and chief men of name, wha keepit the marchys of Scotlande in the auld tyme of the Kinge. Trewe ware they in their tyme, and in there defense God them defendyt.’ There are from thirty to forty shields thus distinguished—Douglas, Soulis, Buccleugh, Maxwell, Johnstone, Glendoning, Herries, Rutherford, Kerr, Elliott, Pringle, Home, and all the other heroes, as you may guess, of the border minstrelsy. The floor of this hall is black and white marble, from the Hebrides, wrought lozenge-wise ; and the upper walls are completely hung with arms and armour. Two full suits of splendid steel occupy niches at the eastern end by themselves ; the one an English suit of Henry the Fifth’s time, the other an Italian, not quite so old. The variety of cuirasses, black and white, plain and sculptured, is endless ; helmets are in equal profusion ; stirrups and spurs, of every fantasy, dangle about and below them ; and there are swords of every order, from the enormous two-handed weapon with which the Swiss peasants dared to withstand the spears of the Austrian chivalry, to the claymore of the ‘Forty-five,’ and the rapier of Dettingen. Indeed, I might come still lower ; for, among the other spoils, I saw Polish lances, gathered by the author of Paul’s Letters on the field of Waterloo, and a complete suit of chain mail taken off the corpse of one of Tippoo’s body-guard at Seringapatam. A series of German executioners’ swords was *inter alia* pointed out to me ; on the blade of one of which I made out the arms of Augsburg, and a legend which may be thus rendered :—

Dust, when I strike, to dust : From sleepless grave,
Sweet Jesu, stoop, a sin-stained soul to save

I am sorry there is no catalogue of this curious collection. Sir Walter ought to make one himself ; for my cicerone informs me there is some particular history attached to almost every piece in it, and known in detail to nobody but himself. ‘Stepping westward,’ as Wordsworth says, from this hall, you find yourself in a narrow, low, arched room, which runs quite across the house, having a blazoned window again at either extremity, and filled all over with smaller pieces of armour, and weapons, such as swords, firelocks, spears, arrows, darts, daggers, &c. &c. &c. Here are the pieces esteemed most precious by reason

of their histories respectively. I saw, among the rest, Rob Roy's gun, with his initials, R. M. C., i. e. Robert Macgregor Campbell, round the touch-hole : the blunderbuss of Hofer, a present to Sir Walter from his friend Sir Humphry Davy : a most magnificent sword, as magnificently mounted, the gift of Charles the First to the great Montrose, and having the arms of Prince Henry worked on the hilt ; the hunting bottle of bonnie King Jamie ; Buonaparte's pistols (found in his carriage at Waterloo, I believe), *cum multis aliis*. I should have mentioned that stag-horns and bull's horns (the petrified reliques of the old mountain monster, I mean), and so forth, are suspended in great abundance above all the doorways of these armories ; and that in one corner, a dark one as it ought to be, there is a complete assortment of the old Scottish instruments of torture, not forgetting the very thumbkinis under which Cardinal Carstairs did not flinch, and the more terrific iron crown of Wisheart the Martyr, being a sort of barred head-piece, screwed on the victim at the stake, to prevent him from crying aloud in his agony. In short, there can be no doubt that, like Grose of merry memory, the mighty Minstrel

—Has a fourth o' auld nick-nackets,
Rusty airn caps and jinglin' jackets,
Wad haud the Lothians three in ~~suckets~~,
A townmont' guid.

These reliques of other, and for the most part darker, years, are disposed, however with so much grace and elegance, that I doubt if Mr. Hope himself would find any thing to quarrel with in the beautiful apartments which contain them. The smaller of these opens to the drawing room on one side and the dining room on the other, and is fitted up with low *divans* rather than sofas ; so as to make, I doubt not, a most agreeable sitting room when the apartments are occupied, as for my sins I found them not. In the hall, when the weather is hot, the baronet is accustomed to dine ; and a gallant refectory no question it must make. A ponderous chandelier of painted glass swings from the roof ; and the chimneypiece (the design copied from the stonework of the Abbot's Stall at Melrose) would hold rafters enough for a Christmas fire of the good old time. Were the company suitably attired, a dinner party here would look like a scene in the *Mysteries of Udolpho*.

Beyond the smaller, or rather, I should say, the narrower armory, lies the dining parlour proper, however ; and, though there is nothing Udolphoish here, yet I can well believe that, when lighted up and the curtains drawn at night, the place may give no bad notion of the private snuggeries of some lofty lord abbot of the time of the *Canterbury Tales*. The room is a very handsome one, with a low and very richly carved roof of dark oak again ; a hugh projecting bow window, and the dais elevated *more majorum* ; the ornaments of the roof, niches for lamps, &c. &c., in short, all the minor details, are, I believe, fac similes after Melrose. The walls are hung in crimson, but almost entirely covered with pictures, of which the most remarkable are—the parliamentary general, Lord Essex, a full length on horseback ; the Duke of Monmouth, by Lely ; a capital Hogarth, by himself ; Prior and Gay,

both by Jervas ; and the head of Mary Queen of Scots, in a charger, painted by Amias Canwood the day after the decapitation at Fotheringay, and sent some years ago as a present to Sir Walter from a Prussian nobleman, in whose family it had been for more than two centuries. Among various family pictures, I noticed particularly Sir Walter's great grandfather, the old cavalier mentioned in one of the epistles in *Marmion*, who let his beard grow after the execution of Charles the First, and who here appears accordingly, with a most venerable appendage of silver whiteness, reaching even unto his girdle. This old gentleman's son hangs close by him ; and had it not been for the costume, &c., I should have taken it for a likeness of Sir Walter himself. (It is very like the common portraits of the Poet, though certainly not like either Sir Thomas Lawrence's picture or Chantry's bust.) There is also a very splendid full length of Lucy Waters, mother of the Duke of Monmouth ; and an oval, capitally painted, of Anne Duchess of Buccleugh, the same who,

In pride of youth, in beauty's bloom,
Had wept o'er Monmouth's bloody tomb.

All the furniture of this room is massy Gothic oak ; and, as I said before, when it is fairly lit up, and plate and glass set forth, it must needs have a richly and luxuriously antique aspect. Beyond and alongside are narrowish passages, which make one fancy one's self in the penetralia of some dim old monastery ; for roofs and walls and windows (square, round, and oval alike), are sculptured in stone, after the richest reliques of Melrose and Roslin Chapel. One of these leads to a charming breakfast room, which looks to the Tweed on one side, and towards Yarrow and Ettricke, famed in song, on the other : a cheerful room fitted up with novels, romances, and poetry, I could perceive, at one end ; and the other walls covered thick and thicker with a most valuable and beautiful collection of water-color drawings, chiefly by Turner, and Thompson of Dudding-stone : the designs, in short, for the magnificent work entitled ‘Provincial Antiquities of Scotland.’ There is one very grand oil-painting over the chimneypiece, Fastcastle, by Thompson, alias the Wolf's Crag of the Bride of Lammermoor, one of the most majestic and melancholy sea pieces I ever saw ; and some large black and white drawings of the Vision of Don Roderick, by Sir James Steuart of Allenbank (whose illustration of *Marmion* and *Mazepa* you have seen or heard of), are at one end of the parlour. The room is crammed with queer cabinets and boxes, and in a niche there is a bust of old Henry Mackenzie, by Joseph of Edinburgh. Returning towards the armory, you have, on one side of a most religious looking corridor, a small greenhouse with a fountain playing before it—the very fountain that in days of yore graced the cross of Edinburgh, and used to flow with claret at the coronation of the Stuarts—a pretty design, and a standing monument of the barbarity of modern innovation. From the small armory you pass, as I said before, into the drawing room, a large, lofty, and splendid *salon*, with antique ebony furniture and crimson silk hangings, cabinets, china, and mirrors *quantum scilicet*, and some portraits ; among the rest the glorious John Dryden,

by Sir Peter Lely, with his gray hairs floating about in a most picturesque style, eyes full of wildness, presenting the old bard, I take it, in one of those ‘tremulous moods’ in which we have it on record he appeared when interrupted in the midst of his Alexander’s Feast. From this you pass into the largest of all the apartments, the library, which, I must say, is really a noble room. It is an oblong of some fifty feet by thirty, with a projection in the centre, opposite the fire-place, terminating in a grand bow window, fitted up with books also, and, in fact, constituted a sort of chapel to the church. The roof is of carved oak again—a very rich pattern, I believe chiefly *à la Roslin*,—and the book-cases, which are also of richly carved oak, reach high up the walls all round. The collection amounts, in this room, to some fifteen or twenty thousand volumes, arranged according to their subjects; British history and antiquities filling the whole of the chief wall. English poetry and drama, classics and miscellanies, one end, foreign literature, chiefly French and German, the other. The cases on the side opposite the fire are wired, and locked, as containing articles very precious and very portable. One consists entirely of books and MSS. relating to the insurrections of 1715 and 1745; and another (within the recess of the bow window) of treatises *de re magica*, both of these being (I am told, and can well believe), in their several ways, collections of the rarest curiosity. My cicerone pointed out, in one corner, a magnificent set of Montfaucon, ten volumes folio, bound in the richest manner in scarlet, and stamped with the royal arms, the gift of his present Majesty. There are few living authors of whose works presentation copies are not to be found here. My friend showed me inscriptions of that sort in, I believe, every European dialect extant. The books are all in prime condition, and bindings that would satisfy Mr. Dibdin. The only picture is Sir Walter’s eldest son is hussar uniform, and holding his horse, by Allen of Edinburgh, a noble portrait, over the fire place; and the only bust is that of Shakspere, from the Avon monument, in a small niche in the centre of the east side. On a rich stand of porphyry, in one corner, repose a tall silver urn filled with bones from the Piraeus, and bearing the inscription, ‘Given by George Gordon, Lord Byron, to Sir Walter Scott, Bart.’ It contained the letter which accompanied the gift till lately: it has disappeared; no one guesses who took it, but whoever he was, as my guide observed, he must have been a thief for thieving’s sake truly, as he durst no more exhibit his autograph than tip himself with a bare bodkin. Sad, infamous tourist indeed! Although I saw abundance of comfortable looking desks and arm chairs, yet this room seemed rather too large and fine for work, and I found accordingly, after passing a double pair of doors, that there was a *sanctum* within and beyond this library. And here you may believe was not to me the least interesting, though by no means the most splendid, part of the suit.

The lion’s own den proper, then, is a room of about five-and-twenty feet square by twenty feet high, containing of what is properly called furniture nothing but a small writing table in the centre, a plain arm chair covered with black lea-

ther—a very comfortable one though, for I tried it—and a single chair besides, plain symptoms that this is no place for company. On either side of the fire-place there are shelves filled with duodecimos, and books of reference, chiefly, of course, folios; but except these there are no books save the contents of a light gallery which runs round three sides of the room, and is reached by a hanging stair of carved oak in one corner. You have been both at the Elisée Bourbon and Malmaison, and remember the library at one or other of those places, I forget which; this gallery is much in the same style. There are only two portraits, an original of the beautiful and melancholy head of Claverhouse, and a small full length of Rob Roy. Various little antique cabinets stand round about, each having a bust on it: Stothard’s Canterbury Pilgrims are on the mantelpiece; and in one corner I saw a collection of really useful weapons, those of the forest-craft, to wit—axes and bills and so forth of every calibre. There is only one window pierced in a very thick wall, so that the place is rather sombre; the light traceried work of the gallery overhead harmonises with the books well. It is a very comfortable looking room, and very unlike any other I ever was in. I should not forget some Highland claymores, clustered round a target over the Canterbury people, nor a writing box of carved wood, lined with crimson velvet, and furnished with silver plate of right venerable aspect, which looked as if it might have been the implement of old Chaucer himself, but which from the arms on the lid much have belonged to some Italian prince of the days of Leo the Magnificent at the farthest.

In one corner of this *sanctum* there is a little holy of holies, in the shape of a closet, which looks like the oratory of some dame of old romance, and opens into the gardens; and the tower, which furnishes this below, forms above a private staircase, accessible from the gallery and leading to the upper regions. Thither also I penetrated, but I suppose you will take the bed rooms and dressing rooms for granted.

The view to the Tweed from all the principal apartments is beautiful. You look out from among bowers, over a lawn of sweet turf, upon the clearest of all streams, fringed with the wildest of birch woods, and backed with the green hills of Ettricke Forest. The rest you must imagine. Altogether, the place destined to receive so many pilgrimages contains within itself beauties not unworthy of its associations. Few poets ever inhabited such a place; none, ere now, ever created one. It is the realization of dreams.

ABBOTS-LANGLEY, a village in Herts, four miles from St. Albans (and formerly belonging to the abbey there), famous for being the birthplace of the Pope Adrian IV.

ABBREVIATE, *v. n.* Ital. *Abbreviare*,
ABBERVIA'TION, *n. s.* } from Lat. *brevis*, *ad*
ABBRE'VIATOR, } *breve agere*, which is
ABBRE'VIATURE. } from the Gr. *βραχίον*
Anglo-Saxon, *braecan*, to break. To make short, to shorten by contraction or cutting off, retaining the substance of the original; to make an epitome, or compendium; to abridge; curtail. The derivatives correspond.

The epistles of St. Paul, St. Peter, St. John, St. James, and Judas, the Apostles, do contain counsels and advertisementes, in the form of orations, reciting divers places, as well out of the Old Testament as out of the Gospels, as it were an *abbreviate*, called of the Greeks and Latins epitome. Sir T. Elyot's *Gov.*

In Xiphilin and Theodosius, the two *abbreviator*s of Dio Cassius, may be observed the like agreement and disagreement. *West on the Resurrection.*

It is one thing to *abbreviate* by contracting, another by cutting off. *Lord Bacon's Essays.*

ABBREVIATE, or ADJUDICATIONS, in Scots law, an abstract or abridgment of a decree of adjudication, which is recorded in a register kept for that purpose.

ABBREVIATION, in archaiology, is a short method of expressing words by initials, or other letters. Ancient MSS., and early-printed Greek books, are frequently identified and classed according to the mode of the abbreviations that abound in them. These are sometimes made by putting the first and last, and sometimes the middle letter of a word, under a line: thus ΘC, KC, IC, XC, YΣ, ΣΗΡ, ΙΗΑ, ΙΣΗΛ, ΠΝΑ, ΠΗΡ, ΜΗΡ, ΟΥΝΟΣ, ΑΝΟΣ, ΙΑΗΜ, ΔΑΔ, signify respectively, Θεος God; Κυριος, Lord; Ιησους, Jesus; Χριστος, Christ; Υιος, a Son; Σωτηρ, a Saviour; Ιεραπλ, Israel; πνευμα, spirit; πατηρ, father; μητηρ, mother; ουρανος, heaven; ανθρωπος, man; Ιερουσαλημ, Jerusalem; Δαυιδ, David. But, of all people, the Jewish Rabbin are the most remarkable for this practice.—Without a key to their abbreviations their writings are unintelligible. They not only abbreviate words like the Greeks and Latins, by retrenching letters or syllables, but they often take away all except the initials; and, what is still worse, they frequently join the initials of several words together, and, adding vowels to them, make a barbarous sort of a word representative of all the words thus abridged. Thus *Rabbi Schelemoh Jarchi*, in the Jargon of Hebrew abbreviations, is called *Rasi*, and *Rabbi Moses ben Malemon* is *Rambam*. Mercerus, David de Ponis, Schindler, Buxtorf, &c., have given explanations of the Hebrew abbreviations. We subjoin the most useful abbreviations commonly found in English writings:—

A. B. or B. A., Artium Baccalaureus, Bachelor of Arts.
 A. C., Ante Christum, Before Christ.
 A. D., Anno Domini, In the year of our Lord.
 A. M., Ante meridiem, Before noon, or Anno mundi, In the year of the world.
 A. U. C., Anno urbis conditæ, in the year of the city, i. e. the building of Rome.
 Bart., Baronet.
 B. C., Before Christ.
 B. C. L., Bachelor of civil law.
 B. D., Baccalaureus divinitatis, Bachelor of divinity.
 B. L., Baccalaureus legum, Bachelor of laws.
 B. M., Baccalaureus medicinæ, Bachelor of medicine.
 C. or Cent., Centum, A hundred.
 C. B., Companion of the Bath.
 C. P. S., Custos Privati Sigilli, Keeper of the privy seal.
 C. S., Custos Sigilli, Keeper of the seal.

- D. D.; Divinitatis Doctor, Doctor of divinity.
 Dec., December.
 D. F., Defensor fidei, Defender of the faith.
 D. G., Dei gratiâ, By the grace of God.
 Dr., Doctor.
 D. T., Doctor Theologiae, Doctor of divinity.
 F., Fiat, Let it be done.
 F. A. S., Fraternitatis Antiquorum Socius, Fellow of the Antiquarian Society.
 Feb., February.
 F. L. S., Fraternitatis Linneanae Socius.
 F. R. S. and A. S., Fraternitatis Regiae Socius et Associatus, Fellow and Associate of the Royal Society.
 F. S. A., Fellow of the Society of Arts.
 G. C. B., Knight of the Grand Cross of the Bath.
 Gent., Gentleman.
 G. R., Georgius Rex, King George.
 H. M. S., His Majesty's Ship.
 Ib. or Ibid., Ibidem, In the same place.
 I. e., Id est, That is.
 J. H. S., Jesus Hominum Salvator, Jesus the Saviour of men.
 Incog., Incognito, Unknown, As a stranger.
 Inst., Instant, Of this month.
 Itin., Itinerary.
 K. B., Knight of the Bath.
 K. C. B., Knight Commander of the Bath.
 K. P., Knight of St. Patrick.
 Kt., Knight.
 K. T., Knight of the Thistle.
 L. or Lib., Libra, Pound, or Liber, Book.
 Lieut., Lieutenant.
 LL. D., Legum Doctor, Doctor of Laws.
 L. S., Locus Sigilli, The Place of the Seals.
 M. A., Artium Magister, Master of Arts.
 M. B., Medicinæ Baccalaureus, Bachelor of Physic, or Medicinæ Baccalaureus, Bachelor of Music.
 M. D., Medicinæ Doctor, Doctor of Physic.
 Mem., Memento, Remember.
 Messrs., Messieurs, Gentlemen.
 M. P., Member of Parliament.
 Mr., Mister.
 Mrs., Mistress.
 M. S., Manuscriptum, Manuscript.
 MSS., Manuscripta, Manuscripts.
 N. B., Nota bene, Observe, Take notice.
 Nem. con., or Nem. diss., Nemine contradicente
or Nemine dissentiente, Unanimously.
 Nov., November.
 N. S., New style
 Obt., Obedient.
 Oct., October.
 O. S., Old style.
 Oxon., Oxford.
 Per. Cent., Per centum, By the hundred.
 P. M., Post meridiem, Afternoon.
 Prob., Problem.
 Prof., Professor.
 P. S., Post scriptum, Postscript.
 Q. D., Quasi dictum, As if it were said.
 Q. E. D., Quod erat demonstrandum, Which was to be demonstrated.
 Q. E. F., Quod erat faciendum, Which was to be done.
 Q. P. I., Quantum placet, As much as you please.
 Q. S., Quantum sufficit, A sufficient quantity,
 Q. V., Quantum vis, As much as you wish.
 R., Rex, King.

Reg. pref., Regius professor.

R. N., Royal Navy.

Rt. Hon., Right Honorable.

Rt. Wpfull., Right Worshipfull.

Sept., September.

St., Saint, or Street.

Viz., Videlicet, That is to say, Namely.

ABBROCHIMENT, in law, the forestalling a fair or market.

ABBTALS, or **ABBUFTALS**. See **ABUTTAL**.

ABB-WOOL, among clothiers, the wool of a weaver's warp.

ABCAS. See **ABASCIA**.

ABCDEFE, or **ABSCEDDE**, from *abcedo*, in surgery, to suppurate; an abceded surface, being that whose texture has been vitiated or separated by the formation of pus or purulent matter.

ABCEDARY, or **ABCEDARTIAN**, an epithet given to compositions whose parts are arranged in the order of the alphabet, chiefly applied to Hebrew writings.

ABDA, a district of Morocco, on the west coast, famous for its grain and for its breed of horses.

ABDALAVI, or **ARDELAVI**, in botany, an Egyptian plant, very like a melon, except that the fruit is more oblong, and acute at the extremities.

ABDALLA, the son of Abdalmothleb, the father of the prophet Mahomet. This parent of the prophet, though a slave, is clothed with such personal attractions by the Arabian historians, that after he had passed the age of 75 his hand was solicited by the fairest and most virtuous women of his tribe; and on the night of his nuptials, we are told, 100 young females expired with grief.

ABDALLATIF, or **ABDOLLATIPH**, an Arabian physician and author, born at Bagdad, in the year 1161. He studied grammar, rhetoric, history, poetry, and the Mahometan law. At the age of twenty-eight he began to travel. He resided a year and gave lectures at Mosul, in Mesopotamia. From thence he went to Damascus; and having vanquished, in debate, Alkendi, a celebrated philosopher, he went on to Jerusalem. Saladin, king of the Saracens, had seized upon Egypt, and was at that time endeavouring to drive the Christians from the Holy Land. Abdallatif proceeded to his head-quarters at Acre; but the Saracen monarch, having been signally defeated by the Christians, was unable at that time to admit him to his presence. He was offered the patronage of one of his principal courtiers, and a pension, if he would return to Damascus. He preferred visiting Egypt, and with ample recommendations proceeded to Cairo. Here he became the friend of Maimonides, the eagle of the doctors. After Saladin made peace with the Christians, Abdallatif waited on him at Jerusalem, where he was received in the most flattering manner; and delivered lectures in the great church or temple. From thence he went a third time to Damascus, and gave public lectures, on various subjects, to a numerous audience. He went after this into Greece, where he remained several years; and passed into Syria, Asia Minor, and Armenia, practising physic in various courts. His purpose was at length to retire to Damascus; but he determined previously

to make a pilgrimage to Mecca, in his way to Bagdad, whither he went in order to present his works to the caliph. There he died in the year 1231. A hundred and fifty works have been ascribed to this author: one only, an account of Egypt, now remains. Dr. Pococke brought it to Europe in MS., and deposited it in the Bodleian library. Dr. White published it with a Latin translation, in 1800, and a French translation, by Silvestre de Sacy, appeared at Paris, in 1810. Abdallatif's book on Egypt supplies a valuable link between ancient and modern history, giving us the only account extant of that country in the middle ages.

ABDALMALEK, the 5th khalif of the race of the Ommiades, called the skinner of a stone, because of his extreme avarice; as also *Aboulzebah*, because his breath was said to be so poisonous as to kill all the flies which rested on his face. He surpassed all his predecessors in power and dominion; penetrating to India in the east, and Spain in the west: he likewise made himself master of Medina and Mecca. His reign began in the 65th of the hegira, A.D. 685, and continued twenty-one years.

ABDALMELEK, (Ben Zohar,) an eminent Spanish physician, of the 12th century called by the  Europeans AVENZOR, which see.

ABDALONYMUS, or **ABDOLONYMUS**, (in classic history,) of the royal family of Sidon, and descended from king Cyniras. Alexander the Great having deposed Strato, inquired whether any of the race of Cyniras was living, that he might set him on the throne; and found this prince happy in his poverty: "I wish," said Abdalonymus, "I may bear my new condition as well; these hands have supplied my necessities: I have had nothing, and I have wanted nothing." This answer pleased Alexander so much, that, besides giving him all that was Strato's, he augmented his dominions, and presented him with a large portion of the Persian spoils.

ABDALS, in the eastern countries, fanatics, supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic, *Abdullah*, the servant of God. The Persians call them *devaneh khoda*, q. d. *furentes deo*, raging with the god. They have been known in India to run about the streets, and kill all they meet of a different religion.

ABDARA, or **ABDERA**, in ancient geography, a town of Boetia in Spain, a Phœnician colony; now called Adra, to the west of Almeria, in Granada.

ABDELAVI. See **ABDALAVI**.

ABDERA, in ancient geography, a maritime town of Thrace, near the mouth of the Nessus, on the east. Timaeus the Clazomenian attempted to find it, but was forced to give it up by the Thracians. The Teians, however, succeeded, and settled in it to avoid the Persians. Pliny and Justin report that the grass of Abdera was so strong that such horses as eat of it ran mad. It is famous for being the birth-place of Protagoras, Democritus, Anaxarchus, Hecataeus the historian, Nicenætus the poet, &c. Many accounts are given of its unwholesome atmosphere, and of the pride of its inhabitants. Hence the phrases, *abderita mens*, and *abderian laughter*.

ABDERAIIMA, a Saracen viceroy in Spain, who revolted and set up an independent principality at Cordova. He had several successors of the same name.

ABDEST, a Persian word literally signifying the water placed in a basin for washing the hands, but used to express the purifications practised by the Mahometans before they enter on their religious ceremonies.

ABDEVENAM, in astrology, the head of the 12th house in the scheme of the heavens.

ABDI, אָבְדִי, Heb. i. e. my servant. The father of Kish, and grand-father of king Saul.

ABDICARIA propositio, in logic, a negative proposition.

ABDICATIO, ἀποκηρυξις, a Grecian custom of renouncing children, prohibited by the Roman laws. *Lucian.*

ABDICATE, *Ab*: *dico*, δικη, right, to go

ABDICATION, from a right; to go from, quit,

ABDICATIVE, or leave, put away from, or de-

ABDICANT, prive of that which has been possessed by law and right. To resign, disclaim, renounce, dispossess.

By avowing to govern by a despotic power unknown to the constitution, and inconsistent therewith, he (King James) hath renounced to be a king according to the law; such a king as he swore to *C.* at the coronation; such a king to whom the allegiance of an English subject is due; and hath set up another kind of dominion, which is to all intents an *abdication* or abandoning of his legal title, as fully as if it had been done by express words.

Speech of Lord Somers, in 1688, on King James's vacating the throne.

O Saviour, it was ever thy manner to call all men unto thee: when didst thou drive any one from thee? neither had it been so now but to draw them closer unto thee, whom thou seekest for the time to *abdicate*.

Bishop Hall's Works.

The father will disinherit or *abdicate* his child, quite cashier him.

Burton's Anat. Mel. p. xxxv.

He cannot *abdicate* for his children, otherwise than by his own consent, in form to a bill from the two houses. *Swift.*

Great Pan, who wont to chase the fair,
And lov'd the spreading oak, was there,
Old Saturn too, with upcast eyes,
Beheld his *abdicated* skies.

Addison's Poem to Sir Godfrey Kneller.

The mortification of unreasonable desires, the suppression of irregular passions, the loving and blessing our enemies, the renouncing worldly vanities and pleasures, the rejoicing in afflictions, the voluntary *abdication* of our estates in some cases, yea, exposing life itself to inevitable hazard and loss, are not chimerical propositions of impossible performances; but duties really practicable. *Barrow's Sermons.*

What is all righteousness that men devise?
What, but a sordid bargain for the skies?
But Christ as soon would *abdicate* his own,
As stoop from heaven to sell the proud a throne.

Cowper's Truth.

ABBITARIUM, O. L. A chest in which relics were kept, or a place to hide goods, plate or money.

ABDOLLATIPH. See **ABDALLATIF**.

ABDOMEN. n. s. Lat. from *abdo*, to hide; a cavity commonly called the lower venter, or belly: it contains the stomach, guts, liver, spleen,

and bladder, and is within lined with a membrane, called the peritoneum. See **ANATOMY**.

ABDOMINAL, *adj.* relating to the abdomen.

ABDOMINALES, in ichthyology, fish which have the ventral fins placed behind the pectoral in the abdomen, and constitute the order of the fourth class of animals in the Linnaean System. See **ICHTHYOLOGY** and **ZOOLOGY**.

ABDON, one of the Papuan isles, N. of Waggeo, in N. lat. 0°, 30', E. long. 131°, 15.

ABDUCE, *v.* *Ab*: *duco*, to lead from; to

ABDUCTION, *Ab* draw, bring or take away from; to withdraw; chiefly a scientific word applied in physic and in logic; in the one, it signifies flexion or extension of the muscles; in the other, a particular kind of argument.—*Abduction* is also used in law, and is the act of carrying off a woman and marrying her against her will;—it refers also to the forcible taking away a wife or child, and to common kidnapping.

If, beholding a candle, we protrude either upward or downward the pupil of one eye, and behold it with one, it will then appear but single; and if we *abduce* the eye unto either corner, the object will not duplicate; for, in that position, the axis of the cones remain in the same plane, as is demonstrated in the opticks, and delivered by Galen.

Brown's Vulgar Errors.

They (the muscles) can stir the limb inward, outward, forward, backward, upward, downward; they can perform adduction, *abduction*; flexion, extension.

Smith's Old Age, p. 62.

The forcible *abduction* or stealing away of man, woman, or child, from their own country, and selling them into another, was capital by the Jewish law.

Blackstone's Commentaries.

ABDUCENS labiorum, in anatomy, a name given by Spigelius to a muscle, which is the *levator anguli oris* of Albinus, and the *caninus elevator* of others.

ABDUCENTES NERVI, that part of the sixth pair of nerves, which is lost on the abductores oculi.

ABDUCTION, in logic, by the Greeks called *apagoge*, is an argument from the conclusion to the demonstration of the proposition assumed.

ABDUCTION, in law, the forcible carrying away of a person, as of an heiress, &c. To enter a woman's house forcibly, carry off, and marry her without her own consent, has in Scotland been punished with death.

ABDUCTION, in surgery, a species of fracture, wherein the broken parts of the bone recede from each other, after the manner of a stalk.

ABDUCTOR AURIS, called also *posterior auris*, by Winslow, a muscle that pulls the ear backwards.

ABDUCTOR AURICULARIS, or of the little finger, called by Winslow, *hypothear*, arises from the annular ligament, and the third and fourth bones of the carpus in the second rank; and is inserted externally into the first bone of the little finger: it serves to draw that finger from the rest, and also to bend it a little.

ABDUCTORES FEMORIS. Anatomists reckon four of these. Their use is to move the thigh bone, according to their different directions.

ABDUCTOR INDICIS, or of the fore-finger, arises from the inside of the bone of the thumb,

and is inserted into the first bone of the fore-finger, which it draws from the rest towards the thumb.

ABDUCTOR MINIMI DIGITI MANUS. See **ABDUCTOR AURICULARIS.**

ABDUCTOR MINIMI DIGITI PEDIS, or of the little toe, arises from the outside of the *os calcis*, near the exterior bone of the *metatarsus*, and is inserted laterally into the outside of the second bone of that toe, which it pulls from the rest.

ABDUCTOR OCULI, or of the eye, is one of the four recti, or straight muscles, arising from the bottom of the orbit, and spread over the first proper tunic; serving to draw the eye towards the outer canthus. It is also called the scornful muscle.

ABDUCTOR POLLICIS MANUS, called also *Thenar*, springs from the annular ligament and first bone of the carpus; whence passing the thumb, it makes that fleshy body called *mons luna*: it draws the thumb from the fingers.

ABDUCTOR POLLICIS PEDIS, or of the great toe, springs from the inside of the *os calcis*, and the greater *os cuneiforme*; and is inserted into the outside of the exterior *os sesamoideum pollucis*; it serves to draw the great toe from the rest.

ABEAR', v. } Applied to the behaviour or

ABEAR'ING. } conduct.—The word *abearance*, instead of *abearyng*, is used by modern writers in English law. See BEAR.

Upon assurance takyn of the said Hunyldus, that there after he shulde be of good *abeuryng* to warde the king, he clerly forgave vnto hym all his former offence. *Falbyn*, repr. 1811, p. 141.

So did the Faery Knight himself *abeare*,

And stouped oft, his head from shame to shield.

Spenser's Faerie Queene.

The other species of recognition with sureties is for the good *abeareance*, or good behaviour.

Blackstone's Commentaries.

Not to be released, till they found sureties for their good *abearing*.

Lord Herbert's Hist. of Hen. VIII. p. 381.

ABED', adv. On bed. See BED.

Some radde, that hir ssoide wende in at on hepe,
To habbe inome hom vnarmed, and somme *abedde*

aslepe. *R. Gloucester*, p. 547.

Hir kyrtells, and hir mantell eke,

Abrode vpon his bedde he spredde,

And thus thei slepen both *abedde*.

Gower, Con. A. b. v.

ABEDNEGO, the name given by Nebuchadnezzar to one of the three captive Jewish children, who were miraculously delivered from the fiery furnace. *Dan. iii.*

ABEILLE (Gasper), an eminent wit of the sixteenth century, was born at Reiz in 1648, and died at Paris in 1718. He wrote several dramatic pieces, but his genius was not equal to the wit of his conversation, which appears to have been singularly aided by an unseemly wrinkled countenance, susceptible of the most ludicrous expression.

ABEILLE (L. P.), a writer on agriculture and natural history, inspector general of the manufactures of France, and secretary to the council of trades before the revolution; born at Toulouse, 1719; died at Paris 1807.

ABEL, ^{אָבֵל} Heb. *Vanity*, the second son of Adam and Eve, who was a shepherd, and was

killed by his brother Cain, from envy of the superior mark of divine favor bestowed on him. Though he was the first martyr, his name is not to be found in any catalogue of saints or martyrs, either in the Greek or Roman church, earlier than the tenth century. Several Roman litanies however contain prayers to him for persons at the point of death.

ABEL (Charles Frenerick), an eminent musician and composer, was by birth a German. He came to England in 1759, and was soon appointed chamber-musician to the queen. He died at London in 1787. Burney, in his history of music, says, ‘The knowledge Abel had acquired in Germany, in every part of musical science, rendered him the umpire in all difficult points. His concertos and other pieces were very popular, and frequently played on public occasions.’ He excelled on the viol di Gamba.

ABEL (Clarke), M. D., is well known as the historian of Lord Amherst’s embassy to China, which he accompanied as chief medical officer and naturalist. Although at the most interesting period of that expedition he was disabled, by a most serious attack of sickness, from following up his observations with the closeness and regularity he had anticipated, his Narrative sufficiently testifies his masculine understanding, his various yet sound knowledge, his high talents, and benevolent bent of mind. Indeed, had Dr. Abel never written any thing besides his *Essay on the Geology of the Cape of Good Hope*, contained in the work alluded to, he would have sufficiently proved his claim to the title of a deep and philosophical thinker, and of an acute observer of the mysteries of nature. He died December 12th, 1826.

ABELIA (J. F.), commander of the Order of Malta, born 1622, was the author of *Malta Illustrata*, an able work on the topography and history of the island.

ABELARD (Peter), a famous doctor of the twelfth century, born at Palais in Britany. He was eminent for his acuteness in logic, of which he gave proofs wherever he travelled, by disputing with and baffling all who would enter the lists with him. He read lectures with great applause at Paris, where he lodged with one Fulbert, a canon, who had a beautiful niece, called Eloise. Abelard was appointed her preceptor; but seduced her instead of teaching her the sciences, and, Eloise proving with child, he sent her to a sister of his in Britany, where she was delivered of a son. To soften the canon’s anger, he offered to marry Eloise privately; and the old man was better pleased with the proposal than the niece, who, from a singular excess of passion, chose to be Abelard’s mistress rather than his wife. She married, however; but used often to protest upon oath that she was single, which provoked the canon to use her ill. Upon this, Abelard sent her to the monastery of Argenteuil; where she put on a religious habit, but did not take the veil. Eloise’s relations, considering this as a second treachery, hired ruffians, who, forcing into his chamber in the dead of night, emasculated him. This infamous treatment made him fly to the gloom of a cloister. He assumed the

habit of St. Dennis: but the disorders of the house soon drove him from thence. He was afterwards charged with heresy; and having endured several persecutions for his religious sentiments, he settled in a solitude in the diocese of Troies, where he built an oratory, to which he gave the name of the *Paraclete*. He was afterwards chosen superior of the abbey of Ruis, in the diocese of Vannes; when the nuns being expelled from the nunnery in which Eloise had been placed, he gave her his oratory; where she settled with some of her sister nuns, and became their prioress. Abelard mixed the philosophy of Aristotle with his divinity, and in 1140 was condemned by the council of Rheims and Sens. Pope Innocent II. ordered him to be imprisoned, his books to be burnt, and forbade him ever teaching again. However, he was soon after pardoned, at the solicitation of Peter the Venerable, who received him into his abbey of Cluni, where he led an exemplary life. He died in the priory of St. Marcel, at Chalons, April 21, 1142, aged 63. His corpse was sent to Eloise, who buried it in the Paraclete. He left several works; the most celebrated of which are the letters that passed between him and Eloise, with the account of their misfortunes prefixed; which have been translated into English, and immortalised by the harmony of M^c Pope's numbers.

ABEL-BETHMAACAH, or **ABEL-MAIN**, a city of Judea, south of Mount Lebanon. Tiglath-pileser, king of Assyria, took it, and carried the inhabitants captive. It was afterwards rebuilt, and became the capital of Abilene in Syria.

ABELIANS, or **ABELINS**, in church history, a sect of heretics mentioned by St. Austin, who pretended to regulate marriage after the example of Abel; allowing each man to marry one woman, but enjoined them to live in continence.

ABELIN, a large hamlet in Palestine, containing a castle of the same name, eight miles from Acre. Some have conjectured that the ruins in the vicinity are those of the ancient Zabulon.

ABELL, (John,) an English musician, and celebrated singer of the 17th century, who quitted this country, at the revolution, for his attachment to popery. Being at Warsaw, he was summoned to court to display his talents, but refused to go: the king then sent for him peremptorily; and on Abell's appearance, he was drawn up in a chair to the top of a spacious hall, at one end of which sat the king and his nobles in a gallery. Some wild bears were now turned into the apartment, and Abell was called upon to sing or be let down amongst them. He preferred, of course, the former, and said that he never made a better use of his voice. In 1701, he published a collection of songs in several languages.

ABELIA, an ancient town of Campania, near the river Clanis, now called **AVELLA**. Its nuts, called *avellane*, were very famous, as also its apples.

ABEL-MIZRAIM, a place between Jordan and Jericho, supposed to have been near Hebron, where the Egyptians celebrated Jacob's funeral. It was also called the threshing floor of Atad.

ABEL-MOSCHI, or **ABEL-MUSCHI**, in botany, a species of the *HIBISCUS*, which see.

ABELOJTES, or **ABELONIANS**. See **ABELIANS**.

ABEN-EZRA, (Abraham,) a celebrated rabbi, born at Toledo, in 1099. He was much admired for his learning, being not only skilled in philosophy, astronomy, medicine, and poetry, but a complete master of the Arabic. He was styled by his brethren, the wise and admirable Doctor. His principal works are, *Commentaries on the Old Testament*, which are printed in Bomberg's and Buxtorf's Hebrew Bibles, and *Jesud Mora*, a work (now very scarce,) intended to recommend the study of the Talmud. His style is elegant and concise. He died in 1174, aged 75.

ABENRADE, or **APENRADE**, a jurisdiction, and town of Denmark in Sleswick. It is seated on a spacious open bay, in the Baltic, surrounded on three sides by high mountains. Just without the town stands the castle of Brundend. Lon. 9° 24', E. Lat. 55° 6', N.

ABENS, or **ABENTZ**, a river of Upper Bavaria, joining the Danube 4 mi. below Abensberg.

ABENSBERG, or **ABENSPURG**, a district and town of Bavaria, circle of Regen, seated on the Abens, near the Danube, S. W. of Ratisbon. Lon. 11° 15', E. Lat. 48° 46', N.

ABER, an old British or Welsh word, signifying the fall of a lesser water into a greater, as of a brook into a river, or of a river into the sea: also, the mouth of the river. In both these senses, it makes part of the names of many towns in Britain. See the following articles.

ABERAVON, a borough town of Glamorganshire, governed by a port-reeve, seated on the mouth of the Avon, 19 miles W. of Cowbridge, and 195 W. from London. The iron and copper works contiguous, have given it some importance. The delightful seat of Lord Vernon stands in the neighbourhood.

ABERBROTHOCK, or **ARBROATH**, a small neat town, on the E. coast of Scotland, in the county of Angus, 15 miles N. E. of St. Andrew's, and 56 N. N. E. from Edinburgh. It is situated on the mouth of the small river Brothock, is a royal burgh, and is well built and flourishing. The number of its inhabitants has greatly increased within these last 40 years, and they are now estimated at upwards of 9000. Their chief manufactures are brown linens or Osnaburghs, sailcloths, and white and brown thread. The foreign imports are flax, flax-seed, and timber from the Baltic. The coasting trade consists of coals from Borrowstounness, and lime from Fife. At this place, in default of a natural harbour, an artificial one of piers has been formed, where, at spring-tides, which rise here 15 feet, ships of two hundred tons can come, and of 80 at neap tides; but they must lie dry at low water. The port is of great antiquity: there is an agreement yet extant, between the abbot and the burghers of Aberbrothock, in 1194, concerning the making of the harbour. Both parties were bound to contribute their proportions; but the largest fell to the share of the former, for which he was to receive an annual tax payable out of every rood of land lying within the borough. The glory of the town was the abbey, whose very ruins give

some idea of its former magnificence. It was founded by William the Lion in 1178, and dedicated to Thomas à Becket. The founder was buried here.

ABERCONWAY, or CONWAY, an ancient borough and market-town in the county of Caernarvon, 223 miles north-west of London, situated upon the western bank of the river Conway, which is here crossed by a chain suspension bridge, erected after the designs of Mr. Telford. The town is enclosed by the ancient fortifications, erected by Edward I., the founder of the noble castle which overlooks them. It is one of three stately palaces, reared by that monarch upon the final extinction of independence in Wales. The town consists of a few irregular streets, with one broad avenue forming part of the new line carried round the base of Penmaenmawr. Here is one of the ancient houses called the Plas Mawr, a venerable Church, meeting-houses of Dissenters, and two spacious inns. Ship-building occupies the greater portion of the inhabitants, and the mouth of the river affords a safe asylum for vessels navigating the Conway river up to Trefriw, as well a shipping place for the produce of Llandudno mines.

ABERCORN, the ABERCURRING of Bede, a romantic little town of Scotland, in Linlithgow, on the Frith of Forth, 12 miles W. of Edinburgh. Antoninus's Roman wall commenced here. The Earl of Hopetoun has a magnificent seat at a small distance.

ABERCROMBY, (Sir Ralph,) K. B. the son of George A. Esq. of Tullibody, Clackmannshire, was born in 1738. In 1756 he became a cornet of the 3d Dragoon Guards. In 1781 he was colonel of the 103d, or King's Irish Infantry; and in 1783 went on half-pay. In 1787 he obtained the command of the 7th Dragoons; and acquired great experience in his profession in the seven years war, and in the war of the American revolution. That of the French revolution furnished him with an opportunity of eminently displaying his talents and experience. In two campaigns on the continent he gave distinguished proofs of his skill and intrepidity; and though the last, in the end of 1794, was singularly disastrous, his character both abroad and at home was in the highest estimation. In the autumn of 1795, he received the Order of the Bath, and succeeded Sir Charles Gray in the West Indies. In this command he was eminently successful, having carried every island and port which he attempted. Early in 1797 he took the Spanish island of Trinidad, and returned soon after to England. In November the same year he went commander-in-chief to Ireland; but this situation he held not long, the civil and military command being united in the person of Marquis Cornwallis. In 1798 he was made commander of the forces in Scotland; and in the autumn of 1799 was employed under the Duke of York in the unfortunate expedition to Holland. No failure ever produced a stronger sensation in the public mind than this; but Sir R. Abercromby was always mentioned with respect, and with an undisguised confidence, that he nobly performed his duty. At the close of 1800, he took the command

of the army destined to deliver Egypt from the French. He landed his troops 8th of March, 1801, in Aboukir bay, facing the French army. On the 13th he fought the battle of Alexandria, and was nearly made prisoner by the French, through a defect in his sight. The 21st was marked by a more decisive and general engagement, when after an obstinate struggle, the enemy retreated. Sir Ralph was wounded and unhorsed in one of the first charges, but wrested the sabre from his antagonist, and gave it to Sir Sidney Smith. He afterwards received a musket ball in the thigh, which proved a mortal wound, notwithstanding which, he would not suffer himself to be removed from the field until the victory was declared to be his. He died on board the Admiral's ship in the bay a week afterwards, and was interred at Malta. On the account of the victory reaching England, Lady Abercromby was immediately raised to the peerage, with reservation to the sons of the deceased general; and a noble monument was erected to his memory soon after in St. Paul's.

ABERDEEN, or ABERDEN, a principal city in the north of Scotland, which comprehends two towns under that denomination, viz. OLD and NEW ABERDEEN. The Old Town is a place of great antiquity, and was of some importance so long ago as 893, when, tradition says, king Gregory conferred upon it some particular privileges. A bishopric, founded at Mortlich by Malcolm II. was translated to Aberdeen by David I, and in 1163, Malcolm IV. granted a new charter to the bishop of Aberdeen: there is still extant a charter of Alexander II, dated 1217, granting to Aberdeen the same privileges he had granted to his town of Perth. Both towns are situated on the coast of the German Ocean; 127 miles N. E. from Edinburgh. Lon. $1^{\circ} 50'$, W. Lat. $57^{\circ} 6'$, N.

Old Aberdeen lies about a mile N. from the new town, at the mouth of the Don, over which is a fine Gothic bridge, of a single arch, greatly admired, which rests on both sides on two rocks. This arch, said to have been built by a bishop of Aberdeen, about the year 1290, is 67 feet wide at the bottom, and 341 feet high above the surface of the river, which at ebb-tide here is 19 feet deep. The old town was formerly the seat of the bishop, and had a large cathedral commonly called *St. Macher's*. Two very antique spires and one aisle, which is used as a church, are now the only remains of it. The cathedral had anciently two rows of stone pillars across the church, and three turrets, the steeple which was the largest of these turrets, rested upon an arch, supported by four pillars. In this cathedral there was a fine library; but, about the year 1560, it was almost totally destroyed. On the south side of the town, is the King's college, which is a large and stately fabric. It is built round a square, with cloisters on the south side. The chapel is very ruinous within; but there still remains some exquisite workmanship. This was preserved by the spirit of the principal at the time of the reformation, who armed his people, and checked the blind zeal of the barons of the Mearns, when about to violate this seat of learning. A ship, freighted with their sacri-

legious booty bound to Holland, had scarcely gone out of port, when it perished in a storm with all its lading. The college was founded in 1494, by William Elphinstone, bishop of this place, lord chancellor of Scotland in the reign of James III, and lord privy seal in that of James IV. But James IV. claimed the patronage of it, and it has since been called the *King's College*. Together with the Marischal college in the new town, it forms one university, called the *University of King Charles*. The library is large, but not remarkable for many curiosities. Hector Boethius was the first principal; and sent for from Paris for that purpose, on an annual salary of 40 Scots marks, at 13 pence each. The square tower on the side of the college was built for the reception of students, by contributions from General Monk, and the officers under him, when quartered at Aberdeen. There are now about 150. There are several bussaries for poor students, professorships of humanity, Greek, philosophy (three) Oriental languages, civil law, divinity, and medicine; annual revenue about £700. Here is also a neat town-house; a trades' hospital for decayed freemen and their widows; and an hospital for 12 poor men. Old Aberdeen has its own government, of a provost, three bailies, a treasurer, and council, with the deacons of six incorporated trades.

ABERDEEN, NEW, the capital of the shire of Aberdeen. It is built on a hill or rising ground, and lies on a small bay formed by the Dee, deep enough for a ship of 200 tons, and above two miles in circumference. The town is approached from the N. and S. by two elegant streets, the latter passing over an arch, the span of which is 132 feet, and its width between the parapet 40 feet. The buildings, which are of granite from the neighbouring quarries, are generally four stories high; and have, for the most part, gardens behind them, which give them a beautiful appearance. In the high street is a large church, formerly belonging to the Franciscans, which was begun by bishop William Elphinstone, and finished by Gavin Dunbar, bishop of Aberdeen, about 1500. Bishop Dunbar is said likewise to have built the bridge over the Dee, which consists of seven arches. In the middle of Castle-street is an octagon building, with neat bas-reliefs of the kings of Scotland, from James I. to James VII. The town-house has a handsome spire in the centre. Opposite, is the Aberdeen bank, a fine building of polished granite. The grammar-school is a low but neat building. Gordon's hospital is handsome; in front is a good statue of the founder: it maintains forty boys, who are apprenticed at proper ages. The infirmary is a large plain building, sending out between eight and nine hundred patients. But the chief public building in the new town is the Marischal college, founded by George Keith, earl of Marischal, in the year 1593; and since greatly augmented with additional buildings. There are about 150 students belonging to it. In both the Marischal and King's college, the languages, mathematics, natural philosophy, divinity, &c., are taught by able professors. In the former is a good observatory. In new Aber-

deen are also a lunatic asylum, erected in 1800, by subscription; three dispensaries, which in 1816, relieved 2700 patients; and a bridewell, which has been recently finished at an expense of £10,000. The convents in Aberdeen were: One of Mathurines, or of the order of the Trinity, founded by William the Lion, who died in 1214; another of Dominicans, by Alexander II. a third of Observantines, a building of great length in the middle of the city, founded by the citizens; and a fourth of Carmelites, or White Friars, founded by Philip de Arbuthnot, in 1350. Aberdeen, including the old town, is supposed to contain 40,000 people. Its trade is considerable, but might be greatly extended by an attention to the white fisheries. The ancient harbour was narrow at the mouth, having the easterly rocky point of the Grampian mountains on the south, and a flat blowing sand on the north, extending along the coast for many miles. This was driven in a long ridge across the harbour's mouth at the *bar*, where the depth of water at low tide was sometimes not above three feet. The town at last came to the resolution of erecting a strong pier on the north side of the harbour. This pier is 1200 feet in length, and gradually increases in thickness and height, as it approaches to the sea, where the head or rounding is 60 feet diameter at the base, and the perpendicular elevation 38 feet. The whole is built of granite, and was under the direction of Mr. Smeaton; the expense amounting to above £17,000. A little to the south of the bar, they have now a depth of 17 fathoms at low water; and, at the harbour mouth, from 8 to 9 fathoms. Two batteries defend the pier; which has lately been extended to the N. so as to form a wet dock. There is also a navigable canal from New Aberdeen to the Don at Inverney. Aberdeen once enjoyed a good tobacco trade. At present, its imports are from the Baltic, and the merchants trade to the Mediterranean, the West Indies, and North America. Its exports are stockings, thread, salmon, pickled-pork, and oat-meal. Large quantities of granite are also sent to London. The cotton manufactories of the vicinity employ nearly 1000 persons; and an extensive flax manufactory stands on the Don. Linen and woollen goods of most kinds are wrought here, as well as nails, cordage, and all ship-building articles. Vessels to the burthen of about 40,000 tons, belong to the port which is extensively engaged in the whale and other fisheries. The salmon exported, averages 2000 barrels annually. New Aberdeen has a provost, four bailies, a dean of guild, treasurer, town-council, and seven deacons of trades, incorporated for its civil government; and with Aberbrothock, Brechin, Montrose, and Inverbervie, returns one member to parliament. Its fairs are on the 31st of January, 3d Wednesday in June, and 18th of July.

ABERDEENSIRE, a county of Scotland, bounded on the N. W. by Banffshire, and the Deveron; on the N. and N. E. by the German Ocean; on the S. by the counties of Kincardine, Angus, and Perth; and on the W. by Inverness-shire. Its length from N. E. to S. W. is about 85 miles; its breadth not quite 40. It comprehends the districts of Mar, Garioch, Formartine,

Strathbogie, and the greater part of Buchan; and sends one member to parliament. It abounds in sea ports, from whence there is a safe and ready passage to the Orkney and Shetland isles, the Greenland fisheries, Norway, and the regions round the Baltic, the German coast, Holland, Flanders, and France; and is watered by numerous streams, as the Don, the Ythan, the Ugie, &c., all of them the resort of salmon, and whose banks display the most extensive plantations, as well as natural woods. Cattle are sent to the south in great numbers. In the Ythan is a pearl fishery, which has yielded single pearls of from two to three pounds value. Several beautiful lakes also diversify the face of this country; Loch Murick, Loch Kander, Loch Builg, and Callader, are the principal. The granite quarries yield the most valuable mineral of Aberdeenshire, sending annually to London upwards of 12,000 tons; mill stone, blue slate, and lime stone also abound: as well as the asbestos, talc, schistus, and mica. On the coast of Buchan amber is found in considerable quantities, and in Lesley parish a beautiful green and variegated amianthus, of which snuff boxes and ornamental articles are made. Some of the mountains (as in the district of Marr) retain evident proofs of volcanic origin; and Peterhead, Aberdeen, Pananach, or Glendye, are celebrated mineral waters. The whole county is tolerably fertile, but ill cultivated; the improvements introducing by spirited proprietors, being but slowly adopted. There are 87 parishes, three royal boroughs, and one city; several handsome towns and noblemen's and gentlemen's seats. The valued rent of the county is £241,931.

ABERDOUR, a town and parish in Fifeshire, Scotland, on the Frith of Forth, about 10 miles N.W. of Edinburgh, resorted to in summer as a sea bathing-place. William, lord of Liddesdale, surnamed the *Flower of Chivalry*, in the reign of David II. conveyed it by charter to James Douglas, ancestor of the present owner, the earl of Morton. The old castle of Aberdour stands on the bank of a rivulet, falling into the Frith. The poor *Clares* had a convent at this place. In the neighbourhood are found free-stone, iron-stone, lime-stone, and coal of superior quality. There is also a muslin manufactory of some repute; and a manufactory of coarse cloths. The neighbouring island of Inch Colm, belongs to the parish.

ABERE-MURDER, Sax. from *ebere*, proved, and *morth*, killing. In old law, murder that has been proved by a judiciary process. It was a crime that could not be expiated by money, as most others could be.

ABERFORD, or ABERFORTH. See ABERFORD.

ABERFOYLE, a parish in the county of Perth, 11 miles in length, and five in breadth, in the western extremity of which the Forth has its rise. It is remarkable for its fine lakes and numerous streams, and the marked direction taken by the Grampians through the lower part of it; as well as for producing a great variety of rare plants, and excellent pasture. The hills abound with oak; and granite, coarse marble, limestone, and slate compose their bases.

ABERFRRAW, a village in the isle of Anglesey, formerly a place of note, the princes of N. Wales having had a palace in it. It has still a good harbour, navigable for vessels of 30 or 40 tons, and the Ffrraw runs up to it. It is 20 miles W. of Holyhead.

ABERGAVENNY, a well built market-town of Monmouthshire, the Gibbanium of Antoninus, 16 miles W. of Monmouth, and 142 W. by N. from London, having two churches and an old castle. It stands on the confluence of the Usk and Gavenny, having a fine bridge of 15 arches over the former; and is surrounded by a wall in ruins. The neighbourhood yields abundance of coal and iron ore. Market on Tuesday.

ABERGEMENT LE DUC, a market town of Burgundy, France, in the arrondissement of Beaune, and department of the Côte d'Or, near the Saône, and eight leagues S. of Dijon.

ABERGUILLY a parish of Carmarthenshire, 12 miles W. of Carmarthen, and 216 N.W. of London, and remarkable as containing the only palace belonging to the bishop of St. David's.

ABERNETHIY, a village in Strathern, a district of Perthshire, in Scotland, seated on the Tay, a little below its junction with the Erne. It is said to have been the seat of the Pictish kings, as well as the see of an archbishop. Here was a cathedral, which became a collegiate church in 854, an university being established in the place. This in 1273 became a priory of regular canons. Here is a good manufacture of household linen and silesias; the church has been lately re-built. In the church-yard is a tower of a circular construction, 48 feet in circumference, and 74 feet in height. Antiquarians have failed in their attempts to discover the use of this and similar buildings: some suppose them to be watch towers, or belfries for summoning the people to prayers; others, that the Picts used them as places of confinement for devotees in performing penance: and, hence they are called towers of repentance. There is only another of this description (at Brechin) in Scotland.

ABERNETHY, (John,) an eminent dissenting clergyman of Dublin, born 1680, and author of sermons on the Divine Attributes, which have been much admired.

ABERRATION, in astronomy, a small apparent motion of the fixed stars discovered by the late Dr. Bradley, astronomer royal. It is occasioned by the progressive motion of light, and the earth's annual motion in its orbit. For the history of its discovery, see Philosophical Trans. March, 1728, No. 406.

ABERRANCE, } Ab: *erro*, to stray or
ABERRATION, } wander; primarily applied
ABERRING, } to the errors or mistakes of
the mind, and to irregularity of conduct.

So then we draw near to God, when, repenting us of our former *aberrations* from him, we renew our covenant with him.

Bishop Hall's Works, vol. v. p. 502.

Could a man be composed to such an advantage of constitution, that it should not at all adulterate the images of his mind: yet this second nature would alter the crisis of his understanding, and render it as obnoxious to *aberrances* as now.

Glanville's Scepsis Scientifica, c. 16.

They do not only swarm with errors, but vices depending thereon. Thus they commonly affect no man any farther, than he deserts his reason, or complies with their aberrancies.

Brown's Vulgar Errors, I. 3.

ABERRATION, in optics, is used to denote that error or deviation of the rays of light, when inflected by a lens or speculum, whereby they are hindered from meeting or uniting in the same point. There are two species of the aberrations of rays, distinguished by their different causes; one arising from the figure of the glass or speculum; the other from the unequal refrangibility of the rays of light. This last species is sometimes called the Newtonian, from the name of its discoverer. See OPTICS.

ABERYSTWYTH, a borough, market, and sea-port town, in the hundred of Genaur-Glyn, and county of Cardigan, South Wales, situated on an eminence overhanging the confluence of the Ystwyth and Rhydial rivers. It is 208 miles from London, 39 from Cardigan, contains a population of 3556, and is the most frequented watering place in the principality. The old town consists of steep streets, enclosed by houses cased with black slate. The new town is regular, handsome, and adorned with an assembly room, market-house, theatre, and three large inns, and the parade called the "Marine Terrace," contains several excellent houses, in a situation both salubrious and agreeable. Besides the chapel of ease, there are four meeting-houses of Dissenters. The town is governed by a mayor, recorder, and common council, and is contributory with Cardigan, Lampeter, and Aptar, in returning one member to parliament. Lead and silver ores, calamine, black lead, slates, and agricultural produce, constitute the chief exports, in which 8000 tons of shipping are annually engaged. The ruins of the castle occupy the summit of a rocky eminence, commanding a view of Cardigan Bay, and of the North Wales coast; it was built by Edward I., who incorporated the town; and the walks surrounding it form delightful promenades for the numerous parties who visit this agreeable watering place in the summer season. Races are held here in the month of August. Markets on Mondays and Saturdays; and Fairs four times in each year.

ABESTA, or **AVESTA**, the name of one of the sacred books of the Persian magi, which they ascribe to their great founder Zoroaster. It is a commentary on the *Zend* and *Pazend*; the three together including the whole system of the Ignicole, or worshippers of fire.

ABESTON. See ASBESTOS.

ABESUM, in chemistry, unslackled, or quickime. See CALX.

ABET, *v. n.* { Anglo Sax. *Betan*, (meliorare, melius reddere, says Skinner.) **ABETMENT**, } To better, to make better. It primarily signifies to enkindle or animate.

It is applied to encouraging, inciting, assisting, supporting, aiding. "It was once indifferent," says Johnson, "but is almost always taken by modern writers in an ill sense."

Then shall I soon, quoth he, so God me grace,
Abet that virgin's cause disconsolate,
And shortly back return. *Spenser's F. Q. xi. 64.*

They abetted both parties in the civil wars, and always furnished supplies to the weaker side, lest there should be an end put to those fatal divisions.

Addison, Frechholder, No. 28.

Yet Christian laws allow not such redress;
Then let the greater supersede the less.
But let th' abettors of the panther's crime,
Learn to make fairer wars another time.

Dryden's Hind and Panther.

That which demands to be next considered is happiness; as being in itself most considerable; as abetting the cause of truth; and as being indeed so nearly allied to it, that they cannot well be parted.

Woolaston's Religion of Nature, p. 31.

ABEVACUATION, in medicine, a partial evacuation, either by nature or art.

ABEX, a name sometimes given to that country of Africa which bounds Abyssinia on the east, and the Red Sea west. It is mountainous, and so barren as to offer little to the notice of travellers. It is 500 miles in length, and 100 in breadth. The inhabitants are Mahometans.

ABEY'ANCE, *n.* Abiance, or en abeiance, old Fr. Expectation.—A term of law, but sometimes of more general application.

Sometimes the fee may be in *abeyance*, that is, as the word signifies, in expectation, remembrance, and contemplation of law; there being no person *in esse*, in whom it can rest and abide; though the law considers it as always potentially existing, and ready to vest, whenever a proper owner appears.

Blackstone's Commentaries.

ABGAR, or **ABGARUS**, a name given to several kings of Edessa in Syria; the most celebrated of whom is said by Eusebius to have sent a letter to Jesus Christ, requesting him to come and remove a distemper in his feet. The Saviour is stated to have returned an answer, accompanied by his portrait. Some great names in ecclesiastical history support the authenticity of these letters, as they are still extant in Eusebius; Moshheim rejects the letters, but sees "no reason of sufficient weight to destroy the credibility of the story." The general opinion of learned men, however, is decidedly against the whole.

ABHOR', *v.* { **Ab**: *horreo*. Vossius conceives the word, "horreo," **ABHOR'RENCE**, } to express the effect produced

ABHOR'RENT, } by the determination of the breath (or rather the blood) to the heart, occasioned by a sudden and painful emotion, which causes a general rigidity, and convulsive shuddering of the body, so that the hair is said to stand on end.

But sins so great is thy delight to here
Of our mishaps and Troye's last decay:
Though to record the same my mind abhorrer,
And plaint eschues: yet thus will I begyn.
Surrey, Chalmer's Poets.

Why then these foreign thoughts of state employments,

Abhorrent to your function and your breeding?

Dryden.

Whilst I was big in clamour, came a man,
Who, having seen me in my worser state,
Shunn'd my abhor'd society.

Shakespeare's King Lear

He hath not despised nor abhorred the affliction of
the afflicted. *Psalm xxii. 24.*

ABI

Justly thou abhor'st
That son, who on the quiet state of men
Such trouble brought, affecting to subdue
Rational liberty.

Milton's Paradise Lost, xii. 79.

The self-same thing they will abhor
One way, and long another for.

Hudibr. p. i. cant. 1.

The first tendency to any injustice that appears,
must be suppressed with a show of wonder and abhorrence in the parents and governors.

Locke on Education.

For if the worlds,

In worlds inclosed, could on his senses burst,
He would abhorrent turn. *Thomson's Sun.* l. 310.

The legal, and as it should seem, injudicious pro-
fanation, so abhorrent to our stricter principles, was
received with a very faint murmur, by the easy
nature of polytheism. *Gibbon*, vol. i. p. 112.

Lands intercepted by a narrow firth,
Abhor each other. *Cowper.*

But peace abhorreth artificial joys,
And pleasure, leagued with pomp, the zest of both
destroys. *Lord Byron's Childe Harold.*

ABHORRERS, a name which was given to a political party in England, in distinction from the *petitioners* of the same period, (1680.) The name and the party soon ceased; but Hume gives an account of their origin and principles. They paid excessive court to the king, by expressing their abhorrence against those who petitioned for redress of grievances, or who presumed to prescribe or dictate to his majesty any period for assembling parliament.

ABIA, or IRE, in ancient history, a maritime town of Messinia, so called after Abia, a daughter of Hercules, and one of the seven cities promised by Agamemnon to Achilles.

ABIAD, a river of Africa, descending, according to Mr. Brown, from the Mountains of the Moon, several hundred miles south of Darfour.

ABIANS, or ABI, anciently a people of Thrace, or, according to some authors, of Scythia. They led a wandering life, living on the flesh of their herds and flocks; on milk and cheese. They cultivated little intercourse with their neighbours, but boldly maintained their own independence, and were a people of great integrity, according to Homer, *Iliad*. xiii. 5, 6.

ABIB, אַבִיב, Heb. i. e. a ripe ear of corn. The first month of the ecclesiastical, and the seventh of the civil year, among the Jews. It answers to our moon that begins in March and ends in April; and contains the feast of the passover and of unleavened bread.

ABIDE', Bidian, or abidian, Sax. To
ABI'DER, stay, remain, tarry, dwell or con-
ABI'DING, tinue in a place or state; also,
Abo'de, to stay under, or support; to
bear up against, or endure with fortitude, good
temper, or the contrary. In the latter senses,
however, the words are nearly obsolete.

The pacient abydng of the righteous shal be
turned to gladnesse, but the hope of the vngodly shall
perish. *Bible, Lond.* 1539. *Prov. chap. x.*

DEM. Abide me, if thou dar'st: for well I wot
Thou runn'st before me, shifting every place,
Thou dar'st not stand, nor look me in the face.

Shakspeare's Midsummer Night's Dream.

MRS. FORD. I would my husband would meet

23

ABI

him in this shape; he cannot abide the old woman of Brainford; he swears she is a witch, forbade her my house, and hath threatened to beat her.

Shakspeare's Merry Wives of Windsor.

Ah me! they little know

How dearly I abide that boast so vain
Under what torments inwardly I groan,
While they adore me on the throne of Hell.

Milton.

To remain in sin and abide in death is all one.

Bishop Taylor's Sermons.

Why do we abide our thoughts and affections scattered from thee, from thy saints, from thine anointed.

Hall's Contemplations.

He (God) does not inflict sensible judgment upon all his enemies, lest the wicked should think there were no punishment abiding for them elsewhere.

Idem.

Thy servant became surety for the lad unto my father, saying, If I bring him not unto thee, then I shall bear the blame to my father for ever. Now therefore, I pray thee, let thy servant abide instead of the lad, a bondman to my lord: and let the lad go up with his brethren.

Gen. xliv. 32, 33.
The marquis Dorset, as I hear, is fled
To Richmond, in the parts where he abides.

Shakspeare's Richard III.

Those who apply themselves to learning, are forced to acknowledge one God, incorruptible and unbegotten; who is the only true being, and abides for ever above the highest heavens, from whence He beholds all the things that are done in heaven and earth. *Stillingf. Defence of Disc. on Rom. Idolat.*

ABIES, in botany, the fir tree. See PINUS.

ABIGA, in botany, the ground pine, or Chamapintus.

ABILA, or ABYLA, a mountain of Africa, one of the pillars of Hercules, as they were anciently called, being directly opposite to Calpe, in Spain, from which it is only 18 miles distant.

ABILENE, a small canton in Syria, between Lebanon and Antilibanus, west of Damascus. See ABEI-MAIM.

ABINEAU POINT, a neck of land projecting into Lake Erie, Canada, and forming a fine bay on each side of the point. It runs out about 10 miles west of Fort Erie. The northern bay is most commonly called Abineau Port.

ABINGDON, the chief town of Washington county, in Virginia, North America, 310 miles S. W. of Richmond. Also a town of Maryland, North America, 20 miles N. E. of Baltimore; and a township of Plymouth county, Massachusetts, 22 S. E. of Boston.

ABINGDON, or ARINGTON, a market town of Berks, in the hundred of Horner, on the Isis, so named from an abbey formerly built in it, six miles S. of Oxford, and 56 W. from London. The streets are well paved, and have a spacious area in the centre, where the markets are held on Monday and Friday, and where an elegant market-house is built, supported on lofty pillars, with a handsome Town-house of free-stone above it, where the assizes, sessions, and county meetings are held. It has two churches, dedicated to St. Nicholas and St. Helena, and two hospitals, the one for 12 persons, six of each sex, the other for 26, viz. 13 of each; besides a charity and a free grammar school. This town is supposed by Bp. Gibson to be the Saxon Cloveshoo, where synods were held, in A. D. 742 and

822. It was incorporated by Queen Mary I. and sends one member to parliament, elected by the suffrages of the inhabitants generally. It is a considerable malting town.

ABIPONIANS, a decayed tribe of S. American Indians, inhabiting the banks of the Plata. The whole nation does not exceed 5000 in number. They are naturally fair; but, by exposure to the air and smoke, become of a brown colour. They are a strong and hardy race of people; which is attributed to their marrying late; and are greatly celebrated on account of their chastity and other virtues; though, according to some writers, they have no knowledge of a Deity, or name to express his existence: but they believe in an evil principle whom they call "Uncle." They are but slightly acquainted with agriculture, living by hunting and fishing, and holding the flesh of their jaguars in great repute. They have a kind of order of chivalry for their warriors; and are so formidable, that 100 of their enemies will fly before ten of these horsemen, armed with the long spears of the country. The caciques in war are their judges in time of peace; but the whole people have long ceased to be of any consideration in the neighbourhood.

ABISCA, a province of Peru of considerable extent, between the Yetan and Marumain to the S. of Cuzco. It is little known to Europeans, being principally the resort of expelled barbarous tribes.

ABISHERING, an ancient law-term, denoting a being free, or exempt, from all amercements.

ABITELLO, in ecclesiastical affairs, a sort of penitential garment, in the Romish church. *Eym. Direct. Inquisit.* iii. 332.

ABITIBBE LAKE, a lake of Upper Canada, in N. lat. 48° 35', W. long. 82° 0', near the settlement of Frederic.

ABITIBBE RIVER, a river of Upper Canada, flowing out of the lake of that name, and emptying itself into the Moose river, near James's Bay. The Abitibbes are a native tribe of this neighbourhood.

ABJECT^{v. & n.} *Ab: jacio*, to cast or throw away from; to be reduced to a low rank or condition; to be degraded.

The audacie and holde speeche of Daniel signifieth the abiection of the kyng and his realme.

The Exposicion of Daniel, by Geo. Joye, p. 75.

I deemed it better so to die,
Than at my foemen's feet an abject lie.

Mirr. for Mag. p. 20.

Rebellion

Came like itself in base and abject routs,
Led on by bloody youth goaded with rage,
And countenanc'd by boys and beggary.

Shakespeare's Henry IV.

I was at first, as other beasts that graze
The trodden herb, of abject thoughts and low.

Milt. Paradise Lost. b. ix. l. 571.

The rarer thy example stands,
By how much from the top of wond'rous glory,
Strongest of mortal men,
To lowest pitch of abject fortune thou art fall'n.

Hilton's Sampson Agonistes.

By humility I mean not the abjectness of a base

mind; but a prudent care not to over-value ourselves upon any account. *Grew's Cosmologia Sacra.* b. ii. c. 7.

Let mean princes

Of abject souls, fear to reward great actions.

I mean to show,

That whatsoe'er subjects, like you, dare merit,
A king, like me, dares give.

Dryden's Marriage a la Mode.

To what base ends, and by what abject ways,
Are mortals urg'd through sacred lust of praise!

Pope's Essay on Criticism.

How poor, how rich, how abject, how august,
How complicate, how wonderful is man!

How passing wonder, He who made him such.

Young.

ABJURE, { *Ab: juro*, to swear from, to
ABJURATION. { forswear; to swear; to go away from, or leave; to disown, to disclaim, to renounce upon oath. .

By our ancient customs felons were allowed to fly to a sanctuary, and on swearing to leave the kingdom forthwith, and for ever were exempted from farther punishment. *Vide Rastall's Collection of Statutes.*

In this season were banished out of Southwark, twelve Scottes whiche had dwelt there a long season, and wer conveied fro parische to parische by the constable, like men yt had abjured the realme, and on their vttermost garment a white crosse before, and another behynd them. Thus were they conuoyed through London northwarde till they came to Scotland.

Hall, repr. 1809, p. 648.

Either to die the death, or to abjure

For ever the society of man.

Shakespeare's Midsum. Night's Dream.

No man, therefore, that hath not abjured his reason and sworn allegiance to a preconceived fantastical hypothesis, can undertake the defence of such a supposition.

Hale.

A Jacobite, who is persuaded of the pretender's right to the crown, cannot take the oath of allegiance; or, if he could, the oath of abjuration follows, which contains an express renunciation of all opinions in favour of the claim of the exiled family.

Paley's Moral Philosophy.

ABJURATION, in ancient customs. The following oath taken by a person guilty of felony; who, having fled to a place of sanctuary, engages to leave the kingdom for ever, will furnish a curious illustration of this subject: "This heare, thou sir Coroner, that I, M. of H. am a robber of sheepe, or of any other beast, or a Murderer of one, or of mo, and a felon of our Lord the king of Engläd; and because I haue done many such euilles or robberies in his land, I do abjure the land of our Lord Edward, king of England, and I shall haste me towards the Port of such a place, which thou hast given me, and that I shal not go out of the high way, and if I doe, I wil that I be taken as a robber, and a felon of our Lorde the king: And that at such a place I will diligently seeke for passage, and I will tarie there but one flud and ebbe, if I can have passage, and unlesse I can haue it in such a place, I wil goe every day into the Sea up to my knees, assaying to passe ouer, and unlesse I can do this within fortie dayes, I wil put my selfe againe into the Church, as a robber and a felon of our Lord the king, so God me helpe & his holie iudgement," & *Rastall's Collect. of Stat.* p. 2.

ABJURATION, in English law, signifies the renouncing and disclaiming upon oath, any right

of the late Pretender to the crown of these kingdoms; also, according to 25 Charles II. an oath abjuring particular doctrines of the church of Rome.

ABLA'CTATE, } Ab: from, and *lacto*, to
 } feed with milk. To wean
a child.

ABLAIQUET, or **ABLAIKET**, a town of Russian Tartary, 540 miles S. E. of Tobolsk, remarkable only for the remains of a great temple and other antiquities.

ABLANCOURT, (PERROT, D') See PERROT.

ABLANIA, in botany, the trichocarpus genus of Linnaeus.

ABLAQUEATION, in horticulture, the art or practice of opening the ground about the roots of trees, to let the air and water operate upon them.

ABLATIVE, in grammar, the 6th case of the Latin nouns, pronouns, participles, and gerunds. Priscian calls it the *comparative* case, as it serves for comparing as well as taking away. It is opposed to the *dative*, as the latter expresses the action of giving. In English, French, &c. there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, "the importance of the question," and "he spoke much of the question," we say, that *of the question* in the first is *genitive*, and in the latter *ablative*; because it would be so, if the two phrases were expressed in Latin. The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians, Frischlin and Crusius; the former of whom maintained, and the latter opposed, the reality of it. The dispute still subsists among their respective followers.

ABLATIVE ABSOLUTE, in the Latin grammar, is a clause or phrase detached from, and independent of the rest of the sentence, and answering to the genitive absolute of the Greek grammarians.

ABLAZE, *a.* On blaze. See BLAZE.

A'BLE, *v. & adj.* *Abal*, Goth. Strength, power, force, skill, are the leading ideas. The verb, *able*, had two other significations, now obsolete: first, to make *able*, or to give power for any purpose, of the same import as to *enable*; and, secondly, to warrant, or answer for.

God tokeneth and assigneth the times *abling* hem to her proper offices.

Chaucer's Boecius, b. i. fol. 215, col. 1.

And ye, my ladies, that ben trewe and stable,
By way of kinde ye oughtin to ben *able*
To haue pitie of folke that ben in paine,
Now haue ye cause to clothin you in sable.

Chaucer, the Complaint of Mars, fol. 326, col. 4.

Lytel Lowys, my Sonne, I perceive well by certaine evidences thyne *abylte* to lerne scyences, touching nombres and proporcions, and also will consydre I thy besye prayer in especyal to lerne the tretyse of the Astrolabye.

Chaucer's Conclusion of the Astrolacie.

That if God willinge to schewe his wraththe, and to make his power knownn, hath suffrid in greet patience vessels of wraththe *able* into deeth, to schewe

the richessis of his glorie into vessels of merci whiche he made redi into glorie.

Widif. Romayne, chap. ix.

For no doute to dreade to offend God and to loue to please him, in all thing quyckeneth and sharpeneth all the wittes of Cristes chosen people: and *ableth* them so to grace, that they joy greatly to withdrawe their cares, and all their wittes and members frome all worldly delyte, and fronde all fleschely solace.

Howell's State Trials, vol. i. p. 202. *Trial of Master William Thorpe for Heresy*, 8, Henry IV. A. D. 1407, written by himself.

A noble crew about them waited round
Of sage and sober peers all gravely gownd,
Whom farre before did marche a goodly band
Of tall young men all *able* armes to sound,
But now they laurell-branches bore in hand;
Glad signe of victory and peace in all their land.

Spenser's Faerie Queene, b. i. canto. xii.

Love all; trust a few;
Do wrong to none: be *able* for thine enemy
Rather in power than use, and keep thy friend
Under thy own life's key.

Shakespeare.

CRLS. They say all louers swear more performance than they are *able*, and yet reserve an *ability* that they neuer perform; vowed more than the perfection of ten, and discharging lesse than the tenth part of one. *Shakspeare's Troi. & Cres.* act iii. sc. 1.

To sell away all the powder in the kingdom,
To prevent blowing up. That's safe, ile *able* it.

Midd. Game at Chess. D. ii. b. act 2
Of singing thou hast got the reputation,
Good Thyrssis, mine I yield to thy *ability*;
My heart doth seek another estimation.

Sidney, b. i.

If aught in my *ability* may serve
To lighten what thou suffer'st, and appease
Thy mind with what amends is in my pow'r.

Milton's Samson Agonistes, l. 744.

They gave after their *ability* unto the treasure,
Ezra, ii. 69.

If any man minister, let him do it as of the *ability* which God giveth: that God in all things may be glorified through Jesus Christ.

1 Peter, iv. 11.

Wherever we find our *abilities* too weak for the performance, he assures us of the assistance of his Holy Spirit.

Rogers's Sermons.

And novels (witness every month's review,) Belie their name, and offer nothing new.
The mind, relaxing into needful sport,
Should turn to writers of an *abler* sort,
Whose wit well manag'd, and whose classic style,
Give truth a lustre, and make wisdom smile.

Cowper's Retirement.

ABLECTI, in Roman antiquity, a select body of soldiers chosen from among those called *extraordinarii*. *Polyb.* vi. 31.

ABLEGMINA, in Roman antiquity, those parts of the entrails of victims, which were offered in sacrifice. They were sprinkled with flour, and burnt upon the altar; the priests pouring wine on them.

ABLET, or **ALBLEN**, in ichthyology, the common *bleak*, a small fresh-water fish, called in Latin *alburnus*. See ALBURNUS and CYPRINUS.

ABLIS, a market town of France, in Orleans, department of the Seine and Oise, arrondissement of Etampes, six leagues E. N. E. of Chartres.

ABLUTION, Ab: *luo*, to wash from. The act of washing, or the water used in cleansing or purifying. Also the ceremonial purification ob-

served under most systems of religion, ancient and modern, true and false. Lastly, the cup of wine and water, formerly given to the people in the Romish church after the host.

SUB. Sirrah, my varlet, stand you forth and speak to him,

Like a philosopher. Answer i'the language.
Name the vexations, and the martyrizations
Of metals, in the work.

FAC. Sir, Putrefaction,

Solution, ablution, sublimation,

Cohabitation, Calcination, Ceration, and

Fixation. *Jonson's Alchemist*, act ii. sc. 4.

Hearts may be found, that harbour at this hour
That love of Christ, and all its quick'ning pow'r
And lips unstain'd by folly or by strife,
Whose wisdom, drawn from the deep well of life,
Tastes of its healthful origin, and flows

A Jordan for the ablution of our woes.

Couper's Conversation.

ABLUTIONS, in religion, appear to be as old as any ceremonies, or even external worship itself. Moses enjoined them; and the heathens adopted them; and Mahomet and his followers have continued them: they thus make a considerable part of the most ancient religions. The Egyptian priests had their diurnal and nocturnal ablutions; the Grecians their sprinklings; the Romans their lustrations and lavations; the Jews their washing of hands and feet, besides their baptisms. The ancient Christians practised ablution before communion; which the Romish church still retains before mass, and sometimes after. The attachment of the Hindoos for the Ganges is such, that ablution in its streams is placed amongst the first duties of their religion; and when, from necessity, they cannot reach that river, if in bathing they use the exclamation, "O Ganges, purify me!" the Brahmins assure them that the service is equally efficacious.

ABLUTION, in pharmacy, is applied both to a preparation which divers remedies undergo, by washing them in water, to cleanse them or increase their power, and to medicines which carry off impurities from the system.

ABO, a seaport town, the capital of Finland, which lies upon the point where the gulphs of Bothnia and Finland unite, 120 miles N. E. of Stockholm. It stands on the estuary of the Aurora-jocki, is a good port, and is the see of a bishop; the seat of a governor, and of a high court of justice for S. Finland. The city became incorporated with the Russian empire in 1809. It is well built, and carries on a thriving trade with England, Holland, and the Mediterranean, in its manufactures of silk, cotton, cloth, paper, rope, &c. It has an extensive glass-house, a sugar refinery of good repute, and two excellent dock yards. Its external trade in iron, timber, fur and corn is also considerable. It has an university, founded by queen Christina in 1640, and endowed with the same privileges as that of Upsal. Long. 22°, 13'. E. Lat. 60°, 27'. N. Population about 12,000.

ABOARD', n. { Bon'd, Sax. a house, a
ABORD', v. & n. } habitation. This familiar
'BORD. sea-term, the orthography of

which differs among our older writers, comes immediately from the French *abord*, as *aller à bord*, to enter a ship, to go aboard.

And afterwards a great wynde arrising in ye sea, by meane whereof their shippes might no longar tarry there, for that, that it was a place wt out porte ; onc part of the embargued thesself, and passing bifore a rocke place call'd Ithis, they came to *aborde* in the porte of Pholie.

Thucydides, by Thomas Nicolls, Lond. 1550, fo. 53, p. 1.

But there it resteth and abode
This great shyp on anker rode ;
The lorde came forth, and when he sigh ;
That other ligge on *bord* so nighte ;
He wondreth, what it might bee,
And bad men to go in and see.

Gower, Con. A. book ii.

And how the tempest all began,
And how he lost his steersman
Which that the sterne, or he tooke keepe,
Smote ouer the *bord* as he slepe,

Chaucer's, Fame, b. i. fol. 277. c. 2.

And wha we had gotte a shipp'e y' wilde sayle
vnto Phenices, we went *aborde* into it, and set forth.

Bible, Lond. 1539, Actes xxi.

We left this place about eleven in the morning,
and were againe conveyed, with more sunshine than
wind, *aboard* our ship. *Fielding's Voyage to Lisbon.*

ABODE', Bodian, Sax. to portend;
ABOD'ANCE, } to abide, bode, and forbode,
ABODE'MENT, } are synonymous, and signify
ABOD'ING. } to show, or exhibit some appearance, sign, or token, from which good or evil is inferred.

Nay, nay, it may nat stonden in this wise
For nece mine, this writen clerkes wise
That percii is with dretching in draw
Nay, such *abodes* ben nat worth an haw.

Chaucer, third Booke of Troilus, fol. 171. col. 2.

For he (bishop Felix) brought all the province
unto the faith, and workes of justice, and in the end
to rewarde of perpetuall blessednesse, according to
the abodement of his name, which in Latine is called
Felix, and in our English tongue, Happie.

• *Stowe's Chronicle*, Howe's ed. 1614, p. 61.

ABO-IIUS, or ABO-SLOT, an ancient fort in Finland, on a peninsula, near the mouth of the river Aurora-jocki, which has often suffered from enemies, and by fire.

ABOI-VENTS, in fortification, lodgments constructed in a ovoid way to protect soldiers from the weather.

ABOLISH', Ab: oleo. to emit an odour.
ABOL'ISHMENT, } Hence *aboleno*, to lose an
ABOL'I'TION, } odour. To extinguish the very odour; to destroy, to annul, to abrogate, to annihilate.

Now to th' entent that ye may yet farther perceive and se, that they by the distruccion of the clergy, meane the clere *abolycion* of Christes faith : it may like you to conferre, and compare together ii places of hys beggars bill. *Sir Thomas More's Works*, p. 311

The plain and direct way had been to prove, that all such ceremonics, as they require to be abolished are retained by us with the hurt of the church, or with less benefit than the abolition of them would bring.

Hooker, b. iv

Or wilt thou thyself

Abolish thy creation, and unmake

For him, what for thy glory thou hast made ?

Milton, b. iii. l. 163.

Nor could Vulcanian flame
The stench abolish, or the savour tame.

Dryd. Virg. Geo. iii.

An apoplexy is a sudden abolition of all the senses and of all voluntary motion, by the stoppage of the flux and reflux of the animal spirits through the nerves destined for those motions. *Arbuthnot on Dict.*

ABOLITION OF SLAVERY. *The Society for mitigating and gradually abolishing the state of Slavery throughout the British Dominions*, sometimes called the **ANTI-SLAVERY SOCIETY**, has been recently formed.

His Royal Highness, the Duke of Gloucester is president of the society. In the list of vice-presidents, are the names of many of the most distinguished philanthropists of the day, and among them, that of the never to be forgotten champion of the negro's cause, Mr. Wilberforce.

The society has already published several works illustrative of the state of slavery, and pointing out its atrocious evils, in a commercial and political, as well as a religious point of view; and which, by apparently unanswerable arguments tend to hold up the system to merited detestation, by every class of society, from the statesman to the peasant. The following summary of the evils to which the slaves in the British colonies are subject, may serve to give some idea of their miserable and degraded condition :—

There are, in the colonies of Great Britain, upwards of 800,000 human beings in a state of degrading personal slavery.

These unhappy persons are the absolute property of their master, who may sell or transfer them at his pleasure, and who may also regulate, according to his discretion, (within certain limits) the measure of their labour, their food, and their punishment.

Many of the slaves are (and all may be) branded like cattle, by means of a hot iron, on the shoulder or other conspicuous part of the body, with the initials of their master's name; and thus bear about them, in indelible characters, the proof of their debased and servile state.

The slaves, whether male or female, are driven to labour by the impulse of the cart-whip, for the sole benefit of their owners, from whom they receive no wages; and this labour is continued (with certain intermissions for breakfast and dinner,) from morning to night throughout the year.

In the season of crop, which lasts for four or five months of the year, their labour is protracted, not only throughout the day, as at other times, but during either half the night, or the whole of every alternate night.

Besides being generally made to work under the lash, without wages, the slaves are further obliged to labour for their own maintenance on that day which ought to be devoted to repose and religious instruction. And as that day is also their only market-day, it is of necessity a day of worldly occupation, and much bodily exertion.

The colonial laws arm the master, or any one to whom he may delegate his authority, with a power to punish his slaves to a certain extent,

without the intervention of the magistrate, and without any responsibility for the use of this tremendous discretion; and to that extent he may punish them for any offence, or for no offence. These discretionary punishments are usually inflicted on the naked body with the cart-whip, an instrument of dreadful severity, which cruelly lacerates the flesh of the sufferer. Even the unhappy females are equally liable with the men to have their persons thus shamelessly exposed and barbarously tortured at the caprice of their master or overseer.

The slaves being regarded in the eye of the law as mere chattels, they are liable to be seized in execution for their master's debts; and, without any regard to the family ties which may be broken by this oppressive and merciless process, to be sold by auction to the highest bidder, who may remove them to a distant part of the same colony, or even exile them to another colony.

Marriage, that blessing of civilized, and even of savage life, is protected in the case of the slaves by no legal sanction. It cannot be said to exist among them. Those, therefore, who live together as man and wife, are liable to be separated by the caprice of their master, or by sale for the satisfaction of his creditors.

The slaves in general have little or no access to the means of Christian instruction.

The effect of the want of such instruction, as well as of the absence of any marriage tie, is, that the most unrestrained licentiousness (exhibited in a degrading, disgusting, and depopulating promiscuous intercourse,) prevails almost universally among the slaves; and is encouraged no less universally by the example of their superiors the whites.

The evidence of slaves is not admitted by the colonial courts, in any civil or criminal case affecting a person of free condition. If a white man, therefore, perpetrates the most atrocious acts of barbarity, in the presence of slaves only, the injured party is left without any means of legal redress.

In none of the colonies of Great Britain have those legal facilities been afforded to the slave to purchase his own freedom, which have produced such extensive beneficial effects in the colonial possessions of Spain and Portugal. On the contrary, in many of our colonies, even the voluntary manumission of slaves by their masters has been obstructed, and in some rendered nearly impossible, by large fines.

It is an universal principle of colonial law, that all black or coloured persons are presumed and taken to be slaves, unless they can legally prove the contrary. The liberty, therefore, even of free persons, is thus often greatly endangered, and sometimes lost. They are liable to be apprehended as run-away slaves, and to be sold into endless bondage as such, if they fail to do that which though free, nay, though born perhaps in Great Britain itself, they may be unable to do—namely, to establish the fact of their freedom by such evidence as the colonial laws require.

Many thousand infants are annually born within the British dominions to no inheritance but that of the hapless, hopeless servitude which has been described; and the general oppressive

ness of which might be inferred from this striking and most opprobrious fact alone, that while in the United States of America the slaves increase rapidly—so rapidly as to double their number in 20 years—there is, even now, in the British colonies, no increase, but on the contrary a diminution of their numbers.

The more immediate objects of the society are, to *ameliorate* the condition of the slaves, and to facilitate the means by which they may obtain their freedom, and for the accomplishment of these intentions:

To remove all the existing obstructions to the manumission of slaves;—

To cause the slaves to cease to be chattels in the eye of the law;—

To prevent their removal, as *slaves*, from colony to colony, and, under certain modifications, their sale or transfer, except with the land to which they might be attached;—

To abolish markets and compulsory labour on the Sunday; and to make that day a day of rest, as well as of religious worship and instruction; and also to secure to the slaves equivalent time in each week, in lieu of Sunday, and in addition to any time which independently of Sunday is now afforded them, for cultivating their provision grounds;—

To protect the slaves, by law, in the possession and transmission of the property they may thus, or in any other way, acquire;—

To enable the slave to purchase his freedom, by the payment at once of a fair price for his redemption, or of a fifth part of that price at a time, in return for an additional day in the week to be employed for his own benefit;—

To make the testimony of slaves available in courts of justice, both in civil and criminal cases;—

To relieve all negroes and persons of colour from the burden of legally proving their freedom, when brought into question, and to throw on the claimant of their persons the burden of legally proving his right to them;—

To provide the means of religious instruction for the black and coloured population, and of Christian education for their children;—

To institute marriage among the slaves; and to protect that state from violation, and from either forcible or voluntary disruption;—

To put an end to the driving system;—

To put an end also to the arbitrary punishment of slaves, and to place their persons as well as property under the guardianship of the law;—

To provide that all children born after a certain day shall be free,—care being taken of their education and maintenance until they shall be capable of acting for themselves;—

To provide that no colonial governor, judge, attorney-general, or fiscal, shall be a possessor of slaves, or shall have a direct and obvious reversionary interest in such property, or shall be the agent of the proprietors of slaves.

The society has further proposed, that the final extinction of slavery should be accomplished, by the redemption of all females from the lowest age, to about 40; by which means,

all their posterity would be born free. The cost of this measure is estimated at £300,000; but should parliament refuse to accede to this, or some other effective plan, the society trust that their object will nevertheless be obtained, by bringing free labour into competition with slave labour; so that the latter shall become of so little value as to be not worth retaining. The parent society is supported by many auxiliaries, not fewer than 250 of which are in active operation in various parts of the kingdom; and if they continue to proceed with the energy that has hitherto marked their progress, there can be little doubt but that they will finally succeed in a cause, in which, truth, justice, and every noble principle of human nature, as well as the dictates of religion, are arrayed on their side.

ABOLLA, from the Lat. *bulla*, Roman ornaments, or from the Gr. *αὐβόλη* *αὐβόλην*, clothing, a warm kind of garment, lined or doubled, worn by the Greeks and Romans, chiefly out of the city, in following the camp.—*Abolla* seems to have stood opposed to the *toga*, which was a garment of peace, as the *abolla* was of war. Kings appear to have used it, and Caligula was jealous of the notice attracted by king Ptolemy for appearing at the shows in a purple one. It was also worn by judges in the execution of their office, whence the phrase of Juvenal: ‘*Facinora maiores abolla.*’ *Mart.* viii. 46. v. 1.

ABOMASUM, or **AEOMASUM**, names of the fourth stomach of ruminating animals. It is in the abomasus of calves and lambs, that the runnet, or curdler, is formed, wherewith milk is curdled. See COMPARATIVE ANATOMY.

ABOMEY, the capital of Dahomey, on the Slave Coast of Africa, E. of Ashantee, about 100 miles from the sea. It consists of mud houses and huts scattered over a large area, and surrounded by a broad and deep ditch. The king’s palaces, of which he has two within the town and one in the suburbs, are said to be ornamented in various parts with human skulls. Cotton is manufactured here with some success, and the colours used in dying it, are both bright and permanent.

ABOMINATE, *v.* Ab: *ominor*, to turn away from, as from an evil omen; to deprecate

ABOMINABLE, *adj.* An ill omen; to turn away from, with loathing and detestation; to hate utterly, to execrate.

Thei knowlochen that thei known God; but bi dedis thei denylen whanne thei ben *abomynable*, and unblieful, and reprenable to all good werk.

Wyclif. Tyte. chap. 1.

Al whom therfore by the whole thousands on an heape (for no fewer he nombred them) dothe thyds dywelyshe drunken soule *abomynably* blasphemie, and calleth them lyars and falsifiers of scripture, maketh them no better then draffe.

Sir Thomas More’s Works, p. 679

I abhor such phanatical phantasms, such insatiable and point-devise companions, such rackers of orthography, as do speak dont fine, when he sherd pronounce debt; d, e, b, t, not d, e, t. He clepeth a calf, cauf, half, hauf: neighbour, vocatur nehour; neigh abbreviated ne; this is *abominable*, whitch he would call

abominable: it insinuatech me of insanie. Ne intelligis Domine, to make frankick, lunatick?

Shakspeare's Love's Labour Lost.

Where all life dies, death lives, and nature breeds,
Perverse, all monstrous, all prodigious things,
Abominable, inutterable, and worse
Than fables yet have feign'd, or fear conceiv'd,
Gorgons, and hydras, and chimeras dire.

Milton's Paradise Lost, b. ii.

This infernal pit

Abominable, accrue'd, the house of woe. *Milton.*
Pride goes hated, cursed, and **abominated** by all.
Hammond.

And the high places that were before Jerusalem, which were on the right hand of the mount of Corruption, which Solomon, the king of Israel, had builded for Ashtoreth the **abomination** of the Zidonians, and for Chemosh the **abomination** of the Moabites, and for Milcom the **abomination** of the children of Ammon, did the king defile. *2 Kings*, xxiii. 13.

The queen and ministry might easily redress this **abominable** grievance, by endeavouring to choose men of virtuous principles.

Swift's Project for the Advancement of Religion.

Covetousness is idolatry, that the love of money is the root of all evil, that it has occasioned in some even the shipwreck of their faith, and is always, in whomsoever it obtains, an **abomination**.

Couper's Letters

ABON, **ABONA**, or **ABONIS**, from *abbon*, or *zon*, Celt. a river, the ancient name of a river in Britain, supposed to be the Avon; also a town in Albion, supposed by Camden to be Abingdon, and by others, who argue from the distance, (9 miles from Venta Silurum) to be Porshut, upon Avon, opposite Bristol.

ABONY, a flourishing Hungarian settlement, in the Ketskemet and county of Pest.

ABORIGINES. The term *aborigines*, though now an appellative, was originally a proper name given only to a people of Italy, who inhabited ancient Latium. St. Jerome says, they were so called, as being, *absque origine*, the primitive planters of the country after the flood; Aurelius Victor, that they were called *Aborigines*, q. d. *Aberrigines*, from *ab*, from, and *errare*, to wander; as having been before a wandering people. The term in fact signifies, of unknown origin; and has therefore in ancient and modern times described the oldest inhabitants of any country.

ABORT', *a. & n.* **Ab**: *orior*, to rise from;

ABORTION, *to arise out of season;*

ABORSE'MENT, *to bring forth premature-*

ABOR'TIVE, *ly, or before the time; to*

ABOR'TIVELY, *miscarry; to fail in bring-*

ABORT MENT, *ing to perfection.*

Of these words *abortion* and *abortive* only are in present use. They are all applied to animal and vegetable productions, and to imperfect or unsuccessful mental operations.

Thou eluish mark'd *abortive* rooting hogge,

Thou that wast seal'd in thy natunite

The slawe of nature, and the sonne of hell.

Shakspeare's Richard III. act i. sc. 3.

How often hast thou waited at my cup,
Remember it, and let it make thee crest-fall'n;
Ay, and allay this thy *abortive* pride.

Shakspeare's Henry VI. p. ii.

All th' unaccomplished works of nature's hand,
Abortive, monstrous, or unkindly mix'd,
Dissolv'd on earth, fleet hither.

Milton's Paradise Lost, b. iii. l. 456.

The void profound

Of unessential night receives him next,
Wide-gaping; and with utter loss of being
Threatens him, plung'd in that *abortive* gulf.

Idem, b. ii. l. 451.

Concealed treasures, now lost to mankind, shall be brought into use by the industry of converted penitents, whose wretched carcasses the impartial laws dedicate, as untimely feasts, to the worms of the earth, in whose womb those deserted mineral riches must ever lie buried as lost *abortions*, unless those be made the active midwives to deliver them.

Bacon's Physical Remains.

Many politic conceptions, so elaborately formed and wrought, and grown at length ripe for delivery, do yet, in the issue, miscarry and prove *abortive*.

South's Sermons.

Nor will his fruit expect

Th' autumnal season, but, in summer's pride;

When other orchards smile, *abortive* fail. *Phillips.*
Behold my arm thus blasted, dry, and wither'd,
Shrunk like a foul *abortion*, and decay'd,
Like some untimely product of the seasons. *Rowe.*

ABORTION, in midwifery, the exclusion of a fetus before it has acquired a sufficient degree of perfection to enable it to perform respiration and the other vital functions. See MIDWIFERY.

ABORTIVE CORN, a distemper of corn mentioned by M. Gillet, and suspected to be occasioned by insects. It appears long before harvest, and may be known by a deformity of the stalk, the leaves, the ear, and even the grain.

ABORTIVE VILLUM, is made of the skin of an abortive calf.

ABOU-HANIFET, in Mahometan theology, a doctor and founder of a sect in the 8th century, who was imprisoned and died at Bagdad, A.D. 757, for his denial of predestination. His followers became numerous, and a mausoleum was built by one of the caliphs to his memory.

ABOUILLONA, or **ABELLIONTE**, a lake, island, and town of Asiatic Turkey, at the foot of Olympus, and supposed to contain the scite of the ancient Apollonia. It is distant eight miles, and a stream called Lupat communicates from the W. of the lake to the sea of Marmora.

ABOUKIR, a town of Egypt, 10 miles N. E. of Alexandria, between the sea, and the lake Mareotis. It is the ancient Canopus, according to M. Savary, and stands upon a ridge of rocks which communicates with Aboukir, a small island, about a league from the town, mentioned by Pliny and Strabo.

ABOUKIR BAY, formed by the same ridge of rocks, offered the best landing place which Sir Ralph Abercrombie could select for the disembarkation of the British army in 1801, (see Abercrombie,) and is distinguished in the British annals as the scene of the memorable battle of the Nile, (or of Aboukir,) fought by our intrepid NELSON, 1st of August, 1798.

ABOULFEDA, (Ismael,) prince of Hamah in Syria, one of the most celebrated of the Arabian geographers and historians. He was born at Damascus in 1273, and soon became distinguished.

by his learning. In 1321 he wrote an important geographical work, which Graevius published in London, in 1660. He wrote also the lives of Mahomet and Saladin; the former was printed at Oxford in 1723, and the latter at Leyden in 1732. His Annals of Mahometanism, a work in high estimation, was published with a Latin version at Copenhagen, in 5 vols. 4to. in 1789—1794. He was a soldier as well as a scholar, and served in several expeditions with his father; was present at the storming of Tripoli in 1289, and in 1291 at the capture of Acre, distinguishing himself as well by his skill as his bravery. He died in 1331. Professor White gives several chapters of extracts from Abulfeda in his Pocock's Specimen Hist. Arabum, Oxon. 1806.

ABOULOLA, (Ahmed,) an eminent Arabian poet, blind, like our great Milton; but esteemed one of the principal ornaments of his country. He was born A.D. 973, and died 1057.

ABOUTIGE, or **ARCTIGE**, a market-town in Upper Egypt, near the Nile, where quantities of poppies grow, of which the natives make the best opium in the Levant. It was formerly the *abotis* of *Stephanus*.

ABOVE', prep. and adv. Ang. Sax. *bufen*, *be-ufan*; top or head. Written variously by our older writers. It designates the upper or uppermost, and is much used as a prefix in composition.

And God sent him tokenyng on nyght als he slepe,
Dat he suld fynd a palmerc orely at morn,
At pe south zate, alone as he was born,
And if he wilde pracie him, for Jhesu Criste's loue,
He wilde doope bataile, and pe suld be *above*.

R. Brunne, p. 32.

But one thing yet there is *above* all other
I gaue him winges, wherewith he might up flie
To honour and fame; and if he wold to hygher
Then mortal things *above* the starry skye. *Wyatt*.

Descend from Heav'n, Urania, by that name
If rightly thou art call'd, whose voice divine
Following, *above th'* Olympian hill I soar
Above the flight of Pegasean wing. *Milton*.

The inhabitants of Tirol have many privileges *above* those of the other hereditary countries of the emperor. *Addison*.

True dignity is his, whose tranquil mind
Virtue has raised *above* the things below;
Who, every hope and fear to heaven resigned,
Shrinks not, though Fortune aim her deadliest blow.

Battie's Minstrel.

ABOUND', v. *Abundo*. A metaphor derived *ABOUND'ING*, a wave. from *unda*, *ABUNDANCE*, from water when it exceeds *ABUNDANT*. the bounds which should

ABUNDANTLY, contain its stream. Hence, to overflow; to be rich; to have in great plenty. And, brethren, we preien ghou, that ghe knowe hem that traeciln among ghou, and ben sonereyns to ghou in the lord, and techen ghou that ghe haue hem *aboundantli* in charite, and for the werk of hem haue ghe pees with hem. *Wyclif*. 1 Tessel, chap. v.

For well I wot, most mighty sovereign,
.That all this famous antique history,
Of some th' *abundance* of an idle brain
Will judged be, and painted forgery. *Spenser*.

Good, the more

Communicated, more *abundant* grows;
The author not impair'd; but honour'd more.

Paradise Lost, b. v.

God on theo
Abundantly his gifts hath also pour'd.
Inward and outward both, his image fair.

Paradise Lost, b. viii.

Let the waters bring forth *abundantly* the moving creature that hath life. Genesis 1. 20.
Their chief enterprise was the recovery of the Holy Land; in which worthy, but extremely difficult action, it is lamentable to remember what *abundance* of noble blood hath been shed, with very small benefit unto the Christian state.

Sir Walter Raleigh's Essays.

At the whisper of thy word,
Crown'd *abundance* spreads my board. Crashaw
Circles are prais'd, not that *abound*:
In largeness, but the' exactly bound:
So life we praise that does excell,
Not in much time, but acting well. Waller
The doubted charge his subjects' love supplies;
Who, in that bounty, to themselves are kind:
So glad Egyptians see their Nilus rise;
And, in his plenty, their *abundance* find.

Dryd. Ann. Mir.

Heroic poetry has ever been esteemed the greatest work of human nature. In that rank has Aristotle placed it; and Longinus is so full of the like expressions, that he *abundantly* confirms the other's testimony.

Dryd. State of Innocence, pref.

The river Inn is shut up between mountains covered with woods of fir-trees. *Abundance* of peasants are employed in hewing down the largest of these trees; that, after they are barked and cut into shape, are tumbled down.

Addis. on Italy.

If the Prophecies have been fulfilled (of which there is *abundant* demonstration) the Scripture must be the word of God; and if the Scripture is the word of God, Christianity must be true. Cowper's Letters.

ABOUT', prep. and adv. Saxon *abusa*, on *burja*, or on *boda*. The first limit or boundary of any thing. It also implies approximation to other things. About was also used like a verb in the imperative mood, and is so still in nautical phrasology. In this sense it is derived immediately from the French *a-bout*, a verb being understood.

Goggomagog was a geand swiþe grete and strong,
Above four and twenti fet me seip he was long.

R. Gloucester, p. 22.

Gold hath these natures: greatness of weight; closeness of parts; fixation; pliancy, or softness; immunity from rust; colour, or tincture of yellow: Therefore the sure way (though most *about*) to make gold, is to know the causes of the several natures before rehearsed. Bacon's Natural Hist. No. 328.

About him all the sanctities of Heav'n

Stood thick as stars, and from his sight receiv'd
Beatitude past utt'rance. Milton.

My brain, *about* again; for thou hast found
New projects now to work upon. Iron Age. 1632.

Children should always be heard, and fairly and kindly answered, when they ask after any thing they would know, and desire to be informed *about*. Curiosity should be as carefully cherished in children, as other appetites suppressed.

Locke.

Even in the hour of death, he (the good man) considers the pains of his dissolution to be nothing else than the breaking down of that partition which stands betwixt his soul, and the sight of that being who is always present, and is *about* to display himself to him in fulness of joy.

Spectator.

ABRA, a silver coin of Poland, formerly

worth about one shilling sterling, also a coin of Poland of the value of three half-pence.

ABRA, an island of the Southern Ocean, in the straits of Magellan, at the entrance of the passage, as it is called.

ABRABANEL, **ABARBANEI**, or **AVRAVANEI**, (Isaac,) a celebrated rabbi, born at Lisbon, in 1437, and said to be descended from king David. He was counsellor to Alphonso V, and afterwards to Ferdinand I. but was obliged to leave Portugal along with his brethren Jews, in 1492. Though he was an avowed enemy to Christianity in his writings, yet he treated Christians with politeness. The Jews called him the sage, the prince, and the great politician. He wrote a commentary on the Old Testament, which is scarce; a Treatise on the Creation, wherein he refutes Aristotle's notion of the eternity of the world; another on the prophecies relating to the Messiah, against the Christians; with a work concerning articles of Faith, and some others of less importance. He died at Venice in 1508, aged 71.

ABRACADABRA, is said to have been the name of a god worshipped by the Syrians, and was recommended as a magical antidote against agues and fevers. It was written in a kind of inverted cone, omitting the last letter of the former every time it was repeated: thus,

α β ρ α κ α δ α β ρ α
α β ρ α κ α δ α β
α β ρ α κ α δ α β
α β ρ α κ α δ α
α β ρ α κ α δ
α β ρ α κ α
α β ρ α κ
α β ρ α
α β ρ

ABRADATES, in ancient history, a king of Susa who surrendered himself to Cyrus, and was killed in battle for the Persian cause. *Xenoph.* *Cyrop.* v.

ABRAHAM, אַבְרָהָם, Heb. i. e. Father of a great multitude, the youngest son of Terah, and the 10th in descent from Noah, founder of the Jewish nation. One fourth of the book of Genesis is occupied with his history; and to its ample and authentic details we refer the reader. In the first ages of Christianity, the Sethians dispersed a work entitled *Abraham's Revelation*; and a work on the *Creation*, ascribed to him, which is mentioned in the Talmud, was printed at Paris in 1552: Rittangel, a converted Jew, professor at Konigsberg, published it with remarks, in 1642.

ABRAHAM, (Nicholas,) a learned Jesuit, of Lorraine, born in 1589, and seventeen years professor of Divinity in the university of Pont-a-Mousson. He wrote a Collection of Theological pieces in folio, entitled *Pharus Veteris Testamenti*; Notes on Virgil and Nonnius; a Commentary on some of Cicero's Orations, in 2 vols. folio, and other works.

ABRAHAMIANS, or **ABRAHAMITES**, a sect of monks, in the 9th century, who were exterminated by Theophilus for worshipping images; also a sect which, in the 8th century, renewed

the errors of Paulos; but were suppressed by Cyriacus, patriarch of Antioch.

ABRAM'S CREEK, a river of North America, entering the Hudson, about 4 miles from the city of that name, in the state of New York.

ABRAMIS, in ichthyology, the *Cyprinus latus*, or bream.

ABRANTES, a town of Portugal, in Estremadura, seated on the Tajus, and giving name to a marquisate. It is surrounded with gardens and olive yards, and occupies a most romantic situation. Distant 45 miles E. of Lisbon.

ABRASA, in medicine, ulcers attended with abrasion of part of the substance, or where the skin is so tender as to be subject to **ABRASION**.

ABRASAX, or **ABRANAS**, the name given to the Deity by the Basilidian heretics, and composed of Greek numerals, which amount to the number 365. For Basilides taught that there were 365 heavens between the Empyrean heaven and the earth; each of which had its angel that created it, and each of whom again was created by the next superior angel, thus ascending by a scale to the supreme Creator. Some authors allege that the Basilidians concealed the doctrine of the Trinity, under this word, and that the initials *a*, *b*, *p*, stand for the Hebrew words *Ab*, *Ben*, *Rough*, i. e. Father, Son, and Spirit. Windelin, of Tournay, improving upon this, explains the whole word thus,

A	Ab	Pater	— — —	1
B	Ben	Filius	— — —	2
P	Rouah Kakadosh	Spiritus Sanctus	100	
Α	Ανθρωπες	homines	— —	1
Σ	Σωζων	salvans	— —	200
Α	Αγιω	per sacrum	—	1
Ξ	Ξυλω	lignum	—	60
				365

It is also frequently put for the stone, or medal, on which the word was engraved.

ABRASION, in medicine, the wearing away, or paring off, superficial ulcerations.

ABRAUM, in natural history, a popular name for a species of red clay, used in England by the cabinet-makers, &c. to give a red colour to new mahogany wood.

ABREAST, a maritime phrase, signifying side by side, or even opposite to; and used to denote ships lying, or sailing, with their sides parallel to each other. It has a more particular reference to the line of battle at sea. When the line is formed *abreast*, the whole squadron advances uniformly and evenly; the commander-in-chief being always stationed in the centre, and the ships equi-distant from each other. *Abreast* of any place, signifies being opposite to it. In the interior of the ship, *abreast* means to be on the starboard or larboard side of the main hatchway, in opposition to *afore* or *abft* the hatchway.

ABREAST. See BREAST.

ABREIRO, a market-town of Trast-loss-Montes, in Portugal, comprehending a district of ten parishes, belonging to the Villa-Real family.

ABRENTIUS, in ancient history, the governor of Tarentum, appointed by Hannibal, who gave up that city to the Romans at the instigation of a beautiful woman.

ABRETTENE, or **ABRETTINE**, in ancient geography, a district of Mysia, in Asia, from which the epithet Abrettenus was given to Jupiter. *Strabo.*

ABREUVOIR, in military affairs, a tank to receive water in the case of encampment; also, small trenches in stone quarries to carry off the water.

ABRI, in military affairs, shelter, or protection, as that derived from a wood, &c.

ABRIDGE, v. } *Abreger*, Fr. from the Ger-
man Brechen, to break.—Sax.

ABRIDG'ER, } *Abregeur*, man Brechen, to break.—Sax.
ABRIDG'MENT. } *Abregean*, nearly synonymous
with abbreviate; to shorten, to lessen, to give the
same substance, or that portion of it which may be
considered necessary in less compass than the
original, to make an abstract.

Largesse it is, whose priuilege
There maie no auarice abreye.

Gower Con. A. b. vii.

Surely this commandment containeth the law and the prophets; and, in this one word, is the *abridgement* of all volumes of Scripture. *Hooker*, b. ii. sec. 5.

THES. Say, what *abridgment* have you for this evening?

What mask? what musick? how shall we beguile
The lazy time, if not with some delight?

PHILOST. There is a *brief*, how many sports are
ripo;

Make choice of which your highness will see first.
Shakespeare's Midsummer Night's Dream.

I have disabled mine estate,

By shewing something a more swelling port,
Than my faint means would grant continuance;
Nor do I now make moan, to be *abridg'd*
From such a noble rate. *Shaksp. Merchant of Venice.*

After thou hadst drawn that large and real map of the world, thou didst thus *abridge* it into this little table of man: he alone consists of heaven and earth, soul and body. *Hall's Contemplations.*

They were formerly, by the common law, discharged from pontage and murage; but this privilege has been *abridged* them since, by several statutes.

Ayliffe's Parergon Juris Canonici.

It is not barely a man's *abridgment* in his external accommodations which makes him miserable; but when his conscience shall tell him that it was his sin and his folly which brought him under that *abridgment*. *South.*

Idolatry is certainly the first-born of folly, the great and leading paradox; nay the very *abridgment* and sum total of all absurdities. *South's Sermons.*

All trying, by a love of littleness,
To make *abridgments*, and to draw to less

Even that nothing, which at first we were. *Donne.*

The constant desire of happiness, and the constraint it puts upon us, no body (I think) accounts an *abridgment* of liberty; or at least an *abridgment* of liberty to be complained of. *Locke.*

ABROACH', v. and *adv.* Sax. *Abracan*, to break. To *abroach*, or *broach* a vessel, is to break into it, to tap it, to prepare to draw off its contents. Hence figuratively, to commence, to set any thing going. *Broach* has also a different signification, which see under the word.

From when had you this doctrine M. Hardinge? who set it first *abroche*? who taught it? who confirmed it? who allowed it?

Jewel's Defence of the Apologie.

Let but some upstart heresy be set *abrouch*, and presently there are some out of a curious humour; others, as if they watched an occasion of singularity,

will take it up for canonical, and make it part of their creed and profession.

Bishop Wilkins's Discovery of a New World.

The jars of gen'rous wine

He set *abroach*, and for the feast prepar'd

Dryd. Virgil.

Hast thou no friend to set thy mind *abroach*?
Good sense will stagnate. Thoughts shut up want
air

And spoil, like bales unopen'd to the sun.

Young's Complaint, night ii.

ABROAD', *adv.* Broad from the Ang. Sax. *Brēdan*, *Abredan*, to broaden, enlarge, extend. The orthography of this word differs among ancient writers. See the following authorities. Opposed to home, or at home.

With thulke stroe he smot al of the scolle and ek
the croune,

That the brain ora al *abrod* in the paviment their
dounne. • *R. Gloucester*, p. 476.

Ane felloun rusche it maid and sound withall
And large *on brede* ouer Grēkis routes did fal.

Douglas, b. ii. p. 54.

Crowns in my purse I have, and goods at home
And so am come *abroad* to see the world.

Shakespeare's T. Shrew.

On cherubim and seraphim full royally he rode,
And on the wings of mighty winds came flying all
abroad. • *Sternhold.*

Intermit no watch
Against a wakeful foe; while I *abroad*,

Thro' all the coasts of dark destruction, seek
Deliverance. *Milton's Par. Lost*, b. ii. l. 463.

Again the lonely fox roams far *abroad*,
On secret rapine bent, and midnight fraud;
Now haunts the cliff, now traverses the lawn,
And flies the hated neighbourhood of man. *Prior.*

Welecome, Sir!
This cell's my court; here have I few attendants,
And subjects none *abroad*. *Shaksp. Tempest.*

Lady —— walked a whole hour *abroad*, without
dying after it. *Pope's Letters.*

What learn our youth *abroad*, but to refine
The homely vices of their native land?

Dryd. Span. Friar.

He who sojourns in a foreign country, refers what he sees and hears *abroad*, to the state of things at home. *Atterb. Scrm.*

We have no slaves at home. Why then *abroad*? *Cowper.*

ABROCHIMENT, or **ABROCUMENTUM**, in old law. See *ABROCHMENT*.

AB'ROGATE, } *Ab rego*: Rogare legem,

ABROGA'TION, } *or facere rogationem populi*, among the Romans, to propose a new law to the people in order to obtain their sanction to its passing. A successful application to the same authority was essential to the repeal of a law; hence also, *abrogare legem*; conformably to the latter usage, to unmake, repeal, annul, or make void, are the significations in English.

Besides this all estates made by king Edward were clerely revoked, *abrogated*, and made frustrate.

Hall, p. 286.

I do not *abrogate* the grace of God, for if righteousness be by the law, then Christ died without a cause. *Genera Bible*, 1561. Gal. chap. ii. v. 21.

Laws have been made, upon special occasions; which occasions ceasing, laws of that kind do *abrogate* themselves. *Hooker*, b. iv. sec. 14.

The negative precepts of men may cease by many instruments, by contrary customs, by public disrelish,

by long omission : but the negative precepts of God never can cease, but when they are expressly abrogated by the same authority.

Taylor's Rule of Living Holy.

The commissioners from the confederate Roman catholics demanded the *abrogation* and repeal of all those laws, which were in force against the exercise of the Roman religion. *Clarend. b. viii.*

ABROHANNI, ABROANI, or MALLEMOLLI, a kind of muslin, or clear, white, fine cotton cloth, brought from the East Indies, particularly from Bengal.

ABROLHOS, or ABROLROS, dangerous shoals about fifty miles from the coast of Brazil, and near the Island of St. Barbe. Their centre is in Lat. $17^{\circ}, 51'.$ S. Long. $39^{\circ}, 18'.$ W.

ABROMA, in botany, a genus of the class polyadelphia, and order dodecadria. It has been denominated Indian flax, as being excellent for making cordage. The fibres are interwoven with the bark, and are remarkably beautiful, fine, and strong. To procure their separation from the parenchymatous substance, they are macerated in water from four to eight days. The world owes to Dr. Roxburgh this important discovery. See his paper on the subject in *Memoirs of the Society of Arts* for 1804.

ABRON, a river of France, entering the Loire, between Avril and Lamotte.

ABRONO, or ABRUGI, in botany, a name given by Serapion and others to the hearts ease.

ABROTANUM* in botany. See ARTEMISIA and SANTOLINA.

ABROTANOIDES, in natural history, a coral in the form of the abrotanum.

ABROTONUM, in ancient geography, a town on the Mediterranean, in the district of Syrtis Parva, in Africa.

ABRUG-BANYA, a populous town in Transylvania, on the river Ompay, 21 miles above Alba Julia. There are mines of gold and silver near it, and the zinc court was formerly held in it. It is the chief of what are called the Metal towns.

ABRUGI. See ABRONO.

ABRUP'T, *adj.* { Ab: *rumpo, ruptum*, to break off, or away from.

ABRUP'TION, } Broken off from. These words express or imply sudden, violent, or unexpected separation of a part from the whole.

Pardon, if my abruptness breed disease ;
“ He merits not t’ offend that hastens to please.”

Jonson.

The devil he is a spirit, and hath means and opportunity to mingle himselfe with our spirits, and sometimes more slyly, sometimes more abruptly and openly, to suggest devellish thoughts into our hearts.

Burton's Anatomy of Melancholy.

Abrupt, with eagle-speed, she cut the sky ;
Instant invisible to mortal eye.

Pope's Homer's Odyssey, b. i.

Abrupt and horrid as the tempest roars,
Thunder and flash upon the steadfast shores,
Till he, that rides the whirlwind, checks the
rein,

Then all the world of waters sleeps again.

Couper's Retirement.

AIRUS, in botany, the trivial name of the GLYCINE. See GLYCINE.

ABRUZZO, a mountainous province of Naples, bounded on the E. by the gulph of Venice; on the N. and W. by Ancona, Umbria and the Campagna of Rome; and on the S. by the Terra di Lavora and Molise. It is divided into two parts by the river Pescara, called Ulteriore and Citeriore. The former has Aquila, and the latter Sulmona, for its capital. The country, though cold, is fertile in corn, rice, fruits, saffron, vines and olives. The rice of Teramo is little inferior to that of Lombardy. A great deal of it is exported, as well as of oil, wines, and Turkey wheat; but the staple commodity is wool, the greatest part of which is sent off unwrought, there being no woollen manufactures in the province, except two small ones of coarse cloth. The sheep, after spending the summer on the mountains, are brought down to pass the winter in the warm plains of Puglia, and some other places on the coast, where the snow does not lie. This whole coast, one hundred miles in length, is utterly destitute of sea-ports; and the only spots where the produce can be embarked are dangerous inconvenient roads, at the mouths of rivers and along a lee shore. Villages, castles, and feudatory estates, are to be met with in abundance; but the numbers of their inhabitants are to be reckoned by hundreds, not thousands: the political and social system being here wholly in decay. Monte-corno and Mayallo are among the most interesting natural features of the province; the first evidently contains many valuable veins of metallic ore; but the great difficulty of access renders the search of them almost impracticable. Mayallo has other merits, and of a gayer kind.—Nature has clothed its declivities and elevated fields with an infinite variety of her most precious plants; vulnerary herbs grow there in as great perfection as on the Alps of Switzerland, and are applied by the natives to wounds with equal success. The warlike nations, who descended hither from the north, have left many traces of their customs and languages, as well as numerous monumental inscriptions; and the inhabitants are said to differ remarkably from the more southern Neapolitans.

ABSCESS, in surgery, from *abscedo*, to depart: a cavity containing pus, or, a gathering of matter; so called, because the parts which were joined are now separated; one part receding from another, to make way for the collected matter. See SURGERY.

ABSCIND', v. { Ab: *scindo*, to cut off or

ABSCIS'SION. } away from. Applied naturally, and to operations in surgery, &c. figuratively in medicine, astrology, rhetoric, and divinity.

Fabricius ab Aquapendente renders the *abscission* of them difficult enough, and not without danger.

Wiesman's Surgery.

By cessation of oracles, with Montacutius, we may understand this intercision, not *abscession* or consummate desolation. *Brown's Vulgar Errors*, b. vi. c. 12.

When two syllables likewise are *abscinded* from the rest, they evidently want some associate sounds to make them harmonious

Rambler.

ABSCISSE, or **ABSCISSA**, in mathematics, part of the diameter or transverse axis of a conic section, intercepted between the vertex, or some

other fixed point and a semiordinate. In a more general sense, it is the segment of a line terminated at some certain point, cut off by an ordinate to a curve.

ABSCISSION in astrology, is when one planet outstrips another, and joins a third before it, and so cuts off the light of the first.

ABSCISSIOX, in rhetorie, a figure of speech whereby the orator stopping short in the middle of his discourse leaves the audience to draw the inference: e.g. "He started from me, toward the edge of the precipice, and my attention being caught for the moment by another voice —. In the next, I heard a plunge in the water —. I need add no more."

ABSCISSION, in surgery, the act of taking away something morbid or unsound in the fleshy or membranous parts of the body. Sometimes also applied to sudden death.

ABSCOND'. *v.* Abs: *condo*, to hide from, to remove to a place of secrecy.

The marmotte, or mus alpinus, which *absconds* all winter, lives on its own fat: for in autumn, when it shuts itself up in its hole, it is very fat: but in the spring-time, when it comes forth again, very lean.

Ray on the Creation.

Outlawry always supposes a precedent right of arresting, which has been defeated by the parties *absconding*.

Blackstone's Commentaries.

ABSCONSIO, in anatomy, a hiding or concealing of the head of one bone in the cavity of another.

ABSENT, *v. adj.* Ab: esse. Participial
ABSENCE, adj. Absens. To be away
ABSENTEE, from, to withdraw. App-
ABSENT'ER, plied more particularly to
ABSENT'MENT. persons, and intimates rather a temporary removal than final departure.

The archbishop desirying the duke (Henry of Lancaster) to *absent* all other persons than such as were his co-patrons saide these or like wordes of him.

Hall.

So, badde is nothing els but *absence* or negative of good, as darkness is *absence* or negative of light.

Chaucer's third Booke of the Tese of Love. folio 309, col. 1.

Night with her will bring

Silence, and sleep; listening to thee will watch,
 Or we can bid his *absence* till thy song

End, and dismiss thee ere the morning shine.

Milton's Paradise Lost, b. vii.

Our Lord being *absent* in body from us (sitting in Heaven at God's right hand), to supply that *absence* that we should not be apt to forget him, and thereby become wholly estranged from him, is pleased to order this occasion of being present, and conversing with us in such a manner as may retain in our memories his gracious performances for us; may impress in our hearts a kindly sense of them; may raise us up in mind and affections.

Barrow.

A great part of estates in Ireland are owned by *absentees*; and such, as draw over the profits raised out of Ireland, refunding nothing.

Child's Discourse on Trade.

ABSENTEE, in political economy, may describe those who are systematically absent from any country, or, indeed, any particular station; but has been in modern times more particularly applied to those land-owners and churchmen of

Ireland who reside in England or on the continent.

The political demerits of this class of landholders have been, on some occasions, exaggerated; they have been said to contribute nothing to the good government or prosperity, and to constitute altogether an unnatural and oppressive burden on the resources of a country. Taxes on absenteeship from Ireland were, for a length of time, therefore, popular in that country. In 1715, a tax of four shillings in the pound was levied on all profits, employments, fees, and pensions, derived from Ireland, in all cases where the persons receiving them should not reside in that country for six months of the year; power to grant leave of absence being reserved to the crown. This dispensing power, however, was brought so much into exercise, as to render the act of little practical operation, and in 1753 it ceased to be renewed. Mr. Flood, the great Irish orator, proposed in 1773, a more general measure, i. e. a tax of two shillings in the pound on the emoluments of absentees, without exception; and the bill was at first supported by the Irish government; but some communications from England inducing the lord lieutenant to withdraw his support, the measure was lost in a division of 122 to 102. In 1783 the question was renewed in the Irish House of Commons, by Mr. Molineux, but again lost by a division of 184 to 122.

Such is the history of a direct tax upon absentees, and the different attempts at taxing them in Ireland; which, as proceeding upon the theory of their being wholly a burden to the country, must be unjust: they can enjoy but the surplus profit of that capital and labour which employ humbler, and, it may be granted, *more* useful classes of the community. Still *their* capital so in operation must be a benefit as far as it goes, to the country in which it is working, and not an injury. As a punishment, such a tax is manifestly impolitic, and calculated only to inflame animosity, and inspire contempt of the legislature imposing it. Persons who can afford to live entirely out of the country, are generally those of superior rank and influence: they would wholly withdraw their capital from it, in many instances, and will despise that attempt to control their movements which they have unusual power of resenting. The justice of this reasoning, according to Mr. Hardy, the biographer of Lord Charlemont, led to the rejection of the absentee tax in 1773. It was felt that a general land tax was likely to result from this partial one proposed upon the absentees. "If the powerful interest of that body," argued the great commoner, "had hitherto been able to secure interest against such a tax, the same interest would be sufficient, and would be exerted to introduce it, in order that the other inheritors of landed property should, as such, be made to pay a tax as well as themselves." In opposition to this, Dr. Smith argues, —Those who live in another country contribute nothing by their consumption, towards the support of the government of that country in which is situate the source of their revenue. If, in this latter country, there should be no land tax nor any considerable duty on the transference either of moveable or immoveable property, as is the case in Ireland,

such absentees may derive a great revenue from the protection of a government, to the support of which they do not contribute a shilling. This inequality is likely to be greatest in a country of which the government is, in some respects, subordinate or dependent on that of some other. The people who possess the most extensive property in the dependent, will in this case generally choose to live in the governing country. Ireland is precisely in this situation, and we cannot therefore wonder that the proposal of a tax upon absentees, should be so very popular in that country. It might, however, be a little difficult to ascertain, either what sort, or what degree of absence might subject a man to be taxed as an absentee; or at what precise time the tax should either begin or end."

But while we hold legislation, or at least compulsory laws on such a subject impolitic, and even unjust; freedom of intercourse throughout all the parts of an extended, civilized empire, being one of the best portions of our birthrights in it; and while the evils of absenteeism may have been exaggerated, we also regard them as real and great; and that they suggest many important moral and political considerations, to men of property connected with Ireland.

That unhappy country suffers from such a withdrawal of her proper supporters and governors, in the curse of *middle men*; in the notorious want of influence and example to stimulate improvement; and in the practical discouragement of all attempts to form a respectable yeomanry, which follow in its train. It is not merely the money spent in the neighbourhood of a gentleman's seat in England, any more than it is his ill-painted coat of arms, or effigy, as the sign of the neighbouring village ale-house, that constitutes the most beneficial tie between the resident proprietor and the neighbouring country; it is his presence, as the chief of a system, at the head of authority, of property, of all improvements, public spectacles, and even of all the public amusements, that diffuses order, prosperity, and happiness.

As to churchmen, we understand that the gross evil of their late notorious absenteeships has engaged the attention of the government, both in its civil and ecclesiastical administration. For who can be surprised at the increase of the Catholics in numbers, property, and every kind of local influence when the appointed lights of the land are withdrawn? Or when they are exhibited to an impoverished peasantry only in the character of voracious consumers of tythe?

Writers of all parties agree in the difficulty of estimating the mischiefs that arise from the great prevalence of middle men in Ireland, and that necessarily attend the existence of absenteeism in every country. Letting and sub-letting, thus, has multiplied without end.

Now, that the rent of land, as well as that of other real property, should be fairly secured by any produce that may be derived from it, seems on the face of things to be as reasonable in Ireland as in England or elsewhere. But the almost incredible number of persons that are interposed between the absentee proprietor and the cultivator of the soil in that country, grinds the

actual farmer to the earth; involves the whole business of agricultural property in legal subtleties; and makes the taking of land by a plain and sober small capitalist the height of presumption and folly. He is, in fact, never secure; he may repay his rent again and again to half a dozen claimants. This has banished practical men of this class, and produced an endless subdivision of excellent farms among desperate adventurers that have nothing to lose.

ABSINTHITES, ABSINTHIAS, OR ABSINTHIATED, tinged or impregnated with the virtues of *absinthium*, or wormwood. In *Bartholin's Act. Med.* (tom. ii.) we read of a woman whose milk was become *absinthiated*, and rendered as bitter as gall, by the too liberal use of wormwood. *Vinum absinthites*, or *poculum absinthiatum*, wormwood wine, is much spoken of among the ancients, as a wholesome drink, and even an antidote against drunkenness. Fehr shews that it should be prepared by fermentation, in order to correct crudities, and call forth a volatile salt.

ABSINTHIUM, in botany, from *a. priv.* and *ψυθεῖ*, pleasure, wormwood. See **ARTEMISIA**.

ABYSIS, ABSES, OR APSIDES. See **APSIDIS**.

ABSOLVE', v. ABSOLV'ER, AB'SOLUTE, AB'SOLETLY, AB'SOLUTNESS, AB'SOLUTELY, ABSOLUTION, ABSOLUT'ORY.	} Ab: <i>solvō</i> , to loose, to untie, to set free. Figuratively to release from the penal consequences of crime, to pardon, acquit, or declare innocent. The adjective and words immediately derived from it express freedom, independence, perfection of state, or existence.
---	---

But let the sonne of perdition perishe, and *absolute* we the chapter, the angel yet speking with Daniel.

The Exposicion of Daniel, by George Joye, p. 146.

We must know what is to be meant by *absolute*, or *absoluteness*; whereof I find two main significations. First, *absolute* signifieth perfect, and *absoluteness* perfection; hence we have in Latin this expression, *Perfectum est omnibus, numeris absolutum*. And in our vulgar language we say, a thing is *absolutely* good, when it is perfectly good. Next, *absolute* signifieth free from tye or bond.

Knox's History of the Reformation. Preface.

DUKE. So then you hope of pardon from Lord Angelo?

CLAUD. The miserable have no other medicine But only hope: I've hope to live, and am prepared to die.

DUKE. Be *absolute* for death: or death or life Shall thereby be the sweeter.

Shakspeare's Measure for Measure.

And of that nature (for the most part) are things, *absolutely* unto all men's salvation necessary, either to be held or denied, either to be done or avoided.

Hooker's Preface.

A monarchy, where there is no nobility at all, is ever a pure and *absolute* tyranny; as that of the Turks. For nobility attempers sovereignty, and drawes the eyes of the people somewhat aside from the line royal.

Lord Bacon's Essays.

Being as I am, why didst not thou

Command me *absolutely* not to go,

Going into such danger, as thou saidst?

Parad. Lost. b. ix.

The *absoluteness* and illimiteness of his commission was generally much spoken of. *Clarendon*. b. viii.

My crown is *absolute*, and holds of none :
I cannot in a base subjection live ;
Nor suffer you to take, though I would give.

Dryd. Ind. Emp.

The *absolution* pronounced by a priest, whether papist or protestant, is not a certain infallible ground to give the person, so *absolved*, confidence towards God.

South's Sermons.

Although it runs in form *absolute*, yet it is indeed conditional; as depending upon the qualification of the person, to whom it is pronounced.

Idem.

The prince long time had courted fortune's love ;
But, once possess'd, did *absolutely* reign ;
Thus, with their Amazons, the heroes strove ;
And conquer'd first those beauties they would gain.

Dryden's Annus Mirabilis.

Chief, let devotion to the sovereign mind,
A steady, cheerful, *absolute* dependence
On his best, wisest government, possess thee.

Mallet.

I see still the distinctions of sovereign and inferior, of *absolute* and relative worship, will bear any man out in the worship of any creature with respect to God; as well at least, as it doth in the worship of images.

Stilingfl. Def. of Disc. on Rom. Idol.

An *absolute* mode is that, which belongs to its subject, without respect to any other beings whatsoever; but a relative mode is derived from the regard, that one being has to others.

Watt's Logic.

A firm persuasion of the supervidence of Providence over all our concerns is *absolutely* necessary to our happiness.

Cowper's Letters.

ABSOLUTE, in metaphysics, denotes that being whose essence does not consist in a mere habitude or relation to another, and stands opposed to *relative* or *respective*. It is more particularly understood of that which does not proceed from any cause, and is independent of any other being, considered as its cause; in which sense, God alone is *absolute*.

ABSOLUTE EQUATION, in astronomy, is the aggregate of the optic and eccentric equations. See **ASTRONOMY**.

ABSOLUTE ESTATE, in law, one free of all conditions and incumbrances.

ABSOLUTE GOVERNMENT, that wherein the government is above the law, and not, as in this country, a creature of the law.

ABSOLUTE GRAVITY, among philosophers, that property in bodies, by which they are said to weigh so much, with regard to circumstances of modification, and which is, in that respect, distinct from specific gravity.

ABSOLUTE NUMBER, in Algebra. See **ALGEBRA**.

ABSOLUTE SPACE, PLACE, MOTION, &c. See the Substantives.

ABSOLUTION, in civil law, is a sentence whereby the party accused is declared innocent of the crime laid to his charge. Among the Romans, the ordinary method of pronouncing judgment was this: after the cause had been pleaded on both sides, the prætor used the word *axerint*, q. d. they have said what they have to say; then three ballots were distributed to each judge, marked as should be previously arranged; and, as the majority appeared of either mark, the accused was absolved or condemned, &c. If he was absolved, the prætor dismissed him with *videtur non fecisse*, or *fure videtur fecisse*.

ABSOLUTION, in the canon law, is a juridical act, whereby the priest declares the sins of penitents remitted. The Romanists hold absolution a part of the sacrament of penance, and the council of Trent, sess. xiv. cap. 3. declares the essence of the sacrament to lie in the words of *absolution*. The *formula* of absolution, in the Romish church, has been said to be absolute; the Greek church deprecatory; and in the churches of the reformed, declarative. But this is a matter strongly contested between protestants at large and the Romanists; as well as between the dissenters of England and the Anglican church. Dissenters object, generally, to all forms of absolution which suppose a power residing in mortals to appease the conscience, or purify the character of a sinner. The church of England, and all protestants, oppose the absolute claims of the Romish hierarchy (as they at least understand them,) to forgive sins on earth. The form that Tetzel used in vending the indulgences which first awoke the indignation and resistance of LUTHER, has been often quoted, but is said by Catholics to be unauthentic. They have thus stated their opinions upon this subject:—“Catholics believe, that when a sinner repents of his sins from his heart, and acknowledges his transgressions to God and his ministers, the dispensers of the mysteries of Christ, resolving to turn from his evil ways and to bring forth fruits worthy of penance; there is then (and not otherwise) an authority left by Christ to absolve such a penitential sinner from his sins: which authority we believe Christ gave to his apostles and their successors, the bishops and priests of his church, in these words, when he said, “Receive ye the Holy Ghost,” &c.

The foregoing is an extract from an authentic catholic work, entitled, “The Faith of Catholics confirmed by Scripture, and attested by the Fathers of the first five centuries of the Church,” by the Rev. Messrs. Berrington and Kirk, Lond. 1813. The same work confirms the proposition stated by these assertions of St. Ephrem of Edessa:—“The exalted dignity of the priesthood is far above our understanding and the power of speech! *The remission of sins is not granted to mortals, but through the ministry of the priest.*” *De Sacerdotio*, i. p. 1: and these observations of Chrysostom:—“Temporal princes have a power to bind but the body only; whereas the power of the priesthood binds the soul, and reaches to heaven.” In this sense, that God ratifies above what the priests do here below, and the master confirms the sentence of his servants. And what is this but that all power, even the concerns of heaven, has been entrusted to them?” *De Sacerdotio*, iii. c. 5.

ABSONIARE, in old records, to shun, avoid or detest; a term introduced in the Anglo-Saxon oaths of allegiance.

ABSORB', v. Ab: *sorbo*, to drink up;

ABSORB'ENT, to swallow; to imbibe; to

ABSORB'ING, to devote one's whole time and

ABSORPTION, attention to a pursuit, so as to be insensible to others; to contemplate intensely.

The rays of the sun are reflected from a white body, but *absorbed* by a black one.

Bacon's Distribution of Knowledge

It was below the dignity of those sacred penmen, or the Spirit of God that directed them, to shew us the causes of this disruption, or of this *absorption*: this is left to the enquiries of men.

Burnet's Theory of the Earth.

Moses imputed the deluge to the disruption of the abyss; and St. Peter to the particular constitution of that earth, which made it obnoxious to be *absorpt* in water.

Idem.

Some tokens shew
Of fearless friendship, and their sinking mates

Sustain; vain love, though laudable, *absorpt*

By a fierce eddy, they together found

The vast profundity.

Phillips.

An earthquake reel'd unheededly away!

None felt stern Nature rocking at his feet,

And yawning forth a grave, for those that lay

Upon their bucklers for a winding sheet;

Such is the *absorbing* hate when warring nations
meet!

Lord Byron's Childe Harold.

ABSORBENT VESSELS, a name given promiscuously to the lacteal vessels, lymphatics, and inhalent arteries. See ANATOMY. Plants are also said to possess absorbent vessels in their fibrous and hairy roots.

ABSORBENTS, in medicine. The term absorbent was introduced into chemistry by physicians, on the erroneous supposition that the faculty of withdrawing moisture from the air was confined to substances which freely unite with water; and hence applied to such as seemed to check diarrhoea, by the absorption of the redundant liquids.

The substance, says Dr. Ure, whose absorbent power is to be chemically examined, after thorough desiccation before a fire, is immediately transferred into a phial, furnished with a well ground stopper. When it is cooled, a portion of it is put into a large wide-mouthed bottle, where it is closely confined for some time. A delicate hygrometer being then introduced, indicates on its scale the dryness produced in the enclosed air, which should have been previously brought to the point of extreme humidity, by suspending a moistened rag within the bottle."

The following are the results of experiments made by Professor Leslie:—

Alumina	causes a dryness of	84 degrees.
Carbonate of magnesia	-	75
Carbonate of lime	-	70
Silica	-	40
Carbonate of barytes	-	32
Carbonate of strontites	-	23
Pipe clay	-	85
Greenstone, or trap in powder	80	
Shelly sea sand	-	70
Clay indurated by torrefaction	35	
Clay strongly ignited	-	8
Greenstone do	-	23
Quartz do.	-	19
Decomposed greenstone	-	86
Greenstone resolved into soil	92	
Garden mould	-	95

The more a soil is comminuted by labour and vegetation, the greater is its absorbent power. This ingenious philosopher infers, that the fertility of soils depends chiefly on their disposition to imbibe moisture; and illustrates this idea by recent and disintegrated lava. May not the finely divided state most penetrable by the deli-

cate fibres of plants, derive its superior power of acting on atmospherical vapour from the augmentation of its surface, or the multiplication of the points of contact?

In similar circumstances, 100 gr. of the following organic substances absorb the following quantities of moisture: ivory 7 gr. boxwood 14, down 16, wool 18, beech 28. Charcoal, and other porous solids of a fibrous texture, have the faculty of absorbing gases in a remarkable degree. See *Leslie on Heat and Moisture*; and *Ure's Dictionary of Chemistry*.

ABSORPTION. By this term modern chemists understand the conversion of a gaseous fluid into a liquid or solid, on being united with some other substance. It differs from condensation in being the effect of mechanical pressure, or the abstraction of caloric. Thus, if muriatic acid gas be introduced into water, it is absorbed, and muriatic acid is formed; if carbonic acid gas and ammonia gas be brought into contact, absorption takes place, and some carbonate of ammonia is produced by the union of their ponderable bases. *Ure's Dictionary.*

ABSORPTIONS OF THE EARTH, a phrase used by Kircher and other geologists, for the sinking in of large tracts of land, by subterranean commotions or other accidents. Pliny tells us of the mountain Cymbotus, with the town of Curites, which stood on its side, being thus wholly absorbed into the earth. He records the like fate of the city of Tantalis in Magnesia, and after it of the mountain Sypelus. Galanis and Garnatus, towns once famous in Phenicia, are said to have met the same fate. But the fact is, no fair distinction can be drawn between these remarkable incidents, and what have been more generally called *earthquakes*.

ABSORUS, or APSORUS, in ancient geography. See ABSYRTIDES.

ABSTAIN', v. } Ab or Abs : *teneo*, to hold
ABSTEN'TION, } or keep from; to forbear, to
AB'STINENCE, } refrain from. In this verb
AB'STINENT, } a middle or reflected action
AB'STINENTLY. } is distinguishable, and a resemblance between the Latin and English derivatives preserved.

Among some religious persons, abstinence is forbearance from certain kinds of prohibited food, as well as the almost total absence of nourishment experienced for an extraordinary period by individuals, many of whose cases are authentically recorded.

Moost dere, I biseche you as comelingis and pilgryms to *absteine* you fro *fleischli* desires thot fighen agens the soule. *Wiclif. Peter i, chap. 2.*

Say, can you fast? your stomachs are too young, And *abstinence* engenders maladies.

Shaksp. Love's Labour Lost.

Abstain

To ask: nor let thine own inventions hope
Things not revealed, which the invisible King
Only omniscient hath suppressed in night,
To none communicable in earth, in heaven:
Enough is left besides to search and know.

Milton.

A little wisdom, and an easie observation were enough to make all men that love themselves, wisely to abstain from such diet which does not nourish.

Taylor's Dissuasive from Popery.

Absstinence merits not ; for religion consists not in the belly either full or empty.

Hall's Contemplations.

Religious men, who hither must be sent,
As awful guides of heavenly government ;
To teach you penance, fasts, and *abstinence*,
To punish bodies for the soul's offence.

Dryden's Indian Emp.

Because the *abstinence* from a present pleasure, that offers itself, is a pain ; nay, oftentimes a very great one : it is no wonder that, that operates after the same manner pain does ; and lessens, in our thoughts, what is future ; and so forces us, as it were, blindfold into its embraces. *Locke.*

ABSTE'MIOUS, *adj.* { Ab or abs: *temetum*,
ABSTE'MIOUSLY. } from strong wines.
To be *abstemious* is to refrain with more than ordinary caution from the inebriating liquids.

The instances of longevity are chiefly amongst the *abstemious*. *Abstinence in extremity will prove a mortal disease* ; but the experiments of it are very rare. *Arbuthnot on Aliments.*

The peach is not only valiant to defend himself, but he is a bold biting fish ; yet, he will not bite at all seasons of the year ; he is very *abstemious* in winter. *Walton's Angler.*

ABSTEMIOUS, properly signifies a person who refrains from all use of wine. So particular were the ancient Romans in exacting this virtue from their ladies, that they were willing, it would seem, to put some others to hazard. In the first ages of the commonwealth, it was expected that they should kiss their friends and relatives whenever they accosted them, that it might be known by their breath whether they had been indulging in wine.

ABSTENSION, in law, a withholding the heir from taking possession of his estate. Among ecclesiastical writers, the word is also used for a person excommunicated.

ABSTERGENTS, or abstersive medicines, are medicines of a saponaceous nature, employed for removing inward obstructions, by dissolving concretions. They are also called *Detergents*.

ABSTERGE, { Ab: *stergo*, to wipe off, to
ABSTERG'NT, } cleanse by wiping or scouring.
ABSTERSE', { ing. The latter words are
ABSTER'SION, } not so analogical, and still
ABSTER'SIVE, { less in use than the preceding.

Abstersion is plainly a scouring off, or incision of the more viscous humours, and making the humours more fluid, and cutting between them and the part ; as is found in nitrous water, which scoureth linen cloth speedily from the foulness.

Bacon's Nat. Hist. No. 42.

The seats with purple clothe in order due ;
And let th' *abstensive* sponge the board renew ;
Let some refresh the vase's sullied mould,
Some bid the goblets boast their native gold.

Pope's Homer's Odyssey, b. xx.

ABSTINENCE, from *abs*, from, and *tene*, to hold, signifies the act or the habit of refraining from something to which there is a strong propensity. Pythagoras earnestly enforced upon his followers the necessity of abstaining from all animal food, except the remains of sacrifices, and to drink nothing but water, except in the evening, when they might take a little wine ; and the ancient *Athletæ* abstained from all kinds of sensu-

pleasure, to render themselves more hardy in the public games. The Jews were also commanded to observe various kinds of abstinence by their laws. Many of the primitive Christians denied themselves the use of particular meats, as we learn from St. Paul's Epistle to the Romans, (chap. xiv.) And the council assembled at Jerusalem, which the Apostles superintended, enjoined the Christian converts to abstain from things strangled, and from blood. Not that the reception of these things was, in itself a moral evil, but because the Jews were so offended by it, that it was the source of perpetual discord between the Jewish and Gentile converts.

A ritual abstinence is however still retained in many communities, and is prescribed by rules and regulations of the Romish church. The church of England has also enforced abstinence from meats on certain days, and since the reformation, the practice has been enforced by statute. Injunctions of general abstinence were renewed under queen Elizabeth, not out of motives of religion, it was said, but to encourage the practice of fishing, and to increase the number of our mariners.

ABSTINENCE, in medicine, is used to signify a *suppression*. Thus in Cælius Aurelianus, *abstinentia sudoris*, signifies a suppression of sweat. Sometimes in this author it means a *compression* ; as *Spiritus ob abstinentiam clausus*, means the wind shut up in the intestines by compression, thereby causing the iliac passion.

ABSTINENCE in a more popular sense of the word, signifies a spare and parsimonious diet, which has been recommended medicinally, observed through superstition, or practised to impose on the credulity or benevolence of mankind. The Venetian Cornaro, after his life was despaired of, betook himself to a regular but abstinent life, revived his health, though almost in his grave at 40, and lived to the protracted period of nearly 100 years of age. The early Christians of the east, driven by persecution into the deserts of Arabia, lived on very spare food, in health and cheerfulness. St. Anthony is said to have taken only 12 ounces of bread and water in 24 hours, and on this slender subsistence, to have lived to the age of 105 years. In like manner, James the hermit, lived 104 years ; Arsenius, tutor of the emperor Arcadius, 120 ; St. Epiphanius, 115 ; Simeon the Styliste, 112 ; and Romauld, 120. By temperance and labour, one Laurence, mentioned by Buchanan, attained the age of 140 ; and Kentigern, commonly called St. Mungah or Mungo, mentioned by Spottiswood, lived to 185, by the same means. Longevity appears to have been frequently connected with remarkable cases of abstinence, a consideration which led Dr. Cheyne to affirm, that most of the chronic diseases prevalent in luxurious climates, the common infirmities of old age, and the short lives of Englishmen, are the common effects of repletion ; and might be prevented or cured by abstinence. Sudden and immediate abstinence is however, extremely detrimental to the constitution ; and many persons who have attempted it, have never afterwards enjoyed health.

Some animals seem to possess extraordinary powers of abstinence. The dormouse, tortoise,

bear, serpent, &c. pass four, five, or six months in the year without eating or drinking. Several species of birds, and almost the whole tribe of insects, live throughout the winter without food. Rattle-snakes after many months' abstinence, have retained their vigour and fierceness. Two cerasites, a sort of Egyptian serpent, mentioned by Dr. Shaw, lived five years in a bottle closely corked, without any thing in the bottle, except a small quantity of sand. When he saw them, they had just cast their skins, and appeared as brisk and lively as ever. Vipers again, seem to live occasionally on those well-known nutritious substances floating in the atmosphere, and which are continually taken in by animal respiration: their young kept from every thing but air, will grow considerably in a few days. The eggs of lizards are observed to increase in bulk after they are produced, and seem to be nourished in the air in the same way as the spawn of fishes is in the water.

Pliny says, a man may live seven days, and that many have been known to continue more than eleven days, without either meat or drink. *Hist. Nat.* lib. ii. c. 54. Alexander Benedictus, that a person at Venice lived without food for 46 days. *Pract. lib. xii. c. 2.*—Clausius et Garcia ab Horto, that some rigid Banians in India, frequently abstain from food for 20 days together;—and Guaguinus states, that Louis the Pious, emperor and king of France, who died 840, existed the last 40 days of his life without food or drink. *Hist. Francor. lib. v.*—Albertus Magnus saw a woman at Cologne, who often fasted 20, and sometimes 30 days; and a hypochondriacal man, who drank nothing but a draught of water every other day, for seven weeks. *De Animalibus, lib. vii.*—Democritus is said to have lived to the age of 109 years, and that in the latter part of his life he subsisted for 40 days at one time, by smelling honey and hot bread.—Petrus de Abano gives an account of a woman in Normandy, who lived without food for 18 years. *Exposit. Ult. prob. x.*—Joubertus, of a woman that lived in good health three years; and of another, who to her tenth year, subsisted without either food or drink: and when she was of proper age, married and had children, and lived like other people. *Decad. 1, paradox 2.*—Albertus Krantzius says, that a hermit in the mountains of the canton of Schwitz, lived 20 years without food. *Hist. Eccles. lib. xii. c. 21.*—Hildanus relates the case of a girl who lived many years without food or drink. The abdomen had wasted and retracted toward the spine, and she neither voided urine nor faeces. *Cent. 5, Obs. Chirurg. 33.*—Sylvius says, there was a young woman in Spain, 22 years of age, who never ate any food, but lived entirely on water. And that there was a girl in Narbonne, and another in Germany, who lived three years in good health without meat or drink. We shall now subjoin a few modern cases of abstinence, which have been given more at large.

Gilbert Jackson, of Carse-Grange, Scotland, about 15 years of age, was seized in February, 1716, with a violent fever, which returned in April for three weeks, and again on the 10th of June. He then lost his speech, his appetite, and

the use of his limbs, and took no food whatever. On June 30, he was seized with a fever again, and the next day recovered his speech, but without eating or drinking, or the use of his limbs. On the 11th of October, he recovered his health with the use of one of his legs, but neither eat nor drank, only sometimes washed his mouth with water. On the 18th of June, 1718, the fever returned and lasted till September. He then recovered, and continued in pretty good health, and fresh coloured, but took no kind of meat nor drink. On the 6th of June, 1719, he was again seized with a severe fever; and on the 10th, at night, his father prevailed on him to take a spoonful of milk, boiled with oatmeal; it stuck so long in his throat, that his friends feared he had been choked; but ever since that time he took food, though so little, that a halfpenny loaf lasted him eight days. All the time he fasted, he had no evacuation, and it was 14 days after he began to eat, before he had any. He still continued in pretty good health."

In the year 1724, John Ferguson, of Killmelford, in Argyleshire, overheated himself in the pursuit of some cattle on the mountains, then drank largely of cold water, and fell asleep. He slept for 24 hours, and awoke in a high fever, and ever since, his stomach loathed, and could retain no kind of aliment but water. Mr. Campbell, a neighbouring gentleman, to whom his father was tenant, locked him up for 20 days, supplying him only with water, and taking care that he should have no other food; but it made no difference either in his look or strength; at the age of 36, (when the account was sent to the Philosophical Society,) he was of a fresh complexion, and as strong as any common man." *Phil. Trans. 1742, vol. xlvi. page 240.*

PENNANT says of his second visit to Barmouth, in 1770, "My curiosity was excited to examine into the truth of a surprising relation of a woman in the parish of Cylynin, who had fasted a most supernatural length of time. I took boat and had a most pleasant passage up the harbour, charmed with the beauty of the shores intermixed with woods, verdant pastures, and corn fields. I landed, and after a short walk, found in a farm called Tydden Back, the object of my excursion, Mary Thomas. She was of the age of 47, of a good countenance, very pale, thin, but not so much emaciated as might be expected from the strangeness of the circumstances I am going to relate. Her eyes were weak, her voice low, and deprived of the use of her lower extremities, and quite bed-ridden; her pulse rather strong, her intellects clear and sensible. On examining her, she informed me that at the age of seven, she had some eruptions like the measles, which grew confluent and universal; and she became so sore that she could not bear the least touch: she received some ease by the application of a sheep's skin just taken from the animal. After this she was seized at the spring and fall, with swellings and inflammations, during which time she was confined to her bed; but in the intervals she could walk about. When she was about 27 years of age she was attacked with the same complaint, but in a more violent manner; and during two years and a half remained in-

sensible, and took no manner of nourishment, although her friends forced open her mouth with a spoon to get something down, but the moment the spoon was taken away, her teeth met and closed with snapping violence; during that time she flung up vast quantities of blood. She well remembers the return of her senses, and her knowledge of every body about her. She thought she had slept but a night, and asked her mother whether she had given her any thing the day before, as she found herself hungry. Meat was brought to her, but so far from being able to take any thing solid, she could scarcely swallow a spoonful of thin whey. From this, she continued seven years and a half without any food or liquid, excepting sufficient of the latter to moisten her lips. At the end of this period she fancied herself again hungry, and desired an egg, of which she got down the quantity of a nut kernel. She requested to receive the sacrament, which she did, by having a crumb of bread steeped in wine. She now eats a bit of bread about two penny weights seven grains daily, and drinks a glass of water, and sometimes a spoonful of wine; but frequently abstains whole days together from food and liquids. She sleeps very indifferently; the ordinary functions of nature are seldom performed, and are very small; her temper is even, her disposition mild; she is religious, and prays fervently; the natural effect of the state of her body unembarrassed by food, and a constant alienation of thought from all worldly affairs." *Journey to Snowden*, vol. ii. p. 105.

A very curious instance of nearly four years' abstinence from all food and drink, is related in two numbers of Hufeland's Practical Journal, Vols. viii. and ix. No 2. And a pamphlet has been since published respecting this fact by Dr. Schmidtmann of Melle, in the bishopric of Osnabruck.

"A country girl, 16 years old, in a village near Osnabruck, had enjoyed a good state of health, during her childhood; but, at about 10 years of age she was seized with epileptic fits against which a number of remedies were employed in vain; since that time she was mostly confined to her bed, particularly in winter, but in summer she found herself a little better. From February 1798, the alvine and urinary excretions began to cease; though she took now and then a little nourishment. But from the beginning of April the same year, she abstained entirely from all food and drink, falling into an uninterrupted slumber, almost senseless, from which she only awoke from time to time for a few hours. Her sensibility during this time was so great that the slightest touch on any part of her body brought on partial convulsive motions. In this state she had continued for nearly 10 months, when Dr. Schmidtmann saw her first, in 1799. Though she had not taken the least nourishment during all this time, Dr. S. found her to his great astonishment, fresh and blooming. For the last two months only the intervals of sleep began to be longer, her senses of sight and hearing were in perfect order; but her feelings, she seemed to have quite lost, as she could suffer pinching of the arms and legs without pain; her gums bled frequently, and the

pulse was scarcely perceptible in the arms, but beat strong and full in the carotids, about 120 in a minute. Dr. S. attempted to make her drink a little milk, but she protested she could not swallow it. The alvine and urinary excretions had quite ceased. Although there could hardly be a suspicion of imposition, the parents being honest people, yet to remove all doubt, six sworn men were appointed from different places in the neighbourhood to watch her day and night, and instructions given them accordingly. This being continued about a fortnight, the men were dismissed, having given evidence upon oath that the patient had never taken any food or drink whatever during that time, nor had any excretion, alvine or urinary; she had become very ill, and nearly dying, seized with convulsions, feverish, and sometimes in a great sweat, which had the extraordinary property of turning water black. When Dr. S. saw her again, he found her quite recovered, not in the least emaciated; but rather looking lustier; her gums however, still frequently bled, and her feeling was not yet returned; but her memory was not impaired, and she amused herself sometimes with reading and writing. No alvine or urinary excretions had taken place. Sometimes she was attacked with sudden weakness, particularly after having bled at the mouth. During the last severe winter she could not endure the heat of the stove, because she felt then faint and oppressed. Dr. Schmidtmann then enters into an enquiry by what means the patient in this case was nourished and maintained in that state in which she was found. And having discussed the matter at large, he is of opinion, that she drew by resorption such elementary particles from the atmosphere as were sufficient for the nutrition of the body, and that the excretions were likewise replaced by the skin."

Instances of the like kind might be multiplied from *Haller*, in his *Elementa Physiologiae*, tom. vi. sec. 2—6; *Conf. Memoires de l'Academie des Sciences de Toulouse*, tom. i. 1783. *Pritchett's Library devoted to Surgery*, (in German,) vol. xii. p. 184. *Sweeter Comments in Boerhaave, Aph.* tom. iii. p. 508; *Histoire de l'Academie Royale des Sciences*, l'an 1769; and in *Hufeland's Art of Prolonging Life*, 1 ed. p. 67; *Halpart Van der Wiel Observat, rar Centur Poster*. In the London Magazine for August 1769, there is an account of a young woman, 24 years of age, who had fasted for two years, and whose excretions were entirely suppressed. *London Medical and Physicat Journal*, vol. iv. p. 87.

In the Philosophical Transactions, we have an account of four colliers who were confined 24 days in a coal pit at Herst l, near Leige, with nothing to support them but water. A French officer of infantry, who had retired from service, and became deranged, took it into his head to refuse food, and persisted in that determination from the 25th of December, till the 9th of February, drinking only about a pint and a half of water daily; with a few drops of anised liquor in each glass, till 39th day, from which time till the 47th day he remained out of bed, but weakness at length obliged him to lie down. The return to food was followed by a temporary

cure of his insanity. *Hist. de l'Academie des Sciences*, 1769.

In the Medical Commentaries, December, vol. iv. p. 360, there is a history of a girl who lost her way, and remained 18 days on a barren moor in the island of Lewis, where she could have had no other sustenance than water. Mr. Miller saw her two hours after she was found, and describes her as much emaciated. We infer, from these instances, the possibility of maintaining life for a considerable time on small quantities of water and other liquids. The feeling of hunger, if not appeased by food, often ceases entirely; but the feeling of thirst becomes increasingly urgent, and where it is attended with bodily heat, becomes aggravated and insupportable.

ABSTINENTES, in ecclesiastical history, a party who appeared in France and Spain, in the third century, and who enjoined abstinence from the use of marriage, and particular foods, especially wine. Some consider them to have been a branch of the Gnostics.

ABSTRACT, *n. v. & adj.* } Abs: *traho, trac-tum*, to draw away from; to separate. Hence, by an easy transition, to refine, to purify. Also, to consider any thing in its essence, or simple being, independently of modes or accidents.

PAL. But man, the abstract

Of all perfection which the workmanship
Of Heaven hath modell'd, in himself contains
Passions of several qualitieſ.

Ford's Lover's Melancholy, act iv. sc. 3.

He whose understanding is prepossess with the doctrine of abstract general ideas, may be persuaded that extension in abstract is infinitely divisible.

Berkley's Principles of Human Knowledge.

Precepts of morality, besides the natural corruption of our tempers which makes us averse to them, are so abstracted from ideas of sense, that they seldom give an opportunity for those beautiful descriptions and images which are the spirit and life of poetry.

Addison.

To abstract the mind from all local emotions would be impossible if it were endeavoured; and would be foolish if it were possible. *Dr. Johnson*.

Abstract terms signify the mode or quality of a being, without any regard to the subject in which it is; as whiteness, roundness, length, breadth, wisdom, mortality, life, death. *Watts's Logic*.

He may be justly driven out from the commerce of mankind, who has so far abstracted himself from it as to neglect the endearments of his wife and the caresses of his children, to count the drops of rain, note the changes of the wind, and calculate the eclipses of the moons of Jupiter. *Rambler*.

ABSTRACT IDEA, in metaphysics, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside the rest.

ABSTRACT MATHEMATICS, otherwise called *Pure Mathematics*, treat of magnitude or quantity, absolutely and generally considered, without regard to any species of particular magnitude, such are arithmetic and geometry.

ABSTRACT NUMBERS, are assemblages of units,

considered in themselves, without denoting any particular and determined articles. Thus six is an abstract number, when not applied to any thing; but if we say six feet, six becomes a concrete number. See NUMBER. and ARITHMETIC.

ABSTRACTI, a name given to a sect among the Lutherans.

ABSTRACTITIOUS, in pharmacy, a term used to distinguish that spirit which is drawn from plants, naturally abounding with it. *Bailey*.

ABSTRUSE', } Abs: *trudo, trudun*, to thrust or push away.

To cast away from the sight.—*Cicero*. Hence, not obvious, plain, nor evident.

Let the Scriptures be hard: Are they more harsh, are they more hard, more crabbed, more abstruse than the fathers? *Milton on the Reformation in England*.

Yet it must be still confessed that there are some mysteries in religion both natural and revealed, as well as some abstruse points in philosophy, wherein the wise as well as the unwise must be content with obscure ideas. *Watts's Logic*.

ABSURD', *adj.* } Ab: *surdus*. Supposed to

ABSURDITY, } be formed from ab and sur-

ABSURDLY, } dus, a deaf person, who

ABSURDNESS. } from not hearing, frequently replies altogether unsuitably to the question proposed. Foolish, nonsensical, not to the purpose.

There was never proud man thought so absurdly well of himself, as the lover doth of the person loved: and therefore it was well said, That it is impossible to love, and to be wise. *Lord Bacon's Essays*.

The capital things of nature generally lie out of the beaten paths, so that even the absurdness of a thing sometimes proves useful. *Idem*.

But grant, that those can conquer, these can cheat;

"Tis phrase absurd to call a villain great;

Who wickedly is wise, or madly brave,

Is but the more a fool, the more a knave.

Pope's Essay on Man.

How clear soever this idea of the infinity of number be, there is nothing more evident, than the absurdity of the actual idea of an infinite number.

Locke.

That satisfaction we receive from the opinion of some pre-eminence in ourselves, when we see the absurdities of another, or when we reflect on any past absurdities of our own. *Addison*.

But man, we find the only creature;

Who, led by folly, combats nature;

Who, when she loudly cries, Forbear,

With obstinacy fixes there;

And where his genius least inclines,

Absurdly bends his whole designs.

Swift's Miscel.

We may proceed yet further with the atheist; and convince him, that not only his principle is absurd, but his consequences also as absurdly deduced from it. *Bentley's Sermons*.

Truth indeed needs no ornament, neither does a beautiful person; but to clothe it therefore in rags when a decent habit was at hand, would be esteemed preposterous and absurd. *Couper's Letters*.

ABSUS, the Egyptian LOTUS.

ABSYNTIUM, or ABSINTHUM. See ARTEMESIA.

ABSYRTES, or ABSYRTUS, in ancient mythology, the infant son of Aeetes, king of Colchis, and Hypsea, who was torn to pieces by his sister

Media, and his limbs scattered on the road, in order to stop her father's pursuit of her, when she eloped with Jason, and assisted him in carrying off the golden fleece.

ABSYRTIDES, or **ABSORUS**, in ancient geography, islands in the gulf of Carnero, in the Adriatic, separated by a narrow channel, and joined by a bridge; so called from Absyrtus, who was said to have been murdered there by his sister. They are now called *Cherso* and *Osero*.

ABUARISCK, a town and principality of Arabia, on the Red Sea, extending from 15° , $2'$. to 17° , $40'$. N. Lat.; yielding little more than salt from its arid hills, although watered by several streams. The principal sea port is Gesar.

ABUBEKER, the immediate successor of Mahomet, succeeded him A.D. 632, taking the title of caliph, vicar or successor, to show his inferiority, it is said, to the prophet, a title which all his successors have since adopted.

ABUKESKO, or **ASTANI** in commerce, Turkish names given to the Dutch dollar.

ABULFARAGIUS, (Gregory,) the son of Aaron, a physician and prelate of Armenia, born at Malatia, in 1226. He was elected primate of the Jacobites in 1266, an office which he held for 20 years. He wrote, an *Epitome of Universal History*, which was published, with a Latin translation by Dr. Pocock, in 1663.

ABULFAZEL, Vizier and historiographer to Akber, the great mogul, and author of *Ayeen Akberry*. Few particulars are known of his life, but he bears a high character for learning and elegance as a writer; he was assassinated in 1664, on his return from a mission to the Deccan.

ABULGHAZI, (Bayatur,) khan of Tartary descended from Jenghiz Khan, was born in 1605 at Urgens. He endured a long series of misfortunes before his accession to the throne of Kharazm in 1645, in which he continued twenty years, having by his courage rendered himself formidable to all his enemies. In 1665, he resigned his sceptre in favour of his son, and undertook a genealogical history of the Turks, which was completed by his successor, and is considered the most authentic history extant of the Turks and Tartars. It was procured by Court Strahlenberg when a captive in Siberia, and has been very generally translated into the European languages.

ABUNDANTIA, or **COPIA**, a heathen goddess generally crowned with garlands of flowers, and pouring all sorts of fruit out of a horn which she holds in her right hand. On a medal of Trajan, she is represented with two cornucopiae.

ABUNDANT Notion, in logic, that which includes more marks and characteristics, than are absolutely necessary for distinction.

ABUNDANT NUMBER, in arithmetic, a number, the sum of whose aliquot parts is greater than the number itself. Thus the aliquot parts of 12, being 1, 2, 3, 4, and 6, they make, when added together, 16. It is opposed to *deficient number*.

ABUS, in ancient geography, a name for the confluence of the Ure, the Derwent, the Trent, &c. forming the mouth of the Humber.

ABUSIR, or **BUSIR**, a town of Egypt, the ancient Busiris on the right bank of the Nile,

40 miles S. of Damietta; also, two fortified towns near the sea, 120 miles W. of Alexandria, and forming the first point of Egypt, seen from the West.

ABU-TEMAN, called the Prince of Arabian poets, flourished from A.D. 805 to 845. 'No one could ever die,' it was said, 'whose name had been praised in his verses.' Sir Wm. Jones speaks of a compilation of poems by Abu-teman, with great commendation; and professor Carlyle selects some of his most elegant specimens of Arabian poetry from this author.

ABUSE, *v. & n.*

ABU'SER,

ABU'SIVE,

ABU'SIVELY,

ABU'SIVENESS,

ABU'SAGE,

ABU'SFUL,

ABU'SION,

I see how thine *abuse* hath wrested so thy wittes,
That all it yeldes to thy desire, and follows thee
by fittes.

Surrey.

Was it not enough for him, to have deceived me; and, through the deceit, abused me; and, after the *abuse*, forsaken me: but, that he must now, of all the company, lay want of beauty to my charge.

Sidney, b. ii.

Ros. No: I will not cast away my physick but on those that are sick. There is a young man haunts the forests, that *abuses* our young plants with carving Rosalind on their barks; hangs odes upon hawthorns, and elegies on brambles; all forsooth deifying the name of Rosalind. If I could meet that fancy-monster, I would give him some good counsel, for he seems to have the quotidian of love upon him.

Shakspeare's As You like it.

Happy are those persons who use the world and *abuse* it not, who possess a part of it, and love it for no other ends but for necessities of nature, and conveniences of persons, and discharge of all their duty and the offices of religion, and charity to Christ, and all Christ's members.

Jeremy Taylor.

They that use this world, as not abusing it; for the fashion of this world passeth away.

1 Cor. vii. 31.

He has fixed and determined the time for our repentance, beyond which he will no longer await the perverseness of men, no longer suffer his compassion to be abused.

Rogers's Sermons.

The world hath been much *abused* by the opinion of making; the work itself I judge to be possible; but the means, hitherto propounded, are in practise full of error.

Brown's Natural History, No. 126.

Nor be with all these tempting words *abused*;

These tempting words were all to Sappho us'd.

Pope.

ABUT', *Abuttan*, from *Boda*. The

ABUT'MENT, *first outward extremity of any*

ABUT'I'AI, *thing; to border on the surface or edge of, to touch the boundary of any thing in juxtaposition.*

Two mighty monarchies,

*Whose high, upreared, and *abutting* fronts*

The narrow perilous ocean parts asunder.

Shakspeare's Henry V

The Loes are two several corporations, distinguished by the addition of east and west, *abutting* upon a navigable creek, and joined by a fair bridge of many arches.

Carew.

ABUTILON, in botany, a genus of mallows called by Linnaeus *Sida*, which see.

ABYDOS, in ancient geography, a town built by the Milesians in Asia, on the narrowest part of the Hellespont, opposite to Sestos on the European side. Here Xerxes constructed his

famous bridge, and Ovid makes it the scene of the loves of Leander and Hero. The inhabitants are called by some writers a soft and effeminate people, much given to detraction; hence the proverb, 'Ne temere Abydum.' We need hardly remind our readers of the celebrity given to this place by the admirable poem of Lord Byron.

ABYDOS, in ancient geography, a town of Egypt, between Ptolemais and Diospolis Parva, towards Cyrene; famous for the palace of Memnon and the temple of Osiris; into which singers and dancers were forbid to enter. This city, reduced to a village under the empire of Augustus, now presents to our view only an heap of ruins without inhabitants; but to the west of these ruins is still found the celebrated tomb of Osymandæs. The entrance is under a portico 60 feet high, and supported by two rows of massy columns, loaded with hieroglyphics. Beyond it, is a temple 300 feet long and 155 wide. Upon entering the monument we meet with an immense hall, the roof of which is supported by 28 columns, 60 feet high, and 19 in circumference at the base. They are 12 feet distant from each other. The enormous stones that form the ceiling, perfectly joined, and incrusted, as it were, one in the other, offer to the eye nothing but one solid platform of marble, 126 feet long, and 26 wide. Monsieur Chevalier, formerly governor of Chandernagore, who resided 20 years in that country, carefully visited this monument on his return from Bengal. He remarked here the gods *Jaggrenat*, *Gonez*, and *Vechou* or *Wistrou*, such as they are represented in the temples of Indostan.—A great gate opens at the bottom of the first hall, which leads to an apartment, 46 feet long by 22 wide. Six square pillars support the roof of it; and at the angles are the doors of four other chambers, but so choaked up with rubbish that they cannot now be entered. The last hall, 64 feet long by 24 wide, has stairs by which one descends into the subterraneous apartments of this grand edifice. The Arabs, in searching after treasure, have piled up heaps of earth and rubbish. The walls, the roof, and the columns of this edifice, have suffered so little from the injuries of time, that did not the hieroglyphics mark its antiquity, it would appear to have been newly built. To the left of this great building we meet with another much smaller, at the bottom of which is a sort of altar, probably the sanctuary of the temple.

ABYLA. See **ABILA**.

ABYO, or **ABUYO**, one of the Philippine islands in the E. Indies, E. of Layla. Lon. 124°, 15°. E. Lat. 10°, 6°. N.

ABYSM', n. { *a. βυσσος*, without bottom. Bot. Abyss'. } tomless. Hence the essential character of an abyss is unfathomable depth, profundity.

And brutish ignorance, ycrest of late
Out of drad darkness of the deep abyss.

Sp. Tears of Muses, 188.

O! the unfathomable abyss of eternity! how are
our imaginations lost in the conceptions of it!

Stillingfleet's Sermons.

Nor second he that rode sublime
Upon the seraph wings of ecstacy,
The secrets of the abyss to spy.

Gray's Progress of Poetry.

ABYSS, in the Septuagint, denotes the water which God created at the beginning along with the earth, which encompassed it round, and which our translators render by *deep*, Gen. i. 2. Abyss is also used for an immense cavern in the earth, wherein God is supposed to have collected all those waters on the third day, which in our version, is rendered the *seas*, and elsewhere the *great deep*. Dr. Woodward and others, suppose that there is a mighty collection of waters in the bowels of the earth, communicating with those of the ocean, by means of certain hiatuses or chasms, passing between them and the bottom of the sea; but so, that the ordinary surface of the abyss, is never level with that of the ocean. The existence of such abyss or receptacle of subterraneous waters, is controverted by Cameraius; but the arguments on each side of this controversy may be seen collected and amplified, in *Cockburn's Inquiry into the Truth and Certainty of the Mosaic Deluge*, p. 271, &c. Vid. also, *Whitehurst's Inquiry into the Original Formation of the Strata*, &c.; also *Journal des Scavans*, lviii. *Mem. of Literature*, viii. and *Jamieson's Mineralogy*, v. iii.

ABYSS, in antiquity, the temple of Proserpine; so called on account of the immense fund of gold and riches deposited there, and as some say, hidden under ground.

ABYSS, in heraldry, denotes the centre of an escutcheon; in which sense, a thing is said to be borne in abyss, (*en abyme*), when placed in the middle of the shield, clear from any other bearing: He bears azure, a fleur-de-lis, in abyss.

A B Y S S I N I A.

ABYSSINIA, **ABASSIA**, **HABESH**, or **UPPER ETHIOPIA**, an extensive kingdom of Africa, lying between the 7th and 16th degrees of N. lat. and 30° and 40° E. long. It is bounded on the east by the Red Sea, on the north by Senaar, on the west and south by Senaar and Kordofan, together with some vast barbarous regions, the names of which are scarcely known to Europeans. Mr. Pinkerton computes the superficial area at 770 miles in length, by 550, its medial breadth, in which perhaps he has not erred

Vol. I.

egregiously; although from the indefinite nature and shifting demarcation of its boundaries, the true dimensions of this country are difficult to ascertain.

The ancients knew nothing accurately of this extensive region, and therefore included it, together with the adjacent territories, under the comprehensive name of Ethiopia; a term which they applied indiscriminately to all nations of a black complexion, and even to Arabia, Persia, Chaldea, and Assyria. Ethiopia Proper, called

E

A B Y S S I N I A.

by the Jews, Cush and Ludim, was bounded on the N. by Egypt, extending to the Lesser cataract of the Nile, and the Elephantine island; on the W. by Libya Interior; on the E. by the Red Sea, and on the S. by unknown parts of Africa. The Africans were divided into the eastern and the western Ethiopians, the latter of whom were also called Hesperians.

The Ethiopian kingdoms, of which the ancients had any knowledge, were two, the first Meroe, situated on a peninsula, which they erroneously supposed to be an island, formed by the union of the Nile with the Astaboras and the Astapus, (Blue River and Tacazze.) Its metropolis of the same name stood upon the Nile, in lat. $16^{\circ} 26'$. Mr. Bruce in passing through Senaar, saw near Chendi immense ruins, which probably belonged to this celebrated capital of Ethiopia. The second kingdom, unknown until the Greeks under Alexander had extended their navigation along the eastern coast of Africa, was that of the Axumite, situated upon the Red Sea, and occupying part of the Abyssinian province of Tigre. Its capital Axum, in a state of decay, remains to exhibit the ruins of its former greatness. It was from the port Adulis, in this territory, that the ancients derived the finest ivory.

When Mr. Salt was last in Abyssinia, it was divided into three distinct and independent states.

TIGRE the most powerful was under the dominion of Ras Welud Selasse, who claimed the monopoly of all the muskets imported, and likewise of the salt. This division of Abyssinia comprehends about four degrees of lat. and the same of long. bounded by a strong sea-coast, and inhabited by a warlike people.

1. *Tigre*, the first sub-division of this region, bounded by the territories of the Baharnegash, the river March and the Tacazze is a wealthy province, measuring 200 miles from N. to S. and 120 from E. to W. It consists of a range of hills intersected by deep valleys and cultivated plains.

2. *Agamè*, E. of Tigre, consists of a rich and fertile level, at considerable altitude, enjoying a favourable climate. It is remarkable for the salt plain in its vicinity, also for the strength of its eastern frontier, near the Taltal.

3. *Enderta*, a mountainous province S. of Agamè, is celebrated for its capital, Antalo, in which the Ras resides for the sake of protecting the southern provinces from the Galla.

4. *Wojjerat*, S. of the preceding, is a wild district full of forests, in which the lion, elephant, and rhinoceros are frequent.

5. *Wofila*, contiguous to Wojjerat, is a small low division, bordering on the lake Ashangee, where the Galla profess Christianity, and mingle with the native Abyssinians.

6. *Lasta* is a rugged and mountainous district, the heights of which are almost inaccessible. To the north are two mountainous districts, between which and the Tacazze, are two low ones, inhabited by *Christian Agows*.

7. Still farther to the north lies *Avergale*, a narrow region stretching for about fifty miles N. and S. along the Tacazze, and inhabited like the preceding by the Agows.

8. *Samen*, E. of the Tacazze, is the highest

land in Abyssinia, running N. and S. about 80 miles, with a medial breadth of about 30.

9. *Shire* is the most picturesque part of Abyssinia, abounding with fine landscapes, flowery meadows, and shady groves. It lies to the west of Axum, and connects itself with the contiguous regions of

10. *Zemben*, a valuable district between Samen and Tigre Proper.

11. The eleventh and last division of Tigre is called the kingdom of *Baharnogash*.

AMHARA, the second independent state, is, according to Bruce, a mountainous region, 120 miles long, and 40 broad, containing the rock Geshen, once the residence of the royal family. This province is now almost entirely in possession of the Galla, whose chief Guxo is the enemy of Ras Welud Selasse, and enjoys an absolute power on the W. side of the Tacazze, and is strengthened in a considerable degree by his connexion with the southern Galla: the cavalry of this prince has been estimated at 20,000, and is derived chiefly from the district of Begender; Gondar is under his jurisdiction. The men in this part of the country were reputed formerly the handsomest in Abyssinia.

The third division of this country, now entirely separated from the before mentioned by the Galla, consists of the united provinces of *Shoa* and *Efat*, and is supposed to contain a larger portion of Ethiopian literature and manners, than any other part of Abyssinia.

Efat, a fine district between the ninth and eleventh degrees of lat., consists principally of high land, running N. and S., and declining on each side to an extensive plain. Numerous rivers flow on both sides from the lofty regions, and fall into the Nile and Hawash, of which latter, two branches, sweeping round to a considerable extent, nearly encircle the province. The present ruler residing at Ankobar the capital, is the grandson of Yasous, whom Bruce mentions (as Doftor Esther told Mr. Salt incorrectly,) as having visited Gondar while he was there. The chief dependence of this province is upon its cavalry, who are both skilful and courageous.

Shoa lies on a lower level than Efat, and is extremely rich in pastureage. Its vallies are deep and beautiful, well watered by streams and rivers. The districts of Walaka and Gondar, dependent on these united provinces, are of no inconsiderable importance.

Walaka, between the rivers Geshen and Samba, is memorable as the province where the only surviving prince of the family of Solomon was preserved after the massacre by Judith, in consideration of which, great privileges were conferred upon the inhabitants. It is also memorable for the monastery of Demba Libanos, where the saint Tecla Haimanout was bred, the famous founder of the power of the clergy.

The Macrobi of the ancients, according to Bruce, the present Kuara, S. of Dembea, is remarkable for a colony of Pagan blacks in its lower region, derived from the black slaves, who accompanied the Arabs after the invasion of Mahomet. One of the great officers of state has kettle drums of silver, which he alone

has the privilege of beating through the streets of Gondar.

The general appearance of Abyssinia is wild and magnificent, overspread with forests, morasses, deep valleys, and beautiful rivers. Travelling is exceedingly difficult, but delightful from the charms of romantic variety, ever opening upon the eye. The mountains are remarkable for their elevation, and in the opinion of some, exceed the Alps and Pyrenees. Some of them appear like obelisks and pyramids, while others are flat and square, grouped with the utmost irregularity, and exhibiting an almost infinite diversity of forms.

The mountains of Abyssinia generally are arranged in three ridges, of which the middle is the loftiest, and at the same time the most rugged and barren. E. of the kingdom are the heights of Taranta, which Bruce represents as so bare, that he found no possibility of pitching a tent there. On the lower part of the mountain he found the tree called kôlquail in a state of high perfection, on the middle olives, which had no fruit, and on the upper part, the Oxycedras or Virginia cedar, called Arze by the natives. On the top is a small village named Halai, inhabited by poor shepherds, who keep the flocks of the rich people in the town of Dixan below. They are of dark complexion, and have black hair, curled artificially; they wear a girdle of coarse cotton cloth, swathed six times round their middle, and carry with them two lances and a shield made of bulls' hides; besides these weapons they commonly carry in their girdles a crooked knife with a blade about 16 inches in length, and near the lower part three in breadth. Here are also abundance of cattle; milk-white cows with wide horns, fine hair like silk, with dewlaps down to the knees; and black sheep with soft hair instead of wool. On the top of the mountain is a plain, which, at the period mentioned by our traveller, was sown with wheat. The air seemed excessively cold, although the thermometer was not below 59° in the evening, and on the western declivity, the cedars had degenerated into shrubs and bushes.

Towards the centre of the kingdom, on the north west part of the mountains of Samen, is the celebrated Lamalmon, which Bruce tells us, he ascended by a winding path, not quite two feet broad, on the brink of a dreadful precipice, and frequently intersected by the beds of torrents which lay in vast irregular chasms of the mountains; the summit from below had the appearance of being sharp pointed, but was in reality, a large plain full of springs, and containing the sources of almost all the rivers in this part of the empire. These springs boil out of the earth, sending forth such quantities of water as would be sufficient to turn a mill. A perpetual verdure prevails upon the mountains; and Bruce thought that, with moderate industry, three harvests might be reaped annually. The Gauza lies in the south of the kingdom; beside which, the mountains of Adowa in Tigré, Amda Gideon, or Jews' Rock, in Samen, and the triple ridge of Afon-nasha, Litchambard, and Amid Amid, supposed by the traveller already named, to be the Mountains of the Moon, are the most celebrated.

From all the Abyssinian mountains gold is washed down by the torrents in the rainy seasons.

Of the mineralogy of Abyssinia little is known, although from its mountainous character, but one opinion upon the subject has hitherto been formed. Near Weach are low hills of granite rocks, resting on beds of micaceous earth. In Tigré the soil is sandy, and the rocks composed of slate, schistus and granite lie in perpendicular strata, although in Geralta and Enderta, the strata are horizontal. But the great salt plain, fifty miles west of Amphila, on the road to Massowa, forms one of the most wonderful phenomena in Abyssinia. It is crossed in sandals made from the leaves of a species of the palm, and is four days' journey from N.W. to S.E. The plain is perfectly flat, and for the first half-mile the salt is soft; at a greater distance it becomes hard and crystallized, like ice on which snow has fallen after it has been partially thawed; branches of pure salt occasionally rising above the surface. For about two feet immediately under the earth it is hard and pure; at a greater depth it becomes coarse and soft, till exposed to the air. It is cut with an adze into pieces of the shape of a whetstone, and passed among the natives as money. The Galla frequently attack the workmen employed in cutting the salt from the plain; and Balgudda, a protector of the salt caravans, derives his emolument from the duty imposed on its exportation. A camel, the usual load of which is 200 pieces, pays 11; a mule, carrying 80, pays nine; an ass, pays six; but when it is brought away by men, no duty is paid.

The principal river of Abyssinia is the Bahr-el-Azrek, or Blue River. It originates in two springs, arising from a small hillock, in a marsh of Sacala, near Geesh, and flows into the lake Dembea; emerging from which, it sweeps its semicircular course round the provinces of Damot and Gojam; after which, taking a north-easterly direction through Senaar, as far as Wed Hogela, in the 16th degree of latitude, it unites with the Bahr-el-Abiad, or principal branch of the Nile, originating in the mountains of the Moon. The Tacazzé rises W. of Antalo, from three small springs in the plains of Magilla, and joined by the river Arequa, runs through Senaar to the Nile, carrying with it nearly one-third of the water which falls in the whole empire. This river is extremely pleasant, being shaded with fine lofty trees, and the water remarkably clear. At the ford, where Bruce crossed, this river was 200 yards over, running very swiftly over a bottom of pebbles. At the very edge of the water the banks were covered with tamarinds, beautifully supported by a background of tall and stately trees, that never lose the charms of their foliage. It is however, infested with crocodiles and hippopotami, and the neighbouring woods are full of lions and hyenas. Two rivers of Abyssinia, the Hanazo and the Hawash, flow towards the entrance of the Red Sea, and the Jemma. The Maleg, a large and important stream, after a parallel course on the W. joins the Abyssinian Nile. The Mareb forms the boundary between Tigré, and the king-

dom of the Baharnagosh. The principal lakes are the Dembea, commonly called Tzana, having in the midst of it an island of the same name. That of Lawasa in the southern region, together with Ashangee and Haik, near the rocks of Geshen and Ambazel.

The climate is cold, and for six months of the year, viz. from April to September inclusive, constantly rainy. During the other six months, the sun being vertical, and the sky cloudless, the heat is excessive through the day; but, still the nights are so cold, owing to the length of the rainy season, and the perpetual equality of the days and nights, that the ground feels disagreeable to the soles of the feet. The mountainous nature of the province generally, nevertheless exposes different situations to the various effects of heat and cold, dryness and humidity, and of a free circulation and stagnation of the atmosphere; those of the natives who live upon the hills, are healthy and sprightly, whilst those who live in the valleys, marshes, or sandy deserts, experience an excessive heat, with a humid suffocating atmosphere. To avoid the inconvenience occasioned by the overflowing of the rivers, during the rainy season, the inhabitants have built many of their towns and villages upon mountains; they are, however, generally mean and slight, consisting of only one story. On Lamalmon, one of the highest of these hills, Mr. Bruce observed the thermometer stood at 32° in the depth of winter; the wind N.W. clear and cold. A light hoar frost fell with the wind, which vanished a quarter of an hour after sunrise, but there appeared no sign of congelation; but upon Amid Amid, he remarked that hail lay for three hours in the forenoon. One of the natives describing a fall of snow, for which no term had been previously invented, uses the following language: "This village (Zinzenam) has its name from an extraordinary circumstance that once happened in these parts; a shower of rain fell, which was not properly of the nature of rain, as it did not run upon the ground, but remained very light, having scarce the weight of feathers, of a beautiful white colour like flour; it fell in showers, and darkened the air more than rain, and liker to mist. It covered the face of the whole country for several days, retaining its whiteness the whole time, then went away like dew, without leaving any smell or unwholesome effect behind it." Mr. Salt, nevertheless in his visit to Abyssinia, found snow upon the mountains of Samen; and Mr. Pearce, in his passage over them, experienced a heavy fall. The thermometer in March, April, and May, averaged, according to the former gentleman, 70° at Chelient, 65° at Antalo, 95° on the banks of the Tacazzé, and upon the mountains of Samen, was below the freezing point.

The inhabitants of Abyssinia are especially subject to fevers of different kinds, which are commonly fatal on the third day; after which period, those who survive, commonly recover. The tertian fever is particularly common. Fevers in Abyssinia not unfrequently terminate in intermittents; and if long continued, in dysenteries, which are often mortal. That species of dysentery beginning with a constant diarrhoea

if it commence with the rainy season, is seldom cured. Bark, ipecacuanha, water, and fruit not over ripe, are sometimes administered with success; ipecacuanha in particular, provided the season be favourable, either removes it, or changes it to an intermitting fever, which yields to the bark. Another endemic disease is the '*hanzeer*', (the hogs or swine) a swelling of the glands of the throat, and the parts under the arms; which by unsuccessful attempts to produce suppuration, and opening the tumours, becomes a running sore resembling the evil. Swellings of the whole body, especially the arms, thighs, and legs, accompanied by ulcers in the nose and mouth, are common in this country. These diseases sometimes yield to mercurials, and the last is speedily cured by antimonials. *Farenteit*, or the worm of Pharaoh, commonly attacks those who are in the habit of drinking stagnant water. It appears in all parts of the body, and is a worm with a small black head, and a white hooked beak, and a white body of a silky texture, resembling a small tendon. The natives seize it by the head, and wind it gently round a piece of silk, or on a bird's feather, and then extract it without much inconvenience. But the most terrible of all diseases, is the *elephantiasis*; for which, no cure has ever been discovered. See ELEPHANTIASIS. To the alternations of scorching heat and chilling cold, thin clothing, the use of stagnant putrid water, for four months in the year, &c. the endemic diseases of Abyssinia are attributed.

The variety of elevation in different parts of the country, occasions a proportionate variety of soil and productions. Corn is produced in great abundance. Teff is their chief article for bread; and where the grounds are unfit for the production of this, the tocosso plant is raised, yielding a black bread for the lowest classes. Although wine is not made in more than one or two places, there is every where the greatest profusion of fruits. Sena, cardamom, ginger, and cotton, are produced in great quantities. A species of rose grows upon large trees, and is in fragrance much superior to those which grow on bushes. The Balessan balm, or balsam plant, which produces the balm of Gilead mentioned in scripture, is found among the myrrh trees, on the coast of the Red Sea, all the way to Babelmandel. Sassa, myrrh, and opocalpasum are common in the same region. The ensete is an herbaceous plant, in Narea, which thrives chiefly in swampy places, and forms a considerable part of the vegetable food of the natives. The kolquall is a tree of which the lower part alone is woody, the upper being herbaceous and succulent; it makes a beautiful appearance, bearing a fine golden coloured flower, which ripens to a deep crimson fruit. The geshe-el-anbe is a kind of grass, about Ras-el-Feel, which grows to the height of nearly three feet and a half. The gaguedi tree, running to the height of about nine feet, is a native of Lamalmon, and produces beautiful yellow flowers, which like the helianthus, are turned towards the sun. The wansey tree, common throughout the whole of Abyssinia, flowers the first day on which the rains cease; it grows to the height of 18 or 20 feet, and is highly

esteemed by the Abyssinians, and by the Galla even worshipped. Kuara, a beautiful tree growing in the southern and western parts of Abyssinia; producing a fruit resembling a red bean, which in the early ages was used as a weight for gold. From this circumstance, Mr. Bruce imagines the imaginary weight carat, is derived. The wooginoos, or brucea antidisenterica, common in valleys throughout the whole country, is an antidote to the dysentery. Cusso, or banksia anthelmintica, is a beautiful tree, so called from its being a strong anthelmintic. Nook, or nuk, resembling our marigold, produces abundance of oil. The lehem, or toberne montana, a tree common near the lake of Dembea, is remarkable for its beauty and fragrance; it grows to a considerable size, the extremities of its branches trailing on the ground, covered with flowers from top to bottom, each cluster containing between 85 and 90; open or shut the fruit is taken, but has rather a harsh taste. The anguah, found near the Tacazzé, produces a gum resembling frankincense. The leaves of the geesh, are put by the natives into their maize, and sometimes reduced to powder, and mixed with other materials, of which they make sowa. The mergombe, a species of solanum, is used as a cathartic; and, from the niche, or niege, a species of the sesanum, they extract vegetable oil. A species of narrow ficus, near Shela, called by the natives chekunit, of which the inner bark is converted into matches for fire arms. Near Adowa, Mr. Salt found a new and beautiful species of amaryllis, bearing 10 or 12 spikes of bloom on each stem, emerging from one receptacle, as large as those of the belladonna. It is sweet scented, like the lily of the valley, and has a white corolla, each petal being marked down the middle with a slight streak of bright purple. The bulbs are frequently two feet under ground.

Numerous plants and trees of Abyssinia, are however, yet undescribed; although Mr. Salt in his two recent journeys added eight genera, and 128 species, to our vocabulary. The process of fructification is, in many instances, very singular. Although the same part of the tree flowers only once in 12 months, the blossoms appear and the fruit ripens, first, on the western boughs, next on the southern, then on the northern, and finally, on the eastern; which continues to produce blossoms and fruit, till the commencement of the rainy season. The leaves of the trees being generally of a rough texture, and varnished, are admirably adapted to resist the rains.

The quadrupeds of Abyssinia are among the most remarkable in the world; and have, accordingly, attracted the attention of travellers. Many of the cow species have no horns, but are distinguished by bosses on their backs; others, have horns of a prodigious size, as the galla, or sanga, whose horns are capable of holding ten quarts each. The horns of one of these animals are in the Museum of the College of Surgeons, in London. They are however, by no means common, being brought only by the Cafilas, or salt caravans, as valuable presents from the south. The sheep are small and black; the horses strong and beautiful; goats, mules, asses, and camels, are common. Of dogs there are two

species, one of which lives in packs in the villages, like the paria dog in India; the other, is kept for game, especially guinea fowl, in taking which it is very expert. Cats are found in every house, and rats are numerous in the fields.

Of wild animals, Abyssinia furnishes vast numbers. There is a great variety of antelopes, one of which is supposed to be allied to the chamois. Several species of the monkey, wild-boar, porcupine, cavy, (nearly allied to that of the Cape) hares, and squirrels, are plentiful, but are thought unclean; also, an undescribed species of lemur, the size of a cat, with a long tail, faintly striped with black and white, and white bushy hair at the end; and clear white hair all over the body, except on the back, where there is a large oval spot covered with short deep black hair, of which every man in Tigré is proud to have a piece on his shield. Elephants are hunted by the Shangalla for their teeth. The cawe leopard is rare and very shy, being only found in the interior districts. The two-horned rhinoceros is also rare, being found only in the forests of Wojjerat, and the low country, near the Funje. Of its horns, the foremost is two feet long, having no connexion with the bone of the head. The opinion of Saarrman is not improbable, namely, that the animal can raise or depress them at pleasure. The skin of this rhinoceros has no folds in it, as that of the one-horned species has, but is of sufficient strength to be made into shields; as is also that of the buffalo. Zebras are common in the southern regions, and their manes are used to decorate the collars of the horses belonging to the most distinguished chiefs on days of state. Wild asses and lions, are found in the sandy districts, near the Tacazzé, and the skin of the latter richly ornamented, forms a dress like that worn by the Caffre chiefs. Whoever kills one of these animals, wears the paw on his shield. Of the leopard there are several species, one of which is black, and extremely rare, whose skin is worn only by governors of provinces. The lion-cat, tiger-cat, or grey lynx, and wild cat, are not uncommon. Civet is procured from the Civet, and is an article of commerce. Wolves, foxes, sea foxes, and jackals, are numerous in every part of the country. But of all the quadrupeds of Abyssinia, none exceed the merciless hyena. "They were a plague" says Mr. Bruce, "in every situation, both in the city and in the field, and surpassed the sheep in number. Gondar was full of them, from the time it turned dark, till dawn of day; seeking the different pieces of slaughtered carcasses, which this cruel and unclean people expose in the streets without burial." The hyena, Mr. Salt remarks, has a singular cry, consisting of three distinct deep-toned cries, then silence for a few minutes, succeeded by the same kind of noise. The hippopotami are chiefly found in the deep pits, like lochs between the fords of the Tacazzé; where they roll and snort like a porpus, but are not able to remain longer than five or six minutes at a time under water. Their colour is a dusky brown, like the elephant, and their usual length 15 feet. Whips, to brush away the flies in hot weather, are made of their skins, the butt-ends of which,

are adorned with hair from the tail of the camel-leopard.

The birds of Abyssinia exhibit every variety of appearance and plumage. Many species of the eagle, vulture and hawk, are found, especially after the tropical rains. These carnivorous birds feed at first upon the fish washed from the salt-springs, where they had been nourished by the force of the inundation, and left after the subsiding of the waters: when these fail, they turn their attention to the bodies of elephants and other beasts, slain by the hunters in the lowlands; rats and field-mice become their next prey, to which may be added the cattle slaughtered by the Abyssinian armies, and the dead bodies which remain upon the field of battle. Many of the birds of Abyssinia feed upon insects, others upon grain, seeds, and fruits. It is an advantage of granivorous birds, that, as the country is crossed by mountains that divide the seasons, and the rains in different parts fall at different periods, they have but a short passage from time to time to supply themselves with food. Of the numerous species of pigeons, all except one, which occupies the eaves of houses, &c.; are migratory. The owls are large and beautiful. The swallows, common in Europe, appear in passage at the very season when they leave that continent: numerous other kinds however are found, which are unknown in Europe. The large birds, resident in the mountains of Samen and Taranta, have tubular feathers, the hollow part being filled with yellow dust, which, agitated by the motion of the animal, issues out in great abundance. The dust expressed from the wing of a nisser, or golden eagle, appeared, says Mr. Bruce, through a microscope with a strong magnifying power, like fine feathers. One of these birds measured eight feet four inches from wing to wing, and nearly five feet from the tip of his tail to the termination of his beak. The rachamah, or black eagle, with several other species, called erkoom, moroc, sheregrig, and waalia, are particularly described by Mr. Bruce, to which Mr. Salt has added a new species, called goodie-goodie, about the size of a falcon, the colour deep brown, and the breast a clear white; the crows have nearly an equal proportion of black and white. The black feathers of the raven are intermixed with brown ones, the tip of his beak white, and a tuft of white feathers on his head, somewhat resembling a chalice or cup. Web-footed water-fowl are generally scarce, but storks and snipes are numerous. There is but one species of goose, called the golden goose, or goose of the Nile, which is common through all the South of Africa. A new species of the vulture has been recently discovered. Ostriches are sometimes met with in the low districts to the north. The hern inhabits marshy ground. The solitary hornbill is often seen in the district of Tigrè. The Egyptian goose, allied to the *Anas Lybica*, is seen in some parts occasionally. Quails, guinea fowls, and partridges, abound. Amongst other rare birds brought home by M. Salt from Abyssinia, may be mentioned the following: A new species of bucco, since called *Bucco Saltii*, which clings to the branches of trees, like the woodpecker; a variety of the upupa

erythrorhynchos, with a black tail; it feeds on the figs of the ficus sycamorus; a nondescript species of the merops; a new species of tanapa, which perches on the backs of cattle, and feeds upon the grubs which live upon them in hot weather; the columba Abyssinica, which flies wild among the daro trees; the Erodia amphioris, supposed to be a new genus of the Arodea Pondiceriana; also the Cursorius Europaeus, an extremely rare bird, shot on the sandy plains traversed by the river Tacazzé.

Of the insects produced in Abyssinia, the most dreadful is the tsaltsalya, a species of the fly somewhat larger than a bee, with colourless wings of pure gauze, placed separately, like those of a fly. This insect is distinguished by a large head and sharp upper jaw, armed at the end with a strong pointed hair, about a quarter of an inch in length, the lower jaw being furnished with two of these hairs, whilst the legs are serrated in the inside and covered with down. Its motion is rapid, like that of a gad-fly, producing a jarring noise, accompanied by a humming, which is no sooner heard than the utmost consternation prevails amongst the cattle, who use every effort to escape his attack. The thick skin of the camel is no security against the proboscis of this dreadful insect, which, whenever it wounds, injects a venom which causes the part to swell, break, and mortify, to the certain destruction of the animal. Of the ravages of the Abyssinian locust, Mr. Salt gives a most dreadful account. Bees are domesticated in the province of Wojjerat, and white honey is produced in great quantities, and sold at Antalo.

The large snake called boa, about the thickness of a man's thigh, and upwards of twenty feet in length, is frequent in Abyssinia. The grassy verge of large pools affords him an agreeable resort; his chief subsistence is antelopes and deer, which he swallows piece-meal after crushing their bones. The cerastes, or horned viper, is commonly about thirteen or fourteen inches in length, and its poison is contained in a bag under its canine teeth. This reptile moves in all directions with great rapidity, springing suddenly upon its victim after approaching with its head averted to a proper distance. The reality of the incantation of serpents and scorpions, which in some is natural, and in others produced by medical preparations, is asserted by Mr. Bruce.

The torpedo and binny are amongst the most remarkable fishes, the latter of which is good for food. It grows to a considerable size, and its body is covered all over with beautiful scales resembling silver spangles.

The agriculture of Abyssinia is not in a state of great perfection; the worst grain is used for seed; and as almost every man cultivates for the support of his own family, it is seldom sold. The ploughs are rudely formed from the root or branch of a tree, and drawn by oxen; although in some cases iron ploughshares are employed. The land is twice ploughed, and afterwards the clods broken by women: the corn, when half ripe, is weeded by men, women, and children, singing as they work. The harvests are reaped by females, who, when strangers pass, utter a

sharp shrill cry, the Lirialect of Syria, where the same custom is in vogue. It is produced by trilling the tongue against the roof of the mouth, and is in effect, a constant repetition of the syllable *al*, uttered with the utmost rapidity. The grain, when gathered, is in most places secured from the weather by a covering of tanned kid skins. The plain of Larai, near Dixan, is in a state of high cultivation, and is rendered eminently productive by the constant practice of irrigation. In appearance, it greatly resembles the vale of Evesham.

With respect to the government of this country, nothing can be more despotic, there being no legal control over the absolute will of the sovereign; and yet, from the want of adequate military force, his authority is capable of being set at defiance, in any of the districts, by the inferior governors; so that hereditary succession, in Abyssinia, imposes but a feeble restraint on those civil wars and commotions, which continue to barbarize the people.

The ceremony of coronation consists in anointing the king with plain oil of olives, which, when poured upon the crown of his head, he rubs into his long hair with both his hands. In former times it was of a more splendid description. The king, arrayed in crimson damask, with a great chain of gold about his neck, his head bare, and mounted on a horse richly caparisoned, advanced at the head of his nobility, passed the outer court of his palace as far as the paved way before the church, where he was met by a number of young girls, daughters of the ambaras, or supreme judges, with many other noble virgins, standing on the right and left of the court. Of these, the two most distinguished in point of rank held in their hands a crimson cord of silk, stretched across from one company to another, about breast high, as if to prevent the king's passing into the church. When this was prepared, the sovereign advanced at a moderate pace, displaying, as he passed, his skill in horsemanship; and being stopped by the string, the damsels asked who he was; to which he replied, "I am your king, the king of Ethiopia." The virgins then answered him, "You shall not pass, you are not our king." Retiring some paces, he again presented himself, and the same question was repeated, when he answered, "I am your king, the king of Israel;" the same reply was still given by the girls. But the third time, on being asked who he was, he replied, "I am your king, the king of Zion," and drawing his sword, cut the string asunder. Upon this, the damsels cried out, "It is a truth, you are our king; truly you are the king of Zion." Upon this, they began to sing hallelujahs, in which they were joined by the army and the whole concourse of the king's attendants. The king, in the mean time, advanced to the foot of the church stair, dismounted and sat down upon a stone resembling the altar of Anubis or the dog-star. A number of priests approached in procession. The king was then anointed, crowned, and accompanied half up the stairs by ecclesiastics, singing as they ascended. At an aperture made in one of the steps he remained stationary, and was fumigated with myrrh, aloes, and cassia;

after which divine service was celebrated, an he returned to the camp, where 14 days were spent in feasting and rejoicing.

The king is saluted like the ancient Persian monarch with the title of "king of kings;" and the royal person is approached with every external sign of adoration; nor in his presence does any one venture to rise from the ground till he receives orders to that effect. When he resides abroad or gives audience, his head is perfectly covered, and his eyes only are seen, while one hand is placed upon his mouth. He communicates with his subjects by means of an officer named Kal-Hatze, the voice or word of the king. When in council he sits enclosed in a balcony with lattice windows and curtains, through a hole in the side of which he speaks to the Kal-Hatze. When in the field he is attended by an officer called Lika Magwass, who carries his shield and lance. Such formerly was the respect paid to him, that no king ever fell in battle, and even now he is often secured by arraying himself in his royal insignia.

The administration of justice in Abyssinia is deplorable, and complainants stand before the palace from day-break to evening, uttering loud cries in their respective languages. So accustomed is the king to these querulous tones of sorrow, that when the rains prevent such as are really distressed from repairing to the capital, a set of vagrants are provided whose object it is to raise the cry of artificial sorrow, lest he should feel a lonely quietness. The phrase adopted on all occasions is, *Rete O jau hai*, Do me justice, O king!

No satisfactory information has at present been obtained with respect to the population of Abyssinia. The account of Alvarez is, that it is one of the most populous regions of the globe. From Mr. Bruce, on the other hand, it appears that although in so barbarous a state, it may be supposed that every tenth person joins the army, yet it is difficult to raise a force of more than 30,000. It is probable that the truth lies between these two extremes.

The devastations committed by the Abyssinian army in their march, says a celebrated traveller are such that they leave nothing living behind them, not "even the vestige of an habitation, but fire and the sword reduce every thing to a wilderness and solitude. The beasts and birds, unmolested, have the country to themselves, and increase beyond all possible conception. The slovenly manners of this people, who, after a battle, bury neither friends nor enemies; the quantity of beasts of burthen that die perpetually under the load of baggage, and variety of mismanagement; the offal and half-eaten carcases of cows, goats, and sheep, which they consume on their march: all furnish a stock of carrion sufficient to occasion contagious distempers, were there not such a prodigious number of voracious attendants who consume them almost before putrefaction. There is no giving the reader any idea of their number, unless by comparing them to the sands of the sea. While the army is in motion, they are a black canopy, which extends over it for leagues. When encamped, the ground is dis-

coloured with them beyond the sight of the eye, and all the trees are loaded with them." In Abyssinia, the number of criminals executed for high treason, whose bodies are cut in pieces and thrown about the streets, invite the hyenas to the capital, in the same manner as the birds of prey are invited by the carion of the camp. To keep them off "an officer called Serach Massery, with a long whip begins cracking and making a noise worse than twenty French postilions at the door of the palace before the dawn of day. This chases away the hyenas and other wild beasts: this too is the signal for the king's rising, who sits in judgment every morning fasting, and after that, about eight o'clock, goes to breakfast."

The houses of Abyssinia are in general thatched and mean; those of the grandees are spacious, but the only approach to architectural grandeur is to be seen in their churches, which are built on commanding eminences of a circular form, with conical thatched roofs, surrounded with pillars of cedar; within which is commonly a refreshing arcade.

Gondar, the metropolis of Abyssinia, is built upon a hill of considerable height, the top of which is flat. It consists of about 10,000 families. The houses are mostly of clay, and the roofs thatched in the form of *cops*. The king's palace at the west end of the town, consists of four stories, flanked with square towers, commanding a fine view of the country southward as far as the lake Tzana. It was formerly a considerable edifice; but having been often burnt, most of it is now in ruins. The audience chamber is 120 feet long. The palace and its contiguous buildings are surrounded by a stone wall 30 feet high, with battlements and a parapet roof, from which the street is seen to great advantage. Koscam the palace of the Iteghe, is situated on the southern side of the Mountains of the Sun. It is a square tower of three stories, with flat roof and battlements, encompassed by a wall which is a mile in circumference, including the richest church in the kingdom. Higher on the hill are the houses of the people of rank, who are for the most part relations of the Iteghe.

Axum, the ruins of which are very extensive, was the ancient capital of Abyssinia, supposed to have been constructed in the time of Abraham. Among the ruins are 40 obelisks of granite; but without hieroglyphics; also the traces of a magnificent temple, originally 110 feet in length, with two wings on each side, a double porch, and an ascent of 12 steps. Sire is larger than Axum, and is situated on the brink of a steep narrow valley. The houses are built of clay, and covered with thatch. Adowa, a town of great importance in the province of *Tigré*, does not contain more than 300 houses; although by reason of the inclosures of a tree, called the *wanze*, surrounding each of the houses, it occupies a spacious area. It stands on the declivity of a hill, on the west side of a small plain, surrounded by mountains, and is watered by three streams, which never become dry, even in the most arid seasons. Masuah is situated on an island, and the houses, except about 20, which

are of stone, are built of poles and bent grass. It carries on a considerable trade, but upon small capitals; property where the hand of power is unlimited, being too precarious to risk a venture in valuable commodities. Gondar and all the neighbouring country depend for the necessities of life upon the Agows, who inhabit the province at the sources of the Nile, and come down to the number of 1000, or 1500 at a time, loaded with wheat, honey, butter, cattle, hides, wax, &c. to the capital.

The natives of this country are of a dark olive complexion, and are so averse to white, that they dislike white grapes on account of the colour. Their dress consists of a large folding mantle with a blue and yellow border, wrapped round them and bound with a sash. Close drawers are also common, to which the priests add a vest of white linen next the skin. They are commonly girt with a belt of white cloth; or among the higher orders, of red Indian cotton with girdles of silk or worsted, brought from the Levant. On the head they wear a small shawl of white cotton, with the crown exposed. Their principal liquor is called maize, made with honey, fermented with barley, and strengthened with the root of the *Rhamnus incibrans*, called *sadoo*. The liquor is drank out of Venetian decanters, called *brulhes*. The common drink amongst the lower classes is made of the bread left at their feasts, and parched barley: it is called *sowa*, and is drank out of horns.

Marriage amongst the Abyssinians is generally a civil contract, and for the most part imperfectly observed. The female, who is seldom consulted on the occasion, is carried to the house of her husband, either on his shoulders or those of his friends. The bride and bridegroom are sometimes seated on a throne of turf, shaded with boughs, round which the relations vociferate and dance. Marriage by civil contract, can be dissolved at pleasure, and requires for this purpose, nothing more than the assent of one or other of the parties. It is renewed again as often as it is agreeable to both parties; who, after they have been divorced, and connected with others, cohabit together as before. "I remember," says Bruce, "to have been once at Koscam, in the presence of the Iteghe, when in the circle there was a woman of great quality, and seven men who had all been her husbands, none of whom was the happy spouse at that time." Ladies of rank retain their estates and maiden names, and assume great superiority over their husbands. There is no distinction between legitimate and illegitimate children; and in case of separation, they are equally divided; the eldest son falls to the mother's first choice, the eldest daughter to the father, &c. If the numbers are unequal after the first election, the rest are divided by lot. The dowry which consists of gold, cattle, musquets, and cloth, is also returned in case of separation. Princesses of the royal blood are not permitted to marry foreigners; and when they take the air, they go in great state, with 400 or 500 women attendants. In some cases marriage is entered into by religious contract, and the sacrament taken imme-

dately after the ceremony; but these occasions are seldom. The king himself only sends a message to the lady he chooses. The usual period of marriage is, in males about ten years old, in females younger; and although in some parts the same man cohabits with several women, and provides them with separate residences; one only is deemed his lawful wife. The women are of a healthy constitution, active, and moderately handsome, having neither flat noses nor thick lips like the negroes. They stand in little need of midwives, which is indeed the case in most countries of the torrid zone. They appear in public, the same as in Europe, without being forbidden the conversation of the men.

When a person is diseased, especially if his disease be the Tigre-ter, his relations shew him all the gold and silver ornaments, fine clothes, &c. which they can collect, making at the same time, a dreadful noise with drums and musical instruments, to drive out the devil, who, as they imagine, produces the disease. As death approaches, the drums, &c. are silent, and are succeeded after the decease by howling, and tearing the hair and skin from the temples. The body is immediately washed, fumigated with incense, sewed up in its former apparel, and buried in great haste. After the burial, commences the toscar, or feast of the dead. An image of the deceased in rich garments, is set upon his favourite mule, and carried through the city, accompanied by other mules, &c. in gay apparel, together with a number of hired female mourners, crying out, as in Ireland, "Why did you leave us? had you not houses and land?" On the return of the procession, an immense number of the people are feasted, and a repetition of this feast at intervals, is given by the different relations; who vie with each other in profusion and liberality. The property of the deceased then descends to his children and relations; and if these are wanting, is divided between the priests and the poor.

In case of murder, the criminal is generally given up to the relations of the deceased, who take him to the market-place, and shortly despatch him with their knives and spears. A person accused of any crime, is immediately on his apprehension, tied by his garments to another, and if he runs away and leave his garments behind him, it is thought a certain proof of guilt. Disputes are commonly decided by the Ras, before whom each party stakes a mule, together with a considerable quantity of gold, slaves, salt, &c. on the veracity of his statement; and these, should his assertion be controverted, are forfeited to the Ras.

The cruel custom of cutting the *shulada*, the mention of which subjected Mr. Bruce to the imputation of romance, has been confirmed on the testimony of subsequent travellers in Abyssinia. It consists in cutting pieces of flesh or raw steaks from the living animal, and eating them raw, and even while yet quivering with life; after which the wound is closed and the animal driven forward. Mr. Bruce relates, that near Axum he fell in with three soldiers "driving a cow. They halted at a brook, threw down the beast, and one of them cut a pretty large

collop of flesh from its buttock; after which they drove the cow gently on as before." In another place he tells us that the flesh was taken from the upper part of the buttock, after which the skin was flapped over the wound, fastened with a skewer, and a cataplasm of clay put over all. The following description of one of their feasts will throw a great light upon Abyssinian manners: "A number of people of the best fashion in the villages, of both sexes, courtiers in the palace, or citizens in the town, meet together to dine between twelve and one o'clock. A long table is set in the middle of a large room, and benches beside it," for the accommodation of the guests. "A cow or bull is brought to the door, and his feet strongly tied. The skin that hangs down under his chin and throat," called the dewlap in England, "is cut only so deep as to arrive at the fat, of which it totally consists;" and is managed with such dexterity, that by the separation of a few small blood vessels, six or seven drops of blood only fall upon the ground. Having satisfied, as they imagine, the Mosaic law, by pouring these six or seven drops of blood upon the ground: "two or more of them fall to work: on the back of the beast, and on each side of the spine they cut skin deep, then putting their fingers between the flesh and the skin, they begin to strip the hide of the animal half way down his ribs, and so on to the buttock, cutting the skin whenever it hinders them conveniently to strip the poor animal bare. All the flesh on the buttock is cut off then, and in solid square pieces, without bones or much effusion of blood; and the prodigious noise the animal makes, is a signal for the company to sit down to table. There are then laid before every guest, instead of plates, round cakes about twice as thick as a pancake, and something thicker and tougher. It is unleavened bread of a sourish taste, far from being disagreeable, and very easily digested, made of a grain called teff. Three or four of these are generally put uppermost for the food of the person opposite to whose seat they are placed. Beneath these are four or five of ordinary bread, and of a blackish kind. These serve the master to wipe his fingers on, and afterwards the servant for bread to his dinner. Two or three servants then come, each with a square piece of beef in his bare hands, laying it upon the cakes of teff placed like dishes down the table. By this time all the guests have knives in their hands, and the men have large crooked ones, which they put to all sorts of uses during the time of war: the women have small clasp knives. The company are so ranged that one man sits between two women; the man with his long knife cuts a thin piece, which would be thought a good beef-steak in England; while you see the motion of the fibres yet perfectly distinct and alive in the flesh. No man in Abyssinia of any fashion whatever feeds himself, or touches his own meat. The women take the steak and cut it length ways like strings, about the thickness of your little finger, then cross-ways into square pieces, something smaller than dice. This they lay upon a piece of the teff bread, strongly powdered with black pepper or cayenne, and fossil salt;

they then wrap it up in the teff bread like a cartridge: in the mean time the man having put down his knife, with each hand resting upon his neighbour's knee, puts his head forward, and opening his mouth, turns to the one whose cartridge is first ready, who stuffs the whole of it into his mouth, which is so full that he is in constant danger of being choked. This is a mark of grandeur; the greater a man would seem to be, the larger a piece he takes in his mouth; and the more noise he makes in chewing it, the more polite he is thought to be. Having dispatched this morsel, his next female neighbour holds forth another cartridge, which goes the same way, and so on till he is satisfied. He never drinks till he has finished eating; and before he begins, in gratitude to the fair ones who fed him, he makes up two small rolls of the same kind and form, each of his neighbours opening their mouth at the same time, while with each hand he puts their portion into their mouths. He then falls to drinking out of a large handsome horn. The ladies eat till they are satisfied, then all drink together, '*Vive la joie et la jeunesse.*' A great deal of joke and mirth goes round, very seldom with any mixture of acrimony or ill-humour. At this time the unfortunate victim at the door is bleeding, indeed, but bleeding little. As long as they can cut off the flesh from his bones, they do not meddle with the thighs or the parts where the great arteries are. At last they fall upon the thighs likewise, and soon after the animal bleeding to death, becomes so tough that the cannibals who have the rest of it to eat, find very hard work to separate the flesh from the bones with their teeth like dogs." Such is Bruce's description of an Abyssinian feast; and although that of Mr. Salt in some respects softens the impressions produced by his predecessor, he nevertheless represents the barbarity of the inhabitants in a light almost equally degrading.

The languages spoken in Abyssinia and the neighbouring districts are a corruption of the Geez called Tigre, Gafat, Amharic, Agow, Falashan, Teheretch, Agow, Galla, and Shangalla. The Amharic, the modern language of Abyssinia, is an Arabic dialect, more simple than the Geez in the form of its verbs. The Falasha is spoken by the tribes professing the religion of the Jews, who formerly ruled in Dembea, Samen, and near the Augrab; and Kahba is one of the ancient Ethiopian tongues. The people of Gafat speak a corrupt dialect of the Amharic.

The Abyssinians compute their time by the solar year, after the manner of the ancient Egyptians. Their month consists of thirty days, to which, in the month of August, is added five days and a quarter to complete the year. The year commences with the 29th or the 30th of August, which is the 1st of their month *Mascuram*; and to every fourth year they add a sixth day. Their common epoch is from the creation of the world, from which they reckon 5500 years to the birth of Christ, rejecting the odd eight years of the Greeks, who made that period. They have other epochs, as from the councils of Nice and Ephesus, but in ecclesiastical computations, they follow the golden number and epact, invented in the reign of Severus

by Demetrius, the twelfth patriarch of Alexandria. They also compute time, by calling their years after the names of the Evangelists, whose writings are read in order every year in their churches; thus, for example, they would say of any events, "They happened in the days of Saint Matthew," that is, in the first quarter of a year, while the writings of Saint Matthew were read in their churches. Their computation of the day is very arbitrary. The beginning of the day comprehending the duration of the twilight they call naggé. From the beginning of evening twilight, to the rising of the stars, they call mését. Midday is called kater, or culmination; and every other part of the day is described by pointing out the place in the heavens where the sun was at the time of which they are speaking.

The use of money being unknown, the revenue is paid in bullion gold. Agowmidre pays annually to the king 1000 ounces of gold, 1000 dabres of honey, and 1000 or 1500 cattle. Damel pays 800 ounces of gold, and thus the income of government is levied in different proportions all over the country. Fossil salt supplies the want of money, and passes current in square pieces. At Masuah several coins have been introduced. The Venetian sequin is equal to two and a quarter pataka; the pataka, or imperial dollar to 28 harfs; one harf to four diwani; one diwani to ten kibur; and one kibur to three boorjoorke or grains, which latter consists of small glass beads of all descriptions and colours, broken or entire. The wakea, or ounce, is equal to ten derims or drachms, and twelve ounces make a liter, *rotal*, or Abyssinian pound. A gondar or wekea is equal to six drachms forty grains troy weight, and is divided into ten drachms of forty grains each. The ordinary value of a wakea is about 76 of the salt pieces mentioned above. The grain measure used in Abyssinia is the ardeb, containing ten measures called madaga, each equal to twelve ounces Cairo weight. An ardeb of grain costs two derims, or two patakas, An ardeb of teff is the same, and six or eight ardeb of tocuoso are equal to an ounce, or ten derims of gold.

The commerce of Abyssinia is confined mostly to the shores of the Arabian gulf, and its manufactures are few and insignificant. They unravel the threads of the blue cloth of Surat, and weave them into their own webs; and procure a black dye from earth, and red, light blue, and yellow, from vegetables. Fine cloth is manufactured at Gondar, and coarse at Adowa, and the latter, besides its common use, circulates as money. The natives of Abyssinia tan hides to great perfection, through the use of the plant merjombe, a species of the solanum, and the juice of the kolquall tree.

The Abyssinians appear in every respect greatly below the rank of civilized nations. They seem indeed, by their churches and other ruined places, to have had a knowledge of architecture. But the workmen were sent for from other countries; so that when these fabrics were reared, especially the imperial palace built by Fr. Paez, a Spanish Missionary, the people flocked from all parts of Ethiopia to view it, and admired it as a new wonder of the world. Gold, silver, copper, and iron, are the

principal ores with which their mines abound in this extensive part of Africa: but not above one-third part is made use of by way of merchandize, or converted into money; of which they have little or no use in Abyssinia. They cut their gold indeed into small pieces for the pay of their troops, and for the expences of the court; but this is a modern custom among them; the king's gold, before the end of the 17th century, was laid up in his treasury in ingots, with intent to be never carried out, nor ever used in any thing but vessels or trinkets for the service of the palace.

Mr. Bruce informs us, from the annals of Abyssinia, that, in the reign of Solomon, the Abyssinians were converted to Judaism, and the government, ecclesiastical and civil, modelled according to what was then in use at Jerusalem. Some ecclesiastical historians affirm, that the conversion of the Abyssinians to Christianity, took place in the days of the Apostles, and was effected by the Ethiopian eunuch, whom Philip baptized. Whatever truth may be in that tradition, it appears that Frumentius, who was ordained about the year 333, was their first bishop, and instructed them in the religion of the Greek church of Alexandria. At present they are a mixture of Moors, Pagans, Jews, and Christians. This last was the reigning and established religion, but in a very low state of degradation, when father Jerome Lobo visited it in 1624, as well as when Mr. Bruce travelled through it. This diversity of people and religion is the reason, that the kingdom in different parts, is under different forms of government, and that their laws and customs are extremely various.

The Abyssinians are described as a branch of the Copts or Jacobites, with whom they agree in admitting but one nature in Jesus Christ, and rejecting the council of Chalcedon, on which account they are called Eutychians and Monophysites. The church is governed by a bishop or metropolitan, styled Abuna, appointed by the Coptic patriarch of Alexandria, residing at Cairo. Next in dignity is the Komos, or Hegumenos, a sort of arch-presbyter, who has the inferior clergy, together with the secular affairs of the parish, under his inspection. The deacons are of the lowest order of priesthood. The canons never marry. The monks, at their admission, vow aloud before their superiors to keep chastity, but they add, in a whispering tone, '*as you keep it.*' The debtarahs, or chanters, who assist in the musical parts of the service, are in higher esteem than the Komos, though not of equal rank. The emperor confers all benefices except that of Abuna, and takes cognizance of all ecclesiastical causes. The monks are extremely ignorant, and are of two kinds, viz, those of Debra Libanos, and those of St. Eustathius. Their superior in the north west of the country, is the Itchegué. He is ordained by two chief priests holding a veil or white cloth over his head, and a third repeating a prayer; after which they all join together in singing psalms.

ACACIA, *ακακία* or *ακαζω*, to sharpen; in botany, a name given by Pliny to a thorny tree of Egypt, supposed to have yielded the gummi

Though the Abyssinians profess Christianity, they practise circumcision, which they extend to both sexes. They observe Saturday and Sunday for sabbaths; oblige women to perform the legal purifications, and abstain from meats forbidden in the law of Moses. Their Lent continues 52 days, during which they never taste food till after sunset. On the feast of Epiphany, which, according to the Abyssinians, is the 11th of January, they assemble near brooks, into which, after receiving the priest's blessing, they jump, leaping, dancing, and shouting. In the performance of baptism, their priests are engaged, one with incense, another with a golden cross, and a third with the consecrated oil from the patriarch of Alexandria. The candidate is first washed over with water, then crossed on the forehead with some of that water, over which the incense has been waved, and the consecrated oil dropped into. If the candidate be a Mahometan, every joint and limb is crossed with the consecrated oil; he is then wrapped in a white linen cloth, and partakes of the sacrament. No unbaptized person may enter a church. Great numbers of pilgrims, in a yellow dress, with cords round their waists, resort to the beautiful plains of Walleasse. The Christians near Dixon, are distinguished by a cross on their breast, arm, &c. They say prayers over whatever they eat, drink, receive, or give, and then blow on it, turning their heads to the east. When they kill animals they turn their backs to the west. They never kill the goodie-goodie falcon, and when a traveller meets one he watches it,—if it sit still with its breast towards him till he is past, it is a good omen,—if its back be towards him, it is unpropitious,—if it fly away, he returns. It is generally believed that every worker in iron at night, transforms himself into an hyæna, and devours human flesh. One of their saint's days is consecrated to Balaam's ass, another to Pilate and his wife, because Pilate washed his hands before he condemned Christ, after the message received from his wife. They at least equal the church of Rome in miracles and legends of saints, which greatly embarrassed the Jesuits; to whom they told such miracles in proof of their religion, that the missionaries were obliged to deny miracles to be any proof at all. Prayers for the dead, invocation of saints and angels, &c. &c. are common. Images in painting decorate their churches, but they abhor all images in relieveo except the cross. They admit the apocryphal books with the apostolic canons and constitutions to be genuine, but consider the Canticles a love-song of Solomon to Pharaoh's daughter. The Jews in this country retain their ancient distinction, Caraites and Talmudists. Ludolf mentions another sect upon the frontiers, between them and the Caffres, supposed to have descended from the captives taken by the kings of Assyria and Babylon. They were never incorporated with other Jews, but have always been *salara*, or strangers. Their Bible is in the corrupt Talmudic dialect.

Arabicum. In the Linnaean system it is the mimosa nilotica.

The common acacia of this country is the

Robinia-pseudo-acacia of Linneus: and the rosa acacia (so called from its rose coloured flowers) is the Robinia hispida of that writer.

In the Materia Medica an inspissated juice of the first of them is used as an astringent: and is sometimes successfully imitated by the juice of sloes boiled to the same consistence.

ACACIANS, in ecclesiastical history, a sect of heretics, of the fourth century, so named from Acacius, bishop of Cæsarea, who denied the Son to be of the same substance with the Father. Their founder was successor to Eusebius, and surnamed Luscus, from being blind of one eye.

ACACIUS, (St.) bishop of Amida, in Mesopotamia, in 220, distinguished by his piety and charity, sold the plate belonging to his church, to redeem seven thousand Persian slaves, and giving each of them some money, sent them home. Their king, Veranius, was so affected with this instance of benevolence, that he desired to see the bishop: and the interview resulted in a peace between that prince and Theodosius I.

of philosophers, since called *academics*. *Academy*

has since been used to designate a literary or scientific society, university, or school.

But ye withdrawen frome this man, that he hath been nourished in my studies or scholes of cleaties, and of *achademicies*, in Greece.

Chaucer's Bæcias, b. i.

Our court shall be a little *academe*,
Still and contemplative in living arts.

Shakspeare's Love's Labour Lost.

Amongst the *academies*, which were composed by the rare genius of those great men, these four are reckoned as the principal, namely, the Athenian school, that of Sicyon, that of Rhodes, and that of Corinth.

Dryden's Dufremoy.

Academical study may be comprised in two points: reading and meditation.

Berkeley's Minute Philosopher.

A young academic shall dwell upon a journal, that treats of trade, and be lavish in the praise of the author; while persons, skilled in those subjects, hear the tattle with contempt.

Watts's Improvement of the Mind.

While through poetic scenes the genius roves,
Or wanders wild in *academic* groves.

Dunciad, b. iv.

He drew him first into the fatal circle, from a kind of resolved privateness; where, after the *academical* life, he had taken such a taste of the rural; as I have heard him say, that he could well have bent his mind to a retired course.

Wotton.

It is observed by the Parisian *academists*, that, some amphibious quadrupeds, particularly the seal-calf or seal, hath his epiglottis extraordinarily large.

Ray on the Creation.

A C A D E M Y.

ACADEMY, originally intended a villa or grove, situated about six stadia, or three quarters of a mile from Athens, the seat of literature and the arts, where Plato taught the substance of his philosophy. The origin of the name is by some derived from Cadmus, commonly called the Phœnician, because he introduced the learning of Egypt into Greece, and brought the sixteen simple letters of the Greek alphabet from Phœnicia. Its origin, however, is more properly ascribed to Academus, or Ecademus, to whom it at first belonged, and who bequeathed it to the citizens for a gymnasium. It was diversified by Cimon with fountains, trees, and walks, for the convenience of philosophers in their private meditations, surrounded with a wall built by Hipparchus, and rendered more solemn by becoming the burial place of illustrious men.

Plato purchased a small garden for 3000 drachmas, equal to £116. 10s. 6d. of our money, and delivered lectures for the benefit of all who attended. In allusion to this circumstance, all public places for the association and resort of learned men have been since called academies. Cicero had a small villa near Puzzuoli, called Academia, in which he entertained his friends, and composed his book *De Natura Deorum*, also his academical questions. Academy is now used in a general sense, to signify a society of learned men, formed for their own improvement, and the promotion of the arts. Ptolemy Soter, it

is said, founded an academy at Alexandria, for the encouragement of learning and the sciences, provided with a collection of books, which afterwards became the finest library in the world, commonly called the "Alexandrian Library;" and Theodosius established an academy at Constantinople, furnished with a number of professors in every department of science and knowledge, intended to rival the institution of Rome destroyed by the Goths at the close of the fourth century.

An academy is different from an university. The latter consists of graduates in the several faculties; of professors who teach in the public schools; of regents or tutors, and students who learn under them; whereas the former is not intended to teach, but to improve. It is not strictly for students to learn in, but for distinguished proficients to conser in, and communicate their lights and discoveries to each other for the general improvement. The first academy of which we read was that of Charlemagne, established at the request of Alcuin his preceptor, to improve the language of the country, as well as elicit a general attention to literature and the arts. During their academical conferences, each member delivered a statement of the ancient authors he had read, and a short commentary upon them, assuming at the same time, the name of the ancient author which gave him most satisfaction. Alcuin took the name of Flaccus,

Augilbert, of Homer; Adelard, bishop of Corbile, was called Augustin; and the king himself, David. The institution perished at the death of Alcuin, and literature seemed as if banished from the world. Although many eminent characters arose, in the dark ages that followed, resembling meteors that dart through the midnight gloom, there was no union of effort, no combination of genius, no interchange of thought, no associations that could promote or even protect knowledge; and had not the muses on their banishment from the academic haunts of public patronage, retired into the private cells of monastic superstition, and there preserved the compositions of antiquity, every spark of light must have been extinguished. After the overthrow of the Roman empire by the Turks about the year 1453, several eminent Greek scholars settled in the West of Europe, chiefly in Italy, under the sanction of Pope Nicholas and the Medicane family. These imported with them the treasures of Grecian knowledge and antiquity, and forming themselves into academies, and intellectual societies, schools, libraries, and museums, began to spread over the face of Europe. Of these useful institutions we shall at present merely attempt an enumeration. The first class of them comes under the head of

ACADEMIES OF ANTIQUITIES.—*The Academy of Cortona* is designed for the study of Etrurian Antiquities, which are very numerous and extensive. The principal is called Lucomon, a name derived from the ancient governors of Hetruria, and the institution imposes a tax of a dissertation on each member in his turn.

The Academy of Antiquities at Upsal, is designed for the illustration of Swedish antiquities, as also the cultivation and improvement of the Northern languages.

In the 15th century, under the pontificate of Paul II. an attempt was made at Rome to establish a similar institution, but it was defeated by the persecuting spirit of the papal hierarchy. And although resumed by Leo X. with apparent success, it gradually dwindled to insignificance, and some others that arose from its ruins were shortly extinguished.

The Academy of Inscriptions and Medals at Paris commenced in the generous exertions of M. Colbert in 1663, under the patronage of Louis XIV.; it was designed for the study and explanation of antique monuments, also for the perpetuation of memorable events (especially those of the French monarchy) by coins, relieves, inscriptions, &c. The number of members at first did not exceed four, from which circumstance it acquired the name of *Petite Academy*. But on July 16, 1701, the institution was greatly enlarged, and consisted of 10 honorary members, 10 pensioners, 10 associates, (each of whom had two declarative voices,) and 10 éléves, or pupils. Shortly after the class of éléves was suppressed, and added to the associates; then a yearly president and vice president were appointed by the king, and other inferior managers whose offices were perpetual. The earliest and most considerable attempt of this academy, was a complete history of the most important events of the reign of Louis, accomplished by means of medals. This they effected as far as the elevation of the Duke

of Anjou to the crown of Spain, besides which they published several volumes of essays in the form of memoirs. The motto of the society was ‘*velat mari*;’ and Mercury is represented on one of their medals, sitting and writing with an antique style on a table of brass, leaning with his left hand upon an urn full of medals, whilst others on a board are lying at his feet, the legend “*Rerum gestarum fides*,” and on the exergue “*Academia regia inscriptionum et numismatum, instituta M.DC.LXIII.*” intimating that the Royal Academy of Medals and Inscriptions ought to give to future ages a faithful testimony of great actions. The usefulness of this and other French Academies has been prevented by the political changes and events connected with the late revolution.

The Academy of Herculaneum was established at Naples in 1755, when a museum was formed for the bestowment and preservation of the antiquities excavated from the ruins of Herculaneum and Pompeia, by the marquis Tanucci, minister of state. The primary object of the society was, to explain the paintings discovered at these places, for which purpose the members met every fortnight, when the paintings were submitted to a corresponding number of Academicians, who made a report upon them at the next sitting. In 1775, the first volume appeared, and has been succeeded by several others under the title of *Antichità di Ercolane*, exhibiting engravings of the most valuable paintings, statues, marble figures, bronzes, medals, utensils, &c. accompanied by explanations from the society.

The Neopolitan Academy of History and Antiquities was established at Naples by Joseph Buonaparte in 1807, consisting of 40 members, 20 appointed by nomination from the king, who were individually to present him for his choice, names of three candidates for every one wanted to complete the number. A grand meeting was to be held every year, when prizes were to be awarded, and analyses of the works read. Eight thousand ducats were to be annually allotted for the current expences, and two thousand for prizes to the authors of four works, at the discretion of the society. The subsequent revolutions in the political state of Naples prevented the permanent usefulness of this institution.

A Parisian Academy for the Discovery of Celtic Antiquities, was established in 1807. It contemplated, first, The elucidation of history, customs, antiquities, and monuments of the Celts, particularly in France. Secondly, the etymology of all the European languages by the Celto-Briton, Welsh, and Erse; and third Druidical remains. Fourth The history and settlements of the Galatæ in Asia. Lenoir, the keeper of the museum of French monuments was president. A *Fasciculus*, containing 150 or 160 pages, was to be printed monthly. The engravings, &c. under the direction of Lenoir. The devices are, *Glorie majorum, and Sermonem patrum, moresque requiret*.

Academy for the Illustration of Tuscan Antiquities, established at Florence, was founded in 1807, &c. has published volumes of essays and researches.

ACADEMIES OF MEDICINE.—*The Leopoldine Academy*, or the *Academia Natura Curiosum*

was founded in Germany, in the year 1652 by I. L. Banchius, a celebrated physician of Swinefurt, in the circle of Franconia, who invited other physicians to meet for the purpose of communicating extraordinary cases that had fallen under their observation, and was afterwards elected president of a society formed upon the basis of such communications. In January 1652, they held their first meeting. The president proposed subjects for discussion, and their works were, at first, published separately; but, in the year 1670, they agreed to publish a volume of memoirs every year. The first of these, called "*Ephemerides*," appeared in 1684, and was followed by others under different titles. In 1687 the emperor Leopold took this society under the royal protection, endowed it with certain privileges and immunities, dignified the presidents with the title of "Counts palatine of the holy Roman empire," and honoured it with the title "*Casareo Leopoldina Natura Curiosorum Academia*;" or the "*Leopoldine Academy*." The institution has no fixed residence, or regular assemblies, but a bureau or office, established first at Breslau, and afterwards at Nuremberg, where all communications are received. The Academy consists of one president, two adjutants or secretaries, and colleagues or members. The colleagues, at their admission, oblige themselves first, to give in a written treatise upon some subject out of the animal, vegetable, or mineral kingdom, not previously handled by any member of the society; and, secondly, to wear as a symbol of the academy, a gold ring on which is a book open with an eye on the front, and on the opposite side the motto of the Academy, "*Nunquam otiosus*," never idle. See *Buchaueri Hist. Acad. Naturae Curiosorum*, Hal. 1756. Societies of the same name have been established on the Continent, as at Palermo in 1645, Venice in 1701, Geneva in 1715, Spain in 1652.

The Royal Academy of Surgeons at Paris, was instituted in 1731. The members of which publish their own observations and discoveries, in which they endeavour to lay down a complete system of surgery. The institution proposes a question annually, and awards a gold medal, value 500 livres, to the best dissertation upon the subject.

The Academy of Surgery at Vienna, instituted in 1783, originated in Francis II. and was placed under the direction of Brambilla. The institution formerly consisted of two professors and 130 pupils, but is now considerably enlarged. Contiguous is an extensive botanical garden, and a splendid edifice provided by the emperor, affording accommodation to professors, students, pregnant women, patients for clinical lectures, servants, &c.; also a voluminous library, complete set of surgical instruments, philosophical apparatus, specimens for illustrations of natural history, preparations in wax, &c. together with a comprehensive variety of anatomical and pathological preparations. Medals, each of 40 florins value, are annually bestowed on those students, who return the best answers to certain chirurgical questions.

COSMOGRAPHICAL ACADEMIES.—The Cosmographical Academy at Venice, called the Argo-

nauts, was instituted about the eighteenth century, by means of Vincent Coronelli, for the improvement of geography. The device is, the globe, accompanied with the motto "*plus ultra*." The primary object of the institution is the publication of correct maps, celestial and terrestrial, accompanied with geographical, historical, and astronomical descriptions, definitions, &c. Each member subscribes to defray the expences, and receives one or more copies of each piece. All the globes, maps, writings, &c. are published by the society. To facilitate the objects of the institution, three societies were settled, one under F. Mons, provincial of the Minorites in Hungary; another under F. Baldigiani the Jesuit, professor of mathematics in the Roman college; a third under Abb. Laurence, an rue Payenne au Marais.

SCIENTIFIC ACADEMIES.—*The Neapolitan Academia Secretorum Natura* was instituted at Naples in 1560, to advance the knowledge of mathematical and physical science; but was soon crushed by an interdict from the church of Rome.

The Academia Lyncei which succeeded the former, was established at Rome, by prince Frederick Cesi, to promote the improvement of natural philosophy. It became eminent in consequence of the discoveries made by its members, as in the case of Galileo.

The Academy del Cimento flourished in the seventeenth century under the auspices of Prince Leopold, afterwards Cardinal de Medicis. To this institution belonged Paul de Buono, who, in 1657, invented an instrument consisting of a globular shell of gold, to demonstrate the incompressibility of water. To the same Academy belonged Vincent Vivani, Francis Redi, Count Laurence Magalotti, (who published "*Saggi di Naturali Esperienze*," a curious work, translated into our language by Waller,) and Alfonso Borelli, who wrote "*De Motu Animalium*."

The Academy degl' Inquieti at Bologna, afterwards incorporated into that of Della Tracia, met in the house of Eustachio Manfredi in 1690; hence, that gentleman is often represented as the founder. Their badge was a representation of the planetary system, surrounded by a serpent with a tail in its mouth. Their motto was "*Mens agitat*," hence their name *Inquieti*. Their very admirable discourses were collected and given to the world in 1667, under the title of *Pensieri Fisico-Mateematici*. In 1714 it was new modelled, and united with the Bononian institute, richly endowed by the Popes, and defended by the civil power. The director was also dignified with the title of president; the society itself called *the Academy of the Institute* and afterwards *Academia Clementina*, from the patronage of Clement. Ladies were admitted into the society, and several of them elevated to professorships. Anna Manzolini was professor of anatomy, &c. The library contains 120,000 volumes, a cabinet of natural history, numerous manuscripts, &c.; and the building consists of 40 rooms, besides halls underneath.

La Società Scientifica Rossunensa degl' Incuriosi, was established at Rossano, in Naples, in 1540. On its establishment, it was an academy

of belles lettres, and became an academy of sciences in 1695, when Don Giacinto Gimma the abbot, divided the members into grammarians, rhetoricians, poets, historians, physicians, mathematicians, philosophers, lawyers, and divines. The greatest honour the academy can confer is, giving a written permission from the president to assume the title of academist, which is not granted till the proposed publication has been sanctioned and approved by all the academy. From this law even the president is not exempt. No academist may publish against the writings of another without the consent of the academy.

Italy has been celebrated for its academies. Jarckius reckons 550, and 25 in the city of Milan. Some of these are gone to ruin; many have acquired lasting fame: the Academy of Filarmonici at Verona, the Academy of Ricovaltro at Padua, and others. In the latter Sig. Vallisnieri wrote his ingenious dissertation.

The Royal Academy of Sciences at Paris was founded by Louis XIV. in 1666, who, after the peace of the Pyrenees, ordered M. Colbert to associate a few men of learning to communicate their discoveries to each other for the promotion of the general improvement. The minister accordingly formed a society of gentlemen, in high repute for philosophy and mathematics, history, and belles lettres. Gentlemen of different departments assembled in different days of the week. History and rhetoric were soon after united to another French academy, which proposed the improvement of the language; and the royal academy consisted of two great divisions, philosophy, and mathematics. The king, in 1669, appointed a new set of regulations, by which he made four kinds of members, honorary, pensionary, associates, and élèves. The last three were to contain each 20 persons, the first only 10. The honorary members were to be all inhabitants of France; the pensionaries to reside in Paris. Of the associates, eight only might be foreigners, and the élèves to be resident in Paris. A president was to be named by the king from the honorary members, the secretary and treasurer to be perpetual. Of the pensionaries, three were to be astronomers, three chemists, three geometers, three botanists, and three anatomists. The remaining two were intended for secretary and treasurer. Of the associates, two were to apply to geometry, two to botany, and two to chemistry. The élèves applied themselves to the same sciences as their pensionaries, and might not speak except when called on by the president. No person might be admitted for associate or pensionary, unless known to the world by authorship, or the invention of some machine, &c. &c. The society's motto was, *Invenit et perficit*.

The Duke of Orleans in 1716 very much extended the institution, suppressed the class of élèves and introduced two other classes, one consisting of twelve adjuncts and six free associates, who were not obliged to pursue any particular study. A vice-president was to be chosen annually by the king from the honorary class, with a director and sub-director from the pensionaries. In 1785, the king superadded several other classes, as natural history, agriculture, mineralogy, and physics. He likewise introduced

several political changes into the constitution. The society consisted of eight classes, viz. astronomy, geometry, physics, mechanics, chemistry, and metallurgy, anatomy, botany, and agriculture, natural history, and mineralogy.

This institution, by computing the meridian, and sending out persons to make observations, has been of great service to the world. Numerous interesting memoirs of the society have been published since its establishment in 1666. To each volume is prefixed an abstract of the history of the academy, and eulogiums on such members as have died within the year. M. Rouille de Meslay, counsellor to the parliament of Paris, founded two prizes, one of 2500, the other of 2000 livres, to be alternately distributed by parliament every year; the subject for the first to be physical astronomy, for the second navigation and commerce.

The history of the academy to the year 1697, was published by Du Hamel. After that period it was continued by Fontenelle in his "Histoire de l'Academie Royal des Sciences; avec les Mémoires de Mathématique et de Physique, tirez des Registres de l'Academie, Histoire de l'Academie Royale des Sciences depuis son Établissement en 1666, jusqu'en 1699," en 13 tomes, 4to.

In 1793, the convention dissolved the institution, on the ground of its being a supposed bulwark of royalty, and established another under the name of the *National Institute*. The memoirs to this period are published in 129 quarto volumes. Other academies of considerable importance are established in the principal cities of France, as the *Academie des Jeux Floraux*, at Toulouse; *Royal Academy of Sciences*, at Toulouse, *Academy at Caen*, Rouen, and many others. That at Dijon contains, in a handsome saloon, the busts of eminent men, natives of the city, as Buffon, Bossuet, Piron, Crebillon, De Brosses, Freret, &c.

The Royal Academy of Sciences at Berlin, established in 1700, was formed by Frederic II. king of Prussia, after the model of that of England, with the addition of belles lettres. In 1710 some alterations took place, and the president became one of the counsellors of state. The members consisted of four classes, the first including physics, medicine, and chemistry. The second, mechanics, astronomy, and mathematics; the third, history, particularly German history and language; the fourth, oriental learning, which was adopted as a means of facilitating the spread of the gospel among the heathen. The first business of every class was to choose a director, who held his station for life: of these Leibnitz was the first director. The classes had free communion with one another.

Though the society originated in Frederic II. at so early a period, it was not till 1743 that it enjoyed any considerable share of the royal favour; when Frederic III. took upon himself in person, the entire management, chose a proper president, invited the most distinguished scholars on the continent to Berlin, and adopted the most vigorous measures to raise the institute into celebrity. In gratitude for these distinguishing marks of favour, the society agreed to hold their

two public assemblies, one in January, on the king's birth-day, and the other in May, on the day of his accession to the throne. On the latter occasion, a gold medal is awarded for the best dissertation, the subject of which is to be successively philosophy, metaphysics, mathematics, and general erudition. The Berlin cabinet of curiosities, and the public library were added by an act of the crown; and in order to expand the views of the academy, and promote among the people a more general attention to the arts, the king, in 1798, appointed a directory consisting of four members to undertake the entire management of the funds, a president, and two additional members, to be chosen from among men of business. Each class had a director of its own, elected for life; and the appointment of officers was at the nomination of the academy, subject however to the confirmation of the king. A number of volumes have been published by the names of "Memoires de l'Academie Royale des Sciences et Belles Lettres à Berlin." A history of the institution has also been given to the public. The regulations of 1798 have greatly tended to liberalize the views of the academy, and to direct their attention to subjects of general utility.

The Imperial Academy of Sciences at Petersburgh, originated with the Czar, Peter the Great, who, during his travels on the continent, having observed the manifold advantages arising from literary institutions, resolved on forming an academy in his own dominions. With the assistance of Wolf and Leibnitz, he had projected the plan of the proposed institution, and invited several learned foreigners to become members, when death put an end to all his designs, and extinguished all the hopes, expectations, and solicitudes of that great and distinguished man. Czarina Catherine I. nevertheless, adopted his views, and approving the plan already laid down, put it into execution in 1725, when the society held their first meeting before the duke of Holstein, and many other persons of rank and eminence. In the ensuing August the czarina herself attended the meeting, on which occasion the celebrated Bulfinger, a German naturalist, delivered an oration on the utility of the loadstone and needle for the discovery and calculation of longitude. Impressed yet more deeply with the importance and excellence of the institution, she immediately devoted £4982 per annum to its support, admitted fifteen members, eminent for literature and science; and under the title of professors, honoured them with pensions. The most distinguished of these individuals were Nicholas and Daniel Bernoulli, the two De Lises, Bulfinger, and Wolf. In 1721, a gymnasium was added to the academy, and afterward an university, the professors of which gave lectures in the various branches of learning.

Peter II. disapproved of the society, and proceeded to stop the salaries of its members. By his example, the institution was neglected by persons of rank, and languished for want of support. It revived, however, under the empress Anne, and flourished during the successful presidency of the celebrated Baron Korse, but after his death, an ignorant person being appointed to the office, the most eminent members quitted the kingdom.

A second revival took place upon the accession of czarina Elizabeth, when the original plan was enlarged, the internal government improved, and most of the eminent members, who had relinquished, were induced to return; and two natives of genius and ability, who had prosecuted their studies in foreign universities, Lomonosoff and Rumorsky, attached themselves to the institution. Catherine II. took the institution under her auspices. An Academy of Arts was added (but afterwards separated in 1764). The influx of learned and ingenious foreigners inspired new vigour: expeditions were sent over the whole empire, for the purpose of obtaining knowledge, and as the funds were inadequate to this large scale of expenditure, the empress made an immediate donation of £2000, to be renewed as often as circumstances might require. The annual income of the society, was now calculated at £10,659, and its annual sale of books, maps, almanacks, memoirs, &c. nearly 80,000 rubles.

The scientific expeditions were to enquire into the quality of earth and waters; the most successful mode of cultivating the barren spots of land; the diseases of men and cattle, together with methods of cure; the breeding of cattle, more especially sheep; the management of bees and silk-worms; the properties of minerals, plants, and every species of botany, of which they were to bring collections illustrative of the science, according to the most approved system, so as to form a complete "Russica Flora." Besides these, they were also to investigate the most proper places for fishing, hunting, &c.; to rectify the longitude and latitude of places, and to make geographical, astronomical, and meteorological observations; to trace the course of rivers; make exact charts; observe the customs, dress, manners, language, religion, history, traditions, and antiquity of different nations, with which they were to combine every other species of information that might tend to enlighten the institution, and discover the internal state of their native empire. The existence of such a society proves, that learning had not vanished from the North; and the number of excellent publications which have since dawned upon the world, evince that the hopes inspired by the wide perambulations of the society were not disappointed. In these Pallas, Gmelin, Stolberg, Guldenstaedt, and others, have immortalized their names.

The academy is at present composed of a president, director, fifteen professors, and four adjuncts. The professors receive an annual stipend of from £200 to £600: the adjuncts are pensioned. The meetings are twice a-week, and the public assemblies are held thrice a-year. Belonging to this society, and immediately contiguous, is a fine library, containing upwards of 36,000 curious volumes and manuscripts: also a museum, rich in native productions, and containing a choice cabinet of coins, antiquities, &c. The various branches of natural history have their corresponding apartments into which they are scientifically distributed. The motto of the society is *Paulatim*, and their device a tree, bearing unripe fruit. Their transactions were first published in 1728, entitled, "Commentarii Acu-

demæ Scientiarum Imperialis Petropolitanae ad ann. 1726." This title distinguished all their works till 1747, when the transactions were called, " *Novi Commentarii Academæ*," &c. In 1777, they were called, *Nova Acta Scientiarum Imperialis Petropolitanae*. Their works hitherto had been published in Latin. They are now written partly in French, attended by a preface called " *Partie Historique*." They have published in the whole 14 volumes of memoirs. The first of the new commentaries appeared in 1750, the twentieth in 1776, and two volumes are printed every year.

The academy has been often torn by dissensions, and a few years ago, was almost annihilated; but by an edict of the empress, it was immediately re-modelled, arose and shone forth afresh upon the world, in a late series of publications, " *Nova Acta*," &c.; and still continues to spread its light over the dark region of this extensive empire.

The Academy of Sciences at Bologna, commonly called the *Institute of Bologna*, was originally founded by count Marsigli in 1712; for the better cultivation of physics, mathematics, anatomy, medicine, chemistry, and natural history. Its history was written by M. D. Limiers, from memoirs furnished from the founder himself, and printed at Amsterdam in 1723; from which it appears that an academy for architecture and painting, previously founded by pope Clement XI. was incorporated with this, and that the city purchased, and appropriated to its use the palazzo Celesi, for the convenience of having the library, museum, observatory, schools, and professors' apartments under the same roof. At the entrance is the following inscription—*Bononiense Scientiarum et Artium Institutum, ad publicum totius orbis usum*.

The Academy, Imperial and Royal, of Sciences and Belles Lettres at Brussels, was founded in 1773, and has published many volumes of interesting memoirs.

The Royal Academy at Stockholm, or Royal Swedish Academy, originated in six persons of learning, among whom may be mentioned the celebrated Linnaeus. These gentlemen met on the 2d of June, 1739, and formed themselves into a private society, for communicating to each other the result of their literary investigations. This society soon drew a considerable share of the public attention; and in 1741, on the 31st of March, was incorporated by the king, under the title of the Royal Swedish Academy. The society receives no pension from the crown; but its funds have been gradually augmented by subscriptions, legacies, and private donations. Of its professors, three persons only receive salaries, viz. a professor of experimental philosophy, and two secretaries. Those professors, who reside at Stockholm, become presidents by rotation, each continuing in office for three months. The election of native members is held in April; that of foreign members in July: both classes of members are admitted without fees. The dissertations are all written in the Swedish language, and published four times in the year. The annual publications compose an octavo volume. The first 40 volumes, published in 1779, are called the Old Transactions: the next

VOL. I.

year commencing a series of New Transactions. Any person who sends a treatise worthy of publication, receives the Quarterly Transactions gratis, and a small silver medal. Agricultural dissertations are published separately, under the title of *Economica Acta*. Premiums and medals are awarded annually by the society, for the encouragement of agriculture, &c. The public meetings of the institution are sometimes honoured with the royal presence. In 1799, the academy was divided into seven distinct classes. First, general and rural economy, containing 15 members. Second, commerce and mechanics, containing 15 members. Third, exterior physics and natural history. Fourth, interior physics and natural philosophy, each containing 15 members. Fifth, mathematics, containing eighteen members. Sixth, medicine, containing 15 members. Seventh, belles lettres, language, and history, containing 12 members. Into such repute had the society arisen, by the eminence and devotedness of its members, that in 1800 the sale of almanacks alone brought in the sum of £400.

The Royal Academy of Sciences at Copenhagen, originated in the occasional meetings of six learned men, whom Christian VI. in 1742, ordered to arrange his cabinet of medals; and who, enlarging their plan by degrees, at length formed a regular institution, under the patronage of the count of Holstein, whose primary object was, to make researches into the history and antiquities of their country, and to explain them. In the year 1743, his Danish majesty, at the instigation of the count, took the academy under his patronage, and endowed it with a fund; directing the members to add to the number of their former pursuits those of history, physics, and mathematics. The institution has published 15 volumes in the Danish language, a great proportion of which have been translated into Latin.

The American Academy of Arts and Sciences, was established in 1780, by the council and house of representatives in the province of Massachusetts Bay, designed to promote the study of American antiquities and history; also to determine the uses to which its natural productions might be applied; together with the study of medicine, mathematics, philosophy, astronomy, meteorology, geography, agriculture, manufactures, commerce, with every other art and science that might tend to enlighten the population, and to advance the interest, honour, and happiness of an independent people. The members were never to be more than 200, or fewer than 40. Since the year 1785, when they published their first volume of memoirs at Boston, the academy has been progressively improving.

The Royal Academy of Sciences at Lisbon, was founded in the year 1779, by the duke De Lafoens, uncle to the queen. It contained 24 effective members, divided into three classes occupying the departments of natural sciences, mathematics, and national literature; 36 free members, a few literary foreigners, with many scientific correspondents. The sovereign himself became president, and the revenue allowed by government enabled them to establish a museum, observatory, and printing-office. The first volume of their memoirs appeared in 1797; and in addition to their

Memorias de Litteratura Portugueza; Memorias Economicos, and other literary transactions, they have published *Collecção de Livros ineditos de Historia Portugueza*.

A *Geographical Academy*, established at Lisbon, in 1799, principally with a view to illustrate the geography of Portugal, has provided the world with an accurate map of this country, so long a desideratum in literature.

The *Royal Neapolitan Academy* was established in 1779, and has published valuable mathematical researches and memoirs.

The *Royal Academy of Turin* was established by the late king, when duke of Savoy. The first volume of memoirs appeared in 1759, published in Latin, with the title of *Miscellanea Philosophica Mathematica Societates private Taurinensis*. The continuations of which have been since published in French. Le Grange, the most celebrated Oriental member of this academy, astonished the scientific world by the novelty and profoundness of his papers, in the first volume of these Transactions and Memoirs.

The *Academy of Sciences, Belles Lettres, and Arts*, was established at Padua, by the senate, near the close of the 18th century; consisting of 24 pensionaries, 12 free associates, 24 pupils, 16 associates from the Venetian states, 24 foreigners and honorary members. A few volumes of Memoirs have been published in Italian.

The *Academy of Sciences and Belles Lettres of Genoa*, was established in 1783, consisting of 32 members; poetry seems to be the point to which they have directed their attention.

The *Academy of Milan* originated in the contracted efforts of a literary society, who published a sheet of observations weekly, on scientific subjects, general criticism, belles lettres, &c. About 1767, a regular society was formed, whose transactions are published, under the title of *Scelta d'Opuscoli Scientifica*.

The *Academy of Sciences at Siena*, was instituted in 1691. Their first volume of transactions was published in 1761; and their publications under the name of *Atti dell' Academia di Siena*, have appeared occasionally, ever since.

The *Academy of Sciences at Verona*, was established about 1789, by M. Longua, whose chief object was to form an association of the principal scientific men in all parts of Italy, for the purpose of literary communication and publishing memoirs. The first volume of which, accordingly appeared in 1782, under the title of *Memorie di Matematica e Fisica, della Società Italiana*, containing the celebrated names of Bosovich, the two Fontanas, and Spallanzani. Academies of a similar description are also established at Mantua, Pisa, and Pavia.

An *Academy of Sciences* was established at Manheim, by Charles Theodore, elector palatine, in the year 1755. It is divided into two classes, *historical* and *physical*, according to the plan originally furnished by Schœpflin. The latter was subjected in 1780, to a subdivision into the *physical* and *meteorological*. The historical and physical memoirs are published, under the title of *Acta Academia Theodoro Palatinae*. The meteorological observations are published separately, under the title of *Ephemerides Societatis Meteorologicae Palatinæ*.

The *Electoral Bavarian Academy of Sciences*, at Munich, was established in 1759, and published memoirs under the title of *Abhandlungen der Bayerischen Akademie*. When the elector became king, he new-organized the society, with a view to give it the precedence over all the literary institutions of Europe. After which, he placed it under the immediate superintendence of the ministry; the privy-counsellor Jacobi, a man of excellent scientific and literary attainments, being president.

The *Electoral Academy at Erfurt*, was instituted by the elector of Mentz, in 1754, consisting of protector, president, director, assessors, adjuncts, and associates. Their memoirs are now published in German, although they originally appeared in Latin.

The *Hessian Academy of Sciences at Giessen*, have also published memoirs, under the title of *Acta Philosophica Medica Academic, Scientiarum Principalis Hessiacæ*. Likewise in the Netherlands, at Flushing, and Brussels, there are scientific academies which have published Memoirs.

The *Royal Irish Academy* arose 1782, from an association of gentlemen, most of them connected with the university, who held weekly meetings for the purpose of reading dissertations on literary and scientific subjects. Indulging the hope of advancing the interests of literature on a more extensive scale, they soon after widened their plan, admitting only such names as were already illustrious, and might do honour to their new institution. This re-organization became the basis of the *Royal Irish Academy*, which professes to unite the advancement of the arts and sciences, antiquities, and every species of literature. Their papers have been numerous; and from 1787 to 1825 they have published fourteen volumes.

A Society was formed in Dublin, similar to the Royal Society in London, as early as 1683, but it declined; and although the plan was revived, under the presidency of the earl of Pembroke, then lord-lieutenant, it was still unsuccessful. In 1740, a physico-historical society arose out of its ruins, which has likewise perished. The state of the population has been exceedingly unpropitious to the cultivation of literature and philosophy.

An *Ecclesiastical Academy* was instituted at Bologna, in Italy, 1687, chiefly with a view of examining the discipline, doctrine, and history, of the different ages of the church.

ACADEMIES OF ARTS.—The *Royal Academy of Arts in London*, established in 1768, was instituted for the encouragement of designing, painting, sculpture, &c. This society is under the patronage of the king, and under the direction of 40 eminent artists of the first rank, in their several professions; who paint from living models, and of whom, nine are annually elected, to attend by rotation, for the purpose of setting the figures, and of examining the performances of the students. There are also a president, a council, and other officers, besides separate professors of painting, architecture, anatomy, and perspective, who annually deliver public lectures on the subject of their respective departments. The academy is open to all students who are desirous

of cultivating the studies to which it is directed ; and, there is an annual exhibition of paintings, sculptures, and designs, many of which have distinguished merit.

The *Academy of Arts at Petersburg*, was instituted by the empress Elizabeth, in 1758, and annexed to the Academy of Sciences; but in 1764 was formed into a separate institution by the empress Catharine, at the suggestion of count Shuvalof; and the number of scholars increased from 40 to 300. The annual revenue was augmented from £4000, its original income, to £12,000. A large circular building fronting the Neva, was constructed for the use and accommodation of the members. The scholars are admitted at the age of six, and continue until they have attained the age of 18; during which time they are instructed in reading, writing, arithmetic, the French and German languages, and drawing. At the age of 14, they are at liberty to choose any of the following arts, which are branched out into four classes. First, painting in all its branches, history, portraits, battles, landscapes, architecture, mosaic, enamelling, &c. Second, engraving on copper-plates, seal-cutting, &c. Third, carving on wood, ivory, and amber. Fourth, watch-making, turning, instrument-making, casting statues in bronze and other metals, gilding, varnishing, imitating gems and medals in paste and other compositions. Prizes are annually distributed to those who excel, and from the aggregate number of those who have attained four prizes, 12 are selected and sent abroad, at the public charge, their travelling expences defrayed ; and, on their settlement in any town, a salary of £60 conferred upon them for the first four years. There is a suitable collection of paintings and models, provided for the imitation of the students, some of which are taken from the best antique statues in Italy, and are of the same size as the originals.

The *Academy of Painting and Sculpture at Paris*, is known to have been instituted at a very early period. The academy of St. Luke, was popular in the 14th century, and in 1430, received many privileges from Charles VII.; subsequently confirmed in 1584, by Henry III.; after which, it became united with the society of sculptors, who met near St. Denys. In consequence of the continual disputes which arose between the sculptors and painters, the academy languished ; but, was afterwards revived by M. Le Brun, Sarazin, Corneille, and other gentlemen of distinguished eminence in their professions, who obtained in favour of it, an arrêt of council in 1648. In 1655, they obtained from cardinal Mazarine, a brevet and letters patent, registered in parliament ; in return for which they chose the cardinal for their protector, and the chancellor for their vice-protector ; and, by the friendly interposition of another minister, M. Colbert, obtained in 1683, a pension of 4000 livres, which enabled them to widen their plan, and tended greatly to facilitate the objects of the society. The academy, shortly after, was made to consist of a protector, vice-protector, director, chancellor, four rectors, a treasurer, four adjuncts, four professors, two of whom lectured on anatomy and geometry, honorary counsellors, a historiographer, two ushers, and a secretary. Twelve

of the most eminent members were selected, each of whom attended in rotation for a month, for the purpose of setting a living model in the proper lights and attitudes, for the imitation of the students, employed in taking draughts and carrying images. For this purpose, he provided a naked man, of tall figure and good proportions, whom he placed before them in the most easy and natural positions, this was called setting the model ; on some occasions, he provided two, and formed a juxtaposition of models ; this was called setting the group. He likewise employed a woman of a graceful appearance, and proportionate stature, whom he placed before the students in the same manner. It is to this careful selection of subjects, and to the copying from the life, more than to an extraordinary measure or warmth of genius, that we attribute the formation of those elegant models, and the draught of those beautiful sketches and designs, for which this academy for a considerable period, has been so highly celebrated ; and which, have tended not a little to call forth the emulation of kindred societies, and to have awokened in many places on the continent, a relish for those ancient arts, which had so long lain dormant. Three prizes, for designs, were distributed among the élèves every three months, and four others for painting and sculpture, annually.

A similar Institution was established at Rome, by Louis XIV., wherein those who had won the annual prizes at Paris were supported three years, with a view to their further improvement.

An *Academy of Drawing and Sculpture*, was established at Mannheim, in 1775, by Charles Theodore, elector palatine, with a view of promoting the fine arts.

An *Academy of Painting and Sculpture* has been founded at Stockholm, containing nine professors, and about 400 scholars. The institution annually distributes three large and three small medals, awarded for the encouragement of rising genius. Those students who most distinguish themselves are also indulged with permission to travel into France and Italy, at the expence of the society. In the hall of this institution are the ancient figures of plaster, presented by Louis XIV. to Charles XI.

The *Academy of Painting, Sculpture, &c. at Vienna*, was founded in 1705, on principles nearly similar.

An *Academy of the Fine Arts* was established at Turin in 1778, who held their meetings in the king's palace.

An *Academy of Architecture* was established at Milan, about the year 1380, by Galeas Visconti; and about the middle of the last century, an academy of the fine arts was established there, in which the pupils were furnished with originals and models : prizes were also distributed annually. This institution, before the effects of the French revolution reached Italy, was one of the best establishments of that kind in the kingdom. In the hall were some admirable pieces of Correggio, and several other ancient paintings, and statues of distinguished merit, amongst which we may mention the small bust of Vitellius, and a statue of Agrippina of most exqui-

site beauty, although it wanted the head and arms which have since been restored.

The Academy of the Fine Arts at Florence had long fallen into decay, but was restored by the late Grand Duke. It contained halls for plaster figures, and nudities for the sculptor and painter. In the hall for plaster figures, were models of all the finest statues in Italy, arranged in two rows; but this, and all similar institutions in Italy, have suffered greatly by the French.

An Academy of the Fine Arts was established at Modena, in which was an extensive saloon, containing many casts of antique statues. It contains also the skull of Corregio; but since it was plundered by the French, it has dwindled into a petty school for drawing from living models. Venice and Mantua contain academies of a similar description.

An Academy for Painting, Sculpture, and Architecture was founded at Madrid, by Philip V. of which the minister for foreign affairs is president: prizes are distributed every three years. At Cadiz is a petty institution, in which a few students are supplied by government with the means of drawing, modelling, &c.

An Academy of Architecture in Paris was established by M. Colbert, in 1671, consisting of a company of skilful architects.

MUSICAL ACADEMIES.—*The Academy of Ancient Music in London* was instituted in 1710, by several eminent performers and gentlemen, to promote the study of vocal harmony. A library was attached, consisting of the best compositions in MS. and print. The gentlemen of the chapel-royal, the choir of St. Paul's, with the boys, assisted in the design. In 1731, a charge of plagiarism against Bononcini, one of the members, nearly destroyed the institution. Dr. Green, Bononcini's friend, withdrew, taking with him the boys of St. Paul's; and, in 1734, Mr. Gates, master of the children of the royal chapel, withdrew. Afterwards it became a musical seminary for the instruction of youth; and by the activity of Dr. Pepusch, the academy continued to subsist.

The Royal Academy of Music in London, arose from the principal of the nobility and gentry uniting to promote the performance of operas, composed by Handel, and performed under his conduct at the theatre in the Hay-market. So extensive was the attention and patronage called forth in favour of the society, that the subscriptions amounted to £50,000. The king conferred upon it the title of Royal Academy, and made a donation of £1000. It consisted of a governor, deputy-governor, and 20 directors. A contest between Handel and Senesino, one of the performers, in which the directors favoured the latter, dissolved the institution. A Royal Society for Music still exists.

An Academy of Dancing was erected by Louis XIV. endowed with great privileges.

An Academy of the Law once existed at Berytus; and another of the Sitientes at Bologna.

ACADEMIES OF HISTORY.—*The Royal Academy of Portuguese History at Lisbon*, was instituted in 1720, by John V.; consisting of a director, four censors, a secretary, and 50 members, each

of whom is expected to discuss some point of the civil or ecclesiastical history of the nation, either in Latin or Portuguese. In ecclesiastical history the prelates, synods, councils, churches, monasteries, eminent characters, reliques, places famous for miracles, &c. within the diocese under discussion, are to be distinctly related in twelve chapters. The civil history extends from the invasion of the Romans to the present time, to improve their knowledge of which, each country member is obliged to search the registers where he lives, and make copious extracts, and original observations. They meet once every 15 days. The academy struck a medal in honour of their prince, containing, on the front, his effigy, with the inscription, 'Johannes V. Lusitanorum Rex'; and on the reverse, he was represented as raising up History, which appeared almost prostrate before him, with the legend, 'Historia Resurget.' Underneath is an abbreviation of the following words: 'REG ia ACAD emia Hist oriae, LUSIT ana INSTITUTA VI. Idus, Decembris, MDCCXV.'

The Academy of Swabian History at Tübingen, was formed for the purpose of publishing the best historical writings, compiling memoirs, writing the lives of eminent historians, &c.

The Academy of History at Madrid, was formed, about 1730, by a few individuals, who agreed to assemble occasionally for the purpose of preserving and illustrating the historical monuments and memoirs of Spain. They drew up a few simple rules, which, in 1738, were confirmed by a royal cedula of Philip V. The society consists of 24 members, who have already published editions of Mariana, Sepulveda, Solis, and the Ancient Chronicles relative to Castile, several of which were before unknown. All the diplomas, charters, &c. belonging to the principal cities and towns from the earliest period, are in their possession. The device of the institution is, a river at its source; the motto 'In patriam populisque fluit.' The academy has long been employed in preparing a Geographical Dictionary of Spain.

ACADEMIES OF BELLES LETTRES, LANGUAGE, &c.—*The Academy of Umidi, at Florence*, afterwards called *Academia la Florentina*, or the Florentine Academy, was instituted in 1549, by the grand duke, Cosmo I., and has always been composed of the most eminent men in Italy. It has paid particular attention to Italian poetry, and has given excellent Italian translations of the Greek and Latin historians.

The Academy of Humourists originated at the marriage of Lorenzo Marcini, a Roman gentleman, on which occasion many persons of rank were present. It being the time of carnival, the gentlemen, to afford diversion for the ladies, recited verses, sonnets, speeches, and comedies, at first extemporaneously, but afterwards by memory and premeditation. The invention of this species of amusement gave them the denomination of Belli Humori. At length, acquiring a relish for these exercises, they resolved to form an academy of Belles Lettres, and altered their title to that of Humoristi, taking for their device a cloud, which, after being formed of the saline exhalations from the sea, falls upon the earth in a gentle shower, refreshing and fertilizing

wherever it comes. Their motto was selected from Lucretius, ‘*Redit agmine dulci.*’

The Academy of Arcadi was instituted in the same city about 1690, to promote the study of poetry and the belles lettres. It is composed of princes, cardinals, and other ecclesiastics, as well as wits of both sexes. It is called Arcadian because, to avoid disputes about pre-eminence, they obliged themselves by a regulation to appear masked as Arcadian shepherds. The number of members, within ten years from its establishment, amounted to 600. They hold seven meetings a year in a field, a grove, or in some gentleman's garden. Six of these meetings are employed in reciting the poems of the Arcadi residing in Rome; all of whom, except ladies, and cardinals, read their own compositions. The seventh meeting is devoted to the compositions of absent members, the recitation of which commonly affords great entertainment, the pieces being written in all the different dialects of Italy. The government of the institution is entirely democratical, allowing of no prince or protector, but only a custos, elected every olympiad, (or fourth year) with the power of appointing 12 others to assist him in the administration, whom he may change yearly at discretion. Under these, for the sake of order, are two sub-custodes, one vicar, or pro-custos, and four deputies, or superintendents annually chosen. The modes of election are five. The first by acclamation, when princes, cardinals, &c. are admitted. The second is by annunciation, used in favour of ladies and academical colonies, where votes are taken privately. The third representation, established in favour of universities, where the young gentry are educated, who can recommend one or two members to be ballotted for privately. The fourth, surrogation, whereby new shepherds are introduced in the room of those that are deceased or expelled. The seventh, destination, whereby, when there is no immediate vacancy, persons of merit are destined to succeed the first vacancy, and receive the title of Arcadi, before an opportunity shall occur for their final admission. All the members at their initiation receive new pastoral names, in imitation of the ancient Arcadians. There are colonies of Arcadians in many other cities in Italy, which are branches of the original institution.

The Royal Academy at Caen was established by letters patent in 1705, though held in private 50 years before that period, in the house of M de Brieux. In 1707, M. Foucault, intendant of the generality of Caen, procured the king's letters patent, by which the society was raised into a perpetual Academy.

An Assembly of men of letters, formed at Lyons in 1712, wanted only letters patent, to constitute a royal academy inferior to few in France.

The Academia della Crusca at Florence, or Academia Furfuratorum, though formed in 1582, obtained no celebrity till 1584, when it attracted the public attention by reason of a dispute between Tasso and several of its members. It has produced an Italian Dictionary of great merit. In this institution Torricelli, the disciple of Galileo, delivered his discourses on the wind, the power of percussion, mathematics, and military

architecture. It is sometimes called the *Bran Academy*, on account of its sifting out words, and rejecting barbarisms, with a view to the refinement of the Italian language. It is now united with the Fiorentina and Apatista, under the general name of Reali Academia Fiorentina.

The Academy of Fructiferi arose in 1617, from an assembly of princes and persons of distinction, who met to refine and perfect the German language. It flourished long under the princes of the empire, who were commonly chosen presidents. The number of members, in 1668, amounted to no fewer than 900. A history of the institution has been written in German by George Neumarek.

The Academic Françoise, or the French Academy, arose from the private meeting of a few men of letters, in the house of M. Conrart, in 1629; and six years afterwards was formed into an academy by cardinal Richelieu, intended for refining and ascertaining the French language and style; comprehending at the same time in its plan, grammar, poetry, and eloquence. Originally the number of members was limited to 40, out of whom a director, chancellor, and secretary, were to be chosen; the latter for life, the former for two months only. The members enjoyed many privileges, one of which was the *droit de committim.*, by which they might refuse to answer or appear before any court, except that of the king's household. At first they met in cardinal Richelieu's apartment, then in that of chancellor Seguier, and afterward, three times a-week in an apartment of the Louvre, now called l'Academie Françoise. At their separation, 40 silver medals were distributed among them, having on one side the head of the king of France, and on the reverse *protecteur de l'academie*, with a laurel and this motto, *à l'immortalité.* This proved an excellent means to secure attendance those who were present receiving the overplus otherwise intended for those who were absent. Religious orders were deemed inadmissible, and expulsion was resorted to only in case of heinous malefaction. To compass their primary object, they not only gave rules, but examples of good writing; and no fewer than 20 of their orations have been printed; but the style has been ridiculed as having a tendency to enervate rather than refine the language. They have produced, nevertheless, a variety of publications; and their speculations, if not exceedingly profound, are however, very beautiful and entertaining; and will be read with pleasure by every one who has cultivated a lively relish for the beauties of rhetoric and belles lettres. The publication of a complete Dictionary of the French Language constitutes their highest celebrity; the derivation of words, the settling of phrases was an employment of 50 years, and was at length completed in 1694. The history of the institution has been written by M. Pelisson, and M. l'Abbé d'Olivet.

A similar institution was founded at Petersburg in 1783, on a plan at first suggested by the princess Dashkof. It was established and endowed by the late empress, and consists of 60 members.

The Royal Swedish Academy, founded in 1786, was intended for the improvement of the

language, purifying it of barbarisms, ascertaining its extent, and reducing it under nine fixed and definite laws; also for the cultivation of the higher graces of poetry and eloquence. It was formed on the plan of the French Academy, and pensions have been granted to some of its members by Gustavus III. A medal is struck by the institution every year, in honour of some illustrious Swede.

The Royal Spanish Academy at Madrid, was founded by the duke d'Escalona. The first meeting was held in his palace in 1713, and in 1714 the king became protector. It consists of 24 members, including the director and secretary, whose object is to improve the language by a careful selection of those terms and phrases, which have been employed by the best Spanish writers, and expunging all low, obsolete expressions and barbarisms; also to distinguish the former from the latter in a dictionary for that purpose. To encourage this undertaking, the academicians are allowed all the immunities and privileges enjoyed by the domestic officers in the king's service, even those in the royal palace. The academy is not to put any thing to the press without permission from the council. Their device is a crucible on the fire, with this motto, "Limpia, fya, da esplendor." "It purifies, fixes, and gives brightness."

ACADEMY is also a term for schools and other seminaries of learning. Of these institutions the Jews had several; the most celebrated are those of Tiberias and Babylon, in which the Jewish Doctors instructed the youth in the Hebrew language, and explained to them the Talmud, and the secrets of the Cabbala. The Romans had two institutions of this kind, where youth were instructed in general literature and science; one at Rome founded by Adrian, the other at Berytus in Phoenicia. The former was famous for the sciences, the latter for the law.

In consequence of the revival of literature, about the 16th century, public schools or academies were formed all over Europe; at Padua, Modena, Naples, Capua, Toulouse, Salamanca, Cologne, and Lyons. The academy of Paris surpassed all the rest in its extended scale of education, the ability of its professors, and the multitude of students by whom it was attended; and was hence distinguished by the title of University, to denote its embracing the whole circle of science. Soon after which, other schools of learning formed themselves upon the same model, and obtained the same title. In the 16th century, academies were founded by the Lutherans at Jena, Helmstadt, and Altorf; and by the Calvinists in Franeker, Leyden, Geneva, and many other places.

The dissenters of England, in consequence of the introduction of certain oaths after the restoration of Charles II. to which they cannot conscientiously subscribe, have been excluded from the Universities, and have formed academies among themselves. Success has amply rewarded their exertions; and the dissenting ministers in these institutions are not only educated and supported on the foundation, but in some respects enjoy advantages not found in the universities.

In many of them, they attend six years; have public examinations once every year; and, different from the universities, the students are expected to attend the *whole* of the time, with the exception of a few weeks allowed after the vacation, to visit different congregations, in the capacity of ministers.

The importance of these institutions to so large a part of the community as the protestant dissenters, must be obvious; and their support, entirely by voluntary subscriptions, evinces a degree of public feeling, worthy of the cause in behalf of which they are established.

The oldest of these academies is Homerton. In this institution two foundations are united; one as old as the restoration, the other as recent as 1730. It was removed from Mile End, and had at that time three professorships, filled by Dr. D. Fisher, as classical tutor; Dr. Conder as divinity tutor; and Dr. T. Gibbons, the biographer of Dr. Watts, as professor of rhetoric and belles lettres. The classical chair of this institution has always stood high. It is filled at present by Dr. Pye Smith, author of some excellent classical publications. The academy receives 20 students, and has furnished some of the most valuable ministers and able theologians that have appeared amongst protestant dissenters.

The Old College at Hoxton, or as it was originally called, *The Evangelical Academy*, was founded in 1783, and removed to its present situation in 1791. It has professors in languages, logic, mathematics, rhetoric, and belles lettres, divinity, elocution, &c. Mr. Halley is the resident tutor. At present it receives about 40 students, who are examined every year before a public assembly of ministers and literary gentlemen, in the Latin, Greek, Hebrew, Samaritan, Arabic, and Chaldee languages and other departments of literature, science, and theology; after which three of the students deliver orations in the academy chapel adjoining the institution, and a report is made accordingly of the meeting. Some of the most eminent men of the present day were educated at this institution. This institution has recently been enlarged; and a handsome building, for the purposes of it, has been erected at Highbury, near Islington. The general plan of the institution is common to all dissenting academies, particularly the public examinations.

The New College at Hackney was formed on Arian and Unitarian principles. High hopes of literary eminence were entertained from the names attached to its original foundation. Dr. Kippis, editor of the *Biographia Britannica*, Gilbert Wakefield, who seceded from the national church, and Mr. Belsham presided over its concerns. Dissensions however prevailed, and it dwindled away. It is now revived on Calvinistic principles, and is become an important and useful institution; Rev. T. Collison, A.M. is the resident tutor.

Rotherham, near Sheffield, is famous for an Academy of considerable eminence, that flourished as early as 1756. The late Dr. Williams presided for many years, and was a man of eminent attainments. His reply to Bishop Tomline's publication, entitled, *A Refutation of Calvinism*,

is considered by eminent judges to be the best defence of modern Calvinism. The academy has no connexion with the original one of Heckinondwicke; but was pronounced a new institution by a committee of the founders held at Halifax on the 11th of September, 1794. It has supplied many able theologians and useful ministers.

An Academy of considerable eminence subsists at *Gosport*, and was lately under the presidency of Dr. Bogue, an eminent theologian recently deceased. In this institution missionary students are educated by the London Missionary Society, by which they are sent to every part of the world. The general laws and regulations are similar to those of other dissenting institutions.

At Newport Pagnel is an Academy for the education of dissenting ministers under the superintendence of T. P. Bull, A. M.

At Axminster also is a similar important institution, under the superintendence of the Rev. Mr. Small, a gentleman of ability and erudition. Both these institutions have furnished many useful and excellent ministers.

The Academy at Wymondly is an extensive and liberal institution, originally established by the late Dr. Doddridge. This establishment has been justly celebrated for classical learning. It is under the direction of the Rev. Mr. Morell.

The Academy at Idle is under the superintendence of the Rev. W. Vint and other gentlemen of eminence, whose labours have contributed, in no ordinary degree, to the extensive usefulness and success of the institution.

The Academy at Blackburn, lately under the superintendence of the Rev. J. Fletcher, A. M. occupies a very conspicuous place amongst dissenting institutions, and is in a prosperous condition. It has furnished many useful ministers. The academies already named belong to the Calvinistic denomination of independent dissenters.

The York Academy, established 1786, on the basis of the original academy at Warrington, is an English presbyterian institution, and has been associated with the celebrated names of Dr. J. Taylor, Hugh Farmer, Job Orton, &c. Dr. Aikin also, father of Mrs. Barbauld, Dr. Priestley, and Dr. Enfield were successively tutors at this place. Dr. Thomas Barnes presided in this establishment at its removal to Manchester in 1786; and was one of the principal founders of the Manchester Literary and Philosophical Society. The classical and mathematical chairs have been justly celebrated. In 1803, it was removed to York. The number of students educated is 20.

The Baptist denomination have several institutions, conducted on an extensive scale, and their usefulness cannot be too highly appreciated.

The first of these is at Bristol, and was lately under the superintendence of Dr. Ryland, whose erudition and talents were well known to the country. The number of students is considerable. Missionary students are educated here.

Stepney Academy is of respectable rank as a dissenting institution, and is under the presidency of Rev. Dr. Newman. The number of students is considerable.

The Academy at Bradford is an institution on the same scale as that at Idle. It is under the

care of Dr. Steadman, whose labours in it have been very important. The general laws of these institutions are similar to those of the independent denomination. There are other similar dissenting institutions at Abergavenny, Exeter, Carmarthen, Wrexham, and others which our limits compel us to omit.

A Political Academy was formed at Paris before the revolution, consisting of six gentlemen, who met on certain days of the week, where they perused political papers, &c. the more effectually to qualify themselves for his majesty's service.

An Academy was formed at Berlin, in 1703, by Frederic I. to educate the nobility of the court suitably to their extraction. The king paid all extraordianries, which rendered the expence moderate. It was called the Academy of Princes, but is now much decayed.

MILITARY ACADEMIES.—The Romans had military academies established all over Italy, which they called Campi Martii, where the ^{young} youth were trained for war at the public expence.

These institutions were not uncommon in Greece, and were superintended by *Tactici*, who taught the higher offices of war.

We have three seminaries of this description: the Naval Academy at Portsmouth, the Royal Military Academy at Woolwich, and the Royal Military College at Farnham and Sandhurst.

The Naval Academy at Portsmouth, was founded by George I. in 1722, although the official warrant is dated 1729. Originally the warrant specified but 40 young gentlemen, fifteen of whom were to be the sons of commissioned officers in the navy. The navy commissioner of Portsmouth was ex-officio governor. Two masters were appointed to instruct the students in navigation and the introductory sciences; and an additional master for writing and drawing. The annual expence was about £1169. In 1806, an order was issued for a new and enlarged establishment, denominated, *The Royal Naval College at Dock Yard, Portsmouth*, of which the first lord of the admiralty was to be governor; and a lieutenant governor and inspector was to be provided, who should be a post-captain in the navy. A professor of mathematics is appointed, who receives £8 annually from each student. There is also a master, a graduate of one of the universities, who teaches classics, moral philosophy, geography, history, &c.; and a writing-master, who teaches, besides writing, arithmetic, algebra, and geometry. There are masters who teach French, drawing, dancing, fencing, &c. The master attendant of the dock-yard gives lessons on nautics, &c. illustrated by vessels in the harbour. The master shipwright of the dock-yard attends the students once a-week, through the dock-yard, illustrates to them the principles on which ships are built, &c. The gunner teaches gunnery, the use of the firelock, &c. The students remain three years, and before they are admitted, their friends give a bond of £200 that they shall enter the sea service. The three years that they remain stands for two of the six years they are required to serve as midshipmen before advancement. The first year they are at sea, they keep journals, draw head-lands, &c. &c.; and when the ship comes into port, they are to attend the

professor, who examines them. The institution, by an act of parliament, 1806, was extended beyond the original design of educating cadets for the navy. A school for shipwrights was established. The professor of the Naval Academy instructs them; and before an apprentice can be taken, he must pass an examination in the first six books of Euclid, and in French, and is then bound to the dock-yard seven years; six of which he spends at the academy, and one at sea. The salary of the apprentices is £60, increasing yearly to £140. They spend half the day with the professor, and half with the master shipwright. From this class, officers and superintendents of naval architecture are commonly chosen.

The Royal Military Academy at Woolwich, established by George II. in the year 1741, was intended to instruct "raw and inexperienced people belonging to the military ordnance in the several parts of the mathematics, necessary for the service of the artillery," &c. In 1776, the number of cadets amounted to 48, and in 1798 to 140. The building in the royal arsenal being in an unhealthy situation, the academy was removed to buildings erected for that purpose on Woolwich Common; 128 cadets were lodged, and 60 were received at the royal arsenal. In 1810, the East India Company withdrew their cadets, who amounted to 40, and the ~~C~~ tra cadets who, for want of room were placed chiefly at Marlow, were taken into the college. The academy now consists of 200 cadets, 72 of whom reside in the arsenal. There is one master for every 16 cadets. The whole number may be enumerated as follows: a professor of fortification, with two assistants; a professor of mathematics, with six assistants; two French masters; three drawing masters, one for figures, one for landscapes, and one for ground; the latter has an assistant. There is also a dancing-master, a fencing master, two modellers, and a lecturer on chemistry. Lectures are also given on philosophy. The inferior parts of education are taught at the arsenal, the higher branches on the Common. The cadets are the sons of noblemen, gentlemen, or military officers. They are considered as the 1st Company of the Royal Regiment of Artillery, and are divided into companies, with proper officers, &c. Each cadet receives 2s. 6d. per day, which covers his expences. Monthly reports are given of the advancement of each in his respective studies, and commissions are distributed according to their merit.

The Royal Military College at Farnham, in Surrey, and at Sandhurst, near Bagshot, was originally settled at *High Wycombe* and *Great Marlow*. That at *High Wycombe* commenced in 1799, when there were 34 cadets. In 1801 it was denominated the Royal Military College by his majesty's warrant, and a supreme board of commissioners appointed to superintend its concerns. In 1802, by his majesty's warrant, a

junior department was formed. Another warrant, issued in 1808, places both departments, forming one college, under the governor and lieutenant-governor. The number of cadets of the junior department was to be 412; and to be divided into four distinct companies, each 103. They are, first, orphan sons of officers who have died or been disabled in the service. They are to be admitted free of expense, but to bring their first suit of uniform, and to be provided with linen, &c. Secondly, the sons of officers serving, who pay a sum annually, according to their rank, of from £10 to £60; and, thirdly, sons of noblemen and gentlemen who pay each not less than £100 per annum. The studies are mathematics, philosophy, history, geography, fortification, military drawing and landscape, arithmetic, classics, French, German, writing, &c. There are four masters of fortification, five of military drawing, three of landscape drawing, four of history, geography, and classics, six of French, one of German, seven of mathematics, three of fencing. This course lasts from three and a half to four years. The candidate before admission, must pass examination, and must be between 13 and 15 years of age. There are monthly and half-yearly examinations previous to any of the cadets receiving commissions from the college, on which occasion, if the examiners approve their proficiency, they have certificates of qualification to serve as officers in the army. The third class may purchase commissions at any time, but cannot obtain them from the college till their proficiency is approved. The senior department is intended for the instruction of officers in the higher parts of their profession. For this purpose they study mathematics, gunnery, fortification, military drawing, castration, surveying, reconnoitring of ground, the disposition and the movement of troops, and all the rules and principles requisite in different circumstances of offensive and defensive war, &c. &c. together with the French and German languages. There are six professors: one for matheinatics, one for fortification, two for military drawing, one for French, and one for German. The number of students is 37. No officer is admitted till he is 21 years of age, and has served with his regiment three or four years. Each student pays thirty guineas annually; and is obliged, the latter part of the time, to keep a horse. If an officer concludes his studies, and passes his examination with credit, he receives a certificate signed and sealed that he is fit for a staff appointment. The students wear uniforms, are subject to the articles of war, and receive 2s. 6d. per day. In 1801, 500 acres of land being purchased at Sandhurst near Bagshot, spacious buildings were erected, and the junior department removed there, the senior department remaining still at Farnham. The East India Company, having withdrawn their cadets from the institution already mentioned, have established one at Hertford, for which see *HERTFORD*.

ACADEMY FIGURE, in painting, is a technical name for an outline of the human subject taken rom the life. Also the copy of such a draught.

ACADIA, or **ACADIE**, a country in N. America, so called by the French, while they had pos- session of it, now **NOVA SCOTIA**, which see. It is

still the name of a small picturesque settlement of the French, on the river Montreal, Lower Canada.

ACENA, in antiquity, *akava*, Gr. a Grecian decemped, or ten-foot rod, used in measuring their lands.

ACENA, in botany, a genus of plants belong-

ing to the class *tetrandria*, order, monogynia. There is only one species, a native of Mexico.

ACAJAIBA, or Acajou, in botany, a name given by some authors, to the tree that produces the Cashew nuts. It is the *ANACARDIUM OCCIDENTALE* of Linnaeus, which see.

ACALANDRUS, in ancient geography, a river falling into the bay of Tarentum, near Metapontum. *Pliny* iii. 2.

ACALEPHE, in botany, the nettle of Theophrastus and Dioscorides.

ACALEPHE, in ornithology, a water-fowl, mentioned by Nicander; also in zoology, a sea animal, mentioned by Aulus Gellius.

ACALYPHA, in botany, the three-seeded mercury, a genus of plants belonging to the class *monoecia*, order *monodelphia*. There are five species, all natives of Virginia.

ACAMAS, in ancient history, the son of Theseus, who followed his father to the siege of Troy, and being sent along with Diomedes to the Trojans, to solicit the restoration of Helen, Laodice, one of Priam's daughters, had a son by him, called Munitus. He was one of the Greeks who afterwards concealed themselves in the wooden horse; also a son of Antenor, the Trojan; and a Thracian monarch, who assisted king Priam in the Trojan war.

ACAMANTIUM, a city of Phrygia.

ACAMATOS, from *a* negative *καμω*, to be wearied. In medicine that position of a limb, which is equally distant from flexion and extension.

ACANACEOUS. See ACANTHACEOUS.

ACANAPIORA, in botany, a name given by some, to the *jacea*, or common knap-weed.

ACANGIS, adventurers, or ravagers; a name given by the Turks to their hussars, who are sent out to procure intelligence, and ravage the enemy's country.

ACANOR, a particular kind of chemical furnace.

ACANTHIA, from *Ακανθα*, Gr. a thorn, in anatomy, the protuberances of the vertebrae of the back, commonly called *spina dorsi*, or the spine.

ACANTHA, in botany, the prickle of a plant.

ACANTHA, in zoology, the spine, or prickly fins of fish.

ACANTHABOLUS, in surgery, from *Ακανθα*, a thorn, and *βαλλω*, to cast away. An instrument for extracting prickles, thorns, &c. In figure it resembles a pair of pincers; but is sometimes made crooked for more conveniently entering the fauces.

ACANTHACEOUS, from *ακανθα*, *aculum*, prickly, a term sometimes applied to plants of the thistle kind.

ACANTHALZUCA, in botany, the echinopus, or globe thistle.

ACANTHE, in botany, a name formerly given to the artichoke.

ACANTHIAS, in ichthyology, a name given by some authors to the thorn-back, a fish, the skin of which is used by our artificers in polishing, and called by them simply fish-skin.

ACANTHICE, mastich, a gum, yielded by the herb helxine.

ACANTHINUM LIGNUM, is used by some writers for Brazil wood.

ACANTHION, among naturalists, a plant of the thorn, or rather of the thistle kind: whose down, being cleansed from the prickles, was manufactured into a kind of stuff, not unlike silk.

ACANTHIS, in ornithology, a bird mentioned by Virgil, Georg. iii. supposed to be the linnet.

ACANTHONOTUS, or NASUS, in ichthyology, a genus of fish of the Indian seas, described by Black as characterised by an elongated body, dorsal fins with spines on the back and abdomen.

ACANTHOPTERYGII, in ichthyology, from *Ακανθα*, a thorn, and *πτερυγιον*, a fin. A class of fishes, in the Linnaean system, the character of which is, that the rays of the fins are bony, and some of them prickly at the extremities. This class contains 17 genera.

ACANTHOS, or ACANTHUS, a town of Egypt, near Memphis, now *Bisalta* or *Dafour*.

ACANTHOS, a maritime town of Macedonia, W. of mount Athos, now called *Erisso*. Near this was Xerxes's ditch, or canal, whereby he attempted to separate Athos from the continent, to convey his ships without doubling the mount into the Singitic bay. Also a town of Epirus, and an island mentioned by Pliny, v. 32.

ACANTHUS, bear's-breech, or brank-ursine, in botany, a genus of the angiospermia order, belonging to the didynamia class of plants; and ranking in the 40th natural order, personatæ. See BOTANY.

ACANTHUS, in architecture, an ornament representing the leaves of the acanthus, used in the capitals of the Corinthian and Composite orders. To the Corinthian capital this ornament adds its characteristic beauty: "The whole plant," as Mr. Elmes elegantly observes, "surrounds with its aspiring leaves, the vase or ball of the capital, as if attempting to lift up the abacus that covers the whole; they then turn down and form themselves into graceful volutes."

ACANTHUS, a name given by Theophrastus to the acacia tree.

ACANTHURUS, in ichthyology, a subdivision of the Linnaean genus, chatodon, containing 15 species, according to Dr. Shaw.

ACANTICONE, in mineralogy, of the genus of flint. It was formerly considered as a variety of common actinolite; but Werner and Haüy have proved it a distinct species, nearly allied to agate, it is the pistacite of Werner, the arandilite of D'Andrade, and the thallite of La Metherie.

ACANZII, Turkish light horse, the avant guard of the grand signior's army.

ACAPATLI, in botany, the piper longum of Linnaeus, or the plant which produces long pepper.

ACAPELLA, in church music, denotes that the instrumental and vocal are to continue in unison.

ACAPNON, *ακαπνον*, in botany, a name of the sampsuchum, or marjoram: also of dry wood.

ACAPULCO, or LOS REYES, a considerable town and port in Mexico, on the South Sea, the capital of New Spain. A ship annually sails hence to Manilla, in the Philippine Islands, near the coast of China, laden with precious metals

and other goods to the value of £350 or 400,000: the metals alone being generally worth £250,000; and another returns in July or August, with diamonds, rubies, and other precious stones; the carpets of Persia; the camphire of Borneo; benjamin and ivory from Pegu and Cambodia; muslins, waste cottons, gold dust, tea, China ware, silk, and cabinets of China and Japan; besides cinnamon, cloves, mace, nutmegs, and pepper. The goods brought to Acapulco are carried to the city of Mexico by mules and pack-horses; and from thence to Vera Cruz on the North Sea, in order to be shipped for Europe. Acapulco itself is an inconsiderable place, containing not more than 4000 inhabitants, except at the annual fair on the arrival of the Manilla galleon. Ships arrive at the port by two inlets, separated from each other by a small island, the entrance into them in the day time is by means of a sea-breeze, and the sailing out by night is effected by a land-breeze. A passage has been recently cut through the mountains to give increased circulation to the air; but its unhealthiness, as a residence, seems incurable, and the inhabitants are the constant prey of the cholera morbus and bilious fevers. Earthquakes are also common; and the insects that choke the atmosphere intolerable to Europeans. A wretched fort, 30 pieces of cannon, and a small garrison defend it. But the harbour is equally extensive, safe, and commodious; surrounded by lofty mountains, which are so dry, that they are destitute of water. The air here is hot, heavy, and unwholesome; to which none can habituate themselves, except certain negroes that are born under a similar climate, or mulattoes. Lon. 100°. W. lat. 16°, 50' N.

ACARA, in ichthyology, the name of a fish caught in the fresh waters of the Brazils, and esteemed a very delicate and well-tasted one. It seldom exceeds three or four inches in length, and has a high back like the perch.

ACARAYA, or GARANHA, in ichthyology, the name of a fish caught on the Brasilian shores, which grows to three feet in length, and is the shape of our carp. It is eaten in Brasil, both fresh and salted.

ACARAI, or ACARIA, a town of Paraguay in South America, built by the Jesuits in 1624. Lon. 51°, 5' W. Lat. 26°, 0'. S. Also a river of Paraguay.

ACARAMUCU, in ichthyology, the balistes monoceros of Linnaeus. See MONODON.

ACARAPEBA, in ichthyology, the name of a small American fish, called also *braseme*. It seems a kind of Smaris.

ACARAPINIMA, in ichthyology, the name of a Brasilian fish, of the *Cantharus* kind.

ACARAPITAMBA, in ichthyology, the name of a fish caught in the Brasilian seas, of an oblong figure, resembling the mullet, and growing to two feet or more in length. Its mouth and teeth are very small.

ACARAPUCU, in ichthyology, the name of a well-tasted fresh-water fish, of Brasil growing to eighteen inches in length.

ACARAUNA, in ichthyology, an American fish, of which there are two species; the one called *Acarauña*, without any addition; and the

other *Acarauña Quadrata*, or the *Square Acarauna*; and by our sailors the *old wife*.

ACARI, or ACARIS, in natural history, an animalcule bred in wax; said by Aristotle to be the least object of human sight.

ACARI, a cape, river, and settlement, lon. 75°, 8'. W. Lat. 15°, 15'. S. in the province of Cumana, Peru. Also a river in Para, Brazil, which enters the Amazon at its mouth.

ACARIGUA, a river and settlement in the province of Venezuela, South America. The former rises near the town of Araure, and discharges itself into the La Portuguesa.

ACARNA, in botany, a name given by Theophrastus and others to the artichoke.

ACARNAN, in ichthyology, the name of a small sea fish very common in the Mediterranean, and called by the fishermen *fravolino* or *phragolino*. It differs little from the erythrinus, except in colour.

ACARNANIA, anciently Curetis, the first country of Free Greece, or Greece Proper, bounded on the W. by the Sinus Ambracius, and separated from Aetolia by the river Achelous, on the E. and by the Sinus Ambracius from Epirus. The people were called *Acarnanes*, denoting persons unshorn; other Aetolians, to the E. of the Achelous, being called *Cretes*, by Homer, from being shorn. According to Lucian, they were noted for effeminacy and incontinence; hence the proverb, *Porellus Acarnanius*. This country was famous for an excellent breed of horses; so that *Ακαρνινος ιππος*, is a proverbial saying for a thing excellent in its kind. It is now called *la Carnia* and *il Despotato*.

ACARNAR, ACHARNAR, or ACHERNER, a star of the first magnitude, in Eridanus; "invisible in our latitude."

ACARON, or ACCARON, called *Ekron* in Scripture, which see.

ACARTUM, in chemistry, red lead.

ACARUS, in entomology, the tick, or mite, a genus of insects belonging to the order of aptera, or such as have no wings. They are of the chatodon genus of Linnaeus; which includes also the black acarauna and the acarauna altera major of Willoughby; and the acarauna maculata of others.

ACASTUS, in classic history, the son of Pelias, king of Thessaly, and a famous hunter, married Hippolyta, who being disappointed in her passion for Peleus her step-son, she accused him to her husband of attempting her virtue; for which he was exposed to wild beasts. But Vulcan, by Jupiter's order, rescuing Peleus, he made successful war on Thessaly, and slew Acastus and Hippolyta. Also, the second Athenian Archon.

ACATALECTIC, n. s. *ακαταληκτικος*, Gr. A verse which has the complete number of syllables, without defect or superfluity.

ACATALEPSIA, ACATALEPSY, from a private, and *καταληψις*, comprehension. In philosophy, incomprehensibility; that which cannot be conceived.

ACATALIUS, in botany, the juniper berry.

ACATAPEC, a settlement of the province of Tehuaca, New Mexico; also the name of several small settlements of South America.

ACATERY, or **ACATRY**, anciently an officer of the king's household, designed for a check between the clerks of the kitchen and the purveyors.

ACATHARSIA, in medicine, an impurity of the blood or humours.

ACATHISTUS, in ecclesiastical affairs, a hymn anciently sung in the Greek church, *ακαθιστος*, i. e. without sitting, on the Saturday of the fourth week in Lent, in honour of the Virgin, for having thrice delivered Constantinople from the barbarous nations.

ACATIUM, in ancient navigation, a boat or pinnace used for military purposes. Also the large sail placed in the middle of a ship. *Poll. Onon.* ii. 81.

ACATLAN, the name of six small native settlements, in New Mexico.

ACAULIS, or **ACAULOUS**, in botany, terms applied to plants, the flowers of which have no pedicel or stalk to support them, but rest immediately on the ground, such as the carline thistle, &c.

ACAYUCA, a town and district of New Mexico, on the coast of the North Sea, 100 leagues S. E. of Mexico. Also a settlement in New Spain, containing 100 Indian families.

ACBAR, in mythology, an idol of enormous size, which the Arabians are said formerly to have worshipped; an idolatry from which, with difficulty, Mahomet restrained them.

ACBAR. See **AKBAR**.

ACBERPOOR, or **ACBERPURA**, a town in the province of Oude, Hindostan, and one of the remaining possessions of the Nabob. It stands in N. lat. 26°, 27'. and E. long. 82°, 35'. South of Fyzabad about 30 miles.

ACBERPOOR, also called **AJETMUL**, a town in the district of Etaweh, province of Agra, Hindostan, 25 miles N. of Caunpoor. N. lat. 26°, 23'. E. long. 82°, 30'.

ACCA LAURENTIA, the nurse of Romulus and Remus, and wife of Faustulus, the shepherd of king Numitor. She was called *Lupa* from her loose character; whence the fable of their king being suckled by a wolf. To her honour the Accalia were dedicated; though some writers suppose them to have been instituted in honour of another courtesan. *Plut. Quast. Rom. in Romul.* This feast was also called Laurentalia.

ACCA, (St.) bishop of Hagustaldt, or Hexam, in Northumberland, in 709. He ornamented his cathedral magnificently, and erected a library. Acca was famous for his skill in church music, and wrote *Passiones Sanctorum*, and *Pro illustrandis Scripturis, ad Bedam*. He died in 740, having enjoyed the see of Hexam 31 years.

ACCABA, a chain of mountains between Palestine and Arabia Petrae, N. E. of the Red Sea, immediately by the Mount Hor of Scripture, northward. It is a range which the Mecca pilgrims are constantly passing, and on which many of their camels are lost. Also a fortress of this neighbourhood, 150 miles E. S. E. of Suez. It was the Ezion-geber of Scripture, used by Solomon; and the Berenice of Ptolemy.

ACCADEMIA, among musicians, a concert.

ACCAPITARE, **ACCAPTARE**, or **ACAPTARE**, from *ad*, to, and *caput*, the head, because vassals

own their lords for their head. In old law, the act of becoming vassal to a lord, or yielding homage to him. **Accipitum**, or **Accipitamentum** was the money paid by the vassal.

ACCAWAW, INDIANS, one of the aboriginal tribes of Guiana. They lived amicably with the Dutch settlers; but were much addicted to the use of vegetable poisons on their arrows and spears.

ACCEDAS AD CURIAM in the English law, a writ of the court of Chancery, where a man has received, or fears, false judgment in an inferior court.

ACCEDAS AD VICE-COMITEM. a writ directed to the coroner, commanding him to deliver a writ to the sheriff, who having a *Pone* delivered to him, suppresses it.

ACCEDONES, or **ACCENDONES**, from *accedo*, to accede. In Roman antiquity, a species of gladiators, who excited or animated the combatants in the public games.

ACCEDE , <i>v.</i> ACCESS' , ACCESS'ARINESS , ACCESS'ARY , or { <i>n. & adj.</i> ACCESS'ORY , { <i>n. & adj.</i> ACCESSIBLE , ACCESSION .	Ad. cedo ; to go to or towards, supposing a fixed point to which we are advancing; to come near to, or approach, in order to render assistance, or to confer a benefit. Hence, to assist, to agree to, to bestow a favour. Accession also signifies addition, increase.
--	--

Beside all this, he was ful gnevously;
For vpon tim he had an hote *access*,
That day by day him shooke full pretously.

Chaucer, of the Blache Knight.

When we are wrong'd, and would unfold our griefs;
We are deny'd *access* unto his person,
Ev'n by those men that most have done us wrong.

Shakspeare.

Away, I prythee,
Do as I bid thee. There's no more to say,
Accessible is none but Milford way.

Shakspeare's Cymbeline.

He grants what they besought;
Instructed, that to God is no *access*
Without Mediator; whose high office now
Moses in figure bears.

Milton, b. xii. l. 239.

They anon,
With hundreds and with thousands, trooping came,
Attended: all *access* was threng'd: the gates
And porches wide; but chief the spacious hall
Thick swarm'd.

Milton's Paradise Lost, b. ii

As for those things, that are *accessory* hereunto
those things, that so belong to the way of salvation
&c.

Hooker, b. iii. sec. 3.

For, as relapses make diseases
More desperate than their first *accesses*. *Hudibras.*

The reputation
Of virtuous actions past, if not kept up
With an *access* and fresh supply of new ones,
Is lost and soon forgotten. *Denham's Sophy.*

He, (the Earl of Strafford,) had taken upon him
the government of Hull, without any apprehension
or imagination that it would ever make him *accessory*
to rebellion. *Clarendon's History of Rebellion.*

And here th' *access* a gloomy grove defends;
And here th' unnavigable lake extends;
O'er whose unhappy waters, void of light,
No bird presumes to steer his airy flight.

Dryden's Aeneid, vi.

They go, commissioned to require a peace ;
And carry presents, to procure access.

Dryden's Aeneid, viii. 209.

And vain were reason, courage, learning ; all,
Till power accede ; till Tudor's wild caprice
Smile on their cause. *Shenstone's Ruined Abbey*.

With longing eyes, and agony of mind,
The sailors view their refuge left behind ;
Happy to bribe with Indies richest ore,
A safe accession to that barren shore.

Falconer's Shipwreck.

ACCELERATE, *v.* Ad : *celero*, *celer*,
ACCELERATION, *n.* to hasten to ; to move
ACCELERATIVE. *n.* with increased speed
or quickness.

Take new beer, and put in some quantity of stale
beer into it ; and see whether it will not accelerate
the clarification, by opening the body of the beer,
whereby the grosser parts may fall down into lees.

Bacon's Natural History, No. 307.

By a skilful application of those notices, may be
gained the accelerating and bettering of fruits, and
the emptying of mines, at much more easy rates,
than by the common methods. *Glanville, Sepsis*.

If the rays endeavour to recede from the densest
part of the vibration ; they may be alternately accelerated and retarded, by the vibrations overtaking
them. *Newton's Optics*.

Spices quicken the pulse, and accelerate the motion
of the blood, and dissipate the fluids ; from whence
leanness, pain in the stomach, loathings, and fevers.
Arbuthnot on Aliments.

The degrees of acceleration of motion, the gravitation
of the air, the existence or non-existence of
empty space, either coextensive or interspersed, and
many the like, have taken up the thoughts and
time of men in disputes concerning them.

Hale's Origin of Mankind.

Lo ! from the dread immensity of space,
Returning, with accelerated course,
The rushing comet to the sun descends,
And, as he sinks below the shading earth,
With awful train projected o'er the heavens,
The guilty nations tremble.

Thomson's Autumn.

ACCELERANTE, in music, a direction to
performers to quicken the time.

For ACCELERATION of the gravitation of
bodies. See MECHANICS.

For ACCELERATION of the motion of compressed bodies. See ELASTICITY.

For ACCELERATION of the motion of pendulums. See MECHANICS.

For ACCELERATION of the motion of projectiles. See PROJECTILE.

ACCELERATION of the fixed stars, in astronomy,
the difference between the revolution of the
primum mobile, and the solar revolution ; which
has been computed at three minutes and 56 seconds.

ACCELERATION of a planet. The increase of
its real diurnal motion, above its mean diurnal
motion.

ACCELERATION of the moon, is a term used to
express the increase of the moon's mean motion
from the sun, compared with the diurnal motion
of the earth. See ASTRONOMY.

ACCELERATORES URINÆ, in anatomy,
muscles which serve for rejecting or expediting
the passage of the urine. See ANATOMY.

ACCENDENTES, or ACCENSORES, in ecclesiastical writings, a lower order of ministers in the church of Rome, whose office is to light and trim the candles, or tapers.

ACCENDO, *v.* Ad : *cendo*. To set fire to ; to
ACCENSION. *n.* light up. Obsolete.

ACCENSI, in the Roman armies, a reserve of soldiers, thus denominated, *quia accensabantur*, *ad censum adficiebantur*. They were sometimes also called *velites* and *relati*, because they fought clothed but not in armour ; sometimes *adscripti*, and *adscriptivi* ; sometimes *rorarii*. The *accensi*, Livy observes, were placed at the rear of the army, because little was expected from them ; they were taken out of the fifth class of citizens. Also an inferior order of officers appointed to attend the Roman magistrates, whose office it was to call assemblies of the people, before the judges, and at the public games. They also used to cry the hour.

ACCENT, *n.* & *v.* Ad : *cano*, *accino*,
ACCENT'UAL, *n.* accentum ; to sing to ;
ACCENTUA'TION, *n.* to sing in concert ; to
sound according to prescribed rules of utterance.
Accentuation applies to the marks in books, directing the accent.

How many ages hence
Shall this, our lofty scene, be acted o'er,
In states unborn, and accents yet unknown !

Shakespeare's Julius Caesar.

Winds ! on your wings to heav'n her accents bear !
Such words, as heav'n alone is fit to hear.

Dry. Virg. past. 3.

The tender accent of a woman's cry
Will pass unheard, will unregarded die ;
When the rough seaman's louder shouts prevail,
When fair occasion shews the springing gale.

Prior.

Tis the clime of the east, 'tis the land of the sun,
Can he smile on such deeds as his children have
done ?

Oh ! wild as the accents of lovers' farewell
Are the hearts which they bear, and the tales which
they tell. *Lord Byron's Bride of Abydos*.

ACCENT, among grammarians, is a certain mark or character placed over a syllable, to direct the stress of its pronunciation. We generally reckon three grammatical accents in ordinary use, all borrowed from the Greeks : viz. the acute accent ('), which shows when the tone of the voice is to be raised. The grave accent (˘), when the note or tone of the voice is to be depressed. The circumflex accent (^), is composed of both the acute and grave, and points out a kind of undulation of the voice. The Latins have made the same use of these three accents.

ACCENTS, among the Hebrews, have a grammatical, a rhetorical, and musical effect : though the first and last seem, indeed, to be the same, both being comprised under the general name of *tonic accents*, because they give the proper tone to syllables ; as the rhetorical accents are said to be euphoniac, because they tend to make the pronunciation more sweet and agreeable. There are four euphoniac accents, and 25 tonic ; of which some are placed above, and others below the syllables ; the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish the sections, periods, and numbers of periods, in a discourse ; and to answer the

same purposes with the points in other languages. Their accents are divided into *emperors*, *kings*, *dukes*, &c. each bearing a title answerable to the importance of the distinction it makes. Their emperor rules over a whole phrase, and terminates the sense completely; answering to our point. Their king answers to our colon; and their duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short. The management and combination of these accents differ in Hebrew poetry from what they are in prose. The use of the tonic or grammatical accents has been much controverted; some holding that they distinguish the sense; while others maintain that they are only intended to regulate the music, or singing; alleging that the Jews sing, rather than read, the Scriptures in their synagogues. The best supported opinion is, that they were invented about the sixth century, by the Jewish doctors of the school of Tiberias, called the *Masoretes*.

ACCENTS, among the Greeks, now seen both in manuscripts and printed books, have occasioned no less dispute about their antiquity and use, than those of the Hebrews. Isaac Vossius endeavours to prove them of modern invention; others contend, that the right pronunciation of their language being natural to the Greeks, it was needless to mark it by accents in their writings; and that, they only began to make use of them so late as the period in which the Romans, being curious to learn the Greek tongue, sent their children to study at Athens; a little before Cicero's time. Wetstein, Greek professor at Basil, in a learned dissertation, endeavours to prove the Greek accents of an older standing. He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the different parts of Greece. He brings several reasons *à priori*, for the use of accents, even in the earliest days: as, that they then wrote all in capital letters equidistant from each other, without any distinction either of words or phrases, which without accents could scarce be intelligible; and that accents were necessary to distinguish ambiguous words, and to point out their proper meaning; which he confirms from a dispute on a passage in Homer, mentioned by Aristotle in his *Poetics*, chap. v. Accordingly, he observes that the Syrians, who have tonic, but no distinctive accents, have yet invented certain points, placed either below or above the words, to show their mood, tense, person, or sense.

The Chinese are said to have but 330 spoken words in their language; but these being multiplied by the different accents or tones, which affect the vowels, furnish a language tolerably copious. Magalhon makes the language *the easiest* to learn on this account. The Siamese are also observed to sing rather than talk. Their alphabet begins with six characters, all only equivalent to a K, but differently accented. For though in the pronunciation the accents are naturally on the vowels, yet they have some to diversify such of their consonants as are in other respects the same.

ACCENT, in music, is a certain enforcement of

particular sounds, whether by the voice or instruments, generally used at the beginning of bars.

The ACCENTS OF SENTENCES seem to have been almost totally overlooked, while those of words have been studied most minutely; it is indeed remarkable, that all mankind seem to agree in lowering the voice at the end of a period, and elevating it in interrogations, and the like. See *Bacon de Aug. Scient.* vi. 1. and *Elem. Crit.* ii.

ACCEPTOR, in music, he that sings the leading part in a choir.

ACCEPT^T, v.

ACCEPT^ABLE,

ACCEPT ^A BLENESS,	Ad: <i>cupo</i> ; <i>accipio</i> , ac-
ACCEPT ^A BLITY,	ceptum, to take to, to take
ACCEPT ^A BLY,	to one's self; to receive
ACCEPT ^A ANCE,	{ what is offered, generally
ACCEPT ^A TION,	with pleasure or satisfac-
ACCEPT ^A ER,	tion: sometimes merely
ACCEPT ^A ION,	expressing assent.
ACCEPT ^A IVE,	
ACCIP ^A IENT.	

The same epithet in several places *accepts* sundry interpretations.

Fuller's Worthies.

What will God accept from us, if not prayers?

Hall's Contemplations.

If it be little, he will accept it into grace and make it bigger.

Jeremy Taylor.

Neither ~~●~~ ye kindle fire on my altar for nought. I have no pleasure in you, saith the Lord of hosts, neither will I accept an offering at your hand.

Malachi, i. 10.

God is no respecter of persons; but, in every nation, he that feareth him, and worketh righteousness, is accepted with him.

Acts x. 34, 35.

This is a faithful saying, and worthy of all acceptance, that Jesus Christ came into the world to save sinners.

St. Paul, 1 Tim. iv. 15.

Do not omit thy prayers, for want of a good oratory; for, he that prayeth upon God's account, cares not what he suffers, so he be the friend of Christ; nor where nor when he prays, so he may do it frequently, fervently, and acceptably.

Taylor.

By that acceptance of his sovereignty, they also accepted of his laws; why then should any other laws now be used amongst them?

Spenser's State of Ireland.

If he tells us his noble deeds, we must also tell him our noble acceptance of them.

Shakespeare's Coriolanus.

Thus I imbolden'd spake, and freedom us'd

Permissive, and acceptance found.

Paradise Lost, b. viii. l. 435.

You have been graciously pleased to accept this tender of my duty.

Dryden's Dedication to his Fables.

Charm by accepting, by submitting sway;
Yet have your humour most, when you obey.

Pope.

ACCEPTANCE, in commerce, is the subscribing, signing, and making one's self debtor for the sum contained in a bill of exchange or other obligation. It is also applied in law, to such a receiving of rent as acknowledges a tenant, &c.

ACCEPTILATION, n. s. *acceptilatio*, Lat.

A term of the civil law, importing the remission of a debt by an acquittance from the creditor, testifying the receipt of money which has never been paid.

ACCEPTOR, in commerce, the person who accepts a bill, and is bound to pay it.

ACCEPTORIUS MODIOLUS, in antiquities, the vessel employed in aqueducts for holding water, distinguished from the erogatonius, which was to deal it out.

ACCESSION, in law, is a method of acquiring property, by which, in things that have a close connection or dependence upon one another, the property of the principal thing draws after it the property of the accessory: Thus, the owner of a cow becomes likewise the owner of the calf. It sometimes likewise signifies consent or acquiescence.

ACCESSION, in medicine, denotes a fit, or return of some periodical disease. It is sometimes confounded with paroxysm: but they are different; an accession being the beginning of a disease, a paroxysm the height of it.

An ACCESSARY, in law, is of two kinds, i. e. an accessory before and after the fact. Accessories before the fact, are those who, though absent, yet procure, command, or encourage, another to commit a crime. Accessories after the fact, those who receive or relieve the felon, knowing his felony. The latter are always considered as less criminal than the principal, (as in murder particularly,) the former equally so.

An ACCESSARY in felony shall have judgment of life and member, as well as the principal who did the felony; but not till the principal be first attainted, and convicted, or outlawed thereon. When the principal is pardoned without attainer, the accessory cannot be arraigned. Such was the law till lately; but now accessories may be convicted without the principal. In the lowest and highest offences all are principals; as in riots, routs, forcible entries and other trespasses, which are the lowest offences. So also in the highest offence, which is high treason, there are no accessories. It is the same as art and part in Scots law.

ACCESSORY NERVES, ACCESSORII, OR PAR ACCESSORIUM WILLISII, so called from Dr. Willis, the discoverer; in anatomy, a pair of nerves, which, arising from the medulla in the vertebrae of the neck, ascend, and enter the skull, and pass out of it again with the par vagum, wrapped up in the same common integument; and after quitting them, are distributed into the muscles of the neck and shoulders. See ANATOMY.

ACCHO, a city of Galilee, on the coast of the Mediterranean, which formerly belonged to the tribe of Asher. It stood on the scite of the celebrated ACRE of ancient and modern times. See ACRE.

ACCI, or ACTI, in ancient geography, a town of Tarracoenensis; supposed to be *Guadix*, to the east of the city of Granada, now greatly decayed. It is the Colonia Accitana of some repute among the Roman colonies. The people were called Gemellenses, because the colony was formed from the third and sixth legions.

ACCIACATURA, in music, is struck simultaneously with the whole harmony; and is thus opposed to the Appoggatura. It is used with great effect in basses.

ACCIAIOLI, (Donata,) a man famous for his learning, and the honourable employments he possessed in Florence, his native country, in the 15th century. He wrote a Latin translation of

some of Plutarch's Lives; Commentaries on Aristotle's Ethics and Politics; and the life of Charlemagne. He was sent to France by the Florentines, to sue for succour from Louis XI. against Pope Sextus IV, but died on his journey at Milan. His body was carried to Florence, and buried in the church of the Carthusians. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Aristides, were married at the public expence, as an acknowledgment of his services.

ACCIAIOLI, (ZANOBIO and JOHN,) were learned men of the same family, with the foregoing. The first was born at Florence, 1461; and patronized by Lorenzo the Magnificent, of whose son, when Leo X. he received the office of librarian to the Vatican. He published the Greek Epigrams of Politian; translations of Ensebius, Olympiodorus and Theodoret; and Orations, in praise of Naples and of Rome. He died in 1519. JOHN ACCIAIOLI was bred to the bar, at Florence, and lectured at Padua with great applause. He published 'Multa Doctissimum Problematum Monumenta,' &c. and died at the close of the 16th century.

ACCIDENCE, n. Ad : *cado, accedo, accidens*, to fall to or at;

ACCIDENTAL, S to befall, to happen to;

ACCIDENTALLY, S usually including surprise, chance, or unnecessary, that is, non-essential addition.

These cokes how they stamp, and strain, and grind,
(And turnen substance into accident,
To fulfill all thy likerous talent;—)

Chaucer, Pardonere's Tale.

If all the yeare were playing holidaies,
To sport, would be as tedious as to worke;
But when they seldom come, they wisht-for come,
And nothing pleaseith but rare accidents.

Shakspeare's 1st Henry IV. p. 50, act i. sc. 2.

Thy sin's not accidental, but a trade.

Shakspeare's Measure for Measure.

So shall you hear

Of accidental judgments, casual slaythers;
Of deaths, put on by cunning and fore'd cause.

Shakspeare's Hamlet.

Look upon things of the most accidental and mutable nature; *accidental*, in their production; and mutable, in their continuance: yet God's prescience of them is as certain in him, as the memory of them is, or can be in us.

Ay, such a minister as wind to fire;

That adds an accidental fierceness to

Its natural fury. *Denham's Sophy.*

Although virtuous men do sometimes accidentally make their way to preferment; yet the world is so corrupted, that no man can reasonably hope to be rewarded in it, merely upon account of his virtue.

Swift's Miscellanies.

ACCIDENS, in philosophy, denotes what does not follow from the nature of a thing, but from some accidental qualities thereof in which sense it stands opposed to *per se*, which denotes the nature and essence of a thing. Thus, fire is said to burn *per se*, or considered as fire, and not *per accidens*; as a piece of iron, though red hot, only burns *per accidens*, by a quality accidental to it, and not considered as iron.

ACCIDENT, in grammar, a property attached to a word, without entering into its essential

definition. A word is said to be primitive, when it is taken from no other word in the language in which it is used: thus, *heaven, king, good*, are primitive words; but *heavenly, kingdom, goodness*, &c. are derivatives. Besides these accidents, which are common to all sorts of words, each particular species has its accidents: thus the accidents of the noun substantive are the gender, declension, and number; and the adjective has the accident of comparison. See the articles GRAMMAR and LANGUAGE.

ACCIDENT, in heraldry, an additional point or mark in a coat of arms, which may be either omitted or retained without altering the essence of the armour, such as abatement, difference, and tincture.

ACCIDENT, among physicians, is sometimes used for what is more generally called symptom.

ACCIDENT ABSOLUTE is a term used in the Roman Catholic theology for an accident, which subsists, or may possibly subsist, at least miraculously, and by some supernatural power, without a subject; such as the colour, flavour, figure and taste of the bread and wine in the eucharist, which remain after these elements, as it is stated, are changed into flesh and blood! The Cartesian Catholics, whose philosophy leads them to deny the existence of absolute accidents, have laboured hard, but in vain, to reconcile their philosophical with their religious tenets.

ACCIDENTS, in astrology, denote the most extraordinary occurrences in the course of a man's life: such as, a remarkable instance of good fortune, a signal deliverance, a great sickness, &c. Also certain casual dispositions, and affections, of the planets, whereby they are supposed to be either strengthened, or weakened, by their being in such a house of the figure.

ACCIDENTAL COLOURS, in optics, are those which depend upon the affections of the eye, in contradistinction to those which belong to the light itself. The impressions made upon the eye, by looking steadfastly at a particular colour, are various, according to the single colour, or combination of colours in the object; and they continue for some time after the eye is withdrawn, and give a false colouring to other objects. The Count de Buffon has endeavoured to trace the connections, which these accidental colours have with such as are natural, in a variety of instances. The subject has also been considered by De la Hire and M. Epenus: and M. d'Arcy has contrived a machine for determining the duration of the effects of light, and after several trials, finds that it continues about eight thirds of a minute. See OPTICS.

ACCIDENTAL POINT, in perspective, is that point in the horizontal line where the projections of two lines parallel to each other meet the perspective plane.

ACCIPENSER, in ichthyology, a genus of fishes, belonging to the order of Nantes, and class Amphibia, in the Linnean system. It has a single linear nostril: the mouth in the under part of the head, contains no teeth; and the cirri are below the snout, and before the mouth. There are three species of this genus, viz. the

1. ACCIPENSER HIUO.
2. ACCIPENSER RUHENUS, this has been called also ACCIPESIUS,

and ONTSCOS by Greek writers. 3. ACCIPENSER STURIO, or the sturgeon.

ACCIPITER, in ichthyology, a name given by Gellius, and some authors, to the fish *milvus* and *lucerna*. It is a species of the trigla; with the head a little accutated, and with a singular fin, placed near the pectoral fins.

ACCIPITER, in the Linnaean system of zoology, the name of the first order of birds, the distinguishing character of which, is, their having a crooked beak. Of this order there are four genera: the *vultur*, *falco*, *strix*, and *lanius*, and seventy-two species.

ACCIPITER, in Roman antiquity and ornithology, the hawk, which, from its carnivorous nature, and its frequenting fields of battle, they considered as a bird of bad omen. Pliny, however, tells us, that in some cases, particularly in marriage, it was esteemed a bird of good omen, because it never eats the hearts of other birds; intimating thereby, that no differences in a marriage state ought to reach the heart. The accipiter was worshipped as a divinity by the inhabitants of Tentyria, an island in the Nile, being considered by them, from the sharpness of its sight, as the image of the sun; and hence we find that luminary represented, in hieroglyphics, under the figure of a hawk.

ACCIPIRINA, in botany, the hawk-weed, called also flax-weed, and sophia chirurgorum.

ACCISMUS, *akkētopos*, a feigned refusal of something which a person earnestly desires: supposed to be formed from *Acco*, the name of a foolish old woman, famous in antiquity for an affection of this kind. Accismus is sometimes considered as a virtue, sometimes as a vice, which Augustus and Tiberius practised with great success. Cromwell's refusal of the crown of England may be brought as an instance of an accismus. It is used in rhetoric, as a species of irony.

ACCITE, v. Ad: *cito*, anciently *cito citum*, to move to stir, to summon. Obsolete. See CITE.

When the place was ready, the kynge and the queene were *accited*, by Docter Sampson, to appere before the legates, at the forenamed place, the twentie and eight day of May.

Hall, p. 756.

A nobler man, a brauer warrior,
Lives not this day within the city walles.

He by the senate is *accited* home
From weary warres against the barbarous Gothes.

Shakespeare's Tit. And. p. 31, act i. sc. 2.

Our coronation done, we will *accite*
(As I before remember'd) all our state;
And (heav'n consigning to my good intents)
No prince, no peer, shall have just cause to say,
Heav'n shorten Harry's happy life one day.

Shakespeare's Henry IV.

ACCIUS, the surname of a patrician family, at Rome, the ancestors of Azo, E. of Este, from whom the various princes of the Brunswick family, and the illustrious house of Hanover, are lineally descended. See Azo.

ACCIVUS, (Lucius) a Latin tragic poet, born, according to St. Jerome, A. U. C. 583. He adopted the most celebrated subjects of the Greecian stage; as Andromache, Andromeda, Atreus, Clytemnestra, Medea, Meleager, Philoctetes, &c. and one dramatic piece, entirely Roman, entitled *Erutus*. Two comedies, the Wedding and the

Merchant, have also been ascribed to him. His style has been censured as harsh; but he was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage.

Accius, an orator, of Pisaurum, against whom Cicero defended Cluentius.—Also a poet of the sixteenth century, on whom Julius Scaliger bestows great ecomiums.

ACCLAIM', v. } Ad: *clamo*, to cry aloud

ACCLAIM', n. } To; to give a shout of en-

ACCLAMATION. } courage and approba-

tion.
It hath been the custom of Christian men, in token of the greater reverence, to stand, to utter certain words of *acclamation*; and, at the name of Jesus, to bow. *Hooker*, b. v. sec. 29.

Gladly then he mix'd

Among those friendly pow'rs, who him receiv'd
With joy and *acclamations* loud, that one

That (of so many myriads fall'n) yet one

Return'd, not lost. *Milt. Parad. Lost*, b. vi. l. 23.

Such an enchantment is there in words; and so fine a thing does it seem to some, to be ruined plausibly, and to be ushered to their destruction with panegyric and *acclamation*. *Suth.*

Back from pursuit thy pow'rs, with loud *acclaim*,
Thee only extoll'd. *Milton's Par. Lost*, b. iii. l. 397.

The herald ends; the vaulted firmament

With loud *acclaims* and vast applause. *Os rent.*

Dryden's Fables.

ANCUS. Thou shalt be crowned:—

An iron crown, intensely hot, shall gird

Thy hoary temples; while the shouting crowd

Acclaims thee king of traitors.

Smollett's Regicide, act v. sc. 8.

ACCLAMATION, ACCLAMATIO, in Roman antiquity, a shouting of certain words in a loud chant or peculiar and regulated tone, by way of praise or dispraise. The acclamations have been distinguished from applauses, as the former were given by the voice, the latter, by the hands; acclamation also was bestowed on persons absent, applause only on those present. They were of various kinds: ecclesiastical, military, nuptial, senatorial, synodical, scholastic, theatrical, &c. besides musical and rythmical acclamations; acclamations of joy and respect, and even of reproach and contumely. Sometimes the former were *Laudationes et bona vota*, or good wishes; the latter, *Excoriationes et convicia*. Suetonius furnishes an instance of this last in the Roman senate, on occasion of the decree for demolishing the statues of Domitian, when the senators could not refrain from contumelious acclamations against the deceased. The like were uttered after the death of Commodus. Acclamations were repeated sometimes a greater, sometimes a lesser, number of times. On the theatres, in the earliest ages of the commonwealth, they were simple and little more than confused shouts. Afterwards they became a sort of regular concerts. That mentioned by Phaedrus which was made for Augustus, and proved the occasion of a pleasant mistake of a flute-player called *Princeps*, shows that musical acclamations were in use in that emperor's reign. Nero, passionately fond of music, took special care to improve and perfect the music of acclamations. When he played on the theatre, at the signal by

clapping, 5000 soldiers began to chant his praise, which the spectators were obliged to repeat. The whole was conducted by a music-master. The honour of acclamations was chiefly rendered to emperors, their children and favourites; and to the magistrates who presided at the games. Persons of distinguished merit also sometimes received them, of which Quintilian gives us instances in Cato and Virgil. The most usual forms were, *Feliciter! Longiorum vitam! Annos felices!* The actors themselves, and they who gained the prizes in the games of the circus, were not excluded the honour of acclamations.

Military acclamations were those of the soldiers and the people in the time of triumph. The victorious army accompanied the general to the capital; and, among the verses they sung in his praise, frequently repeated *Io TRIUMPHIE*, which the people answered in the same strain. They also gave their general the title of *Imperator* after some notable victory; a title which he only kept till his triumph was over. Those of the senate were usually given after a report made by some senator, to which the rest expressed their consent crying *OMNES! OMNES!* or else, *AQUUM EST! JUSTUM EST!* Sometimes they began with acclamations, and sometimes ended with them without any debate. It was in this manner that all the elections and proclamations of emperors were conducted; something of which practice is still retained in the *Vivat Rex! Vive le Roi!* and *Long live the King!* of modern times.

The Greeks borrowed the custom of receiving their emperors in the public places from the Romans. Their form was *Αγαθη τύχη!* good luck. Luitprand relates, that at a procession where he was present, they sung to the emperor Nicephorus, *πολλὰ ετη!* that is, many years. Plutarch mentions an acclamation so loud, upon occasion of Flaminus's restoring liberty to Greece, that the very birds fell from heaven with the shout. The Turks practise something like this on the sight of their emperors and grand-viziers to this day. The form among the Jews, was, *hosannah*.

As for the acclamations wherewith authors, poets, &c. were received, who recited their works in public, among the Romans; the assemblies were held with great parade in the capitol, temples, the Athenaeum, or the houses of great men. Invitations were sent every where, to get the greater appearance. Men of fortune, who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions one, who lent money to men of letters, and forgave the interest to such as applauded his exercises. These acclamations were conducted much after the same manner as those on the theatre; but, they were suited both to the subject and to the person. There were particular ones for philosophers, for orators, for historians, and for poets. One of the most usual forms was *Sophos*, repeated three times. Martial comprehends several other forms in this verse:

Graviter! Cito! Neguiter! Euge! Beate!
Acclamations were, in process of time, received

into the acts of councils, and the ordinary assemblies of the church. The bishops, it is clear, were long elected by acclamation. The people expressed their approbation of the preacher variously, calling him, *Orthodox! Third Apostle! &c.* These acclamations being sometimes carried to excess, and often misplaced, were frequently prohibited by the ancient doctors, and at length abrogated; though they appear to have been in some use as late as the time of St. Bernard.

ACCLAMATION MEDALS, among antiquaries, such as represent the people expressing their joy in the posture of acclamation.

ACCLIVITY, Ad: *clivus*, to the hill-top. The slope of the hill reckoned upwards, opposed to the declivity. Figuratively, that which takes an ascending course.

The men (of the Alps,) leaving their wives and younger children below, do (not without some difficulty) clamber up the *acclivities*, dragging their kine with them; where they feed them, and milk them, and make butter and cheese, and do all the dairy-work.

Ray on the Creation.

ACCLIVITY, in fortification, the talus of a rampart; or, more strictly, the steepness or slope of any work reckoned upwards. *James.*

ACCLIVUS, in anatomy, a muscle, otherwise called *obliquus ascendens abdominis*.

ACCLOY' or CLOY. See **CLOY.**

But better is, that a wights tong rest,
Than enternete him of soch doing,
Of which he neither rede can nor sing,
And who so it doth, full foul he himself *acloyeth*,
For office, uncommitted, oft anoyeth.

Chaucer, fol. 247, col. 3.

As then, no winde at all there blew,
No swelling cloude *acloyd* theaire;
The skie, like grasse (glasse) of watchet hew,
Reflected Phœbus golden hair.

Spenser's Elegy upon Astrophel.

At the well-head the purest streams arise:
But mucky filth his branching arms annoys,
And with uncomely weeds the gentle wave *acloys*.

Faerie Queene.

The mouldy moss which thee *acloyeth*,

Spens. Shep. Kal. Feb. 135.

ACCLOYED, among farriers, a horse's foot pricked in shoeing.

ACCOIL', or **COIL**. See **COIL**.

About the cauldron many cooks *accoil'd*,
With hooks and ladles, as need did require;
The while the viands in the vessel boil'd,
They did about their business sweat, and sorely toil'd.

Faerie Queene.

ACCOLA, in antiquities, a person who lived near a place; in distinction from *incola*, the *inhabitant* of a place. Thus the verse:

Accola non propriam, propriam colit incola terram.

ACCOLAIE, Lat. from *ad*, to, and *collum*, the neck. A ceremony used in the conferring of knighthood. Some suppose it to have been the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection; q. d. a clasping, or taking round the neck. An ingenious author will rather have it to be a blow on the neck; in imitation of that practised among the Romans, in the manumission of their slaves,

VOL. I.

when it is known a blow was given. John of Salisbury assures us, the blow was used among the Normans; and that William the Conqueror, thus conferred the honour of knighthood on his son Henry. At first, it was given with the naked fist, but was afterwards changed into a stroke with the flat of the sword, on the shoulder of the knight.

ACCOLADE, or **ACCOLE'F**, is also used in heraldry, to express the position of two things joined together, as two shields divided at the flanks; or lions, dogs, and other animals, which have collars or crowns about their necks. English heralds ordinarily say, collared, or gorged with an open crown, instead of *accolé*. Others use the term *accolée*, when two keys, battoons, maces, swords, &c. are saltier-wise, behind the shields.

ACCOLADE, in music, a line drawn perpendicularly next the margin, by which all the different parts of a composition are joined together in score. See **MUSIC**.

ACCOLTI, (Bernardo,) secretary to the republic of Florence, surnamed L'Unico, or the Nonsuch, from the great extent of his genius and learning, and the excellency of his poetic vein; which not only gained him a seat among the academicians of the court of Urbino, but made Pope Leo X. in 1520, create him prince of the state of Nepi. He wrote a comedy, *Virginie*, and other beautiful poems, which were printed at Venice, in 1519. His father was an eminent civilian of Arezza, who wrote *De Bello a Christianis contra Barbaros gesto*, &c. from which Tasso is said to have derived the plot of his *Jerusalem Delivered*.

ACCOMACK, a county of Virginia, North America, on the Chesapeake Bay, bounded N. by Maryland, and E. by the Atlantic. It contains a population of about 14,000.

ACCOM'MODATE , v. & adj. } Ad: <i>com-</i> ACCOM'MODATELY , } <i>modum</i> , to ACCOM'MODATENESS , } the advant- ACCOMM'DATION , } age; to as- ACCOM'MODATOR . } sist, oblige, 	} supply, reconcile, adapt, adjust, or lend. The } indefinite use of this word is thus ridiculed by } Shakspeare.
---	---

Accommodated, that is, when a man is, as they say, accommودated; or when a man is being, whereby he may be thought to be accommodated; which is an excellent thing.

2 Hen. IV. act iii. sc. 2.

But sithens it, [sc. speaking in praise of the dead] hath bene approued and allowed of a long tyme, that it ought to be this done, it becommeth me obeyuge to the lawe, to *accommodate* and apply my spekyngye to the opynyo and wille of every one of you, the most that I maye.

Thucydides, by Tho. Nicolls, Lon. 1550.

Will you present and *accommodate* it to the gentleman.

Poetaster, iii. 4.

In these cases we examine the why, the what, and the how, of things; and propose means, *accommodate* to the end.

L'Estrange.

God did not primarily intend to appoint this way of worship; and to impose it upon them as that, which was most proper and agreeable to him; but that he condescended to it, as most *accommodate* to their present state and inclination.

Tillot.

Heaven! speed the canvass, gallantly unfurl'd,
To furnish and *accommodate* a world;
To give the pole the produce of the sun,
And knit th' unsocial climates into one.

Couper's Charity.

ACCOMMODATION, the application of one thing, by analogy, to another: in theology, it relates chiefly to the application of prophecy: thus, a prophecy is said to be fulfilled properly, when a thing foretold comes to pass; and by way of accommodation, when an event happens to any other place or people, in a similar way. Some writers have maintained that circumcision, the tabernacle, brazen serpent, &c. were originally of Egyptian use, and only accommodated by Moses to the purposes of Judaism. It appears much more probable, however, that the neighbouring nations borrowed such customs from the Jews.

The principle of an *accommodated* interpretation of prophecy, was strenuously opposed by Dr. Owen, who maintained that there could be only a directly literal, or a typical signification. It seems indeed, liable to great abuse. See *MARSH'S Michaelis*, v. i. p. 200, and Notes p. 470—479.

ACCOMPANY, v. } See *COMPANY*. To
ACCOMPANIMENT. } go or come with; to associate with, or attend upon in going, or coming.

Go visit her, in her chaste bower of rest,
Accompany'd with angel-like delights.

Spenser's Sonnet iii.

So shall mine eyes in payne *accompany* my hart,
That were the guides, that did it lead of loue to feel
the smart.

Wyatt's Complaint of the Absence of his Loue.

No man in effect doth *accompany* with others, but he learneth, ere he is aware, some gesture, voice, or fashion.

Bacon's Nat. Hist.

Nobility is to be considered only as an imaginary distinction, unless *accompanied* with the practice of those generous virtues by which it ought to be obtained.

Tatler.

By our traffic into foreign countries, though we many times bring home light and frivolous toys, yet they are often *accompanied* with gold and silver, both in coin and bullion.

Spelman's Dialogue concerning the Coin of the Kingdom.

The great business of the senses being to make us take notice of what hurts or advantages the body, it is wisely ordered by nature, that pain should *accompany* the reception of several ideas.

Locke.

As folly is usually *accompanied* with perverseness, so it is here.

Swift's Short View of Ireland.

— The Persian dames

So were accustom'd, all the eastern fair,
In sumptuous cars, *accompany'd* his march;
A beauteous train by Ariana graz'd.

Glover's Leonidas, b. viii.

All pretences of conscience are vehemently to be suspected, which are *accompanied* with turbulent passion, and a furious zeal.

Tillotson's Sermons.

In a mind truly virtuous, the scorn of vice is always *accompanied* with the pity of it.

Spectator, No. 79.

ACCOMPANIMENT, the adding of one thing to another by way of ornament.

ACCOMPANIMENT, in heraldry, any thing added to a shield by way of ornament; as the belt, mantling, supporters, &c. It is applied to several bearings about a principal one; as a saltier, bend, fess, cheveron, &c.

ACCOMPANIMENT, in music, the instrumental parts which accompany a voice. The ancients had their accompaniments on the theatre; they had even different kinds of instruments to accompany the chorus, from those which accompanied the actors in the recitation. It is generally supposed, that their accompaniments went no farther than the playing in octave, or in antiphony to the voice. Modern organists apply it to those pipes which they occasionally touch to accompany the treble. See *MUSIC*.

ACCOMPANIMENT, in painting, denotes such objects as are added, either by way of ornament, or probability; as dogs, guns, game, &c. in a hunting piece.

ACCOMPlice, Ad: *complex*, icis, from *plico*. to fold; *complice*, Fr. knit together; one who is connected with another in a discreditable undertaking; a complice is used by our elder writers.

Hir *complicis* al samyn in this nede;
Stert to thare lady in affray and dredre;
And sone they clauncht and lappit in thare armes,
This Quene that founderant was for hir smert harmes.

Douglas, b. xi. p. 394.

If a tongue would be talking, without a mouth; what could it have done, when it had all its organs of speech, and *accomplices* of sound about it?

Addison's Spectator, No. 247.

The prince who refuses to be judge, instructs his people to consider him as the *accomplice* of his ministers.

Gibbon's Roman Empire.

ACCOMPlice. The council of Sens, and several other synodical statutes, expressly prohibit the revealing accomplices. See *ACCESSARY*. The law of Scotland, in regard to accomplices, is exactly as there stated.

ACCOMPLISH, v. } Ad: *compleo*, to
ACCOMPLISHED, } fill up to; *accomplir*,

ACCOMPLISHMENT. } to fill up the measure;
to fulfil, complete, finish; to adorn; to succeed in, or to obtain an object.

To whom our general ancestor repli'd,
" Daughter of God and man, *accomplish'd* Eve."

Milton's Par. Lost, b. iv.

I'll make a proof, how I advance in
My new *accomplishment* of Dancing.

Churchill's Ghost, b. iii.

By whatever art you may at first attract the attention, you can hold the esteem, and secure the hearts of others, only by amiable dispositions, and the accomplishments of the mind.

Blair.

From the tents,
The armourers *accomplicing* the knights,
With busy hammers closing rivets up,
Give dreadful note of preparation.

Shakespeare's Henry V.

So shall my word be that goeth forth out of my mouth; it shall not return unto me void, but it shall accomplish that which I please.

Isaiah lv. 11.

ACCOMPT', n. } Ad: *con*: *proto*.
ACCOUNT', v. & n. } Compter, anciently

ACCOUNTABLE, } *Accomptier*; Fr. to
ACCOUNT'ANT, n. & adj. } reckon up with.—

ACCOUNT'ING. To cast up all the parts into a sum, or amount; to number or calculate; to register facts relating to money. To notice, observe, think, consider, generally with regard and approbation; to explain, or unfold, to assign the cause, reason, or motive.—The

noun *account* often expresses advantage, or profit; when otherwise it is qualified by an adjective.

Men pat ben ryche,

Aren a *countable* to Crist, and to the kyng of hevern.
Vision of Piers Ploughman, repr. 1813, p. 218.

Liste and I selle rede the parcelles what amountes,
If any man in dede wille keste in *accounts*.

R. Brune, p. 135.

For this cause chiefly we thought it good to yelde
up an *accoumpte* of our faith in writing.

Jewel's Defence.

At many times I brought in my *accounts*,

Laid them before you : you would throw them off;
And say, you found them in mine honesty.

Shakspere's Timon.

Therefore is the kingdom of heaven likened unto
a certain king, which would take *account* of his ser-
vants ; and, when he had begun to reckon, one was
brought unto him, which owed him ten thousand tal-
lents.

Matt. xix. 23, 24.

The soul may have time to call itself to a just
accompnt of all things past; by means whereof re-
pentance is perfected.

Hooker, b. v. sec. 46.

To whom thou much dost owe, thou much must pay;
Think on the debt against th' *accompnting* day.

Sir J. Denham.

The opinion of more worlds than one has in
ancient times been *accounted* a heresy.

Bp. Wilkins's Mat. and Phil. Works.

The true ground of morality can only be the will
and law of a God, who sees men in the dark, has in
his hands rewards and punishments, and power
enough to call to *account* the proudest offender.

Locke.

There is such a peculiarity in Homer's manner of
apostrophizing Eumeus : it is generally applied, by
that poet, only to men of *account* and distinction.

Pope's Odyssey; notes.

We would establish our souls in such a solid and
substantial virtue, as will *turn to account* in that great
day, when it must stand the test of infinite wisdom
and justice.

Add. Spect. No. 399.

I am therefore much delighted with reading the
accounts of savage nations, and in contemplating
those virtues which are wild and uncultivated ; to
see courage exerting itself in fierceness, resolution in
obstinacy, wisdom in cunning, patience in sullenness
and despair.

Spectator.

We are held

Accountable ; and God, some future day,
Will reckon with us roundly for th' abuse
Of what he deems no mean or trivial trust.

Couper's Task, b. 6.

ACCOUNT, in chronology, is taken sometimes for the computation of time : thus, we say, the Julian Account, the Gregorian Account, &c. in which sense it is equivalent to *style*.

ACCOUNT, current, general, open, personal, real, imaginary, &c. See BOOK-KEEPING.

ACCOUNTANT-GENERAL, in law, an officer in the court of Chancery, appointed by act of parliament to receive all monies lodged in the court, instead of the masters, and convey the same to the bank of England for security.

ACCOUNT, or ACCOMPT Books, in commerce, is used to express the books which merchants, traders, bankers, &c. use for recording their transactions in business. See BOOK-KEEPING.

ACCOUNTS, CHAMBER of, in the late French policy, was a sovereign court of great antiquity, which took cognizance of, and registered the accounts of the king's revenue. It was nearly the same with the English Court of Exchequer.

ACCORD', v. & n. Ad : cor. to the heart.
ACCORD'ABLE, *Accorder*, Fr. Some de-
ACCORD'ANCE, duce it from *chorda*, a
ACCORD'ANCY, string, when it refers to
ACCORD'ANT, harmony, and from *cor*
ACCORD'ING, adj. when unity is intended.
ACCORD'INGLY. Possibly both words

may have the same origin. To be of one heart,
to agree or act cordially, to concur, to unite, to
suit each other, to conform, to harmonize, to
grant a request.

For in the dai suyng he apperide to hem chydynge,
and he *accordide* hem in pees and seide men ghe ben
britheren, whi noyen ghe ech othre ?

Wyclif. Dedis, chap. vii.

But natheles while I have time and space,

Or that I forther in this tale pace;

Me thinketh it *accordant* to reason

To tellen you alle the condition,

Of ech of hem so as it seemed me,

And whiche they weren and of what degré,

And eke in what aracie that they were inne,

And at a knyght that wol I firste beginne.

Prologue of the Canterbury Tales.

At last such grace I found, and means I wrought,
That I that lady to my spouse had won;

Accord of friends, consent of parents sought,
Affiance made, my happiness begun.

Spencer's Faerie Queene.

Things are often spoke, and seldom meant :
But (that my heart *accordeth* with my tongue,
Seeing the deed is meritorious,
And to preserve my sovereign from his foe)

Say but the word, and I will be his priest.

Shakspeare's Henry VI.

Sirrah, thou'rt said to have a stubborn soul,
That apprehends no further than this world ;
And squar'st thy life *accordingly*.

Shakspeare's Measure for Measure.

As the actions of men are of sundry distinct kinds,
so the laws thereof must *accordingly* be distinguished.

Hooker, b. i.

There was no means for him to satisfy all obliga-
tions to God and man : but to offer himself for a
mediator of an *accord* and peace between them.

Bacon's Hen. VII.

Men would not rest upon bare contracts, without
reducing the debt into a speciality ; which created
much certainty, and *accorded* many suits.

Sir M. Hale.

Several of the main parts of Moses's history, as
concerning the flood, and the first fathers of the
several nations of the world, do very well *accord* with
the most ancient accounts of profane history.

Tillotson, Sermon, i.

If both are satisfy'd with this *accord*,
Swear by the laws of knighthood on my sword.

Dryden's Fables.

Jarring int'rests of themselves create
Th' *according* music of a well-mixt state.

Pope.

Her hands *accorded* the lute's musick to the voice ;
her paining heart danced to the musick.

Sidra, b. ii.

The lights and shades, whose well *accorded* strife
Gives all the strength and colour of our life.

Pope's Epist.

ACCORD, in common law, an agreement be-
tween two or more persons, to give and accept
satisfaction for an offence or trespass committed,
which becomes a bar to any suit.

ACCORD, in music, the production, mixture,
and harmonious relation of two or more sounds.
It is synonymous with concord, or harmony.

G 2

**ACCOSt^r, or } } Ad: *costa*. To the rib,
ACCOSt^s, } } side, or coast; to approach
ACCOSt^{able}, } the side in order to gain the
ear; to speak to; to commence a discourse with;
in obsolete sense, to sail coast wise,
Ne is there hauke which mantleth her on perch,
Whether high towering or *accoasting* low,
But I the measure of her flight doe search,
And all her pray, and all her diet know.**

Spenser's Faerie Queene, b. vi. can. ii.

Lapland hath since been often surrounded, (so
much as *accosts* the sea) by the English.

Fuller's Worthies, in *Derbyshire*.

The French are a free, debonair, *accostable* people; both men and women. *Hornell's Letters*.

At length, collecting all his serpent wiles,
With soothing words renew'd him thus *accosts*.

Parad. Reg.

I first *accosted* him: I s'd, I sought;
And, with a loving force, to Phenix brought.

Dryden's Eneid.

They were both indabitble, strong, and high-minded men, yet of sweet and *accostable* nature, almost equally delighting in the press and affluence of dependents and suitors. *Wotton*.

ACCOStED, in heraldry, of *ae*, and *costa*, a rib. Side by side, as in the phrase, 'Chevron between six rams accosted.' See HERALDRY, Plate I.

ACCOUCHEMENT, in medicis, or rather in modern Gallicised delicacy, the delivery or lying-in of a woman in child-bed. Hence the practitioner is called the *accoucheur*.

ACCOUPLE, or COUPLE. See COUPLE.

The yong galans of Fraunce had coates garded with one colour, cut in ten or twelve parties verie richely to beholde: and so all the Englishe men *accopled* themselues with the French men louingly togather, and so roade to London.

Grafton repr. 1809, vol. ii. p. 296.

He sent a solemn embassage, to treat a peace and league with the king; *accoyping* it with an article in the nature of a request. *Bacon's Henry VII.*

ACCOURAGE. See ENCOURAGE.

After two yeres Philometer obtayned helpe of the Romans to recover his lost cities, and thus *accouraged* of the Romans, he expelled his auuncles syriake hoste and armes.

Exposition of Daniel, by George Joye, p. 198.

That foward pair she ever wold assaige,
When they wold strive due reason to exceed;
But that same foward twain wold *accourage*,
And of her plenty add unto her need.

Faerie Queene, b. ii. c. 2.

ACCOUTRE, v. } *Accoutrer*: Fr. To

ACCOU'TREMENT. } provide with suitable arms; to equip; to appoint, primarily in a military sense, then generally.

ORLA. What were his marks?

Ros. A lean cheek, which you have not; a blac eye, which you have not; an unquestionable spirit, which you have not; a beard negleeted, which you have not; but I pardon you for that; for simply your having no beard is a younger brother's revenue; then your hose should be ungartered; your bonnet unbanded; your sleeve, your shoe untied; and every thing about you demonstrating a careless desolation; but you are no such man, you are rather poit: device in your *accoutrements*, as loving yourself, than seeming the lover of any other.

Shakespeare's As You Like it.

I profess requitel to a hair's breadth, not only in

the simple office of love, but in all the *accoutrement*, complement, and ceremony of it.

Shakspeare's Merry Wives of Windsor.

Is it for this, they study? to grow pale,
And miss the pleasures of a glorious meal?
For this, in rags *accoyred*, are they seen,
And made the May-game of the public spleen.

Dryden.

Christianity is lost among them, in the trappings and *accoutrements* of it; with which, instead of adorning religion, they have strangely disguised it; and quite stifled it, in the crowd of external rites and ceremonies.

Tillotson, Sermon xxviii.

I have seen the pope officiate at St. Peter's; where, for two hours together, he was busied in putting on or off his different *accoutrements*, according to the different parts he was to act in them.

Addison, Spectator, No. 201.

How gay with all th' *accoutrements* of war,
The Britons come, with gold well fraught, they come!

Phil.

ACCREDITT, v. Ad: *credo*. Fr. *Accrediter*, to trust to; to put or get into credit, as the result of confidence or esteem.

I am better pleased indeed, that he (the Analytical Reviewer,) censures some things, than I should have been with unmixed commendation; for his censure will (to use the new diplomatic term) *accredit* his praises.

Couper's Letters.

ACCRESCENT, v } Ad: *cresco*, to grow
ACCRETION, } to; growing to; an out-
ACCRETIVE. } ward addition by ad-
hesion.

Infants support abstinence worst, from the quantity of aliment consumed in *accretion*.

Arbuthnot on Aliments.

If the motion be very slow, we perceive it not: we have no sense of the *accretive* motion of plants and animals; and the sly shadow steals away upon the dial; and the quickest eye can discover no more, but that it is gone.

Glanville's Sceptic.

ACCROACHⁱ v. See ENCROACH.

In semblant (as men sayne,) is gile,
And that was proued thilke while;
The ship whiche wende his helpe *accroache*,
Drofe all to peces on the roche.

Gower.

ACCROCHE, in heraldry, Fr. *accrocher*. denotes a thing being hooked into another.

ACCROCHING, in old law, the act of encroaching or usurping on another's right; and, particularly the attempt to exercise royal power, which as a very vague charge, led to a multitude of constructive treasons.

ACCRUE^r, or } Fr. *accroître*, p. p. *accru*;
ACCRUE^v, v. } to grow larger; to increase;

ACCRU'MENT. } to augment; to obtain benefit; to derive advantage.

Do you not feel your torments to *accrue*?

Spens. Raines of Rome, 207.

The yearly benefit that, of these his works, *accrueth* to her majesty, amounteth to one thousand pounds.

Carew's Survey.

The great profits which have *accrued* to the duke of Florence from his free port, have set several of the states of Italy on the same project.

Addison on Italy.

From which compact there arising an obligation upon every one, so to convey his meaning; there *accrues* also a right to every one, by the same signs, to judge of the sense or meaning of the person, so obliged to express himself.

South's Sermons.

ACCUBATION, } Ad: *cumbo*, to lie
ACCUM'BENT. } down to; referring to
 the custom of reclining at table, as practised by
 the ancients.

It will appear, that *accubation*, or lying down at
 meals, was a gesture used by very many nations.

Brown's Vulgar Errors.

"Now there was leaning on Jesus' bosom one of
 his disciples whom Jesus loved;" which gesture will
 not so well agree unto position of sitting, but is natu-
 ral, and cannot be avoided in the laws of *accubation*.

Idem.

ACCUBATION, in antiquity, was the table
 posture of the Greeks and Romans; between
 sitting and lying down to meat. The Greeks
 introduced this posture: having in their turn
 borrowed it from the eastern nations; for we
 find Homer representing their primitive heroes
 seated round the wall, with a table before each,
 on which his food was placed. The Romans, dur-
 ing the frugal ages of the republic, were strangers
 to it; but as luxury obtained, this posture was
 adopted, at least by the men; for as to women,
 it was long reputed an indecency for them to
 use it; though afterwards, this too was over-
 looked. But children did not lie down, nor
 servants, nor soldiers, nor persons of meaner
 condition. The Roman manner of disposing
 themselves at table, was this: a low round table
 was placed in the *cenaculum*, or dining-room,
 and about this, usually three, sometimes only two
 beds, or couches; according to the number of
 which, it was called *biclinium*, or *triclinium*.
 These were covered with a sort of bed-cloaths,
 richer or plainer, according to the quality of the
 person, and furnished with quilts and pillows,
 that the guests might lie the more commodiously.
 There were ordinarily three persons on each bed;
 to crowd more, was esteemed sordid. In eating
 they lay down on their left sides, with their heads
 resting on their elbows. The first lay at the head
 of the bed, with his feet extended behind the
 back of the second; the second lay with the back
 of his head towards the navel of the first, only
 separated by a pillow, his feet behind the back
 of the third; and so of the third, or fourth. The
 middle place was esteemed the most honourable.
 Before they came to table, they changed their
 cloaths, putting on what they called *canatoria
 vestis*, the dining-garment, and pulled off their
 shoes, to prevent soiling the bed.

Horace thus describes the order of sitting:—

*Summus ego & prope me Viscus Thurinas & infra,
 Si memini, Varius: cum Servilio Balatrone
 Vibidius, quos Mecanas adduxerat umbras.
 Nomentanus erat super ipsum, Porcius infra.*

Lib. ii. Sat. 8.

Guests, from the period of the heroic ages, were
 arranged at table according to their rank; so
 that persons of distinction had the uppermost
 seats, and subsequently a *nomenclator* was em-
 ployed at public entertainments, to call every
 guest by name to his proper place. The heroes
 seem to have been ranged in long ranks, and the
 chief personages at the top of each row on both
 sides of the table.

In Persia, the middle place was accounted the
 most honourable, and always given to the king;

in Greece, the nearest to the table; at Rome,
 the last or uppermost part of the middle bed, or
 couch, was the place of greatest distinction.

Among the Jews, the Pharisees and others,
 loved the uppermost rooms at feasts. (Matthew
 xxiii. 6.) Plutarch records a singular instance
 of this feeling, which illustrates our Saviour's
 reproof. At a splendid entertainment given by
 Timon, in which every one was desired to re-
 cline in whatever place he pleased, a certain
 person came in a very elegant dress and attended
 by a numerous retinue; but no sooner had he
 approached the door, and taken a view of the
 guests, who had already arranged themselves in
 the room, than he suddenly withdrew; and being
 followed by several of the company, who eagerly
 inquired the cause of this proceeding, he re-
 marked, "there was no fit place left for him." Lying
 on one's bosom, a phrase of St. John's
 Gospel, respecting the posture of that beloved
 disciple, is also illustrated by the above customs.

ACCUM'BER. See **ENCUMBER.**

He sette not his benefice to hire,
 And lette his shepe *acombred* in the mire.

Chaucer's Prol. to the Personnes Tale.

Alas, the clear christall, the bright transplendant
 glasse,
 Doth not bewray the colours hid which vnderneath
 it has
 As doth th' *accumbed* sprite the thoughtfull thrones
 discouer,
 Of feares deite of feruent loue that in bartes we
 couer.

Wyatt.

ACCUMULATE, } Ad: *cumulus*, a heap;
ACCUMULA'TION, } to heap, or place toge-
ACCUM'ULATIVE, } ther, but not to unite; to
ACCUM'ULATOR. } pile up; to collect; to
 increase.

By thys meanes and pollecy, thys Alexander gat
accumulated, and heaped vp a great summe of money.

Hall.

The greatness of sins is, in most instances, by ex-
 tension and *accumulation*.

Taylor's P'schical Discourses.

Injuries may fall upon the passive man; yet,
 without revenge, there would be no broils and
 quarrels, the great *accumulators* and multipliers of
 injuries.

Decay of Piety.

Great Strafford! worthy of that name, though all
 Of thee should be forgotten, but thy fall,
 Crush'd by imaginary treason's weight,
 Which too much courage did accumulate.

Denham, on the Earl of Strafford's Trial and Death.

The miser who *accumulates* his annual income, and
 lends it out at interest, has really spent it in the grati-
 fication of his avarice.

Hume's Essays.

ACCURACY, } Ad: *cura*. Care, atten-
AC'CURATE, } tion, freedom from error,
AC'CURATELY, } exactness, nicety, correct-
AC'CURATENESS. } ness.

Those conceive the celestial bodies have more
accurate influences upon these things below, than
 indeed they have but in gross.

Bacon.

The sine of incidence is either *accurately*, or very
 nearly, in a given ratio to the sine of refraction.

Newton.

That all these distances, motions, and quantities
 of matter, should be so *accurately* and harmoniously
 adjusted in this great variety of our system, is above
 the fortuitous hints of blind material causes; and

must certainly flow from that eternal fountain of wisdom.

Bentley.

No man living has made more accurate trials than Rheumure, that brightest ornament of France.

Colson.

ACCURSE'. See CURSE.

Hii myghte *acors* þe sole quene, þat Seynt Edward slou.

R. Gloucester, p. 296.

—Dredy ys at þe laste,

Lest Crist in his constorice *gow a cors* menye.

Vision of Piers Ploughman, repr. 1813, p. 7.

But whan he sawe y^t he myght not reconysle them by fayre meunys, he than vsed copulsars, and de-noused them *accursed*, but if they restored the goodes of the Churche by a serteyn day. Fabian, p. 275.

F. I am *accurst* to rob in that theefe's company ; that rascall hath remoued my horse, and tied him I know not where.

Shakespeare, 1 Hen. IV, p. 54, act ii. sc. 2.

The chief part of the misery of wicked men, and those *accursed* spirits, the devils, is this ; that they are of a disposition contrary to God.

Tillot.

ACCURSED, in the Jewish idiom, was synonymous with hanged, or crucified, or dying on a tree. Deut. xxi. 22, 23 ; which has been thought to explain Rom. ix. 3, where the apostle Paul wishes himself accursed after the manner of Christ, i. e. crucified, if happily he might by such a death save his countrymen. Compare 2 Tim. i. 3.

ACCURSIUS, a law-professor in the 12th century, born in Florence. His authority was for some time so great, that he was called the Idol of the Lawyers. He left a valuable digest of the decisions of the Old Jurists, published at Lyons, in 1589, in 6 vols. folio.

ACCURSTUS, (Mariangelus,) a famous critic of the 16th century, born at Aquila, in the kingdom of Naples. His Diatribes, printed at Rome, in folio, in 1524, on Ovid and Solinus, are a proof of his abilities. In his edition of Ammianus Marcellinus, there are five books more than in any of the preceding ones : and he affirms he had corrected 5000 errors in that historian. His predominant passion was collating old manuscripts ; yet he made Latin and Italian verses ; was complete master of the French, German, and Spanish tongues ; and understood optics and music.

ACCUSE', v.

ACCUSER, Ad: *causa, accuso*. To ACCUSA'BLE, charge a fault upon a person, ACCUSATION, either in a court of law or ACCU'SATIVE, otherwise.

ACCUSATORY.

O cruel day, *accuser* of the ioy
That night and loue haue stole and fast ywrien,
Accursed be thy comming into Troy.

Chaucer, Third booke of Troilus, fol. 174, col. 2.

Therfore Pilat wente out without forth to hem, and seide, what *accusyn* bringen ghe aghens this man ? Thei answerden and seiden to him, If this were not a mysdoore we haddeyn not bitaken him to thee.

Wiclf. Jon. chap. xviii.

To which I answercide, that it is not custome to Romayns to dampne ony man bifore that he that is accused haue his *accuseris* present, and take place of defending to putte awei the crimes that ben putt aghens him.

Wiclf. Dedis, chap. 25.

And now they beyng bent of bothe sydes, with

burnyng hertes they prepare theyr *accusements* they runne to y^e judges.

Erasmus, Para. of N. T. by P. Udall, Mat. chap. v. p. 22, col. 2.

MOWB. Let not my cold words here *accuse* my zeal,

'Tis not the tryal of a woman's war,
The bitter clamour of two eager tongues,
Can arbitrate this cause betwixt us twain ;
The blood is hot that must be cool'd for this.

Shakspeare's King Richard II.

And dogged Yorke, that reaches at the moone,
Whose ouer-weening armie I haue pluckt back,
By false accuse doth leuell at my life.

Shakespeare, 2 H. VI, p. 131, act iii. sc. 1.

You read

These *accusations* ; and these grievous crimes,
Committed by your person and your followers.

Shakspeare.

Thus they in mutual *accusations* spent
The fruitless hours, but neither self-condemning ;
And of their vain contest, appear'd no end.

Milton.

Innocency is no shelter from ill tongues ; malice never regards how true any *accusation* is, but how spiteful.

Hall's Contemplations.

All *accusation*, in the very nature of the thing, still supposing, and being founded upon some law : for, where there is no law, there can be no transgression ; and, where there can be no transgression, I am sure there ought to be no *accusation*.

South.

Never send up a leg of a fowl at supper, while there is a cat or dog in the house, that can be *accused* for running away with it : but, if there happen to be neither, you must lay it upon the rats, or a strange greyhound.

Swift.

ACCUSATIO, in medicine. See INDICATIO.

ACCUSATION, Lat. from *ad*, to, and *causare*, to plead. In law, the charging any person with a criminal action, that exposes him to public punishment. Writers on politics treat of the benefits and the inconveniences of accusations. Various arguments are alleged, both for and against, the public accusation of great men. Nothing, according to Machiavel, tends more to the preservation of the state. This, accordingly, was strictly observed by the Romans, in the instance of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, are not more beneficial than calumnies are pernicious ; which is also confirmed by the practice of the Romans. Manlius, not being able to make good his charge against Camillus, was cast into prison.—By the Roman law, there was no public accuser for public crimes ; every private person might accuse another of them, and prosecute to punishment, or absolution. Cato, the most innocent person of his age, had been accused forty-two times, and as often absolved. But the accusation of private crimes was never received, but from the mouths of those who were immediately interested in them. None (e. g.) but the husband could accuse his wife of adultery.

The ancient Roman lawyers distinguish between postulatio, delatio, and accusatio. For, first, leave was desired to bring a charge against one, which was called postulare ; then he against whom the charge was laid, was brought before the judge ; which was called deferre, or dominis

delatio: lastly, the charge was drawn up and presented, which was properly the accusation. The accusation commenced, according to Pædianus, when the reus, or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the delatio made by his opponent.

By the laws of the Inquisition, a person is necessitated to accuse himself of whatever crime may be imputed to him. On the slightest report that a person is a heretic, or even that he is suspected of heresy, an inquisitor will receive the denunciation of a stranger, who generally abjures the office of accuser, because if he should fail in his proof, he is exposed to the law of retaliation. The unhappy culprit is now visited with all the terrors of the institution, to induce him to self-crimination, which has urged the confession of whatever has been imputed, and even the voluntary invention of crimes that had no existence.

In England, by Magna Charta, no man shall be imprisoned, or condemned on any accusation, without trial by his peers, or the law; none shall be vexed with any accusation, but according to the law of the land; and, no man may be molested by petition to the king, &c. unless it be by indictment, or presentment of lawful men, or by process at common law. The office of attorney-general, and ex-officio informations, constitute the only exception to these noble provisions. Promoters of accusations are to find surely to pursue them; and, if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime. But the institution of grand juries is perhaps, our best practical barrier against false accusations.

ACCUSATIVE, in Latin and Greek grammar, the fourth case of nouns, pronouns, and participles; so named, probably, from its being used, when an action passes *a causa ad aliquem vel aliquid*, from some active cause, or agent, to some person, or thing; others derive it at once from accusamus, because we predicate something of some one. See *Varro de Ling.* Lat. vii.

ACCUSTOM,

Accus'tomable,
Accus'tomably,
Accus'tomance,
Accus'tomarily,
Accus'tomary.

Account'mer, Fr. See
Custom. To repeat fre-quently the same act.

The queene than askis of gold, for the nanis,
Ane wechly cwp, set all with precius stanis
Bad fill it full of the richt Hypocras,
Into the quihlk grete Belas accusumit was
To drink vmpuhile, and fra him every king
Discend of his geneology and ofspryng.
Douglas, b. i.

And then as he (Henry V.) was ever accusomed to do, he went on foote to the chief churche in the toun, and rendred to God his most heartie thankes for his prosperous successe and fortunate chauce.
Hall.

After which murder fynished, y^e sayde syr Rafe, with his adherentys fled unto y^e place of ye Erle of Artoys, wheré the Duke of Burgoyne vsyd accusomably to resorte.
Fabyan.

I shall always fear that he who accusomis himself

to fraud in little things, wants only opportunity in greater.
Adventurer, No. 119.

How shall we breathe in other air
Less pure, accustom'd to immortal fruits.
Milton.

It has been some advantage, to accustom one's self to books of the same edition.

Watts's Imp. of the Mind.

Air and exercise are necessary to all men, but particularly so to the man whose mind labours, and to him who has been all his life accustomed to much of both, they are necessary in the extreme.
Couper's Letters.

ACE, n. *ειγ*, Gr. as Fr. one, an integer, unity. The side of a die, or a card marked with one point.

A small quantity; a particle; an atom.

DEM. No die, but an ace for him, for he is but one.

LIS. Lesse than an ace, man, for he is dead, he is nothing.

Shakspeare, Mid. Night's Dream, p. 161, act v. sc. 1.

GET. Then will I,

(For wise men must be had to prop the republick)
Not bate yo a single ace of a sound senator.

Beaumont and Fletcher's Prophetess act i. sc. 3.

When lots are shuffled together in a lap, urn, or pitcher; or if a man blindfold casts a die; what reason in the world can he have to presume, that he shall draw a white stone rather than a black, or throw an ace rather than a sise.
South.

He will not hate an ace of absolute certainty; but, however doubtful or improbable the thing is, coming from him it must go for an indisputable truth.

Gouvernment of the Tongue.

I'll not wag an ace farther: the whole world shall not bribe me to it.
Dryden's Spanish Friar.

ACELIDEMA, Heb. a field of blood, formerly called the Potter's, and some think, the Fuller's field, situated S. of Jerusalem, and N. of the rivulet Siloam: the field purchased by the Jewish rulers, with the 30 pieces of silver, which Judas returned to them, in despair, after betraying our Saviour; and which they allotted as a burial place for strangers. The place, which is still shewn to travellers, is small, and covered with an arched roof. The bodies deposited in it are, it is said, consumed in three or four days, or even less. Drutmar, a monk of Corbie, says, that in his time there was a hospital here for the entertainment of French pilgrims.

ACENTETUM, or **ACANTETA**, in natural history, a name given by the ancients to the purest and finest rock crystal, which was much used and admired in the formation of cups and vases.

ACEPHALI, in civil history, certain levellers, in the reign of king Henry I. who were not believed to possess even a tenement to entitle them to have the right of acknowledging a superior lord. In our ancient law books, it is also used for persons who held nothing in fee.

ACEPHALI, or **ACEPHALITE**, in ecclesiastical history, the denomination of various sects: who refused to follow a leader, or head: as, 1. Those who, in the fifth century, refused to follow either St. Cyril, or John of Antioch. 2. Certain Christians who abandoned Peter Mongus, upon his submission to the council of Chalcedon; being generally of the opinion of Eutyches, that there was only one nature in Christ. 3. The adherents of Severus of Antioch; and of all in general who

refused to admit the council of Chalcedon. 4. Bishops, exempt from the jurisdiction of their patriarch, were also thus named.

ACEPHALI, in ancient history, certain nations, or people, represented by ancient naturalists and cosmographers, as formed without heads; their eyes, mouths, &c. being placed in their breast, shoulders, &c. Such were the Bleminyes, a nation of Africa mentioned by Pliny and Solinus. Ctesias and Solinus mention others in India near the Ganges. Mela also speaks of a people, *quibus capita et vultus in pectore sunt*. And Suidas, Stephanus Byzantinus, Vopiscus, relate the like. Different opinions have been formed as to the origin of these fables. Bartholin, who turns the whole into a metaphor, says, that the name, Acephali, was anciently given to such as had less brain, or conducted themselves less by the rules of prudence, than others. Olearius supposes, that the ancient voyagers, viewing certain barbarous people from the coasts, had been imposed upon by their uncouth dress. Wepfer gives a catalogue of such acephalous births, from Schenekius, Licetus, Panicus, Wolfius, Mauriceau, &c. See also *Philos. Transact.* lxxv. p. 311.

ACEPHALOUS WORMS, or what are supposed such, are frequent. The *bimbricus latus*, or joint-worm, and the *tænia* or *tape-worm*, were long taken to be acephalous: the first who supposed them to have a head was Tulpinus, and after him Fehr: the former even makes them biceps, or two-headed. See *TÆNIA*. Crabs and such animals as have their chief senses about the breast or heart, have also been called *acephali*. *Gal. de Usu*, part viii. 4.

ACEPHALUS, in poetry, a verse which is lame or defective by wanting a beginning. Some also give the name *ακεφαλος* to all verses which begin with a short, instead of a long syllable.

ACER, the MAPLE or Sycamore TREE: a genus of the monœcia order, belonging to the polygamia class of plants; and ranking under the 23d natural order, tritilate.

ACERATOS, *ακερατος*, Gr. from *α*, negative, and *κερατον*, or *κεραννυμι*, to mix: unmixed, uncorrupted. It is applied sometimes to the humours of the body by Hippocrates. Paulus Aegineta mentions a plaster under this name, but probably means *aceron*. See ACERIDIS.

ACERB^Y { *Acerbitas*, sourness. De-

ACER-BITY, *adj.* { rived from the taste of unripe fruit; sharpness, roughness.

It is true that purgatory (at least as is believed) cannot last a hundred thousand years; but yet God may by the *acerbitie* of the flames in twenty years equal the canonical penances of twenty thousand years.

Taylor's Dissuasive from Popery.

ACERENZA, a small town of the province of Basilicata, in the kingdom of Naples, formerly the see of an archbishop. It is eighty miles E. of the capital.

ACERIC ACID, in chemistry, an acid found in the juice of the maple, and decomposed by heat.

ACERIDES, *ακηριδες*, from *α* negative, and *κηρος*, wax. Plasters made without wax.

ACERINA, in ichthyology, a name given by Pliny and others of the old naturalists, to the fish we now call the ceruna, and aurata flaviatilis, and in England the ruff. It is a genuine species of perch, and is distinguished by Artedi from all the other fish of that genus, by having the back fin single, and the head cavernous. See PERCA.

ACERNO, a town of Italy, in the citerio principality of Naples, with a bishop's see; situated fourteen miles N. E. of Salerno.

ACEROSUS, an epithet of Hippocrates for a coarse kind of bread, made of chaff.

ACEIRRA, or ACERRÆ, a town in the kingdom of Naples, in the Terra di Levoro, seated on the river Agno, eight miles N. E. of Naples.

ACERA, in antiquity, an altar erected among the Romans, near the bed of a person deceased, on which his friends daily offered incense till his burial. The original intention probably was to overcome any offensive smell that might arise about the corpse. Also a little pot, wherein were put the incense and perfumes to be burnt on the altars of the gods, and before the dead. It appears to have been the same with what was otherwise called *thuribulum* and *pyxis*. Thus Horat. lib. 3. Od. viii. v. 2 :

Quid velint flores et acerra thuris Plena, miraris.

The Chinese have still a custom like this: they erect an altar to the deceased in a room hung with mourning; and place an image of the dead person on the altar, to which every one that approaches it bows four times, and offers oblations and perfumes. By the laws of the XII. tables, the erection of *Acerra*, was prohibited among the Romans. We find mention of *acerra* in the ancient church. The Jews had also their *acerra*, in our version rendered censers; and the Romanists still retain them under the name of incense pots.

ACESCENT, in chemistry, applied to liquids and other substances, which readily run into the acid fermentation, or in which it has already commenced.

ACESTA, in ancient geography, a town of Sicily, named after *Acetes*, and built by Æneas; called also *Segesta*. *Virg. Æn.* 746.

ACESTES, in ancient history, a king of Sicily, who assisted Priam in the Trojan war, and afterwards entertained Æneas. *Idem.*

ACESTIDES, in chemistry, chimneys of furnaces for making brass, narrow at top to receive and collect the fumes of the metal, that *cadmia* may be produced in greater quantities.

ACESTORIS, or ACESTRIDES, from *ακος*, healing, female physicians; midwives so called among the Greeks.

ACETABULUM, in anatomy, 1. A deep cavity, in certain bones, appointed for the reception of the large head of other bones, in order to their articulation, such as that of the ischium, which receives the head of the thigh-bone. See ANATOMY. The *acétabulum* is lined, and capped round with a cartilage, whose circular margin is called *supercilium*. In its bottom lies a large mucilaginous gland. 2. The same with *Cotyledon*. 3. A glandular substance, found in the placenta of some animals.

ACETABULUM, in antiquity, 1. A little vase, or cup, used at table to serve up things proper for sauce, or seasoning; similar to our vinegar cruetts. Hence Agricola takes it to have been named from acetum, vinegar. 2. A Roman measure, used both for liquid and dry things, chiefly in medicine. It contained a cyathus and a half, or fifteen drachms, equal to about one-eighth of a pint.

ACETABULUM, in botany, navel-wort, a species of the peziza, or cup-peziza, a genus belonging to the cryptogamia fungi of Linnaeus. It is named acetabulum, from the resemblance its leaves bear to a cup. See PEZZIA.

ACETARIA, from *acetum*, vinegar, salad.

ACETIC ACID, in chemistry, the acid which in a more diluted state is called vinegar. For its chemical properties, see ACID and CHEMISTRY, and for its mode of manufacture into that article, see VINEGAR.

ACETIFICATION is used by some chemists to denote the operation whereby vinegar is made. It is a species of fermentation, arising from exposing vinous liquors in open vessels, in a warm place, which turns them acid. Acetification chiefly differs from the fermentation whereby wine is made in this, that the latter is effected by a gentler heat, sufficient only to raise, and rarefy the sulphurous parts; whereas, in acetification, there is what is sufficient to raise and rarefy the saline parts.

ACETI SPIRITUS, in chemistry, spirit of vinegar. It is made by drenching copper filings with distilled vinegar and repeatedly evaporating it.

ACETOSA, sorrel; by Linnaeus joined to the genus of dock, under the title of *Rumex*. See RUMEX.

ACETOSELLA, in botany, wood sorrel, a species of OXALIS, which see.

ACETOUS ÄTHER, an æther made by means of vinegar.

ACETOUS FERMENTATION, that by which vinegar is produced. See DISTILLATION.

ACETUM, Latin, from *acere*, to be sharp, in medicine, chemistry, &c. vinegar; the vegetable acid. See VINEGAR. There are several medicines of which it is the basis; as,

1. **ACETUM ALKALIZATUM**, alkalized vinegar; distilled vinegar, with the addition of some alkaline or volatile salt.

2. **ACETUM DISTILLATUM**, distilled vinegar, chiefly used in preparations for dissolution and precipitation.

3. **ACETUM ESURIENS**, appetitive vinegar, the richest acid, according to Boerhaave, that can by any art be prepared from vinegar. It is made by dissolving verdigrise in distilled vinegar, evaporating the solution, and after recovering the crystallized verdigrise, distilling the acid spirit by a retort.

4. **ACETUM PHILOSOPHORUM**, philosophers vinegar, a sour kind of liquor; made by dissolving a little butter of antimony in a great deal of water.

5. **ACETUM ROSARUM**, vinegar of roses; this is made of rose buds infused in vinegar 40 or 50 days; the roses are then pressed out, and the vinegar preserved. It is chiefly used by way of embrocation on the head and temples, in the head-ach.

6. **ACETUM SAMBUCINUM**, vinegar of elder.

7. **ACETUM SCILLITICUM**, vinegar of squills, &c. For these and other medicated vinegars, see VINEGAR. They are much used in Germany as antidotes against pestilential diseases.

ACHI, or **ACHEN**, (J. V.) a painter of the sixteenth century, born at Cologne. He imitated Spranger, and travelling to Venice and Rome, painted in the latter city a celebrated Nativity for the church of the Jesuits. Returning home, he was much patronized by the German princes, and died in 1621.

ACHA, in geography, the name of three smaller rivers of Bavaria, one flowing into the Danube, near Donawerth, and another into the same river, near Ingolstadt; the third falling into the Inn, near the mouth of the Saltza.

ACHABYTUS, in ancient geography, a high mountain in Rhodes, on the top of which stood a temple of Jupiter.

ACHIAC, in ornithology, a bird of the partridge kind, common in the Philippine islands.

ACHAEA, in ancient geography, a town of the island of Rhodes, in the district of Jalyssus, and the first and most ancient of all; said to be built by the Heliades, or grandsons of Apollo.

ACHÆA, a hamlet of Asiatic Sarmatia, on the Euxine. The inhabitants were called Achæi, and were colony of the Orchomenians.

ACHÆANS, the inhabitants of **ACHAIA** Propria, a Peloponnesian state. This republic was not considerable in early times, for the number of its troops, its wealth, or the extent of its territories; but it was famed for its probity, its justice, and its love of liberty. Its high reputation for these virtues was very ancient. The Crotoneans and Sybarites, to re-establish order in their towns, adopted the laws and customs of the Achæans. After the famous battle of Leuctra, a difference arose between the Lacedemonians and Thebans, who held the virtue of this people in such veneration, that they terminated the dispute by their decision. The government of the Achæans was democratical. They preserved their liberty till the time of Philip and Alexander: but in the reigns of those princes, and afterwards, they were either subject to the Macedonians, who had made themselves masters of Greece, or oppressed by cruel tyrants. The Achæan commonwealth consisted of twelve inconsiderable towns in Peloponnesus. Its first annals are not marked by any great action, for they are not graced with one eminent character. After the death of Alexander, this little republic was a prey to all the evils which flow from political discord. A zeal for the good of the community was now extinguished. Each town was only attentive to its private interest. There was no longer any stability in the state; for it changed its masters with every revolution in Macedonia. Towards the 124th Olympiad, about the time when Ptolemy Soter died, and when Pyrrhus invaded Italy, the republic of the Achæans recovered its old institutions and unanimity. The inhabitants of Patæ and of Dymæ were the first asserters of ancient liberty. The tyrants were banished; and the league comprised at length the whole of Greece, with the single exception of the Lacedemonians. The

fundamental constitution of this confederacy was as follows:—A public council was held, in which affairs of importance were determined, and a register appointed to record its transactions. It was convened once a year, and at first had two presidents, who were nominated alternately by the different towns and states: but they soon elected only one, who presided in the council, and commanded the army. By the Greeks he was called *strategos*, and by the Romans *praetor*. He continued in his office two successive years. Next in authority to the *praetor*, were the ten *demiurgi*, who were appointed to act as his privy council, and were empowered on extraordinary occasions to summon a general assembly. The *Achæan league*

formidable to all the surrounding countries for upwards of 120 years; but internal dissensions became at last more fatal to it than the arms of Rome, to which, in the year B. C. 147, this people finally submitted.

The arms which the Achæans chiefly used were slings, with which, by long practice, they took so nice an aim, that they were sure, not only to hit their enemies on the head, but on any part of the face they chose. Their slings were of a different kind from those of the Balcarians, whom they far surpassed in dexterity.

Livy and Homer use the term *Achæi* for the whole people of Greece.

ACHÆMENES, the first king of Persia, said to have been the grandson of Perseus. The whole royal family were called after him *ACHÆMENIDES*.

ACHÆMENES, another king of Persia, the father of Cambyses, and grandfather of Cyrus the Great. He is mentioned by Horace, lib. ii. ode xii.

ACHÆMENES, the son of Darius I. and brother of Xerxes, who commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece.

ACHÆRUM-PORTUS, in ancient geography, the name of a harbour near Sigeum; into which the Xanthus falls, after being joined by the Simois; also a port of the Taurica Chersonesus, on the Euxine sea, now called Porto Buon.

ACHÆUS, in ancient history; first, a king of Lydia, deposed and hung for extortion. *Ovid*. Second, the founder of the Achean state, in the Peloponnesus, son of Xuthus, king of Thessaly. Third, a tragic poet of Eretria, who lived some time after Sophocles. Fourth, another poet of Syracuse. Fifth, a cousin-german to Seleucus Ceraunus and Antiochus the Great, kings of Syria, who enjoyed the dominions he had usurped from Antiochus for many years; but at last was betrayed by a Cretan, in the 140th year of Rome; and his limbs being cut off, his body was sewed in the skin of an ass, and gib-beted.

ACHAGUA, in geography, an Indian tribe, of the kingdom of New Granada, formed into settlements by the Jesuits, in 1661. They are said to be of kind disposition; very expert in the use of the dart and spear, and very brave.

ACHAIA, in ancient geography, that part of Greece which Ptolemy calls Hellas, and the

younger Pliny, Græcia. It is now called Livadia. See LIVADIA.

ACHAIA PROPRIA, in ancient geography, a small district, N. of Peloponnesus, running westward along the bay of Corinth and bounded on the W. by the Ionian Sea, on the S. by Elis and Arcadia, and on the E. by Sicyonia: its metropolis was called *Patrae*. It is now the *Romania Alta*, of the Morea.

ACHALALACTLI, in ornithology, an American bird, described by Nieremberg, of the size of a pigeon; is common about the lakes and rivers of Mexico, and feeds on small fish. It is remarkable for a beautiful silvery ring round its neck.

ACHAMELLA, or ACMELLA, in botany, a plant that grows in the island of Ceylon, of which there are three species. It is recommended in nephritic disorders; and is the *verbesina acmella* of Linnaeus.

ACHANDES, in ichthyology, a name given by some to the remora, or sucking fish.

ACHANE, *axavn*, Gr. an ancient Persian corn measure, containing 45 Attic medimni.

ACHANIA, in botany, a genus of plants of the class monodelphia, order polyandria.

ACHAOVA, in the *materia medica* of the ancients, an Egyptian herb, nearly resembling chamomile, but lower, and with broader leaves, approaching to those of feverfew, and of a faint, but not disagreeable smell. Avicenna, however, seems to have called the herb we call *marum*, by this name.

ACHARACA, in ancient geography, a town of Lydia, between Tralles and Nysa; in which were the temple of Pluto, and the *cave* Charonium, where patients slept in order to obtain a cure. *Strabo*.

ACHARISTON, from *a*, without, and *xapēc*, value, a name of Galen's for some medicines, which cured so quickly, that they were undervalued; as the Greek name implies.

ACHAT, in law, a contract, or bargain, especially in the way of purchase.

ACHATES, the companion of Æneas, and his most faithful friend, celebrated in Virgil.

ACHATES, in natural history, the AGATE, which sec.

ACHATES, in ancient geography, a river of Sicily, now the *Drillo*; which is said to have given name to the Achates, or Agate, first found there.

ACHATORS, purveyors, ordained to be so called, by Act Par. 36 Edw. III.

ACHAZIB, or Achzib, in ancient geography, first, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais; second, a town on the southern parts of the tribe of Judah.

ACHE'. Ace, Saxon, to eke, to lengthen out; applied to continued pain.

I know in heate and cold, the louver how he shakes,
In singing how he doth complaine, in sleeping how he wakes,
To languish without ache, sicklesse for to consume;
A thousand things for to devise, resoluing all in fume.
Surrey.

I'll rack thee with old cramps;
Fill all thy bones with aches, make thee roar,
That beasts shall tremble at thy din.
Shakesp.

A coming show'r your shooting corns presage,
Old *aches* throb, your hollow tooth will rage. *Swift.*
Upon this account, our senses are dulled and spent
by any extraordinary attention; and our very eyes
will *ache*, if long fixed upon any difficulty discerned
object. *Glanville.*

Visions of glory! spare my *aching* sight,
Ye unborn ages crowd not on my soul! *Gray.*

ACIEFN, ACIE', or ACIEN, a kingdom of Sumatra, on the N. W. of that island, extending fifty miles along the coast, and said by some to contain 26,000 superficial miles. So powerful was this kingdom in the beginning of the sixteenth century, as to expel the Portuguese invaders entirely from the island.

Acheen is divided into 193 parishes, forming three general governments, each under the jurisdiction of a paugleemo and subordinate officers. Some parts of the kingdom are subject to frequent and sudden inundations; and the inhabitants can have no intercourse except through the medium of boats: but as there are few swamps and bogs, the air is healthy, and fevers, dysenteries, &c. are said to be uncommon. The soil that prevails is light and fertile, producing rice, cotton, and fine fruits. It is a layer of black mould, on a substratum of reddish clay, on which many culinary vegetables come to great perfection; and is so extremely rich and exuberant, that culinary roots, onions, limes, citrons, and nearly all the fruits and plants of the frigid and torrid zones grow here. Very fine gold dust is found in the mountains, and still more is supplied from the southern parts of Nalaboo and Soosoo. A volcano, in the vicinage of Acheen the capital, yields an abundance of sulphur, both for home consumption and exportation. Acheen was formerly the great mart of eastern commodities, and still carries on a flourishing trade, both with European and eastern nations. They export fruits, gold, jewels, diamonds, sulphur, camphor, pepper, benzoin, sapan-wood, betel-nut, patch-leaf, or *colsos Indicus*; and import cotton, cloth, silk, opium, gunpowder, arms, glass, and cutlery. The king is the chief merchant, and claims a duty of twelve per cent. upon all goods imported into his dominions. He also entirely monopolizes the sale of opium, and farms the retailing of it among the people.

All matters relative to the commerce and the customs of the port, come under the jurisdiction of the *shabandar*, who performs the ceremony of lifting *chap*, or giving a license for trade, by lifting a golden-hafted creese over the head of the merchant, without which he dares not land his goods. Presents are then sent to the king and his officers. If the stranger be an ambassador, the royal elephants are sent down to carry him and his letters to the monarch's presence. After some general discourse, he is conducted to a separate building, and entertained by the officers of state, with all the delicacies of the country. In the evening he departs in the manner he came, surrounded by a prodigious number of lights. Their trading is chiefly carried on by gold-dust; and every tradesman carries about with him scales and bags. The people are taller and more

swarthy than the other inhabitants of the island; and from their comparative skill in mechanics, it would appear that they are more intelligent. They have a curious method of casting small brass guns. The chief dress is of blue and white cloth, made, among the higher classes, from cotton of their own growth; their silk is now on the decline. They are said to be a base and treacherous people. The chief animals are pasture cattle, horses, and elephants. The horses are much prized at Madras.

The religion of Acheen is Mahometanism; and the government despotic, admitting females to reign. The king usually maintains a guard of 100 seapoys about his palace. He appoints a Paugleeno to each district, and under him a twaum, and four paugeeches, to each mosque. The grand council of the nation, consists of the king, or *sultan*, four oolooballangs, eight of a lower degree, and sixteen cajoorang. At the king's feet sits a woman, to whom he makes known his pleasure. She communicates it to an officer, who proclaims it to the assembly. The throne was formerly of ivory and tortoise, protected by a curtain of gauze, which did not obstruct the audience, but prevented perfect view. The criminal laws are uncommonly severe. Theft is punished by suspending the criminal from a tree, with a gun or weight tied to his foot; in some cases by cutting off a finger, a hand, or a foot, &c. according to the heinousness of the crime;—house-breaking by drowning. If a man robs a priest he is burnt alive. Adultery is punished by placing the adulterer in a spacious area, environed by the friends of the injured husband, where he is provided with a weapon; and if he can force his way through them, he escapes condign punishment; but in general he is cut to pieces in a few moments, and the body is refused funeral rites.

The king confers a title of honour, the ensign of which is a small golden sword suspended round the neck, as a badge of distinction: this is seldom conferred on any of the natives. The resident for the East India Company was withdrawn in 1785; but the traffic still continues.

ACIEL, a celebrated place and cave in Hindostan, four miles from Patiala, district of Sisheril. Here a cold flame is said to issue from the earth, and is regarded as a manifestation of the Deity. Pilgrims crowd hither, and a great fair is held at the place annually.

ACHELOUS, a hero, in the ancient mythology, who wrestled with Hercules, for Deianira, daughter to king Oeneus: but as Achelous had the power of assuming all shapes, the contest was long dubious: at last, as he took that of a bull, Hercules tore off one of his horns; so that he was forced to submit, and to redeem it by giving the conqueror the horn of Amalthea, or plenty; which Hercules and the Nymphs having filled with a variety of fruits, consecrated to Jupiter. Some explain this fable, by saying, that Achelous is a winding river of Greece, whose stream was so rapid, that it roared like a bull, and overflowed its banks; but Hercules, by bringing it into two channels, broke off one of the horns, and so restored plenty to the country. See next article.

ACHELOUS, a river of Acarnania, which rises in mount Pindus, and dividing Aetolia from Acarnania, falls from N. to S. into the Sinus Corinthiacus. It was formerly called Thoas, from its impetuosity, and, by Homer, King of rivers. It is now called Aspro Potamo.

ACHEM, or **ACHEN**. See **ACHEEN**.

ACHEMENIS, an herb mentioned by Pliny; supposed by the ancients to have the property of exciting terror.

ACHEPE BAY, a small inlet near North Cape, on the eastern coast of the island of Cape Breton, British North America.

ACHERI, (Luke d') a learned Benedictine, of the congregation of St. Maur, born at St. Quintin, in Picardy, in 1609, and famous for printing several works, till then only in MS. viz.: the epistle attributed to St. Barnabas; the works of Lanfranc, archbishop of Canterbury; a collection of scarce and curious pieces, entitled *Spicilegium*; i. e. Gleanings, in 13 volumes quarto, &c. After a very retired life, he died at Paris, in 1685, in the abbey of St. Germain, where he had been librarian.

ACHERNA, in astronomy, a star of the first magnitude, in the sign of Eridanus.

ACHERON, Αχέρων, Gr. in ancient mythology, the son of Ceres, whom she hid in hell, for fear of the Titans, and turned into a river, over which departed souls were ferried in their way to Elysium.

ACHERON, a river of Thesprotia, in Epirus; which, after forming the lake Acherusia, falls into the sea to the west of the Sinus Ambracius. It is now called *Delichi*.

ACHERON, or **ACHEROS**, a river of the Brutii in Italy, running from E. to W. where Alexander, king of Epirus, was slain by the Lucani, being deceived by the oracle of Dodona, bidding him beware of Acheron, which he supposed to mean the Acheron in his own kingdom.

ACHERSET, an ancient measure of corn, conjectured to be the same with our quarter, or eight bushels.

ACHERUSIA, in ancient geography, first, a lake in Egypt, near Memphis, over which, according to Diodorus, the bodies of the dead were conveyed for judgment, in the boat Baris, the property of Charon. And thus arose the Grecian fable of Charon and the Styx. Second, a lake between Cumae and the promontory Misenum, now *Il Lago Della Collucia*. Some confound it with the *Lacus Luciferus*, and others with the *Lacus Averni*. Third, a lake of Epirus, through which the Acheron runs. Fourth, a peninsula of Bithynia on the Euxine, near Heraclea.

ACHERUSIA, in ancient mythology, a cave, through which Hercules was fabled to have descended to hell, to drag forth Cerberus.

ACHETA, in entomology, a name by which the ancients called the larger species of *cicada*, or the third family of the Linnean gryllus.

ACHIA, or **ACHIAR**, a kind of cane which grows in the East Indies, and is pickled there while green, with strong vinegar and spices. It is a Malayan word for all kinds of pickled fruits and roots.

ACHIENUS, or **Achænus**, in natural history, a word used by the ancients to express a stag

or deer, in his second year. In the first it was called nebrus, in the third dicrotus, and always after that cerastes.

ACHICOLUM, or **ARCHITHOLUS**, in antiquity, the fornix, tholus, or sudatorium of the ancient baths; which was a hot room where they used to sweat.

ACHIEVE, v. { *Ach'ever*, Fr. to carry
ACHIEV'ABLE, } forward to the head, chief
ACHIEV'ANCE, } point, or end; to accom-
ACHIEV'ER, } plish an enterprize; to
ACHIEV'MENT. } finish; complete a design satisfactorily; to acquire.

The protectour sore thristed for the *acheuyng* of his pretensed enterprysse, and thought every daye a yere tyll it were perfourmed. *Hall*, p. 350.

And for to speke in other wale,
Full ofte tyme I have herde him saie,
That he, which hath no loue *acheaved*,
Hym thinketh that he is not relieved.

Gower, Con. A. b. vi.

And after that her thought gan for to clere,
And saied, he which yt nothing vndertaketh,
Nothing *acheueth*, be him loth or dere.

Chaucer, Troilus, b. ii. fol. 162, col. 1

William tok his leue, his way to Scotland ches,
Wele mot William *cheue*, and alle þat lufes pes.

R. Brunne, p. 146

From every coast, that heaven walks about,
Have thither come the noble martial crew,
That famous hard *achievements* still pursue.

Fuerie Queene.

LEON. A victorie is twice itself, when the *atchieuer* brings home full numbers.

Shaks. *Much Adoe about Nothing*, p. 101, act i. sc. 1.

And now great deeds

Had been *achiev'd*, whereof all hell had rung,
Had not the snaky sorceress that sat
Fast by Hell's gate, and kept the fatal key,
Ris'n with hideous outcry, rush'd between.

Milton's Paradise Lost, b. ii.

It is an unworthy thing to plead hardness of *atchieving*, where the benefit will more than requite the endeavour. *Hall's Contemplations*.

Then shall the war, and stern debate, and strife
Immortal, be the bus'ness of my life;
And in thy fame, the dusty spoils among,
High on the burnish'd roof, my banner shall be hung,
Rank'd with my champion's bucklers; and below,
With arms revers'd, th' *achievements* of the foe.

Dryden.

No exploits so illustrious, as those which have been *achieved* by the faith and patience, by the courage and prudence of the ancient saints: they do far surpass the most famous *achievements* of Pagan heroes. *Burrow's Sermons*.

The baths were not much frequented, being rarely used but after the accomplishment of some very great work which required abundance of labour and toil; as the ending of a war, *achieving* any great and painful enterprise. *Potter's Antig.*

ACHIGAN RIVER, a tributary stream to the river Assumption in Lower Canada, North America, which it joins about twelve miles from its mouth in the St. Lawrence. It is a considerable outlet for the timber of the upper forests of the country.

ACHILL, an island on the west coast of the county of Mayo, Ireland, from which it is separated by a narrow channel. It is about thirty miles in circumference. N. Lat. 53°, 38'. W. Long. 9°, 52'.

ACHILL-HEAD, a cape on the west of the above island.

ACHILLAS, in ancient history, an Egyptian general, who murdered Pompey the great. *Plut. in Pomp.*

ACHILLEA, in ancient geography, an island, containing the tomb of Achilles, near the mouth of the Ister. Second, a peninsula near the mouth of the Boristhenes. Third, a fountain of Miletus, whose water rose salt and afterwards freshened.

ACHILLÆA, YARROW, MILFOIL, NOSEBLEED, or SNEEZEWORT; a genus of the order of the polygamia superflua, belonging to the syngenesia class of plants. The natural order to which it belongs is the forty-ninth composite discoides.

ACHILLEIS, in literature, a celebrated poem of Statius, in honour of Achilles. See *STATIUS*.

ACHILLES, in ancient history, the son of king Peleus by the goddess Thetis, and the celebrated hero of Homer's *Illiad*, is said to have been born at Phthia in Thessaly. The fabulous part of his history is, that his mother, in order to render him immortal, by consuming the mortal parts of his body, which he derived from his father, laid him, when a child, every night under live coals, anointing him at the same time with ambrosia, which preserved him from burning, except one of his lips which he had licked; that, to render him invulnerable, she dipped him in the river Styx, excepting the heel by which she held him, a story not even credited by Homer, who mentions his being wounded in the right arm; that she afterwards entrusted him to the care of Chiron the Centaur, who fed him with the marrow of wild beasts, to strengthen him for the toils of war; and that to prevent him from going to the siege of Troy, she disguised him in the dress of a young woman, and attempted to conceal him among the daughters of king Lycomedes, one of whom he made the mother of Neoptolemus. The authentic part of his story seems to be, that Ulysses persuaded him to accompany the other Grecian chiefs in their crusade against Troy; that he there distinguished himself by his valour, till Agamemnon by taking from him Briseis a female captive, provoked him to withdraw himself in disgust: but, that his friend Patroclus being killed by Hector, in order to avenge his death he returned to the camp, slew the prince, and barbarously dragged his dead body round the walls of Troy at his chariot's wheels; that afterwards, falling in love with Philoxena, one of Hector's sisters, he was mortally wounded with an arrow in the heel, by her brother Paris, while treating about the marriage; and, in fine, that he was buried on the promontory of Sigeum, where the Greeks sacrificed the unfortunate princess, on his tomb; according to the barbarous custom of that age, and agreeably to his dying request, that he might enjoy her company in the Elysian Fields. His death is supposed to have happened about A. C. 1183. Alexander the Great is said to have visited his tomb, and placed a crown upon it, saying that "Achilles was happy, in having such a friend as Patroclus in his life, and such

a poet as Homer, to celebrate him, after his death."

ACHILLES, in logic, a name given to the principal argument alleged by each sect of philosophers in behalf of their system. In this sense, we say, this is his *Achilles*; that is, his master proof.

ACHILLES (Tatius,) See *TATIUS*.

ACHILLINI, (Alexander,) born at Bologna in 1463, was one of the most celebrated anatomists and philosophers of the fifteenth and sixteenth centuries. He first discovered some of the smaller bones in the ear; and filled in 1506 his professorship at Padua, with such distinction, that a vast influx of students came to that university from all parts of Europe. In 1508, his philosophical works were published in one volume, folio; besides which, he wrote *Annotationes Anatomicae*, 1520, quarto; *De Humani Corporis Anatomia*, 1521, quarto; and various other anatomical works.

ACHILLINI, (J. Philotheus,) brother of the above, who was born at Bologna, in 1466, and died there 1558, was also a distinguished scholar and poet.

ACHILLINI, (Claudius,) grandson of the last Achillini, read lectures at Bologna, Ferrara, and Parma, at the beginning of the seventeenth century, where he was much esteemed as a philosopher, a divine, an orator, mathematician, and poet. He accompanied cardinal Ludovisio, afterwards Gregory XV. when he went as legate into Piedmont: but being neglected by him, when he became pope, he left Rome in disgust, and retired to Parma, where the duke appointed him professor of law, with a good salary. He published a volume of Latin letters, and another of Italian poems, which gained him great reputation, and died in 1640, aged sixty-six.

ACHILLIS TENDO, in anatomy, is a strong tendinous cord, formed by the union of the tendons of the four extensor muscles of the foot, and inserted into the os calcis. It has its name from the fatal wound Achilles is said to have received in that part, from Paris the son of Priam.

ACHILLIS, a small lake in the county of Ross, Scotland, whose waters are supposed to have a subterranean outlet.

ACHIOTE, in botany, a name given by some authors to the uraca, or arnotto, called oreleta, and orellana, by others. It is the *BIXA ORLEANAE* of Linnaeus.

ACHIOTTE, or **ACHIOTE**, a foreign drug, used in dyeing, and in the preparation of chocolate. It is the same with the substance more usually known by the name of arnotto.

ACHIROPETOS, from *α*, without, *χειρ*, hand, and *ποιεω*, to make, a name given by ancient writers to certain pictures of Christ and the Virgin, said to have been made without hands. The most celebrated of these, is a Christ in the church of St. John Lateran at Rome, begun by St. Luke, but finished by angels.

ACHIVI, the Greeks, so called by the Roman poets.

ACHELEUTHEN, a lordship, town, and castle of Austria, on the Crems, ten miles E. S. E. of Ems.

ACHLYS, *αχλυς*; Gr. a cloud, in medicine, first a darkness or dimness of sight, arising from

a small cicatricula on the pupil, occasioned by a superficial ulcer on the cornea. Second, a disorder of the womb; answering to what Latin writers call *suffusio uteri*.

ACHMET, the son of Seerim, lived in the ninth century, and wrote a book concerning the interpretation of dreams according to the doctrine of the Indians, Persians, and Egyptians, which was translated out of Greek into Latin by Leo Tuscus, in 1160, and republished at Paris, 1603, with Artemidorous on Dreams.

ACHMIM, a large town of Upper Egypt, 200 miles south of Cairo, situated on the eastern bank of the Nile. "One admires there (says Abulfeda, as quoted by Mr. Savary,) a temple, which is equal to the most celebrated monuments of antiquity. It is constructed with stones of a surprising size, on which are sculptured innumerable figures." Though this town is fallen from its ancient splendour, it is still one of the most beautiful of Upper Egypt; and the country around is remarkably fertile, producing the finest corn of this part of Africa, as well as sugar and cotton. The streets are wide and clean, and commerce and agriculture flourish. It has a manufactory of cotton, stuffs, and pottery, which are conveyed over all Egypt. Achmim is the *Chemmis* of Herodotus, and the *Panopolis* of Strabo, or the city of Pan, who was worshipped there. Herodotus says, that Perseus was a native of this city, and that his descendants had established festivals there in his honour. It has lost its ancient edifices, and much of its extent; the ruins of the temple, described by Abulfeda, being without its limits, to the north. Nothing remains of it but some stones, of such magnitude, that the Turks have not been able to move them. On one of them are traced four concentric circles, in a square. The innermost of these contains a sun. The two next, divided into twelve parts, contain, the one, twelve birds, the other, animals almost effaced, which appear to be the signs of the zodiac. The fourth has no divisions, and presents twelve human figures, which Mr. Savary imagines to represent the twelve gods, the twelve months of the year, and the twelve signs of the zodiac. The four seasons occupy the angles of the square, on the side of which may be distinguished a globe with wings. The columns of this temple have been partly broken, to make lime and mill-stones. Some of them have been transported into one of the mosques of Achmim, where they are placed without taste; others are heaped up in the square of the town. Mr. Savary tells us of a serpent which is worshipped here, and the wonder of the country. See HARIDI. Here also is a church of some antiquity.

ACHMUNEIN, a town of Upper Egypt, 120 miles S. of Cairo, supposed to be the ancient Hermopolis, and containing the portico of a temple covered with hieroglyphics, which Denon considers the most superb remaining monument of Egyptian architecture.

ACHNE, *Aχνη*, Gr. chaff, froth, lint, smoke, or any thing light. It is used by Hippocrates to denote a white mucilage, observable in the eyes of patients who have fevers; and also a white mucus in the fauces, thrown up from the lungs.

ACHOR, a valley of Jericho, lying along the Jordan, not far from Gilgal.

ACHOR, in medicine, the third species of tinea, or scald-head. It is a sort of small running ulcer on the face and head, chiefly of children while they suck; by which the skin is broken into a number of little holes, out of which issues a viscid humour, like *ichor*, whence its name.—Achor differs from the favus and tinea only in the degree of virulence.

ACHRADINA, in ancient geography, one of the four divisions of Syracuse, and the strongest, largest, and most beautiful part of it; separated by a very strong wall from the outer town, Tycha and Neapolis. It was adorned with a very large forum, with beautiful porticos, a most elegant prytaneum, a spacious senate house, and a superb temple of Jupiter Olympius.

ACHRAS, or SAPOTA PLUM: a genus of the monogynia order, belonging to the hexandria class of plants; and ranking in the forty-third natural order, dumosar.

ACHIROI, *αχροι*, Gr. from *α* negative, and *χρωται*, colour, persons who have lost their natural colour; such as have the jaundice.

ACIROMATIC, Gr. of *α*, primitive, and *χρωμα*, colour, an epithet expressing want of colour.

ACHRONICAL TELESCOPES, are telescopes contrived to remedy the aberrations in colours; See ABERRATION.—A particular account of the invention and construction of these instruments will be found under OPTICS.

ACIRONICAL. See ACRONYCHAL.

ACHSHAPIH, a city, originally a kingdom, near the foot of mount Tabor, taken by Joshua, and given to the tribe of Asher. In St. Jerome's time, it was reduced to a small village, and called Chasalus.

ACHTELING, a measure for liquids used in Germany, thirty-two achtelings make a heemer; four sciltens or sciltins, make an achteling.

ACHTIRKA, a well-built town of Russia, capital of a district, in the government of Charko, on a river of the same name. Population 12,000. 40 miles W. S. W. of Charkov.

ACIY, a species of cassia, that grows in Arabia.

ACHYRANTHUS, in botany, a genus of the pentandria order, belonging to the monogynia class of plants, and associating with the miscellaneæ, in the thirty-fourth natural order.

ACHZIB. See ACHAZIB.

ACIA, a term in the Roman surgery, concerning the meaning of which physicians and commentators are much divided. Celsus, speaking of the healing of wounds either by suture, or the fibula, says, each is best effected by means of a soft *aciu*, not too much twisted, that it may sit the easier on the body. Boxornius will have the acia to be the *acus* of the fibula, or that part which is pinched: in which view *acia molle* is only imported, that it was not set so as to pinch too much.

ACICANTHERA, in botany, the trivial name of a species of RHEIXIA, which see.

ACICOCA, an herb of Peru, and is sometimes used instead of the herb paraguay, of which it is said to have all the properties.

ACICULA, the small pikes or prickles of the hedge-hog, *echinus marinus*, &c.

ACIDALIA, an epithet given to Venus by Virgil, from ACIDALUS, which see.

ACIDALIUS, Valens, a critic of the sixteenth century, born at Witstock, in Brandenburgh. Having visited several academies in Germany, Italy, &c. he took up his residence at Breslaw, where he became a Roman catholic, and was chosen rector of a school at Niesse. Thuanus says that his sitting up at night, to compose his conjectures on Plautus brought upon him a distemper, which carried him off in three days, on the 25th of May, 1595, being just twenty-eight years of age. He wrote a commentary on Quin-

tus Curtius ; Notes on Tacitus ; besides speeches, letters, and poems, which last are inserted in the *Deliciae* of the German poets. A little piece, printed in 1595, under the title of *Mulieres non esse Homines*, was falsely ascribed to him. Mr. Baillethas given him a place among his *Enfans Celebres* ; and says, that he wrote his comment upon Plautus when he was but seventeen or eighteen years old, and that he composed several Latin poems at the same age.

ACIDALUS, a fountain in Orchomenus, a city of Beotia, in which the Graces are said to have bathed.

ACIDOTON, in botany, the trivial name of a species of ADELIA.

A C I D.

ACID, *n. & adj.*

ACID'ITY,

ACID'ULATE,

ACES'CENCY,

ACES'CENT.

Acide, Fr. That which cuts or corrodes ; having the quality of sourness.

The smoke of sulphur will not black a paper, and is commonly used by women to whiten tifflines, which it performeth by an *acide*, vitriolis, and penetrating spirit ascending from it. *Brown's Vulgar Errors.*

The same persons (perhaps) had enjoyed their health as well, with a mixture of animal diet, qualified with a sufficient quantity of *acescents* ; as bread, vinegar, and fermented liquors. *Arbuthnot on Aliments.* In spring-like youth it yields an *acid* taste ; But summer doth, like age, the sourness waste ; Then cloth'd with leaves from heat and cold secure, Like virgins, sweet and beauteous when mature.

Denham's Old Age, part iii.

ACID, from, *acesto*, to sharpen, a name given to a very extensive and important class of substances, from their prominent quality of sharpness or sourness. Sourness of taste, however, is merely one of the sensible properties of these substances, and they possess some others equally if not more characteristic. Of acids there is a large number and great variety, so that were we to devote the present article to the history of them individually, we should be under the necessity of amplifying it to an extent inconsistent with our plan of arrangement. It is merely then our design in the present instance to treat on the general principle of acidity, referring an account of the particular acids to the article CHEMISTRY, and to the alphabetical order into which they may fall. Thus for acetous or acetic acid, let the reader turn to the word acetous or acetic, and so on through the whole series of adjective designations.

The properties of acids are,

1. Sourness of taste, amounting in some of the species to a corrosive quality.

2. A general, though not invariable power of combining with water in any proportion, with a condensation of volume, and evolution of heat. (For the most part indeed, acids are found in a state of fluidity ; but not so without exception, some being met with in a solid form.)

3. They are mostly susceptible of volatilization, or are decomposed by heat.

4. They change the purple or blue colour of vegetables to a bright red.

5. They combine in definite proportions with alkalis, (see alkali) earths, and metals ; and by this combination is constituted that important class of bodies called salts.

" This last (says Dr. Ure) may be reckoned their characteristic and indispensable property. The powers of the different acids were originally estimated by their relative causticity and sourness ; afterwards by the scale of their attractive force towards any particular base ; and next by the quantity of the base that they could respectively neutralize. But Berthollet proposed the converse of this last criterion as the measure of their powers, ' The power by which they can exercise their acidity,' he estimates ' by the quantity of each of the acids which is required to produce the same effect, viz. to saturate a given quantity of the same alkali.' It is therefore the capacity of saturation of each acid which, in ascertaining its acidity according to him, gives the comparative force of the affinity to which it is owing. Hence he infers, that the affinity of the different acids for an alkaline base, is in the inverse ratio of the producible quantity of each of them, which is necessary to neutralize an equal quantity of the same alkaline base ; an acid is therefore, in this view, the more powerful, when an equal weight can saturate a greater quantity of an alkali. Hence, all those substances which can saturate an alkali, and cause their properties to disappear, ought to be classed among the acids ; in like manner among the alkalis, should be placed all those which, by their union can saturate acidity, and the capacity of saturation being the measure of this property, it should be employed to form a scale of the comparative power of alkalis as well as that of acids."

" However plausible," continues Dr. Ure, " à priori, the opinion of this illustrious philosopher may be, that the smaller the quantity of an acid or alkali required to saturate a given quantity of its antagonist principle, the higher should it rank in the scale of power and affinity ; it will not however accord with chemical phenomena : 100 parts of nitric acid are saturated by about 36½ of magnesia, and 52½ of lime."

"Hence by Berthollet's rule, the power of these earths ought to be as the inverse of their quantities: viz. $\frac{1}{362}$ and $\frac{1}{524}$, yet the very opposite effect takes place, for lime separates magnesia from nitric acid, and in the present example the difference of effect cannot be imputed to the difference of force with which the substances tend to assume the solid state.

"We have, therefore, at present, no single acidifying principle, nor absolute criterion of the scale of powers among the different acids: nor is the want of this of great importance. Experiment furnishes us with the order of decomposition of one acido-alkaline compound, by another acid, whether alone or aided by temperature; and this is all that practical chemistry seems to require."

The question respecting the principle of acidity will be found to involve a great deal of what is very important in its bearing upon the doctrines of chemistry generally, and it is a question, which perhaps may be regarded as open to still further investigation than that which it has received from the extraordinary ingenuity and industry of modern chemists. A disposition to generalize beyond the warrants of fact, has pervaded the speculations of individuals in reference to the rationale of acidity, from very early times. Paracelsus conceived that there was only one acid principle in nature. Becher maintained the same doctrine, and modified it by the supposition, that this acid principle is a compound of earth and water, both of which, were regarded as two distinct elements. Stahl adopted the same theory, and imagined the sulphuric acid to constitute the general principle of acidification—a supposition, which upon the authority of Stahl, was for a long time held in the schools; but was at length openly combated by Bergmann and Scheele. Still, however, the hypothesis of acidity, being the result of some pervading principle, continued to obtain; and Wallerius, Megar, Sage, and others in their turns advanced several speculations on the essential nature and mode of this principle, when at length the French chemists, with Lavoisier at their head, propounded a doctrine entirely new, and of most extensive application: viz., "That acids result from the union of a peculiar combustible base, called the radical, with a common principle, technically called oxygen, or acidifer;" the radical or base giving the specific or peculiar property to the respective substances, and oxygen being the essence of acidity in the whole.

"I have already shewn," says Lavoisier, "that phosphorus is changed by combustion into an extremely light white flaky matter. Its properties are likewise entirely altered by this transformation: from being insoluble in water, it becomes not only soluble, but so greedy of moisture, as to attract the humidity of the air with astonishing rapidity. By this means it is converted into a liquid considerably more dense, and of more specific gravity than water. In the state of phosphorus, before combustion, it had scarcely any sensible taste; by its union with oxygen, it acquires an extremely sharp and

sour taste; in a word, from one of the class of combustible bodies, it is changed into an incombustible substance, and becomes one of those bodies called acids.

"Sulphur also, in burning, absorbs oxygen gas; the resulting acid is considerably heavier than the sulphur burnt; its weight is equal to the sum of the weight of the sulphur which has been burnt, and of the oxygen absorbed; and lastly, this acid is weighty, incombustible, and miscible with water in all proportions."

"The examples, above cited," continues Lavoisier, "may suffice for giving a clear and accurate conception of the manners in which acids are formed. By these it may be clearly seen that oxygen is an element common to them all, and which constitutes or produces their acidity; and that they differ from each other according to the several natures of the oxygenated or acidified substances." "Although," he further adds, "we have not been able either to compose or to decompose the acid of sea-salt, we cannot have the smallest doubt that it, like all other acids, is composed by the union of oxygen with an acidifiable base. We have therefore called this unknown substance, the muriatic base, or muriatic radical."

The above communication of Lavoisier was generally received, and accepted as the foundation of a new system of chemical doctrine—both inflammability and acidity were thought to be fully explained by the oxygenous theory; and it was expected that every new development of fact would harmonize with the new theory of causation.

The nomenclature of acids was now altered to suit the new theory; the terminations *ous*, *ic*, and the prefix *oxy* being employed to denote the different measures in which the acidifiable base was combined with oxygen.

In the first state, or that in which acid bodies were supposed to exist, with the least possible quantity of oxygen, their names terminated in *ous*, as sulphurous, nitrous, phosphorous, or acetous.

The second state, or that in which they contained a saturating quantity of oxygen was expressed by the termination *ic*, as sulphuric, or nitric: and when imagined to contain an excess of oxygen the term *oxy* was prefixed, as oxy-muriatic.

But it was soon suggested that Lavoisier in thus conceiving oxygen to be the universal principle of acidity, had run into a hasty generalization which was unwarrantable by nature. "It is carrying the limits of analogy too far (observed Berthollet) to infer that all acidity, even that of the muriatic, fluoric, and boracic acids arises from oxygen, because it gives acidity to a great number of substances. Sulphureted hydrogen, which really possesses the property of an acid, proves directly that acidity is not in all cases owing to oxygen. There is no better foundation for concluding that hydrogen is the principle of alkalinity, not only in the alkali, properly so called, but also in magnesia, lime, strontian and barytes, because ammonia appears to owe its alkalinity to hydrogen. We must not, therefore, always infer from the acidity of a sub-

stance that it contains oxygen, although this may be an inducement to suspect its existence in it."

Sir H. Davy, was however, the first to shew in a systematic manner, that the French chemists had been in error when they assumed oxygen to be the absolute essence of acidity; and, he at length propounded those highly interesting principles concerning acidification, which have shaken the Lavoisierian system to its foundation. He demonstrated that oxy-muriatic acid is, as far as our knowledge extends, a *simple* substance, which may be classed in the same order of natural bodies as oxygen gas, being determined like oxygen, to the positive surface in voltaic combinations; and, like oxygen, combining with inflammable substances, producing light and heat. The combinations of oxymuriatic acid with inflammable bodies were shewn to be analogous to oxides and acids in their properties and powers of combination, but to differ from them in being, for the most part decomposable by water; and finally, that oxymuriatic acid has a stronger attraction for most inflammable bodies than oxygen. His preceding decomposition of the alkalis, (see ALKALI) and the earths, having evinced the absurdity of that nomenclature which gives to the general and essential constituent of acid nature, the term oxygen or acidifier; his new discovery of the simplicity of oxy-nuriatic acid shewed the theoretical system of chemical language to be equally vicious in another respect. Hence, this philosopher most judiciously discarded the appellation oxymuriatic acid, and introduced in its place the name chlorine, which merely indicates an obvious and permanent character of the substance, its greenish yellow colour. See CHLORINE and CHEMISTRY.

Succeeding chemists have brought powerful analogies in support of the new theory of Davy, by shewing that hydrogen alone has the power of changing certain undecomposed bases into real acids; and that this is effected without the presence or assistance of oxygen. Dr. Murray has indeed argued with a good deal of ingenuity against the unqualified reception of Davy's principles, and has suggested that acidity may in most, if not in all cases, consist of a species, so to say, of oxy-hydrogenation.

"When," says Dr. Murray, "a series of compounds exist, which have certain common characteristic properties, and when these compounds all contain a common element, we conclude with justice, that these properties are derived more peculiarly from the action of this element. On this ground, Lavoisier inferred, by an ample induction, that oxygen is a principle of acidity. Berthollet brought into view the conclusion, that it is not universally so, from the examples of prussic acid and sulphurated hydrogen. In the latter, acidity appeared to be produced by the action of hydrogen. The discovery of Gay Lussac of the compound radical cyanogen, and its conversion into prussic acid by the addition of hydrogen, confirmed this conclusion; and the discovery of the relations of iodine still further established it. And now the system must be still further modified. While each of these conclusions is just, to a certain extent, each of them

requires to be limited in some of the cases to which they are applied; and while acidity is sometimes exclusively connected with oxygen sometimes with hydrogen, the principle must also be admitted, that it is more frequently the result of their combined operations."

"There appears," continues Dr. Murray, "even sufficient reason to infer, that from the united action of these elements, a higher degree of acidity is acquired, than from the action of either alone. Sulphur affords a striking example of this. With hydrogen it forms a weak acid: with oxygen it also forms an acid, which though of superior energy, still does not display much power: with hydrogen and oxygen, it seems to receive the acidifying influence of both, and its acidity is proportionably exalted."

These speculative objections of Dr. Murray to the simplicity of chloridic theory, go, it will be seen, partly upon the supposition, that the agency of media is not sufficiently appreciated in that theory; and that the elements, at least of water, are always at work in modifying the combinations of substances upon which the experiments are made. "He thinks it doubtful," says Dr. Ure, "whether nitrogen and oxygen can alone form an insulated acid. Hydrogen he conceives essential to its energetic action. What, may we ask then, exists in *dry* nitre, which contains no hydrogen? Is it nitric acid? or merely two of its elements in want of a little water to furnish the requisite hydrogen? The same question may be asked relative to the sulphate of potash. Since he conceives hydrogen necessary to communicate full force to the sulphuric and nitric acids, the moment they lose their water they should lose their saturating power, and become incapable of retaining caustic potash in a 'neutral state.' Out of this dilemma he may indeed try to escape, by saying, that moisture or hydrogen is equally essential to alkaline strength, and that therefore the same desiccation or hydrogenna-tion which impairs the acid power, impairs also that of its alkaline antagonist. The result must evidently be, that in a saline hydrate or solution, we have the reciprocal attractions of a strong acid and alkali; while in a dry salt, the attractive forces are those of relatively feeble bodies. On this hypothesis the difference ought to be great between dry and moistened sulphate of potash. Carbonic acid is admitted to be destitute of hydrogen, yet its saturating power is very conspicuous in neutralizing dry lime. Now, oxalic acid, by the last analysis of Berzelius, as well as my own, contains no hydrogen. It differs from the carbonic only in the proportion of its two constituents, and oxalic acid is appealed to by Dr. Murray, as a proof of the superior acidity bestowed by hydrogen."

"On what grounds," continues Dr. Ure, "he decides carbonic acid to be a feebler acid than oxalic, it is difficult to see. By Berthollet's test of acidity, the former is more energetic than the latter, in the proportion of 100 to about 58, for these numbers are inversely as the quantity of each requisite to saturate a given base. If he be inclined to reject this rule, and appeal to the decomposition of the carbonate by oxalic acid, as a criterion of relative power, let us adduce

his own commentary on the statical affinities of Berthollet, where he ascribes such changes not to a superior attraction in the decomposing substance, but to the elastic tendency of that which is evolved. Ammonia separates magnesia from its muriatic solution at common temperatures; at the boiling heat of water, magnesia separates ammonia. Carbonate of ammonia, at temperatures under 230°, precipitates carbonate of lime from the muriate: at higher temperatures, the inverse decomposition takes place with the same ingredients. If the oxalic be a more energetic acid than the carbonic, or rank higher in the scale of acidity, then, on adding to a given weight of liquid muriate of lime, a mixture of oxalate and carbonate of ammonia, each in equivalent quantity to the calcareous salt, oxalate of lime ought alone to be separated. It will be found, on the contrary, by the test of acetic acid, that as much carbonate of lime will precipitate as is sufficient to unsettle these speculations.

"Finally, dry nitric acid and dry sulphate of potash, are placed, by this supposition, in as mysterious a predicament as dry muriate of soda in the chloridic theory. Deprived of hydrogen, their acids and alkali are enfeebled or totally changed. With a little water, both instantly recruit their powers. In a word, the solid sulphuric acid of Nordhausen, and the ~~dry~~ potash of potassium, are alone sufficient to subvert this whole hypothesis of hydrogenation."

The able chemist whom we have last quoted proposes the following distribution of acids "to give general views to beginners in the study." We treat them, as before stated, in their alphabetical order:—

I. Division 1st, Acids from inorganic nature, or which are procurable without having recourse to animal or vegetable products.

II. Division 2d, Acids elaborated by means of organization.

The first group is subdivided into three families: 1st, Oxygen acids; 2d, Hydrogen acids; 3d, Acids destitute of both these supposed acidifiers.

1. Division 1. Inorganic Acids.

Family 1st.—Oxygen acids.

Section 1st, Non-metallic.

- | | |
|---------------------|----------------------|
| 1. Boracic. | 11. Hypophosphorous. |
| 2. Carbomc. | 12. Phosphorous. |
| 3. Chloric. | 13. Phosphatic. |
| 4. Perchloric? | 14. Phosphoric. |
| 5. Chloro-Carbonic. | 15. Hyposulphurous. |
| 6. Nitrous. | 16. Sulphurous. |
| 7. Hyponitric. | 17. Hyposulphuric. |
| 8. Nitric. | 18. Sulphuric. |
| 9. Iodic. | 19. Cyanic? |
| 10. Iodo-Sulphuric. | |

Section 2d, Oxygen acids.—Metallic.

- | | |
|----------------|----------------|
| 1. Arsenic. | 6. Columbic. |
| 2. Arsenious. | 7. Molybdic. |
| 3. Antimonic. | 8. Molybdaous. |
| 4. Antimoniac. | 9. Tungstic. |
| 5. Chromic. | |

Family 2d.—Hydrogen acids.

- | | |
|--------------|---------------------|
| 1. Fluoric. | 3. Hydrochloric, or |
| 2. Hydriodic | Muriatic. |

- | | |
|---------------------|---------------------|
| 4. Ferroprussic. | 7. Hydrosulphurous. |
| 5. Hydroscelenic. | 8. Hydrotellurous. |
| 6. Hydroprussic, or | 9. Sulphuroprussic. |
| | Hydrocyanic. |

Famly 3d.—Acids without oxygen or hydrogen.

- | | |
|-----------------------|-----------------|
| 1. Chloriodic. | 3. Fluoboric |
| 2. Chloropruissic, or | 4. Fluosilicie. |
| | Chlorocyanic. |

II. Division 2d. Acids of organic origin.

- | | |
|---------------------|----------------------|
| 1. Aceric | 24. Meconic. |
| Acetic. | 25. Menispermic. |
| Ammiotic. | 26. Margarie. |
| Benzoic. | 27. Melassic? |
| Boleitic. | 28. Mellitic. |
| 6. Butyric. | 29. Moroxylic. |
| 7. Camphoric. | 30. Mucie. |
| 8. Caseic. | 31. Nanceic. |
| 9. Cevadie. | 32. Nitro-leucie. |
| 10. Cholesteric. | 33. Nitro-saecharie. |
| 11. Citric. | 34. Oleic. |
| 12. Delphinic. | 35. Oxalic. |
| 13. Ellagic. | 36. Purpuric. |
| 14. Formic. | 37. Pyrolithic. |
| 15. Fungic. | 38. Pyromalic. |
| 16. Gallie. | 39. Pyrotartaric. |
| 17. Igasurie. | 40. Rosacie. |
| 18. Kinic. | 41. Saclactic. |
| 19. Laecie. | 42. Selvacie. |
| 20. Lactic. | 43. Suberic. |
| 21. Lampic. | 44. Succinic. |
| 22. Lithic or Uric. | 45. Sulphoinic? |
| 23. Malic. | 46. Tartaric. |

The acids of the last division are all decomposable at a red heat, and afford generally carbon, hydrogen, oxygen, and in some few cases also nitrogen. The mellitic is found like amber in wood, coal, and, like it, is undoubtedly of organic origin.

ACIDIMETRY, in chemistry, the measurement of the power or strength of acids; generally effected by saturating a given weight of them with an alkaline base, when the quantity of alkaline is required in the measure of their power.

ACIDULÆ, as natural history, a species of mineral waters, distinguished by a latent acidity in their nature. When they are unaccompanied with heat, they are called *acidulae*; but if heat be added to their brisk spirit, they are denominated *thermae*. *Acidulae* are native waters, impregnated with particles of some acid mineral, as vitriol, atum, nitre, or salt, and contain a considerable quantity of fixed air. Water may readily be impregnated with carbonic gas, but an air-tight vessel must be employed. The physicians also frequently include chalybeate and aluminous or ferruginous waters, under the class of *acidulae*. An analysis of mineral waters may be made, either by evaporation, which will discover both the quantity of solid matter contained in the water, and by subsequent trials, the peculiar nature of it; or by distillation, whence it may be known, whether the water contain any volatile matter, saline or bituminous; or again, by the mixture of certain liquors. The most common for this purpose are the infusion of galls, syrup of violets, oil of tartar, volatile alkaline salts, tincture of sulphur and aqua-

aforts. A small quantity of the infusion of galls will discover whether the water be impregnated with iron. If it contain a coarse oker, the colour struck by the galls is very dark; the finer iron produces an inky purple; but the finest, such as the pyrrhotite water contains, gives a perfect black. A dram of syrup of violets, mixed with a small wine glass of the mineral water, will produce a green colour, if there be any alkaline salt, or alum in it; though, it is said, that if the spirit be new, alum will turn it red. This green colour is also observed, when a solution of iron is met with; with an acid, the syrup produces a red. Volatile alkaline salt precipitates the contents of hard water, and discovers mercury, or any of its preparations, by turning the liquor whitish, and coagulating part of it. It discovers copper, by producing a blue colour. Volatile tincture of sulphur discovers lead in water, by turning it into a dusky brown colour. Nitric acid turns the water into a green colour, if it contains a solution of copper.

ACIDULATED, an epithet applied to medicines that have an acid in their composition.

ACIDULOUS, in chemistry, expresses either generally a slight degree of acid, or in particular an excess of acid in a compound salt; thus acidulous sulphate of potash is the sulphate of potash with an excess of acid.

ACIDULUM, in chemistry, a genus of native vegetable salts, consisting of potash saturated with an excess of acid, and comprising two species, tartarous acidulum, or the acidulous tartrite of potash, and the oxalic acidulum, or acidulous oxalat of potash.

ACIERNO. See ACERNO.

ACILIA LEX, in Roman antiquity, a celebrated law, enacted by Acilius the tribune, for the plantation of five colonies in Italy. 2. Another law, called also Calpurnia, enacted A. U. C. 684, against bribing elections. 3. A law against extortion.

ACILIUS, (M. Balbus) a consul with Portius Cato, A. U. 640; during whose consulship, according to Pliny, milk and blood fell from heaven.

ACILIUS, (Glabrio) a tribune who put down an insurrection amongst the slaves of Etruria. He was consul with P. Corn. Scipio Nasica, and conquered Antiochus A. U. C. 563, for which he obtained the honour of a triumph. He was a candidate for the censorship in opposition to Cato. Also, a son of the preceding, who erected a temple to Piety, and the first golden statue that was ever seen in Italy, to the memory of his father. The temple was erected on the site where a Roman female had fed her aged father with her milk. There was also a consul of this name in Domitian's time whose son was put to death by the tyrant for exhibiting more strength than himself in a contest with wild beasts.

ACILIUS, the surname of a Roman family, which produced several great men. See GLABRIO.

ACINACIFORMIS in botany, from ἀκινάκης, a scimitar, scimitar-shaped, an epithet for a leaf: *Folium acinaciforme*, a leaf which has one edge convex and sharp, the other straight and thick, as in the *Mysembranthemum*. *Linn. Phil. Bot.*

ACINACES in antiquity, a kind of cutlass or scimetar, in use among the Persians.

ACINARIA, in botany, a name given by some to the marsh wortle-berries, or *vaccinia palustris*.

ACINESIA, *ἀκίνεσια*, from *α*, negative, and *κίνεω*, to move. In medicine, the immobility of the whole body or any part of it, as in a palsy, apoplexy, &c. Also, applied by Galen to the suspension of the pulse.

ACINI, in botany, small grains, or berries, growing in bunches, after the manner of grapes; also the stones or seeds of grapes. The berries of the elder, privet, ivy, &c. are of this kind, and so called.

ACINI GRANDULOSI, in anatomy, some glands, so called from their formation.

ACINIFORMIS TUNICA, the same with the tunica uvea of the eye. It is also called *acinos* *tunica*.

ACINODENDRON, in botany, the name given by Burman, to a species of plants, called melastoma, belonging, in the Linnaean system, to the genus thymus, and to the class and order didynamia gymnospermia.

ACINOS, in botany, stone, or wild basil. See THYMUS.

ACINUS, in botany, properly signifies the grape. See ACINI. It is also the name of the staphyloma.

ACIPENSER. See ACCIPENSER.

ACIS, in fabulous history, the son of Faunus and Simetheis, was a beautiful shepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was so enraged, that he dashed out his brains with a piece of rock; after which Galatea turned him into a river, which was called by his name: now the Aci or Iaci.

ACITLI, in ornithology the common Mexican name of the great crested diver, common to Europe and America, and more usually called by authors, the *lepus aquaeus* or water hare.

ACKEN, a small town in the duchy of Magdeburg, situate on the Elbe, five miles below Dessau. It has a citadel.

ACKLAND'S ISLAND, sometimes called South Crooked Island, one of the Bahamas, lying in N. lat. 23°, 20'. and E. long. 73°, 30'. It is about 50 miles in length; and seven in breadth, at its northern extremity, but very narrow southward. Atwood's harbour, to the north, has good anchorage for small vessels. The flamingo roosts here in great numbers.

ACKLIN'S KEYS is a name sometimes given to a group of islands, of which the above and Longkey or Fortune's Island are the principal.

ACKNOW, Composed of the
ACKNOW'EDGE, } prefix *a*—subsequent-
ACKNOW'EDGEMENT, } *ly ac, cnawan*, to know,
ACKNOW'EDGING, } and *legan*, to lay,
Ang. Sax. To lay open to, to make known to, to discover to; to confess, to make a concession.

So eeh that denyeth the sone hath not the fadir,
but he that knowlechith the sone hath the fadir.
Wielif, 1 Jon, chap. ii.

That their hearts might be comforted, being knit together in love, and unto all riches of the full assurance

ance of understanding, to the acknowledgement of God, and of the Father, and of Christ.

Colossians, chap. ii. v. 2.

But is it credible, that the very acknowledgement of our unworthiness to obtain, and in that respect, our professed fearfulness to ask any thing, otherwise than only for his sake to whom God can deny nothing; that this should be termed baseness, abjection of mind, or servility—is it credible? *Hooker's Ec. Pol.*

My people do already know my mind;
And will acknowledge you and Jessica,
In place of lord Bassanio and myself. *Shaks.*
Thou sun of this great world both eye and soul,
Acknowledge him thy greater; sound his praise
In thy eternal course, both when thou climbest
And when high noon hast gain'd, and when thou
fall'est. *Milton.*

None, that acknowledge God or providence,
Their soul's eternity did ever doubt. *Davies.*

There can be no more forcible motive to patience, than the acknowledgement of the divine hand that strikes us. *Hall's Contemplations.*

As teaching bringeth us to know that God is our supreme good; so prayer testifieth that we acknowledge him our sovereign good. *Bishop Taylor's Sermons.*

ALMANZ. Accept this diamond, till I can present
Something more worthy my acknowledgment. *Dryden's Conquest of Granada, part ii.*

We are the subjects of the Almighty; and whether we acknowledge it or not, we live, and cannot but live under his government. *Bishop Porteus.*

ACKNOWLEDGMENT MONEY, a sum paid by tenants, in several parts of England, on the death of their landlords, as an acknowledgment of their new lords.

ACKWORTHI, a village, near Pontefract in Yorkshire; distinguished by a benevolent institution for the education of the children of Quakers. This school belonged originally to the Foundling Hospital, London; but in the year 1777, being offered for sale, with eighty-five acres of adjoining land, the respectable society of Friends bought the property, and endowed it at an expense of £7000 for the education of their own youth of both sexes. The edifice is built entirely of stone; and part of the eastern wing has been converted into a meeting house.

ACLIDES, in Roman antiquity, a kind of missile weapon, having a thong fixed to it, by which, after casting it out of the hand, it might be drawn back again. Servius describes the acides as full of spiculae.

ACLOWA, in botany, a barbarous name of a species of colutea. It is used by the natives of Guinea to cure the itch: They rub it on the body as we do unguents.

ACMASTICA, in medicine, a continued fever. See SYNCHEUS.

ACME, *ἀκμή*, Gr. the highest point of any thing; the crisis.

ACMELLA. See ACHAMELLA

ACMONIA. See AGMONIA.

ACNE, in medicine, a name given to a small pimple, or hard tubercle, on the face.

ACNIDA, VIRGINIAN HEMP, in botany, a genus of the dioecia order, belonging to the pentandria class of plants; and, in the natural order, associating with the seabridae.

ACNUA, in Roman antiquity, a measure of sand, about equal to the English rood.

ACO, a fish found in the lake Como, Italy and in the Mediterranean, called also aquo and saraculus.

ACOBAMBA, a settlement of Peru, in the province of Argaraes, forming the capital, but now decayed. Also, the name of two smaller Peruvian settlements.

ACOEMETE, or ACOEMETI, from *a* private, and *koaw*, to sleep, in church history, certain monks, who flourished in the East, in the fifth century; and who had divine service performed, without interruption, in their churches. The religious of the Holy Sacrament, in the church of Rome still keep up a perpetual adoration: some one or other of them praying before the sacrament, day and night. The ancient acoemetae are supposed, by Wetstein and others, to have written the Codex Alexandrinus, as it contains a catalogue of the psalms to be sung every hour of the day and night.

ACOLCHICHI, in ornithology, the Mexican name for the orioles phoenicus of Linnaeus.

ACOLIDY, or COLD. See COLD.

And as it shulde so betide,
A poure lazar upon a tide
Came to the gate and axed meate:
But there might he nothing geate,
Thus laie this poure in great distresse,
A colde and hongred at the gate. *Gower, Con. A. book vi. v. 9.*

—Prick my hand
And it will bleed; a fever shakes me,
And the self-same wind that makes the young
lambs shrink,
Makes me acold.

Beaumont and Fletcher's Faithful Shepherdess,
act i. sc. 1.

ACOLIN, in zoology, the name of a bird of the partridge kind, common in the Spanish West Indies.

ACOLYTHI, in ecclesiastical history was first applied to young people, who continually attended the bishops, and were generally candidates for the ministry. In the Romish church their functions became different. They were such as had only received the first of the four lesser orders, and whose business was to light the tapers, carry the candlesticks, and the incense-pot, and prepare the wine and water.

ACOLYTHUS, a title in the Grecian empire, given to the captain or commander of the Varangi, a body of guards appointed for the security of the emperor's palace.

ACOMAC. See ACCOMAC.

ACOMINATUS, (Nicetas,) was secretary to Alexius Commenus and to Isaacus Angelus successively; he wrote a history from the death of Alexius Commenus in 1118, where Zonaras ended his, to the year 1203, which has undergone many impressions, and is much applauded by the best critics in history.

ACON, an instrument used in the ancient exercises, like the *discus*. Also an ancient order of knights, who joined the Hospitallers.

ACONCAGUA, a province of Chili, South America, bounded on the north and west by Quillosa, on the east by the Andes, and south by Santiago. The mountains furnish immense quantities of copper ore; and the neighbourhood

abounds with greens and fruits. There is a royal road through this province, across the Cordilleras to Mendoza and Santiago, by which the mails of Europe are regularly received once a month. The treasures which pass by this road in winter, are frequently interrupted by means of snow falling down from the mountains, and provisions for continual stoppages are a necessary part of the equipage. The territory itself is level, and contains a population of 8000 souls.

ACONCAGUA, a trading town of Chili, the ancient capital of a province, now reduced.

ACONCAGUA, a considerable river of Chili, which, rising in the Cordilleras, and passing through Quilot, Cirvon, &c. enters the Pacific at about 33° S. lat.

ACONCROBA, in botany, a plant that grows wild in Guinea, and is much esteemed for its virtue in the small-pox. It is given infused in wine.

ACONE, in antiquity, 1. A stone used as a whetstone, and more usually known among the Romans by the name *cotula*. 2. A mortar for the purpose of levigation.

ACONITA, in chemistry, a vegetable poison recently extracted from the *aconitum Napellus*, or wolf's bane. It is of an alkaline character, and we are indebted to Mr. Brande for its discovery.

ACONITI, *ακονίτος*, without dust, in antiquity, an appellation given to some of the Athletes, but differently interpreted: i. e. 1. Of those who only anointed their bodies with oil, but did not smear themselves over with dust, which was the usual practice. 2. Of those who conquered easily without dust, q. d. *ακονίτης απάχτη*, with little trouble.

ACONITON, in medicine, signifies not plastered, and is applied to vessels not lined within.

ACONITUM, ACONITE, WOLFSBANE, or MONKSHOOD; a genus of the trigynia order, belonging to the polyandria class of plants. In the natural order, it associates with the multisilique.

ACONQUIJA, a lofty mountain of Tucuman, in the vice-royalty of Buenos Ayres, covered with perpetual snow, and said to be very productive of the precious metals.

ACONTIAS, from *Ακόντιον*, Gr. a name with Pliny and others, for a sort of comet, or meteor. Also a serpent of Calabria and Sicily, whose bite is very poisonous. It is an obsolete name of the *anguis jaculus*, or dart-snake. See ANGUS.

ACONTIUM, *ακόντιον*, in Grecian antiquity, a kind of dart or javelin resembling the Roman pilum.

ACONTIUS, (James,) a philosopher, civilian, and divine, born at Trent: in 1557, he embraced the reformed religion; and coming into England in the reign of queen Elizabeth, was much honoured by her, which he acknowledges in his celebrated Collection of the Stratagems of Satan, dedicated to that queen. He also wrote *De Methodo sive recta Investigandarum*, 1558, which

is considered his best work: and *Ars Munitionum Oppidorum*, 1585.

ACOOTAN, one of the Aleutian or Fox-islands, containing some very lofty mountains.

ACOPA or ACOPICA, in botany, a name given by Dioscorides, and some authors, to the menyanthes trifoliata, or buck-bean.

ACOPA, Gr. from *α* privative, and *κοπης*, weariness, in medicine, remedies against lassitude or weariness, such as tensions, pains in the bones, &c. Acopis, is a fossile salt, described by Pliny, and used by the ancients, mixed with oil for this purpose.

ACOPON, ACOPUM, or ACOPOS. See ACORA.

ACOR, in medicine, sourness or acrimony, as in the stomach, &c.

ACORDINA, in chemistry, Indian tutty.

ACORI, in natural history, BLUE CORAL. The true acori is very scarce; some, however, is obtained on the coasts of Africa, near the river Camarones. That of the kingdom of Benin is also much esteemed. It is also a name for the greater Galangal root.

ACORN, { Ang. Sax. *Ac*: oak: corn.

ACORNED. { The corn, grain, or fruit of the oak.

Cornels and bramble-berries gave the rest;
And falling acorns furnish'd out a feast.

Dryden's Ovid.

The ACORN, in early ages, was a common article of food, and so late as 1709, was extensively used in France during a scarcity. It was divested of its husk and then boiled. In Spain, it is said in former times to have been served at table as a delicacy. It has often been substituted for coffee when roasted.

ACORY, in medicine, the seed of the oak, used as an astringent.

ACORN, in maritime affairs, a little piece of wood, fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the mast head, to keep the vane on.

ACORUS, CALAMUS AROMATICUS, SWEET FLAG, or SWEET RUSH: a genus of the monogynia order, belonging to the hexandria class of plants; and ranking in the second natural order, piperite.

ACORUS, in natural history. See ACORI.

ACOSTAN, a mountainous island in the north seas between Asia and America, observed by Captain Cook.

ACOTYLEDENES, of *α*, priv. and *κοτυληδον*, lobeless, in botany, a class of plants without lobes, or seminal leaves. It is the first class in the natural order of Jussieu.

ACOUS, or ACCOUS, a town of France, in the province of Bearn, department of the Lower Pyrenees, and arrondissement of Oleron. Population 1600. It is about nine leagues southwest of Pau.

ACOUSMATICI, from *ακεω*, to hear, such of the disciples of Pythagoras, as had not completed their five years' probation. They are sometimes called by Latin writers, acousticci.

A C O U S T I C S.

ACCOUSTIC DISCIPLES. See **ACOUSMATICI.**

ACOUSTIC DUCT, in anatomy, the *meatus auditorius*, or external passage of the ear. See **ANATOMY.**

ACOUSTIC INSTRUMENT, or auricular tube, See **ACOUSTICS.**

ACOUSTIC MEDICINES, remedies against imperfections and disorders of the ear.

ACOUSTIC NERVE, the auditory nerve. See **ANATOMY.**

ACOUSTIC VESSELS, in the ancient theatres, were a kind of vessels, made of brass, shaped in the bell-fashion, which being of all tones within the pitch of the voice or even of instruments, rendered the sounds more audible, so that the actors could be heard through all parts of the theatres, when they were even 400 feet in diameter.

ACOUSTICA, or **ACOUSTICS,** from *akouω*, *audio*; called also, **PHONICS**, from *φωνή*, *vox*, *vel sonus*, a voice, or sound, is the doctrine or science of sounds. Some authors divide it into two branches, and entitle that which treats of the properties of sounds that come ~~directly~~ to the ear, **DIACOUSTICS**, and that which illustrates the nature of reflected sounds, **CATACOUSTICS**; but these distinctions do not appear to be of any real importance. In treating of this subject, we propose to give a concise view,

I. OF THE DIFFERENT THEORIES OF SOUND.

II. OF THE DIFFUSION OF SOUND.

III. OF ITS VELOCITY, and

IV. OF ITS REVERBERATION : closing our article with a few familiar experiments that will illustrate the laws of this science.

SECT. I. OF THE THEORY OF SOUND.—

Strange it is, that upon a topic which has exercised the powers of a Bacon, a Newton, and a Boyle, and to which some of our most accurate modern experimenters have also directed their attention, so little that is satisfactory in theory can be produced. There is, in fact, hardly any *doctrine* of acoustics, that can be offered with confidence to the reader. Embracing phenomena, which must have attracted the attention of mankind from the earliest period of history, and which, in its connection with music, and every modulation of the human voice, offers much that is in the highest degree essential to the pleasure of social intercourse, a philosophical theory of sound seems as yet to have eluded research. We shall, in this article, therefore only attempt a record of the best opinions upon the subject that have been given by our predecessors: fairly avowing to our readers, that we look to a better digest of past experiments, and many future additional ones, for a more satisfactory theory than any that has yet been offered: every one that we have yet seen being in many important points, inconsistent with well-recorded facts and observations. And the progress of our work will give us an opportunity (under **EAR**, **ECHO**, **HARMONY**, **HEARING**, **MUSIC**, **PNEUMATICS**, **_SOUND**, &c.) of recording any thing that may then

be added to the philosophical materials of the subject.

Sound then has been said to be strictly a sensation or perception of the mind, communicated by the ear; or the effect of some external collision of bodies which has produced a tremulous motion or vibration, communicated to the ear. In popular language, the surrounding air or atmosphere, is generally understood to be the medium of sound, but a slight observation of facts will shew that air is by no means the only conductor of sound; fluids generally, and bodies of all degrees of hardness and of elasticity are also mediums of its diffusion.

Philosophers, in attempting to find the immediate cause of sonorous motion, tell us that all bodies consist of an infinite number of invisible parts or corpuscles perfectly hard and incompressible; that these are surrounded by particles differing according to the different union and figures of their component parts; and that these last being compressed by an external power or impulse, have a constant tendency to restore themselves to their settled and former state. It is this motion of the latter particles which M. Perrault and others consider as the proximate cause of sound. So that if we rightly understand this theory, it is simply the struggle of the elastic *portion* of bodies which produces the phenomenon in question. But what proof has ever been offered of the existence of these hard and incompressible portions?

Other writers have contended that all bodies are essentially elastic, and are composed of parts connected throughout by a system of mutual attraction and repulsion. When this arrangement is disturbed, a force, of infinite variety in its degrees of power, is exerted to restore the equilibrium, and that hardness and softness, solidity and fluidity, are but relative and comparative, and not absolute qualities of bodies. When, therefore, we strike a substance thus composed, the particles immediately proximating yield to the impression, but press against the next particles in the series, and thus convey a vibratory motion like the oscillations of a spring or pendulum along the whole chain; the rapidity of the transmission depending upon the relative elasticity of the body. In some bodies, in a bell, glasses, &c. when struck, this sympathetic movement of parts is very evident, and the manner in which, with the finger, we can deaden or stop the sound, by assisting to set the particles at rest, seems to confirm this view of the subject.

Professor Leslie has examined with some care, the laws of this interior mechanism of bodies to which he attributes sound. He says, we may determine the celerity of transmission, by the elasticity of the medium compared with its gravity; or by obtaining the height of a column of the same density as the conducting substance, whose weight would measure its elasticity. This he terms the modulus of its elasticity, and observes that it may be demonstrated upon the

principles of Dynamics, that the rapidity of the transmission of sound through any medium, is equal to what a descending body would acquire in falling through half the height of the modulus of elasticity; and that this celerity for any second of time may be obtained in English feet, by multiplying the square root of half the modulus by eight. One easy method which he suggests for ascertaining the modulus of elasticity in solid rods or planks is, to observe their swag or curvature when laid in an horizontal position on props. He found by experiments of this kind, that the modulus of Memel fir was equal to 671,625 feet; and that its particles would therefore convey a vibratory impulse with a velocity of 4636 feet in a second, nearly four times the rapidity with which sound travels through the air.

Several foreign philosophers have directed their attention to the velocity with which the tremor of sound passes through various bodies. M. Biot ascertained that sound was conveyed through a train of iron pipes of 2550 feet in length, in 2.79 sec.; through the air, it would have passed the same distance in 2.5 sec. M. Hassenfratz has attempted to make similar calculations, in the subterranean quarries of Paris, upon the transmission of sound through brick and stone; but no precise results have as yet been given to the world.

Professor Chladni has endeavoured to obtain data upon this curious point, from a very different source: viz. the musical note which a bar of a given substance would emit when struck; and he thus contends that sound may be reckoned to pass through glass and iron at the prodigious rate of 17,500 feet, or upwards of three miles in each second.

Through fresh water, sound is propagated at a velocity of about 4475 feet in a second, or at a rate four times swifter than through the atmosphere. The waters of the ocean convey sound, about a seventeenth more rapidly. Ice is said to possess the power of transmission about equally with water; an easy proof of which is supplied by the tremor that may be felt underfoot on a frozen river or lake struck, at a distance, long before the sound of the blow reaches the ear. That fishes are endued with auricular organs, has been demonstrated by the late great anatomist, Mr. John Hunter. They have a strong perception of sound, even at the bottom of deep rivers; though it was not until modern times that the seat of their auricular organs was discovered.

While the theory of sound thus involves some singular questions as to its origin and first transmission, its connexion with the auditory nerves of man is also curious. The ear is the immediate and most direct instrument of this perception; but the whole of the skull bone, the palate, the teeth, and even the nostrils, assist in its functions; thus the deaf have been made sensible of sounds by holding a piece of metal between their teeth.

We should not omit to state that the extraordinary rapidity with which sound passes through solid bodies, induced philosophers to suppose, even to a very late period, that its transmission

was instantaneous; and that Sir Isaac Newton himself seems to have coincided with this. It appears now, however, perfectly clear, that its motion is in all cases progressive, and subject to regular, however mysterious, laws.

SECT. II. OF THE DIFFUSION OF SOUND.—The theories and experiments to which we have adverted, trace the transmission of sound in various important ways. Regarding the air, however, now, as the great ordinary medium of sound, we devote this section to the consideration of its functions in this respect.

Sonorous bodies seem to communicate to the air their own tremulous impression, which is then further propagated according to the laws of pneumatics. A few particles being driven from the surface of the sonorous body, propel their contiguous particles into a less space. The medium thus rarefied in one place, becomes condensed in the other; while the air thus compressed in the second place, is restored by elasticity to its former one; and the air contiguous to that becomes compressed. The air less compressed, again expanding itself, a new compression is made, and the motion arising from each agitation, produces an undulation of air, analogous to a wave upon the surface of the water, carrying with great velocity all the articulate distinctions and divisions of sound.

In the formation of these waves of air, the particles go and return through very short and equal spaces, after the manner of a pendulum, while it vibrates two oscillations; the velocity of the whole undulation, in the mean time, determining the force and other qualities of every simple sound.

That air is the principal vehicle of sound is universally allowed; and, that, without the medium of it, or some other fluid, we should ordinarily have no sounds at all, is proved by the experiment of a receiver, exhausted of its air, in an air-pump, when a bell, rung in the vacuum, makes no sound whatever: the fact is also now confirmed, that the force of the pulsations depend considerably upon the degree of density, or rarefaction of the air. Dr. Priestley, to ascertain whether the intensity of sound is affected by any other property of the air besides its density, provided an apparatus, with which he performed several experiments, and at last came to the conclusion that the intensity of sound depends solely upon the density of the surrounding air, and not in any measure upon any chemical principle in its constitution. In inflammable air of ten times the rarefaction of common air, the bell could be scarcely heard. In fixed air, the sound could be heard about half as far again as in common air, owing to the superior density of that air. In dephlogisticated air, the sound was sensibly louder than common air. See *Experiments and Observations*, vol. v. p. 296, &c. Mr. Hauksbee, also, made many experiments of a similar nature, in air of different degrees of condensation, in the course of which, a bell was heard at the distance of thirty yards in common air, at sixty with the force of two atmospheres, and as far as ninety with the force of three. (Phil. Trans. 1709, xxiv. 1904, xxvi. 367, 371.)

Philosophers, however, are much divided in opinion, respecting the *manner* in which sound is conveyed to the ear; i. e. whether it is diffused in the air, in a circular or undulatory manner, like the waves occasioned in a smooth water, by throwing in a stone; or, whether it runs in straight lines, like the rays of light diffused from a centre, in the manner that the electrical fluid runs along a rod of iron. Sir Isaac Newton adopted the former theory, and illustrated the propagation of sound by an undulatory, or rather *vermicular* motion in the particles of the air, drawn from the familiar instance of the crawling of a worm, which first carries its contractions from the hinder part, to throw its fore part to the proper distance, and then carries them back to bring the hinder part forward. Something similar to this takes place in the air, when agitated by the percussion of a sounding body: and thus he supposes there is an alternate condensation and relaxation of the air during one vibration: and as the air in its progress forward strikes an opposing body with greater force, than in its retrogradation, Sir Isaac entitles each of these accelerated progressions a *PULSE OF SOUND*: and as all motion upon fluids, in any direction, operates more or less, in a circular or spherical manner all around, so these sounds will be driven in all directions, forward, backward, upward, downward, and on every side, like circles in disturbed water. An idea of the rules of sound, according to this hypothesis, may be formed from observing the tone of a church bell, while its sounds are dying away, and which are owing to the alternate progression and recession of the air; for as each of these pulsations is formed by a single vibration of the string, they must be equal to each, as these vibrations are known to be.

With regard to the *velocity* of sound, (which will be more particularly treated of in Sect. III.) Newton has determined it by a very intricate calculation, to be in proportion to the density of the parts of the air, and the distance of these parts from each other; proving that each part moves like a pendulum; from whence he infers, that if the density of the atmosphere were the same every where as on the surface of the earth, a pendulum, reaching from its highest surface down to that of the interval, is thus lost to sense: just as a flame in proportion to the velocity. And he shows, that the velocity of each pulse would as much exceed, that of such a pendulum, swinging with one complete vibration, as the circumference of a circle exceeds the diameter. From all this he calculates that the motion of sound should be 979 feet in a second; but, upon taking an additional consideration of vapours in the air, he finds the exact velocity of sound to be 1142 feet in a second, or about thirteen miles in a minute, a proportion established by experience.

This theory of Sir Isaac Newton's met with many opposers. Even Bernoulli, his disciple, and one of his principal followers, owned he did not understand this part of his *Principia*. He attempted therefore to give a more perspicuous demonstration of his own, that he might confirm and illustrate the Newtonian theory. The sub-

ject seemed to reject elucidation: his theory is obviously wrong, as D'Alembert has proved in his Theory of Fluids. Various objections have been made to the Newtonian system of sounds. It is urged, that this theory can only agree with the motion of sound in an elastic fluid, whereas sounds are known to move forward through water that is not elastic. To explain their progress therefore through water, a second theory must be formed: so that two theories must be made to explain a similar effect; which is equally contrary to the simplicity of true philosophy, and of nature. It is further argued, that the slow vermicular motion, but ill represents the velocity with which sounds travel. In short, it is urged, that such undulations as have been described, when coming from several sonorous bodies at once, would cross, obstruct, and confound each other; so that, if they were conveyed to the ear by such means, we should hear nothing but a medley of discordant and broken articulations. But this is equally with the rest, contradictory to experience, since we hear the fullest concert, not only without confusion, but with the highest pleasure. These objections, have given rise to another theory: which we shall likewise lay before the reader; though it appears also liable to objections, which shall be afterwards noticed.

Every sound may be considered as driven off from the sonorous body in straight lines, and impressed upon the air in one direction only: but whatever impression is made upon a fluid in one direction, is diffused upon its surface into all directions; so that the sound first driven directly forward, soon fills up a wide sphere, and is heard on every side. Thus, as it is impressed, it instantaneously travels forward with a very swift motion, resembling the velocity with which we know electricity flies from one end of a line to another. Now, as to the pulses, or close shakes as the musicians express it, which a sounding body is known to make, each pulse is itself a distinct and perfect sound, and the interval between every two pulses is profoundly silent. Continuity of sound from the same body, is only a deception of the hearing; for as each distinct sound succeeds at very small intervals, the auditory nerves have no time to transmit its distinct images to the mind, and the interval is thus lost to sense: just as a flaming torch, flared round in a circle, appears to be a ring of fire. In this manner, a beaten drum, at some small distance, presents us with the idea of a continuing sound; and, when a child runs with his stick along a piece of railing, a continuing sound is heard, though the stroke against each rail is perfectly distinct and insulated. According to this theory, therefore, the pulses are nothing more than distinct sounds repeated by the same body, the first stroke or vibration being always loudest, and travelling farther than those that follow; while each succeeding vibration gives a new sound but with diminished force, till at last the pulses die away totally, as the force decays that gives them existence. All bodies whatsoever that are struck, return more or less a sound; but some, wanting elasticity, give back no repetition of the sound; the noise is at once begotten and dies

while other bodies, being more elastic and capable of vibration, give back a sound, and repeat it several times successively. These last are said to have a tone; the others are not allowed to have any. The tone of the elastic string, or bell, is notwithstanding nothing more than a similar sound of what the former bodies produced, but with the difference of being many times repeated while their notes are but single. So that, if we would give the former bodies a tone, it will be necessary to make them repeat their sound, by repeating our blows swiftly upon them. This will effectually give them a tone; and even an unmusical instrument has often had a fine effect by its tone in our concerts.

Let us then suppose, that by swift and equally continued strokes, we give any non-elastic body its tone: it is very obvious, that no alterations will be made in this tone by the quickness of the strokes, though repeated ever so fast. These will only render the tone more equal and continuous, but will make no alteration in it. On the contrary, if we make an alteration in the force of each blow, a different tone will then undoubtedly be excited. The difference will be small, it must be confessed; for the tones of these inflexible bodies are capable of but small variation, however, there will certainly be a difference. A table will return a different sound when struck with a club, from what it will do if struck with a whip. Thus non-elastic bodies return a difference of tone, not in proportion to the swiftness with which their sound is repeated, but in proportion to the greatness of the blow which produced it; for in two equal non-elastic bodies, that body produced the deepest tone which was struck by the greatest blow. Mr. Euler is of opinion, that no sound making fewer vibrations than thirty, or more than 7520 in a second, is distinguishable by the human ear; according to which principle, the extremes of our sense of hearing with respect to acute and grave sounds, is an interval of eight octaves. *Tentam. Novum Theor. Mus. cap. i. sect. 13.*

We now then come to the critical question, What is it that produces the difference of tone in two elastic sounding bells or strings? Or, what makes the one deep and the other shrill? This question has always been hitherto answered by saying, that the depth or height of the note proceeded from the slowness or swiftness of the vibrations. The slowest vibrations, it has been said, are qualified for producing the deepest tones, while the swiftest produce the highest tones. In this case, an effect has been given for a cause. It is in fact the force with which the sounding string strikes the air, that makes the true distinction in the tones of sounds; and which, with greater or less impressions, resembling the greater or less force of the blows upon a non-elastic body, produces correspondent affections of sound. The greatest forces produce the deepest sounds: the high notes are the effect of small efforts. Much also depends upon the constitution, figure, and quantity of the sonorous body, the manner of percussion, &c.; to say nothing of the intervening obstacles, distance, and disposition of the auricular organ. Thus a bell, wide at the mouth gives a grave sound;

but if it be very massy, that will render it still graver; but if massy, wide, and long or high, that will make the tone deepest of all. Thus, then, will elastic bodies give the deepest sound, in proportion to the force with which they strike the air: but if we attempt to increase their force by giving them a stronger blow, this will be in vain; they will still return the same tone; for such is their formation, that they are sonorous only because they are elastic, and the force of this elasticity is not increased by our strength, as the period of a pendulum's vibration will not be increased by falling from a greater height.

From the above considerations, the most accurate distinctions of sound have been resolved into loud and low, grave and acute, long and short. With respect to the vibration necessary to produce the various concatenations of sound, particularly in the ascending series, it has been found from the nature of elastic strings, that the longest strings have the widest vibrations, and consequently go backward and forward slowest; while, on the contrary, the shortest strings vibrate the quickest, or come and go in the shortest intervals. Hence it has been asserted, that the tone of the string depends upon the length or shortness of the vibrations. This, however, is not the case. The same string, when struck upon, must always, like the same pendulum, return precisely similar vibrations; but it is well known, that the same string does not always return precisely the same tone: so that in this case, the vibrations follow one rule, and the tone another. The vibrations must be invariably the same in the same string, which does not return the same tone invariably, as is well known to musicians in general. In the violin, for instance, we easily alter the tone of the string an octave, or eight notes higher, by a softer method of drawing the bow; and, some are known thus to bring out the most charming airs imaginable; or, those peculiar tones called *flute notes*. The only reason, it has been alleged, that can be assigned for the same string thus returning different tones, must certainly be the different force of its strokes upon the air. In one case, it has double the tone of the other; because upon the soft touches of the bow, only half its elasticity is put into vibration.

Thus, say the authors of this theory, we shall be able clearly to account for many things relating to sounds that have hitherto been inexplicable. For instance, if it be asked, when two strings are stretched together of equal lengths, tensions, and thickness, how does it happen, that one of them being struck, and made to vibrate throughout, the other shall vibrate throughout also? The answer is obvious: the force that the string struck receives, is communicated to the air, and the air communicates the same to the similar string; which therefore receives all the force of the former; and the force being equal, the vibrations must be so too. Again, if one string be but half the length of the other, and be struck, how will the vibrations be? The answer is, the longest string will receive all the force of the string half as long as itself, and therefore it will vibrate in proportion, that is, through half its length. In the same manner,

if the longest string were three times as long as the other, it would only vibrate in a third of its length; or if four times, in a fourth of its length. In short, whatever force the smaller string impresses upon the air, the air will impress a similar force upon the longer string, and partially excite its vibrations. Hence also we may account for those gradations of sound in the *Aolian lyre*; an instrument (says Sir John Hawkins) lately obtruded upon the public as a new invention, though described above a century ago by Kircher. (*Acoustics*, Pl. I. fig. 1.) This instrument is easily made, being nothing more than a long narrow box of thin deal, about thirty inches long, five inches broad, and one inch and three fourths deep, with a circle in the middle of the upper side or belly about one

1 a half in diameter, pierced with small holes. On this side are seven, ten, or (according to Kircher) fifteen or more strings of very fine gut, stretched over bridges at each end, like the bridge of a fiddle, and screwed up or relaxed with screw-pins. The strings are all tuned to one note, and the instrument is placed in a current of air, where the wind can brush over its strings with freedom. A window, with the sash just raised, to give the air admission, will answer this purpose exactly. When the air blows upon these strings with different degrees of force, there will be excited different degrees of sound; sometimes the blast brings out all the tones in full concert; sometimes it sinks them to the softest murmurs; it produces every tone, and by its gradations of strength solicits those gradations of sound, which art has taken different methods to produce. See *AOLIAN HARP*.

The same observations may be applied to the loudness and lowness, or, as musicians speak, the strength and softness of sound. In vibrating elastic strings, the loudness of the tone is in proportion to the deepness of the note; that is, in two strings, all things in other circumstances alike, the deepest tone will be loudest. In musical instruments, upon a different principle, as in the violin, it is otherwise; the tones are made in such instruments, by a number of small vibrations crowded into one stroke. The resined bow, for instance, being drawn along a string, its roughnesses catch the string at very small intervals, and excite its vibrations. In that instrument, therefore, to excite loud tones, the bow must be drawn quick, and this will produce the greatest number of vibrations. But it must be observed, that the more quickly the bow passes over the string, the less apt will the roughness of its surface be to touch the string at every instant; to remedy this, therefore, the bow must be pressed the harder as it is drawn quicker, and thus its full sound will be brought out from the instrument. If the swiftness of the vibrations, in an instrument thus excited, exceed the force of the deeper sound in another, then the swift vibrations will be heard at a greater distance, and as much farther off as the swiftness in them exceeds the force in the other. By this theory, it is alleged, may all the phenomena of musical sounds be easily explained. It was an ancient opinion that music was first discovered by the beating of different hammers upon the

smith's anvil. Without pursuing the fable, let us suppose an anvil, or several similar anvils, to be struck upon by several hammers of different weights or forces. The hammer, which is of double weight, upon striking the anvil, will produce a sound, double that of another, of half its weight: this double sound musicians have agreed to call an octave. The ear can judge of the difference or resemblance of these sounds, with great ease, the numbers being as one and two, and therefore very readily compared. Suppose a hammer, three times less than the first, strikes the anvil, the sound produced by this will be three times less than the first: so that the ear, in judging the similitude of these sounds, will find somewhat more difficulty; because it is not so easy to tell how often one is contained in three, as it is to tell how often it is contained in two. Again, suppose the hammer four times less, or five time less, the difficulty of judging will be still greater. If the hammer be six or seven times less, the difficulty still increases, insomuch, that the ear cannot readily determine the precise gradation. Now, of all comparisions those which the mind makes most easily, and with least labour, are the most pleasing. And as the ear is but an instrument of the mind, it is therefore most pleased with the combination of two sounds, the difference of which it can most readily distinguish. It is more pleased with the concord of two sounds, which are to each other as one and two, than of two sounds which are as one and three, or one and four, or one and five, or one and six or seven. Upon this pleasure which the mind takes in comparison, all harmony depends. The variety of sounds is infinite; but because the ear cannot compare two sounds so as readily to distinguish their discriminations when they exceed the proportion of one and seven, musicians have been content to confine all harmony within that compass, and have allowed but seven notes in musical composition.

Let us now then suppose a stringed instrument fitted up in the order mentioned above. For instance: let the first string be twice as long as the second; let the third string be three times shorter than the first; let the fourth be four times, the fifth string five times, and the sixth six times as short as the first. Such an instrument would probably give us a representation of the lyre, as it came from the hands of the inventor. This instrument will give us all the seven notes following each other, in the order in which any two of them will accord together most pleasingly; but yet it will be a very inconvenient and disagreeable instrument; for in a compass of seven strings only, the first must be seven times as long as the last; and also seven times as loud; so that when the tones are to be played in a different order, loud and soft sounds would be intermixed with most disgusting alternations. In order to improve the first instrument, therefore, succeeding musicians very judiciously threw in all the other strings between the two first, or, in other words, between the two octaves, giving to each, the same proportion it would have had in the first natural instrument. This made the instrument more portable, and

the sounds more even and pleasing. They therefore disposed the sounds between the octave in their natural order, and gave each its own proportional dimensions. Of these sounds, where the proportion between any two of them is most obvious, the concord between them will be most pleasing. Thus octaves, which are as two to one, have a most harmonious effect: the fourth and fifth also, sound sweetly together, and they will be found, upon calculation, to bear the same proportion to each other that octaves do. The true cause why concord is pleasing, must arise from our power, in such a case, of measuring more easily the differences of the tones. In proportion as the note can be measured with its fundamental tone by large and obvious distinctions, then the concord is most pleasing; on the contrary, when the ear measures the discriminations of two tones by very small parts, or cannot measure them at all, it loses the beauty of their resemblance: the whole is discord and pain.

There is another property in the vibration of musical strings which is held to confirm the foregoing theory. If we strike the string of a harpsichord, or any other elastic sounding chord it returns a continuing sound. This till of late, was considered as one simple uniform tone; but all musicians now confess, that it constantly returns four tones. The notes are, besides the fundamental tone, an octave above, a twelfth above, and a seventeenth. One of the bass notes of the harpsichord has been dissected in this manner by Rameau, and the actual existence of these tones proved beyond a possibility of being controverted. The experiment is easily tried: for if we smartly strike one of the lower keys of a harpsichord, and then take the finger briskly away, a tolerable ear will be able to distinguish, that, after the fundamental tone has ceased, three other shriller tones will be distinctly heard; first, the octave above, then the twelfth, and lastly the seventeenth; the octave above is in general almost mixed with the fundamental tone, so as not to be easily perceived, except to an ear long habituated to the minute discriminations of sounds. Thus, the smallest tone is heard last, and the deepest and largest one first: the two others in order. In the whole theory of sounds, nothing has given greater room for speculation, conjecture, and disappointment, than this amazing property in elastic strings. The whole string is universally acknowledged to be in vibration in all its parts; yet this single vibration returns no less than four different sounds. They who account for the tones of strings by the number of their vibrations, are here at the greatest loss. Daniel Bernoulli supposes, that a vibrating string divides itself into a number of curves, each of which has a peculiar vibration; and though they all swing together in the common vibration, yet each vibrates within itself. This opinion, which was supported, as most geometrical speculations are, with the parade of demonstration, was only born to die soon after. Others have ascribed this to an elastic difference in the parts of the air, each of which, at different intervals, thus received different impressions from the string, in

proportion to their elasticity. This is absurd. If we allow the difference of tone to proceed from the force, and not the frequency, of the vibrations, this difficulty will admit of an easy solution. These sounds, though they seem to exist together in the string, actually follow each other in succession: while the vibration has greatest force, the fundamental tone is brought forward; the force of the vibration decaying, the octave is produced, though only for an instant; to this succeeds, with diminished force, the twelfth; and, lastly, the seventeenth is heard to vibrate with great distinctness, while the three other tones are always silent. These sounds, thus excited, are all of them the harmonic tones, whose differences from the fundamental tone are, as was said, strong and distinct. On the other hand, the discordant tones cannot be heard. Their differences being but small, they are overpowered, and in a manner drowned in the tones of superior difference. Yet not always; for Daniel Bernoulli has been able, from the same stroke, to make the same string bring out its harmonic and its discordant tones also. So that from hence we may infer, that every note whatsoever is only a succession of tones; and that those are most distinctly heard, whose differences are most easily perceptible.

Against this theory, however, though of plausible appearance, some strong and insuperable objections seem to offer themselves: the fundamental principle of it is incorrect. No body whatever, whether elastic or non-elastic, yields a different note by being struck by a larger instrument, unless either the sounding body, or that part of it which emits the sound is enlarged. In this case the largest bodies always return the gravest sounds. In speaking of elastic and non-elastic bodies in a musical sense, we are not to push the distinction so far as when we speak of them philosophically. A body is musically elastic, all of whose parts are thrown into vibrations so as to emit a sound when only a part of their surface is struck. Of this kind are bells, musical strings, and all bodies whatever that are considerably hollow. Musical non-elastic bodies are such bodies as emit a sound only from that particular place which is struck: thus, a table, a plate of iron nailed on wood, a bell sunk in the earth, are all of them non-elastics in a musical sense, though not philosophically so. When a solid body, such as a log of wood, is struck with a switch, only that part of it emits a sound which comes in contact with the switch; the note is acute and loud, but would be no less so though the adjacent parts of the log were removed. If, instead of the switch, a heavier or larger instrument is made use of, a larger portion of its surface then returns a sound, and the note is consequently more grave; but it would not be so, if the large instrument struck it with a sharp edge, or a surface only equal to that of the small one. In sounds of this kind, where there is only a single stroke, without any repetition, the immediate cause of the gravity or acuteness seems to be the quantity of air displaced by the sounding body; a large quantity displaced, produces a grave sound, and a smaller quantity a more acute one, the force wherewith the air is displaced signify-

ing very little. This is confirmed by some experiments made by Dr. Priestley, concerning the musical tone of electrical discharges. His remarks are : " As the course of my experiments has required a great variety of electrical explosions, I could not help observing a great variety in the musical tone made by the reports. This excited my curiosity to attempt to reduce this variation to some measure. Accordingly, by the help of a couple of spinets, and two persons who had good ears for music, I endeavoured to ascertain the tone of some electrical discharges ; and observed, that every discharge made several strings, particularly those that were chords to one another, to vibrate : but, one note was always predominant, and sounded after the rest. As every explosion was repeated several times, and three of us separately took the same note, there remained no doubt but that the tone we fixed upon was at last the true one. The result was as follows : A jar containing half a square foot of coated glass sounded F sharp, concert pitch. Another jar of a different form, but equal surface, sounded the same. A jar of three square feet sounded C below F sharp. A battery consisting of sixty-four jars, each containing half a square foot, sounded F below the C. The same battery, in conjunction with another of thirty-one jars, sounded C sharp. So that a greater quantity of coated glass always gave a deeper note. Differences in the degree of a charge in the same jar made little or no difference in the tone of the explosion : if any, a higher charge gave rather a deeper note."

These experiments prove how much the gravity or acuteness of sounds depend on the quantity of air put in agitation by the sounding body. We know that the noise of the electric explosion arises from the return of the air into the vacuum produced by the electric flash. The larger the vacuum, the deeper the note : for the same reason, the discharge of a musket produces a more acute note than that of a cannon ; and thunder is deeper than either. Other circumstances also concur to produce different degrees of gravity or acuteness in sounds. The sound of a table struck with a piece of wood, will not be the same with that produced from a plate of iron struck by the same piece of wood, even if the blows should be exactly equal, and the iron perfectly kept from vibrating. Here the sounds are generally said to differ in their degrees of acuteness, according to the specific gravities or densities of the substances which emit them. Thus gold, which is the most dense of all metals, returns a much graver sound than silver ; and metalline wires, which are more dense than strings return a proportionably graver sound. But neither does this appear to be a general rule in which we can put confidence. Bell metal is denser than copper, but it by no means appears to yield a graver sound ; on the contrary, it seems very probable, that copper will give a graver sound than bell-metal, if both are struck upon in their non-elastic state ; and we can by no means think that a bell of pure tin, the least dense of all the metals, will give a more acute sound than one of bell-metal which is greatly more dense.—In some bodies hardness seems to have a considerable effect.

Glass, which is considerably harder than any metal, gives a more acute sound ; bell-metal is harder than gold, lead, or tin, and therefore sounds much more acutely ; though how far this holds with regard to different substances, there are not a sufficient number of experiments for us to judge. In bodies musically elastic, the whole substance vibrates with the slightest stroke, and therefore they always give the same note, whether they are struck with a large or with a small instrument ; so that striking a part of the surface of any body musically elastic is equivalent, in it, to striking the whole surface of a non-elastic one. If the whole surface of a table was struck with another table, the note produced would be neither more nor less acute whatever force was employed ; because the whole surface would then yield a sound, and no force could increase the surface : the sound would indeed be louder in proportion to the force employed, but the gravity would remain the same. In like manner, when a bell, or musical string, is struck, the whole substance vibrates, and a greater stroke cannot increase the substance.—Hence we see the fallacy of what is said concerning the Pythagorean anvils. An anvil is a body musically elastic, and no difference in the tone can be perceived whether it is struck with a large or with a small hammer ; because either of them are sufficient to make the whole substance vibrate, provided nothing but the anvil is struck upon : smiths, however, do not strike their anvils, but red hot iron laid upon their anvils ; and thus the vibrations of the anvil are stopped, so that it becomes a non-elastic body, and the differences of tone in the strokes of different hammers proceed only from the surface of the large hammers covering the whole surface of the iron, or at least a greater part of it than the small ones. If the small hammer is sufficient to cover the whole surface of the iron as well as the large one, the note produced will be the same, whether the large or the small hammer is used. The argument for the preceding theory, grounded on the production of what are called *flute notes* on the violin, is also built on a false foundation ; for the bow being lightly drawn on an open string, produces no flute notes, but only the harmonics of the note to which the string is tuned. The flute notes are produced by a particular motion of the bow, quick and near the bridge, and by fingering very gently. By this management, the same sounds are produced, though at certain intervals only, as if the vibrations were transferred to the space between the end of the finger-board and the finger, instead of that between the finger and the bridge. Why this small part of the string should vibrate in such a case, and not that which is under the immediate action of the bow, we are ignorant ; nor dare we affirm that the vibrations really are transferred in this manner, only the same sounds are produced as if they were.

Though these objections seem sufficiently to overturn the foregoing theory, with regard to acute sounds being the effects of weak strokes and grave ones of stronger impulses, we cannot admit that longer or shorter vibrations are the occasion of gravity or acuteness in sound. A

musical sound, however lengthened, either by string or bell, is only a repetition of a single one, whose duration by itself is but for a moment, and is therefore *inappreiable* like the smack of a whip, or the explosion of an electrical battery. The continuation of the sound is nothing more than a repetition of this instantaneous inappreiable noise after the manner of an echo, and it is this echo that makes the sound agreeable. For this reason, music is much more agreeable, when played in a large hall where the sound is reverberated, than in a small room where there is no such reverberation; and for the same reason, the sound of a string is more agreeable when put on a hollow violin than when fastened to a plain board, &c.—In the sound of a bell we cannot avoid observing this echo very distinctly. The sound appears to be made up of distinct pulses, or repetitions of the same note produced by the stroke of the haminer. It can by no means be allowed, that the note would be more acute though these pulses were to succeed one another more rapidly; the sound would indeed become more simple, but would still preserve the same tone. In musical strings the reverberations are vastly more quick than in bells, and therefore their sound is more uniform or simple, and consequently more agreeable than that of bells. In musical glasses, the vibrations must be inconceivably quicker than in any bell, or stringed instrument: and hence they are of all others the most simple and the most agreeable, though neither the most acute nor the loudest. As far as we can judge, quickness of vibration contributes to the uniformity, or simplicity, but not to the acuteness, nor to the loudness, of a musical note. See *HARMONICA*.

It may here be objected, that each of the different pulses of which we observe the sound of a bell to be composed, is of a very perceptible length, and far from being instantaneous; so that it is not fair to infer that the sound of a bell is only a repetition of a single instantaneous stroke, seeing it is evidently the repetition of a lengthened note. To this it may be replied, that the inappreiable sound, which is produced by striking a bell in a non-elastic state, is the very same which, being first propagated round the bell, forms one of these short pulses, that is afterwards re-echoed as long as the vibrations of the metal continue, and it is impossible that the quickness of repetition of any sound can either increase or diminish its gravity.

The writers on sound have been betrayed into many difficulties and obscurities, by rejecting the 47th proposition, B. ii. of Newton, as inconclusive reasoning. Of this proposition, however, the ingenious Mr. Young of Trinity College, Dublin, published some time since a clear, explanatory defence. He concedes that the demonstration is obscurely stated, and takes the liberty of varying, in some degree, from the method of Newton. “1. The parts of all sounding bodies (he observes,) vibrate according to the law of a cycloidal pendulum: for they may be considered as composed of an indefinite number of elastic fibres; but these fibres vibrate according to that law. 2. Sounding bodies pro-

pagate their motions on all sides *in directum*, by successive condensations and rarefactions and successive goings forward and returning backward of the particles. 3. The pulses are those parts of the air which vibrate backwards and forwards; and which, by going forward, strike *pulsant* against obstacles. The latitude of a pulse is the rectilineal space through which the motion of the air is propagated during one vibration of the sounding body. 4. All pulses move equally fast. This is proved by experiment: and it is found they describe 1070 Paris feet, or 1142 London feet in a second, whether the sound be loud or low, grave or acute. 5. To determine the latitude of a pulse: Divide the space which the pulse describes in a given time by the number of vibrations performed in the same time by the sounding body, the quotient is the latitude.

“M. Sauveur, by some experiments on organ pipes, found that a body, which gives the gravest harmonic sound, vibrates twelve times and an half in a second, and that the shrillest sounding body vibrates 51,100 times in a second. At a medium, let us take the body which gives what Sauveur calls his *fixed sound*: it performs 100 vibrations in a second, and in the same time the pulses describe 1070 Parisian feet; therefore the space described by the pulses whilst the body vibrates once, that is, the latitude, or interval of the pulse will be 107 feet. See *SOUND*.

6. To find the proportion which the greatest space, through which the particles of the air vibrate, bears to the radius of a circle, whose perimeter is equal to the latitude of the pulse. During the first half of the progress of the elastic fibre, or sounding body, it is continually getting nearer to the next particle; and during the latter half of its progress, that particle is getting farther from the fibre, and these portions of time are equal: therefore we may conclude, that at the end of the progress of the fibre, the first particle of air will be nearly as far distant from the fibre as when it began to move; and in the same manner we may infer, that all the particles vibrate through spaces nearly equal to that run over by the fibre. Now, M. Sauveur has found by experiment, that the middle point of a chord which produces his fixed sound, and whose diameter is one sixth of a line, runs over in its smallest sensible vibrations one eighteenth of a line, and in its greatest vibrations seventy-two times that space; that is seventy-two \times one eighteenth of a line, or four lines, that is, one third of an inch. The latitude of the pulses of this fixed sound is 10·7 feet; and since the circumference of a circle is to its radius as 7·10 is to 113, the greatest space described by the particles will be to the radius of a circle, whose periphery is equal to the latitude of the pulse, as one-third of an inch is to 1·7029 feet, or 20·4348 inches, that is, as one to 61·3044. If the length of the string be increased or diminished in any proportion, *ceteris paribus*, the greatest space described by its middle point will vary in the same proportion. For the inflecting force is, to the tending force, as the distance of the string from the middle point of vibration to half the length of the string; and therefore the inflecting and tending forces being given, the string will vibrate through spaces pro-

portionate to its length; but the latitude of the pulse is inversely as the number of vibrations performed by the string in a given time; that is, directly as the time of one vibration, or directly as the length of the string; therefore the greatest space, through which the middle point of the string vibrates, will vary in the direct ratio of the latitude of the pulse, or of the radius of a circle whose circumference is equal to the latitude; that is, it will be to that radius as one to 61-3044.—7. If the particles of the aerial pulses, during any part of their vibration, be successively agitated, according to the law of a cycloidal pendulum; the comparative elastic forces arising from their mutual action, by which they will afterwards be agitated, will be such as will cause the particles to continue that motion, according to the same law, to the end of their vibration. 8. If a particle of the medium be agitated according to the law of a cycloidal pendulum, the comparative elastic force, acting on the adjacent particle, from the instant in which it begins to move, will be such as will cause it to continue its motion according to the same law; that is, the comparative elastic force of the second particle, at the instant in which it begins to move, will be to the force with which it is agitated in any other moment of time, before the subsequent particle has yet been set in motion, directly as its distance from the middle point of vibration. Now this comparative elastic force, with which the second particle is agitated in the very moment in which it begins to move, arises from the preceding particle's approaching it according to the law of a pendulum; and therefore, if the preceding particle approaches it in this manner, the force by which it will be agitated, in the very moment it begins to move, will be exactly such as should take place in order to move it according to the law of a pendulum. It therefore acts out according to that law, and consequently the subsequent elastic forces, generated in every successive moment, will also continue to be of the just magnitude which should take place, in order to produce such a motion. 9. The pulses of the air are propagated from sounding bodies, according to the law of a cycloidal pendulum. All the particles of air in the pulses successively set out from their proper places, according to the law of a pendulum, and therefore will finish their entire vibrations according to the same law. Cor. 1. The number of pulses propagated is the same with the number of vibrations of the tremulous body, nor is it multiplied in their progress. Cor. 2. In the extreme points of the little space through which the particle vibrates, the expansion of the air is in its natural state. 10. To find the velocity of the pulses, the density and elastic force of the medium being given. This is the 49th prop. B. 2. Newton, in which he shows, that whilst a pendulum, whose length is equal to the height of the homogeneous atmosphere, vibrates once forwards and backwards, the pulses will describe a space, equal to the periphery of a circle described with that altitude as its radius. Cor. 1. He thence shows, that the velocity of the pulses is equal to that which a heavy body would acquire, in falling down half the altitude in the homogeneous atmosphere: and

therefore that all pulses move equally fast, whether the tone be loud or low, grave or acute. Cor. 2. And also, that the velocity of the pulses is in a ratio compounded of the direct subduplicate ratio of the elastic force of the medium, and the inverse subduplicate of its density. Hence sounds move somewhat faster in summer than in winter. 11. The strength of a tone is as the moment of the particles of air. The moment of these particles (the medium being given) is as their velocity; and the velocity of these particles is as the velocity of the string which sets them in motion: The velocities of two different strings are equal, when the spaces which they describe in their vibrations are to each other as the times of these vibrations: therefore two different tones are of equal strength, when the spaces, through which the strings producing them vibrate, are directly as the times of their vibration. Hence we should suppose, that in this case, an equal number of equal impulses would generate equally powerful tones in these strings. But we are to observe, that the longer the string, the greater, *ceteris paribus*, is the space through which a given force inflects it; and therefore whatever diminution is produced in the spaces through which the strings move in their successive vibrations, arising either from the want of perfect elasticity in the strings, or from the resistance of the air, this diminution will bear a greater proportion to the less space, through which the shortest string vibrates. And this is confirmed by experience; for we find that the duration of the tone and motion of the whole string exceeds that of any of its subordinate parts. Therefore, after a given interval of time, a greater quantity of motion will remain in the longer string; and consequently, after the successive equal impulses have been made, a greater degree of motion will still subsist in it. That is, a given number of equal impulses being made on various strings, differing in length only, a stronger sound will be produced."

These propositions Mr. Young has illustrated by mathematical demonstrations at considerable length; for which, as our room permits us not to insert them completely, and they would not bear to be abridged, we must refer our readers to his work.

SECT. III. OF THE VELOCITY, &c. OF SOUND.—Experience has taught us that sound travels at the rate of more than one thousand feet in a second, nor do any obstacles materially hinder its progress, a contrary wind only a small matter diminishing its velocity. The method of calculating its progress is easily made known. When a gun is discharged at a distance, we see the fire long before we hear the sound. If then we know the distance of the place, and know the time of the interval between our first seeing the fire and then hearing the report, this will show us exactly the time the sound has been travelling to us. For instance, if the gun is discharged a mile off, the moment the flash is seen, you take a watch and count the seconds till you hear the sound; the number of seconds is the time the sound has been travelling a mile.—Again, by the above axiom, we are enabled to find the distance between objects that would be otherwise immeasurable. For example,

suppose we see the flash of a gun, in the night, at sea, and tell seven seconds before we hear the report, it follows therefore, that the distance is seven times 1142 feet, that is, 24 yards more than a mile and a half. In like manner if we observe the number of sounds between the lightning and the report of the thunder, we know the distance of the cloud from whence it proceeds.

Wind, blowing in the direction of sound, has been supposed to increase its velocity; but owing to the superior rapidity of the latter, its acceleration by this means must be very inconsiderable; hence the chief effect observable from the wind is, that, by increasing and diminishing the space of the waves, it carries the sound to a greater distance. The velocity of sound in liquids has never been distinctly ascertained, although it might be easily calculated by measuring the compressibility of the medium: in gases it bears proportion to their relative densities; and is observed in pure hydrogen to be three times that of common air. In the ordinary medium, it is much influenced by the elevation or depression of temperature, occasioned by the condensation or rarefaction of air; also by the proportion of humidity contained in it. Cold fogs, by increasing the density of air without changing its elasticity, diminish the velocity of sound; whilst warm vapours, which tend to make it lighter, naturally increase it.

Sound being capable of transmission through material substances, the hardest and least compressible, with a velocity much greater than that with which it is conveyed through the air, the motion of a troop of cavalry is perceived at a greater distance, by listening with the head in contact with the ground, than by waiting while the sound travels through the atmosphere; and the furniture of a house is agitated by the approach of a waggon before those in the room hear the sound. Mr. Wunsch observed that a series of deal rods, closely united, communicated an instantaneous impulse of sound, while a sensible interval elapsed before he heard it in the air. He also found that the blow of a hammer on the upper part of a great building, is heard twice by a person standing near it on the ground; the first sound descending through the wall, and the second through the ordinary medium.

The decay of sound is the natural consequence of its diffusion through a larger quantity of matter, as it diverges every way from its centre; the velocity of the particles of the transmitting medium, diminishing in proportion to the increased distance from the centre; their motion, therefore, which measures the strength of the sound, must vary as the square of the distance; hence, at the distance of ten feet from the sounding body, the velocity of the particles in the medium is only one tenth as great as at the distance of one foot, and the impetus of sound one hundredth only. *Young's Nat. Phil.* vol. i. lect. 31.

Dr. Derham has proposed and answered the following important queries relative to the laws of sound, which condense most of our existing information on the subject.—

"How far does sound move in a second of time? Sound moves 1142 feet, or 380 yards, in a second, which is after the rate of an English

mile in $9\frac{1}{4}$, or 9.25 half seconds; two miles in $18\frac{1}{2}$; three miles in $27\frac{1}{4}$; and about thirteen miles in one minute.

Does the report of a gun, discharged with its mouth towards us, come sooner than when the muzzle is in a contrary direction? There is no difference in the velocity of sound from this different direction.

Do the winds affect the motion of sounds? By repeated experiments it appears that there is some, though a very small difference, according as the sounds are with or against the wind, and as the wind is strong or soft.

Do a great and intense sound, and a soft and languid one, move with the same velocity? They do; for by experiments, a cannon, fired with a half-pound charge of powder, was heard at the distance of $17\frac{1}{2}$ miles in the same time after the flash was seen, as when fired with a charge of six pounds.

Does the sound of a gun move equally swift at all elevations? It does.

Do different quantities or strength of gunpowder, occasion any difference as to the velocity of sound? None.

Does sound move, in a right line, the nearest way, or does it sweep along the earth's surface? and is there any difference in the time, if the piece be discharged in an acclive or declive position? Sound moves the nearest way; and the velocity appears to be the same in acclivities as in declivities.

Have all kinds of sounds, as those of guns, bells, &c. the same velocity? and are sounds equally swift in the beginning of their motion and the end? There appears no inequality in either of these respects; and, therefore, the times in which sounds are heard, are proportional to their distance, that is, at a double distance, they are heard in twice the time, &c. It appears from the above experiments and observations, that all sounds whatever travel at the same rate. The sound of a gun, and the striking of a hammer, are equally swift in their motions; the softest whisper flies as swiftly, as far as it goes, as the loudest thunder. To these axioms may be added, that, smooth and clear sounds proceed from the bodies that are homogeneous, and of an uniform figure; and harsh or obtuse sounds, from such as are of a mixed matter and irregular figure: that the velocity of sound is to that of a brisk wind as fifty to one: that the strength of sounds is greatest in cold and dense air, and least in that which is warm and rarefied: that every point against which the pulses of sound strike, becomes a centre from which a new series of pulses are propagated in every direction: and that sound describes equal spaces in equal times.

SECT. IV. OF THE REVERBERATION OF SOUNDS.
—Sound, like light, after it has been reflected from several places, may be collected into one point, as in a focus; and it will be there more audible than in any other part, even than at the place from whence it proceeded. On this principle it is, that a whispering gallery is constructed. The form of this gallery must be that of a concave hemisphere, as ABC; (See Plate I. fig. 2.) and if a low sound or whisper be uttered at A, the vibrations expanding themselves every

way, will impinge on the points DDD, &c. and from thence be reflected to EEE, and from thence to the points F and G, till at last they all meet in C, where the sound will be the most distinctly heard.

THE AUGMENTATION of sound by SPEAKING TRUMPETS, is illustrated in the following manner: (See Plate I. fig. 3.) Let ABC be the tube, BD the axis, and B the mouth-piece for conveying the voice to the tube. It is evident, when a person speaks at B in the trumpet, the whole force of his voice is spent upon the air contained in the tube, which will be agitated through the whole length of the tube; and, by various reflections from the side of it to the axis, the air along the middle will be greatly condensed, and its *momentum* proportionably increased, so that when it comes to agitate the air at the orifice of the tube AC, its force will be as much greater, than it would have been without the tube, as the surface of a sphere, whose radius is equal to the length of the tube, is greater than the surface of the segment of such a sphere, whose base is the orifice of the tube. For a person speaking at B, without the tube, will have the force of his voice spent in exciting concentric pulses of air all around the point B; and when the pulses are diffused as far as D every way, it is plain the force of the voice will there be diffused through the whole superficies of a sphere, whose radius is BD; but in the trumpet it will be so confined, that, at its exit it will be diffused through so much of that spherical surface of air, as corresponds to the orifice of the tube. But since the force is given, its intensity will be always inversely as the number of particles it has to move; and therefore in the tube it will be to that without, as the superficies of such a sphere to the area of the large end of the tube nearly. But it is obvious, Mr. Young observes, that the confinement of the voice can have little effect in increasing the strength of the sound, as this strength depends on the velocity with which the particles move. Were this reasoning conclusive, the voice should issue through the smallest possible orifice; cylindrical tubes would be preferable to any that increased in diameter; and the less the diameter, the greater would be the effect of the instrument; because the mass of air to be moved would, in that case, be less, and consequently the effect of the voice greater; all which is contradicted by experience.

The CAUSE of the INCREASE of SOUND in these tubes must therefore be derived from some other principles: and amongst these we shall probably find, that what the ingenious Kircher has suggested, in his *Phonurgia*, is the most deserving of our attention. He tells us, that "the augmentation of the sound depends on its reflection from the tremulous sides of the tube; which reflections, conspiring in propagating the pulses in the same direction, must increase its intensity." Newton also seems to have considered this as the principal cause, in the scholium of prop. 50. B. 2. *Princip.* when he says, "we hence see why sounds are so much increased in stentorophonic tubes; for every reciprocal motion is, in each return, increased by the generating cause."

When we speak in the open air, the effect on

the tympanum of a distant auditor is produced merely by a single pulse. But when we use a tube, all the pulses propagated from the mouth, except those in the direction of the axis, strike against the sides of the tube, and every point of impulse becoming a new centre, from whence the pulses are propagated in all directions, a pulse will arrive at the ear, from each of these points; thus, by the use of a tube, a greater number of pulses are propagated to the ear, and consequently the sound increased. The confinement too of the voice may have some effect, though not such as is ascribed to it by some; for the condensed pulses produced by the naked voice, freely expand every way; but in tubes, the lateral expansion being diminished, the direct expansion will be increased, and consequently the velocity of the particles, and the intensity of the sound. The substance also of the tube has its effect; for it is found by experiment, that the more elastic the substance of the tube, and consequently the more susceptible it is of these tremulous motions, the stronger is the sound. If the tube be laid on any non-elastic substance, it deadens the sound, because it prevents the vibratory motion of the parts. The sound is increased in speaking trumpets, if the tube be suspended in the air; because the agitations are then carried on without interruption. These tubes should increase in diameter from the mouth-piece, because the parts, vibrating in directions perpendicular to the surface, will conjoin in impelling forward the particles of air, and consequently, by increasing their velocity, will increase the intensity of the sound; and the surface also increasing, the number of points of impulse and of new propagations, will increase proportionally. The several causes, therefore, of the increase of sound in these tubes, Mr. Young concludes to be, first, the diminution of the lateral, and consequently the increase of the direct, expansion and velocity of the included air. Second, The increase of the number of pulses, by increasing the points of new propagation. Third, the reflections of the pulses from the tremulous sides of the tube, which impel the particles of air forward, and thus increase their velocity. The same reasoning applies *vice versa*, to the hearing trumpet.

An *echo* is a reflection of sound striking against some object, as an image is reflected in a glass: but it has been disputed what are the proper qualities in a body for thus reflecting sounds. It is in general known, that caverns, grottoes, mountains, and ruined buildings, return this image of sound. There is a very extraordinary echo, at a ruined fortress near Louvain, in Flanders. If a person sung, he only heard his own voice, without any repetition: on the contrary, those who stood at some distance, heard the echo but not the voice; but then they heard it with surprising variations, sometimes louder, sometimes softer, now more near, then more distant. There is an account in the *Memoirs of the French Academy*, of a similar echo near Rouen. As every point against which the pulses of sound strike, becomes the centre of a new series of pulses, and sound describes equal distances in equal times; therefore, when any sound is propagated from a centre, and its pulses strike

against a variety of obstacles, if the sum of the right lines drawn from that point to each of the obstacles, and from each obstacle to a second point, be equal, then will the latter be a point in which an echo will be heard. Hence all the points of the obstacles which produce an echo, must lie in the surface of the oblong sphaeroid, generated by the revolution of the ellipse round its major axis.

" As there may be several sphaeroids of different magnitudes, so there may be several different echoes, of the same original sound. And as there may happen to be a greater number of reflecting points in the surface of an exterior sphaeroid, than in that of an interior, a second or third echo may be much more powerful than the first, provided that the superior number of reflecting points, that is, the superior number of reflected pulses propagated to the ear, be more than sufficient to compensate for the decay of sound which arises from its being propagated through a greater space. This is finely illustrated in the celebrated echoes at the lake of Killarney, in Kerry, where the first return of the sound is much inferior in strength to those which immediately succeed it. From what has been laid down, it appears, that for the most powerful echo, the sounding body should be in one focus of the ellipse, which is the section of the echoing sphaeroid, and the hearer in the other. However, an echo may be heard in other situations, though not so favourably: as such a number of reflected pulses may arrive at the same time at the ear, as may be sufficient to excite a distinct perception. Thus a person often hears the echo of his own voice; but for this purpose he should stand at least sixty-three or sixty-four feet from the reflecting obstacle, according to what has been said before. At the common rate of speaking, we pronounce not above three syllables and a half, that is, seven half syllables in a second; therefore, that the echo may return just as soon as three syllables are expressed, twice the distance of the speaker from the reflecting object, must be equal to 1000 feet; for, as sound describes 1142 feet in a second, six sevenths of that space, that is, 1000 feet nearly, will be described, while six half, or three whole syllables are pronounced: that is, the speaker must stand near 500 feet from the obstacle. And in general, the distance of the speaker from the echoing face, for any number of syllables, must be equal to the seventh part of the product of 1142 feet multiplied by that number. In churches we never hear a distinct echo of the voice, but a confused sound when the speaker utters his words too rapidly; because the greatest difference of distance, between the direct reflected courses of such a number of pulses, as would produce a distinct sound, is never in any church equal to 127 feet, the limit of echoes.

" But though the first reflected pulses may produce no echo, both on account of their being too few in number, and too rapid in their return to the ear; yet it is evident, that the reflecting surface may be so formed, as that the pulses which come to the ear after two reflections or more, may, after having described 127 feet or more, arrive at the ear in sufficient numbers, and

also so nearly at the same instant, as to produce an echo, though the distance of the reflecting surface from the ear be less than the limit of echoes. This is confirmed by a singular echo in a grotto on the banks of the little brook, called the Dinan, about two miles from Castlecomber, in the county of Kilkenny. As you enter the cave, and continue speaking loud, no return of the voice is perceived; but, on your arriving at a certain point, which is not above fourteen or fifteen feet from the reflecting surface, a very distinct echo is heard. Now this echo cannot arise from the first course of pulses that are reflected to the ear, because the breadth of the cave is so small, that they would return too quickly to produce a distinct sensation from that of the original sound: it therefore is produced by those pulses, which, after having been reflected several times from one side of the grotto to the other, and having run over a greater space than 127 feet, arrive at the ear in considerable numbers, and not more distant from each other, in point of time, than the ninth part of a second."

The following are familiar *experiments* with sound.—I. Let a concave mirror of about two feet diameter, be placed in a perpendicular direction. The focus of this mirror may be fifteen or eighteen inches from its surface. At the distance of about five or six feet let there be a partition, in which there is an opening, equal to the size of the mirror; against this opening must be placed a picture, painted in water colours, on a thin cloth, that the sound may easily pass through it. Behind the partition, at the distance of two or three feet, place another mirror, of the same size as the former, and let it be diametrically opposite to it. Place the figure of a man seated on a pedestal, with his ear exactly in the focus of the first mirror: his lower jaw must be made to open by a wire, and shut by a spring; and there may be another wire to move the eyes; these wires must pass through the figure, go under the floor, and come up behind the partition. A person, properly instructed, should be placed behind the partition near the mirror. Then propose to any one to speak softly to the statue, by putting his mouth to the ear of it, assuring him that it will answer instantly. You then give the signal to the person behind the partition, who, by placing his ear to the focus of the mirror, will hear distinctly what the other said; and, moving the jaw and eyes of the statue by the wires, will return an answer directly; which, will in like manner, be distinctly heard by the first speaker. This experiment appears to be taken from the Century of Inventions of the marquis of Worcester: whose designs, at the time they were published, were treated with ridicule and neglect, as being impracticable, but are now known to be generally, if not universally, practicable. The words of the marquis are, " How to make a brazen or stone head in the midst of a great field, or garden, so artificial and natural, that though a man speak ever so softly, and even whisper into the ear thereof, it will presently open its mouth and resolve the question in French, Latin, Welsh, Irish, or English, in good terms, uttering it out of its mouth, and then shut it until the next question be asked." —The

two following, of a similar nature, appear to have been inventions of Kircher, by means of which, he used to "utter feigned and ludicrous consultations, with a view to show the fallacy and imposture of ancient oracles."

II. Let there be two heads of plaster of Paris placed on pedestals, on the opposite sides of a room. There must be a tin tube of an inch diameter, that must pass from the ear of one head, through the pedestal, under the floor, and go up to the mouth of the other. Observe, that the end of the tube, which is next the ear of the one head, be considerably larger than that end which comes to the mouth of the other. Let the whole be so disposed that there may not be the least suspicion of a communication. When a person speaks, quite low, into the ear of one bust, the sound is reverberated through the length of the tube, and will be distinctly heard by any one who shall place his ear to the mouth of the other. It is not necessary that the tube should come to the lips of the bust.—If there be two tubes, one going to the ear, and the other to the mouth, of each head, two persons may converse together, by applying their mouth and ear reciprocally to the mouth and ear of the busts; and at the same time, other persons that stand in the middle of the chamber, between the heads, will not hear any part of their conversation.

III. Place a bust on a pedestal in the corner of a room, and let there be two tubes, as in the foregoing amusement, one of which must go from the mouth, and the other from the ear of the bust, through the pedestal, and the floor, to an under apartment. There may be likewise wires that go from the under jaw and the eyes of the bust, by which they may easily be moved. A person being placed in the under room, and, at a signal given, applying his ear to one of the tubes, will hear any question that is asked, and immediately reply; moving at the same time, by means of the wires, the mouth and eyes of the bust, as if the reply came from it.

IV. In a large case, such as is used for dials and spring-clocks, the front of which, or at least the lower part of it, must be of glass, covered on the inside with gauze, let there be placed a barrel organ, which, when wound up, is prevented from playing, by a catch that takes a toothed wheel at the end of the barrel. To one end of this catch there must be joined a wire, at the end of which there is a flat circle of cork, of the same dimension with the inside of a glass tube, in which it is to rise and fall. This tube must communicate with a reservoir that goes across

ACQS, a small town at the foot of the Pyrenees, in the department of Arriege, France, famous for its hot springs.

Acqs, AQUE or DAX, an old city of France on the Adour. See DAX.

ACQUA, a town of Italy, in Tuscany, famous for warm baths, 15 miles E. of Leghorn.

ACQUAINT', v. Accointer: Old Fr. to ACQUAINT'ABLE, go to; to makes one's self ACQUAINT'ANCE, known to; to frequent the ACQUAINT'ANT, society of; to be intimate with; to inform.

the front part of the bottom of the case, which is to be filled with spirits, such as is used in thermometers, but not coloured, that it may be the better concealed by the gauze. This case being placed in the sun, the spirits will be rarefied by the heat; and rising in the tube, will lift up the catch or trigger, and set the organ in play: which it will continue to do as long as it is kept in the sun; for the spirits cannot run out of the tube, that part of the catch, to which the circle is fixed, being prevented from rising beyond a certain point, by a check placed over it. When the machine is placed against the side of a room on which the sun shines strong, it may constantly remain in the same place, if inclosed in a second case, made of thick wood, and placed at a little distance from the other. When you want it to perform, it will be only necessary to throw open the door of the outer case, and expose it to the sun. But if the machine be moveable, it will perform in all seasons by being placed before the fire; and in winter it will more readily stop when removed into the cold.

V. Under the keys of a common harpsichord let there be fixed a barrel, something like that in a chamber organ, with moveable stops corresponding to the tunes you would have it play. From each of the keys let a wire descend perpendicularly: the ends of these wires must be turned up for about one fourth of an inch. Behind these wires let there be an iron bar, to prevent them from going too far back. Now, as the barrel turns round, its pins take the ends of the wires, which pull down the keys, and play the harpsichord. The barrel and wires are to be all enclosed in a case. In the chimney of the same room where the harpsichord stands, or one adjacent, let a smoke-jack be placed; with a wire or cord, that, passing behind the wainscot adjoining the chimney, goes under the floor and up one of the legs of the harpsichord, into the case, and round a small wheel fixed on the axis of that first mentioned. There should be pulleys at different distances, behind the wainscot, and under the floor, to facilitate the motion of the cord. This machinery may be applied to any other keyed instrument, as well as to chimes, and to many other purposes where a regular continued motion is required. An instrument of this sort may be considered as a perpetual motion, according to the vulgar acceptation of the term; for it will never cease going till the fire be extinguished, or some parts of the machinery be worn out. See PNEUMATICS.

And he was a quoinche, to the quene of Fraunce,
And somdel to muche, as me wende, so that in som
thing

The quene louede, as me wende, more him than the
king. R. Gloucester.

Sothelye dulle witte and a thoughtfull soule so sore
have mined and grafted in my spirites that soche craft
of enditinge woll nat bin of mine acquaintaunce.
Chaucer's Testament of Love.

We, that acquaint ourselves with ev'ry zone,
And pass the tropicks, and behold each pole;
When we come home, are to ourselves unknown,
And unacquainted still with our own soul. *Dantes.*

Brave soldier, pardon me,
That any accent, breaking from my tongue,
Should 'scape the true *acquaintance* of mine ear.

Shakspeare.

This keeps the understanding long in converse
with an object, and long converse brings *acquaintance*.

South.

I hope, I am pretty near seeing you; and therefore I would cultivate an *acquaintance*: because, if you do not know me, when we meet; you need only keep one of my letters, and compare it with my face; for my face and letters are counterparts of my heart.

Swift to Pope.

A long noviciate of *acquaintance* should precede
the vows of friendship.

Bolingbroke.

CARDINAL G. For souls just quitting earth, peep
into heaven;

Make swift *acquaintance* with their kindred forms,
And partners of immortal secrets grow.

Dryden's Duke of Guise.

Our admiration of a famous man lessens, upon
our nearer *acquaintance* with him; and we seldom
hear of a celebrated person, without a catalogue of
some notorious weaknesses and infirmities.

Addison.

Acquaint yourselves with things ancient and modern,
natural, civil, and religious, domestic and national, things of your own and foreign countries;
and, above all, be well *acquainted* with God and yourselves; learn animal nature, and the workings of
your own spirits.

Watts's Logieck.

He that becomes *acquainted*, and is invested with
authority and influence, will in a short time be con-
vinced, that in proportion as the power of doing well
is enlarged, the temptations to do ill are multiplied
and enforced.

Johnson.

Acquaint thyself with God, if thou wouldest taste
His works.

Couper.

ACQUAPENDENTE, an ancient town of Italy, in the patrimony of St. Peter, with a bishop's see, and lately containing sixteen churches and convents. It is seated on a hill
near the Paglia, 50 miles, N. by W. from Rome,
and 10 miles W. from Orvieto.

ACQUARIA, a town of Italy, in Frigana, a
district of Modena, remarkable for its medicinal
waters. It lies 18 miles S. from the city of
Modena,

ACQUERIO, a decayed city, once of some
note, in the province of Terra de Lavora, Naples.

ACQUEST, in law, goods acquired by purchase
or donation, not by heritage.

ACQUI, a town and district of Italy, in the
duchy of Montferrat, with a bishop's see, and
commodious baths. It was taken by the Spaniards
in 1745, re-taken by the Piedmontese in 1746,
and afterwards dismantled by the French. It is
seated on the river Bormio, or Bormida, on the
high way from Finale to Alessandria, 17 miles
S.S.W. of the latter. It is famous for a silk
manufactory, which employs the greater portion
of its inhabitants, reckoned (1802) at 6600. Lon.
8°, 35' E. Lat. 44°, 40' N.

ACQUIESCE', v. } Ad: *quiesco*: to rest
ACQUIES'CENCE, n. } in, to be still; to submit

ACQUIES'CENT. } to what is proposed by
conformity; to accept, receive or bear without
dissatisfaction, or with pleasure and delight.

Others will, upon account of the receivedness of
the proposed opinion, think it rather worthy to be ex-
amined, than *acquiesced in*.

Boyle.

A nation, cast in the happy medium between the
spiritless *acquiescence* of submissive poverty, and the
sturdy credulity of pampered wealth; cool and
ardent; adventurous and persevering; winging her
eagle flight against the blaze of every science, with
an eye that never winks, and a wing that never tires.

Curran's Eulogy of Scotland.

ACQUIETANDIS, PLEGIIS, a writ of justices
lying for a surety against the creditor who refuses
to acquit a debtor after the debt is paid.

ACQUIETANDIS IN SHIRIS ET HUNDREDIS, the
being free from suits and services in shires and
hundreds.

ACQUIETARE, in law, to discharge, or pay
the debts of a person deceased; as the heir those
of his father, &c.

ACQUIRE, ACQUI'RER, ACQUI'RABLE, ACQUI'REMENT, ACQUI'RRY, AC'QUISITE, ACQUISITION, ACQUISIT'IVE, ACQUI'SITOR, ACQUEST'.	Ad: <i>quaro</i> : <i>acquiro</i> : to ask, or seek for; to obtain as the result of power, or labour; to derive advantages not conferred by nature or inheritance.— <i>Acquisition</i> is applied to material and physical, and acquire- ment to mental and spiritual attainments.
--	---

The greatest goodness of all goodness, is when
tirannies are put under by virtues *acquired*, or to find
remedy against accustomed vices with good inclinations.

Golden Booke, c. xv.

—A lower place, not well,
May make too great an act. For learme this, Silius,
Better to leaue yndone, than by our deed
Acquire too high a fame, when him we serme's
away.

Shakspeare's Ant. and Cle. p. 351, act iii. sc. 1.

The human genius, with the best assistance, and
the finest examples, breaks forth but slowly; and the
greatest men have but gradually *acquired* a just taste,
and chaste simple conceptions of beauty.

Usher.

His servant he, with new *acquest*
Of true experience from this great event,
With peace and consolation hath dismisi.

Milton.

ACQUIT" v. ACQUIT'MENT, ACQUIT'TAL, ACQUIT'TANCE, v. n.	Acquitter: Fr. to deliver from; to give quiet to one accused, or held responsible; to release from a charge or obligation of any kind; to discharge the claims of duty; to act a part suitable to character or reputation.
--	--

Ne do I wish (for wishing were but vain)
To be *acquit* from my continual smart;
But joy, her thrall for ever to remain,
And yield for pledge my poor captive heart.

Spencer.

PRIM. We arrest your word, Boyet you can produce <i>acquittances</i> For such a sum from special officers Of Charles his father.	Shakespeare's Love's Labour Lost.
---	-----------------------------------

But if black scandal and soule-fac'd reproach
Attend the sequell of your imposition;
Your meere enforcement shall *acquittance* me
From all the impure blots and staynes thereof.

Shakespeare.

But soon shall find
Forbearance, no *acquittance*, ere day end
Justice shall not return, as beauty, scorn'd.

Milton.

It is a great mercy that signies a final and
universal *acquittance*.

Bishop Taylor's Sermons.

Steady to my principles, and not dispirited with my afflictions, I have, by the blessing of God on my endeavours, overcome all difficulties; and, in some measure, acquitted myself of the debt, which I owed the publick, when I undertook this work. *Dryden.*

He that judges without informing himself to the utmost that he is capable, cannot *acquit* himself of judging amiss. *Locke.*

ACQUITTAL is of two kinds: in *law*, and in *fact*. When two are indicted of felony, the one as principal the other as accessory; the principal being discharged, the accessory is, by consequence, also freed: in which case, as the accessory is acquitted by law, so is the principal in fact.

ACQUITTAL is also used, where there is a lord mesne and a tenant, and the tenant holds lands of the mesne, and the mesne holds over the lord paramount; here, the mesne ought to acquit the tenant of all services claimed by any other for the same lands.

ACQUITTANCE, in law, a release or discharge in writing for a sum of money, or a receipt for the same.

ACRA, or **ACARA**, a small independent state and town, on the Gold Coast of Africa, where the English, Dutch, and Danes, formerly had strong forts, and each fort its particular village. The whole district is about twenty-six miles in length, and varying in breadth from twelve to twenty miles. The English settlement is called Fort James, which is capable of mounting twenty cannon. It is generally ill-manned, and the Dutch Fort is gone wholly to decay. Aera was once dependent on the government of Aquamboe, but has of late years shaken off the yoke. The language is said to be unknown to any other district on the coast. Its situation is healthy, and its trade very extensive. The government is much more democratic than is generally known in this part of the world, and but little if any gold is now found in the neighbourhood. The inhabitants are more civilised than most of the other nations of this coast, and keep up a freer intercourse with the interior. In busy parts of the year, the town is crowded with Ashantees, Fantees, Akims, Aquamboes, &c.

ACRA, in ancient geography, a promontory of Calabria, called Salenia, by Ptolemy: now Capo di San Maria di Leuca.

ACRA and **ACRO**, as a prefix to Greek names of places, imply their situation on an eminence; as *Acragas*, *Acroceraunia*. Also one of the hills on which stood that part of Jerusalem which formed the old and lower city.

ACRAE, an ancient Sicilian town, twenty-four miles south of Syracuse, near the present monastery of Santa Mauro d'Arcia, between Noto and Avula. Medals of this city, which appears to have been built on an eminence (Sili. Ital. lib. xiv.) are found in gold, silver and bronze.

ACRAE, a fabulous daughter of the river Asterian, who gave her name to a mountain of Argolis, a country of Peloponnesus;—it was also used as a surname of Diana from a temple erected to her honour by Melampus on a mountain near Argos. *Paus.* ii. c. 17.

ACRAGAS, or **AGRAGAS**, in ancient geography, so called by the Greeks, and sometimes by

the Romans, but more generally *Agrigentum*, by the latter; a town of Sicily, two miles from the sea, at the confluence of the Acragas and Hypsa; built by the people of Gela, A. A. C 584. It was a sea-port of great strength, standing on the top of a very steep rock, washed on two sides by rivers, and having a citadel to the S.E. surrounded by a deep gulf, which made it inaccessible but on the side next the town. It was famous for the tyrant Phalaris and his brazen bull. The country around it was laid out in vine and olive yards, in the produce of which they carried on a great and profitable commerce with Carthage. See *AGRIGENTUM*.

ACRAPULA, or **ACRAIPULA**, *Ἀκραπύλα*, Gr. medicines to prevent the bad effects of eating and drinking to excess, or surfeits.

ACRAS, or rather **ACURAS**, the wild pear. See *SAPOTA*.

ACRASIA, Gr. from *a* privative, and *κεραυνοῦμι* to mix, in medicine, implies the predominance of one quality above another, either with regard to artificial mixtures, or the humours of the human body, when not mixed in a just proportion. It was also used to express excess of any kind, which was called *Acrasia*, or the drinking of *unmixed* wines.

ACRASUS, in ancient geography, a town of Asia Minor, in Lydia. Some imperial Greek medals of this city still exist, which were struck under the pretors, in honour of Severus, and several other emperors.

ACRATH, in ancient geography, a place in Mauritania Tingitania, now *Velcz de Comare*: a citadel and commodious harbour on the Mediterranean in the kingdom of Fez.

ACRATISMA, in antiquity, a breakfast among the ancient Greeks, consisting of a morsel of bread soaked in pure unmixed wine, which was supposed to possess peculiar virtues.

ACRE. Saxon *Acepe*; Latin *ager*, a field, A measure of land; formerly applied to land of indefinite extent.

And ten *akers* of vynes shal geue but a quarte, and
xxx bushels of seide shal geue but an epha.

Essay, c. v.—*Bible*, 1539

Heathcote himself, and such large *acred* men,
Lords of fat Esham, or of Lincoln fen.

Pope's Imit. Horace.

ACRE, or **ACRA** a city of Palestine, the chief town and sea-port of a pachalic, of the same name, otherwise denominated, the pachalic of Saida, and extending from the Mediterranean on the west, to Jordan on the east; and from Nahrel-kelb to the south of Cassarea. It has been known by a variety of names. The Jews called it *Acco* or *Acco*. See *Judges*, ch. i. 31. The Arabians *Akka*. It was afterwards called Ptolemais, from the Ptolemies of Egypt; and St. John d'Acre, from the knights of Jerusalem. But its most ancient name was *AKH*, a name often seen on small bronze medals that have been found in the country.

Early travellers have said much about the splendour of this place; but Dr. Clarke assures us that it is like most other Turkish cities, mean and dirty, full of wretched shops and wretched people. The streets are so narrow, that but one

camel can pass at a time. The town, however, possesses some advantages of situation. On the north and east, is a fertile plain; on the west the breezes blow warm and fresh from the ocean. It stands on a bay, the coast of which is a perfect curve, and stretches three leagues, in a semicircular direction from the city to mount Carmel. But the marshes that lie contiguous, render it very unhealthy; it is ravaged by frequent distempers; and in the summer of 1760, no fewer than 7000 persons fell victims to the plague within the short space of five months. The harbour though bad, is the best the coast furnishes, and is said to be the key of Palestine; being the only avenue through which the inhabitants receive rice, the staple commodity. So that the pacha who holds Acre, has the power of drying up all the resources of Syria. It is sheltered from the north and north-west winds by the town: but has been greatly choked up in modern times. European vessels principally resort to Caifa, at the extremity of the bay opposite Acre.

Until recently, there were but a few wretched towers near the sea, on which cannon were mounted, which burst nearly as often as they were fired; but since the French attack on this place, they have been considerably improved. The city was anciently encompassed with a wall, within which Djezzar pacha constructed two others, filled the intermediate spaces with earth, and surrounded the whole with a moat or ditch; the outer wall being prolonged to the shore, and communicating with a fort built in the sea. The town itself has considerably diminished from its ancient extent, and stands at least a mile within the old wall. Few of its ancient buildings remain except the *iron castle*, so called from the side next the sea having been covered with a composition of that metal, and which is in a state of extreme decay. There is a mosque built by Djezzar pacha, a Greek church, an Armenian church, a Franciscan monastery, a Jewish synagogue, three khans or inns, and two bazaars or market places. The houses are principally of stone, flat-roofed, and with terraces. The palace of the knights of Saint John of Jerusalem is the present habitation of the pacha, in one of the halls of which is a fountain of various coloured marble, built by Daher, the son of Omar. Nearly adjoining the palace is another beautiful fountain, which was built of white marble, from the ruins of the ancient Caesarea, and in the garden are some pillars of yellow variegated marble from the same place. The population of Acre in 1797 was computed at 20,000, who are a mixture of Turks and Arabs.

Josephus states this city to have belonged to the tribe of Ashur. It was held by Demetrius, son of Seleucus: it afterwards fell to Antiochus Epiphanes, was captured by the Hebrew Alexander, ceded to Ptolemy, and passed from him to Cleopatra. It was conquered by the Persians, and at last fell into the hands of Rome. Acre was the chief theatre of the crusades. Under the dominion of the Moors, it sustained many sieges; but on the 12th June, 1191, yielded to Philip of France and Richard I. of England,

100,000 Christians being said to perish in the siege, besides great numbers who were lost by shipwreck and disease. After this, nearly all the Christian powers in Europe and Asia enjoyed authority here; and in the thirteenth century, the town was filled with churches and convents, of which nothing is at present to be seen. In 1291 it was retaken by the Saracens, and as some say, was sacked and demolished; 60,000 Christians perishing on that occasion. This siege was rendered memorable by the following instance of female resolution. A number of beautiful young nuns, terrified at the prospect of being exposed to the lust of the Infidels, cut off their noses, and mangled their faces, to render themselves objects of aversion. The Saracens, inflamed with resentment, put them all to the sword. In the seventeenth century, Faccardin, prince of Druses, took possession of it; and choked up the harbour to defend himself from the Turkish vessels. The Turks, however, took it, and the pacha of Saide appointed an annual governor. Daher, the son of Omar, an Arab chief, now captured Acre by a sudden assault. He restored the importance of the place, built a palace, and mounted cannon. He was, however, attacked by a Turkish fleet; was taken and his head sent to Constantinople. To him succeeded Ahmed pacha, a Bosnian by birth, who in consequence of his barbarity was called Djezzar, or *butcher*, and who murdered several of his wives with his own hand. In his reign Buonaparte landed in Egypt; and the celebrated siege of Acre, in which Djezzar was so gallantly assisted by Sir Sydney Smith, commenced on the 18th of March, 1799. After a most dreadful carnage, in which prodigies of valour were exhibited on all sides, the French abandoned the place. On the death of Djezzar, Ismael pacha, his successor, was defeated by Suleiman, on whom the Porte conferred the pachalic; and this man, by his mild and pacific manners, has conciliated the country, and much improved the resources of the place. Acre is distant 27 miles S. of Tyre; 23 from, and to the N.N.W. of, Jerusalem. N. long. $32^{\circ} 40'$. E. lat. $39^{\circ} 25'$.

ACRE, in commerce, the same with *lack*, and signifying the sum of 100,000 Mogul rupees; a pound sterling being equal to about eight rupees.

ACRE, did not originally signify a determined quantity of land, but any open ground, especially a wide campaign; and in this antique sense it seems to be preserved in the names of places, as Castle-acre, West-acre, &c. In England, it contains four square rods; a rod being forty perches or poles, of sixteen feet and a half each by statute. Yet the length of the pole varies in different counties, from sixteen feet and a half to twenty-eight. The acre is also divided into ten square chains of twenty-two yards each, that is, 4840 square yards. An acre in Scotland contains four square rods: one square rod is forty square falls; one square fall, thirty-six square ells; one square ell, nine square feet and seventy-three inches: one square foot, 144 square inches. The Scots acre is also divided into ten square chains; the measuring chain should be twenty-four ells in length, divided into 100 links,

each link 8¹⁵³₁₅₃ inches; and so one square chain will contain 10,000 square links. The English statute acre is about three rods and six falls standard measure of Scotland. The French acre, *arpent*, contains one English acre and a fourth, or 54,450 square English feet, whereof the English acre contains only 43,560. The Strasburg acre is about half an English acre. The Welsh acre contains commonly two English ones. The Irish acre is equal to one acre, two rods, and nineteen perches $\frac{3}{4}$, English.

ACRE FIGHT, an old sort of duel fought by English and Scottish combatants, upon the frontiers of the kingdoms, with sword and lance; it was also called *camp-fight*, and the combatants *champions*, from the open field being the stage of trial.

ACRE TAX, a tax laid on land at so much per acre; called also *acre-shot*.

ACREME, a term sometimes used in ancient law-books, for ten acres.

ACRESPIRE. See PLUMULE

ACRIBEIA, Gr. *ἀκρίβεια*, in medicine, a term literally denoting an exquisite or delicate accuracy; as in describing diseases, &c.

ACRID, *adj.*

ACRIMO'NIOUS, } *Ἀκρη*, a point, at once, sharp, bitter, pungent, and AC'RIMONY, } corrosive.

AC'RITUDE.

The malignity of soldiers and sailors against each other, has been often experienced at the cost of their country; and perhaps no order of men have an enmity of more acrimony, or longer continuance.

Rambler.

Most satyrists are indeed a public scourge,
Their mildest physic is a farrier's purge;
Their acrid temp'r turns as soon as stirred
The misk of their good purpose all to curd.

Cörper's Charity.

ACRID, in natural history, denotes any thing sharp or pungent to the taste. Ancient naturalists distinguish two kinds of *acrid* taste; the first proceed from hot and dry, as that of pepper; the second from hot and moist substances, as that of garlic. According to Grew, it properly belongs to the class of compound tastes. It is not simply sour or pungent, there being bodies not acrid, which yet are pungent, e. g. arum; nor is it simply hot; for there are many hot bodies which are not acrid, as the roots of zedoary, yarrow, and contrayerva. The characteristic, therefore, of acridity consists in pungency joined with heat. Acrids have been classed according as they yield their acrimony. First, by distillation; secondly, by infusion; and thirdly, by neither.

ACRIDOPHAGI, Gr. from *ἀκρε*, a locust, and *φαγω*, to eat, in ancient geography, an Ethiopian people, who are said to have fed on locusts, as their name imports. Diodorus Siculus and Strabo give marvellous details of their habits, and particularly their diseases. They seldom lived, they say, more than forty years, and were then attacked internally by winged lice, in such numbers, that it was impossible to exterminate them. It is well known, that to this day, the inhabitants of Ethiopia, Arabia, &c. frequently use locusts as food. Dr. Haselquist, who travelled in Syria and Egypt so late as the year 1752, speaks of the inhabitants

of Arabia, Ethiopia, &c. using locusts as food. He was told, by a learned sheik at Cairo, who had lived six years in Mecca, that a famine frequently rages, at the latter place, when there is a scarcity of corn in Egypt, and obliges the inhabitants to live upon coarser food than ordinary. That the Arabians then grind locusts in hand-mills, or stone mortars, and bake them into cakes. Sometimes they boil them, stew them with butter, and make them into a kind of frie-casee; which is not disagreeably tasted. A later traveller, Dr. Sparrman, informs us, "That locusts afford a high treat to the more unpolished and remote hordes of the Hottentots; when, as sometimes happens, after an interval of eight, ten, fifteen, or twenty years, they make their appearance in incredible numbers." The Abbé Poiret, also, in his 'Memoir on the Insects of Barbary and Numidia,' informs us, "That the Moors make locusts a part of their food; that they go to hunt them; fry them in oil and butter; and sell them publicly at Tunis, at Bonne, &c." "The Jews," as Dr. Shaw observes, "were allowed to eat them. When sprinkled with salt, and fried," he adds, "their taste resembles that of our fresh-water cray-fish." Russel also says, the Arabs salt and eat them as a delicacy. These accounts sufficiently explain the Scriptural statement respecting the food of John the Baptist in the wilderness, *Matt.* iii. 4. For while some maintain, that the original word signifies 'the tops of certain herbs,' or 'the fruits' of trees; and others have supposed it means quails; Shaw contends it is applied to the locust on account of its appetite for such food. The word is used by Aristotle, and other historians, in the same sense, and therefore the literal interpretation of it may be received. See *Strabo*, lib. xvi. *Athenaeus*, lib. xlix. *Plin. Nat. Hist.* lib. vi. and xi. *Hieronymus Opera*, tom. iv. *Barrow's Travels*, vol. i. *Drake's Voyages*. *Buffon, Nat. Hist.* vol. vi. *Bryant on the Plagues of Egypt*, art. Locusts. *Harmer's Observations*, vol. ii., &c.

ACRIS, in natural history, a name given to the locust, because it is said to feed *ταξ ἀκρωτῶν φυτῶν*, on the tops of trees.

ACRIS, in surgery, the extremity of a fractured bone.

ACRISIUS, in mythology, a king of Argos, who being told by the oracle that he should be killed by his grandchild, shut up his only daughter Danaë in a brazen tower; but Jupiter came down to her in a golden shower, and Perseus, who afterwards killed Acrisius, was the fruit of their amour.

ACRISY, *Ἀκρισία*, Gr. from *α*, negative, and *κρίω*, to judge of, in medicine, that state of a disease in which no right judgment can be formed of its issue.

ACRITAS, in ancient geography, a promontory of Messenia, now *Capo di Gallo*, between Methone to the W. and Corone to the E. where the Sinus Coronæ begins.

ACRIVIOLA, in botany, the nasturtium Indicum, or Indian cress.

ACROAMA, *ἀκροαμάται*, to hear, in philosophy, theology, &c. any thing sublime, profound, or abstruse; hence *ACROAMATICI*, was a denomination given to those disciples of Aristotle,

&c. who were admitted into the secrets of the inner or acroamatic philosophy.

ACROATHON, or ACROATHOUM, in ancient geography, a town on the top of mount Athos, whose inhabitants, according to Mela, lived much longer than in any other country: it is now *La Cima di Monte Santo*.

ACROBALYTE, of *akρος*, and *βαλλω*, to throw, a name given to the soldiers of Tarentum, who were famous for throwing the javelin to great distances, while on horseback.

ACROBATICA, or ACROBATICUM, from *akρος*, high, and *βαυνω*, I go; an ancient climbing engine, among the Greeks, similar to the scensorium among the Latins. Vitruvius and Aquinus suppose it to have been used for both civil and military purposes.

ACROCERAUNIUM, in ancient geography, a promontory of Epirus, on which are situated the ACROCERAUNIA, or MONTES CERAUNII, *akρος* high, *κεραυνος* thunder; so called from their being often thunder-struck. They ran between the Ionian sea and the Adriatic; where Illyria ends, and Epirus begins; and are the modern Monti della Chimera. They are called by Horace, *Infernes scopulos*.

ACROCHIRISMUS, *ακροχειρισμος*, among the ancient Greeks, a kind of gymnastic exercise, wherein only the hands and fingers were employed. Hippocrates ascribes to it a virtue of extenuating the rest of the body, and making the arms fleshy.

ACROCHOLIA, *ακροκωλια* from *akρος*, extreme, and *κωλον*, a limb. Those extremities of animals, which are used in food, or of which jellies are made. Also an ancient name for the penile wart. See WART.

ACROCORINTHUS, in ancient geography, a steep hill, over hanging the city of Corinth, famous for an acropolis, or citadel. On its top stood a temple of Venus; and lower down issued the fountain of Pyrene.

ACRODRYA, from *Ακρον*, and *δρυς*, an oak, in natural history, all fruits, that have rinds, or shells, such as acorns, almonds, &c.

ACROK'E. On Crook. See CROOK.

ACROMION, or ACROMIUM, from *Ακρος*, and *ωφος*, shoulder, in anatomy, the upper part of the scapula or shoulder-blade. See ANATOMY.

ACROMONOGRAMMATICUM, from *α-κρος*, *μονος*, *γραμμα*, letter, among poets, a kind of poem, or composition, wherein each subsequent verse commences with the letter with which the verse preceding terminates.

ACROMPHALIUM, or ACROMPALON, *ακρος*, and *ομφαλος*, the navel; the tip of the navel.

ACRON, a physician of Agrigentum, who recommended lighting large fires, and purifying the air with perfumes, to stop the pestilence that raged at Athens, about A. A. C. 473. Also a king of the Ceninenses, whom Romulus slew.

ACRON, a district of the Fantee territory, on the Gold Coast of Guinea, Africa. Its capital is Assam, or Apam, a commodious sea-port, where the Dutch have a small fort. This place was destroyed with most of the inhabitants, in 1811, by the Ashantees. A week after it was plundered and laid in ruins by Attah, late king of

Akim; it is about fifty miles E. N. E. of Cape Coast. GREAT ACRON is a kind of republic, farther inland.

ACRON, or ACROS, in botany, among the ancients, the capitulum, top, or flower of a plant. Also in medicine, that which is most excellent. Likewise the height, or crisis of a disease.

ACRONIUS LACUS, in ancient geography, a lake formed by the Rhine, soon after its rise out of the Alps, and after passing the greater lake at Constance, called Venetus, and now the Bodensee, or Lesser Lake of Constance.

ACRONYCHAL, or ACRONICHUS. See ACRON. This appellation was particularly applied to the superior planets, when they were come to the meridian of midnight.

ACRONYCTE, in astronomy, stars, rising in the twilight, about sun-setting.

ACROPOLIS, in ancient geography, the citadel, and one of the divisions of Athens; the citadel standing on a rock or eminence was inaccessible, except on one side. At the foot was the temple of Minerva.

ACROPOLITA, (George,) one of the Byzantine historians, was born at Constantinople, in 1220, and employed in some of the most important affairs of the empire; being sent ambassador to Larissa, to establish a peace with Michael Comnenus, suspected of engaging in a conspiracy. He wrote a continuation of the Greek history, from the taking of Constantinople by the Latins, till it was recovered by Michael Palaeologus, (to whom he was chancellor,) in 1261, a treatise concerning Faith, Virtue, and the Soul; an Exposition of the Sermons of St. Gregory Nazianzen, &c.

ACROPOSTHIA, from *ακρος*, extreme, and *προσθη*, the prepuce, the extremity of the prepuce, which is cut off in circumcision.

ACROSPLEOS, in botany, the wild oat grass, or bromus.

ACROSPIRE, in natural history, &c. the same with PLUMULE, which see.

ACROSS'. On Cross. See CROSS.

When other louers in armes *acrosse*,
Reioice their chiefe delight;
Drowned in teares to mourne my losse.
I stand the bytter nyght
In my window.

Surrey.

It was anciently the manner for the bishop to lay both his hands *across* on the head of the confirmed, not only in imitation of Jacob, but in allusion to the death of Christ in whom we believe, and from whom we receive the Holy Ghost. *Comber's Companion.*

ACROSTICK, from *ακρος*, extremity, and *στιχος*, verse, a poetical composition, in which the initial letters of the lines or the verses form the name of some person or thing. The acrostic is obviously an artificial and adventitious arrangement of poetry; and has been very fancifully and even fantastically cultivated. Sometimes the acrostic has been formed of the first letters of the lines, sometimes of the last, and sometimes it is to be read downwards, and at others upwards.

The appellation has been applied by some authors to two ancient epigrams in the Anthology; in honour of Bacchus and Apollo. Each con-

sists of twenty-five verses, the first whereof is the argument of the whole, and the other twenty-four composed of four epithets, beginning each with the same letter, and thus following in the order of the twenty-four letters of the Greek alphabet, from A to Ω; each comprehending four epithets, which makes ninety-six in all for each god.

The most curious of these fanciful acrosticks which we have seen, occurs in the "De Laude Virginum," of the celebrated Aldhelm. It consists of thirty-eight lines, each beginning and ending with the successive letters of the words of the first line, and thus the first and last lines, and the initial and final letters of each line consist of the same words. Only in the last line the words occur backwards, and the final letters are to be read upwards throughout the piece.

Aldhelm quaintly calls this *quadratum carmen*, a square verse.

But the acrostick form of verse, which has been called alphabetical poetry, has clearly been employed for useful purposes. When books were few, and writing could but rarely be resorted to as a record, the acrostic form of poetry presented an easy method of assisting the memory to retain detached sentences: and thus moral maxims and forms of devotion were preserved from age to age, which might otherwise have been lost. We have upon this principle seven of the psalms of the Hebrew old Testament, a poem, Proverbs xxxi. 10—31, and four chapters of Jeremiah's Lamentations, regular acrosticks,

i. e. three of them perfectly alphabetical, in which every line is marked by its initial letter, and the other nine in which the stanzas are so distinguished. For other peculiarities of these singular poems, we refer the reader to "Bishop Lowth's Lectures on the Hebrew Poetry."

ACROSTICS, among ecclesiastical writers, denote the end of verses of psalms, which the people sang by way of chorus, or response, to the *precentor*, or leader of the psalm.

ACROSTICUM, RUSTYBACK, WALL-RUE, or FERN, in botany, a genus of plants of the class cryptogamia, order filices. The fructifications are accumulated on the whole inferior surface of the frond, so that they every where cover it.

ACROSTOLIUM, in ancient naval architecture, the extreme part of the ornament on the prows of ships; which it was usual to tear off from vanquished vessels, and fix them to the conqueror's, as a token of victory.

ACROTELEUTIC, from *ἀκρος* and *τελος*, end, among ecclesiastical writers, the end of a verse or psalm; or something added thereto, to be sung by the people, as the *Gloria Patri*, &c.

ACROTERIA, among ancient physicians, signified the larger extremities of the body, as the head, hands, and feet, and their extremities.

ACROTERIA, in architecture, little pedestals without bases, placed at the middle and the two extremes of pediments, sometimes serving to support statues; also the statues themselves in such situations.

ACROTERIASM, in old surgery, was the act of cutting off the extreme parts of the body, i. e. the amputation of any extremity.

ACROTHYMIA, or ACROTHYMION, from *ἀκρος*, extreme, and *θυμος*, thyme, a sort of wart, described by Celsus as hard, and rough, with a narrow basis and broad top; the top is of the colour of thyme; it easily splits and bleeds. It is also called *thymus*.

ACT, v. n.

AC'TION,

AC'TIONABLE,

AC'TIONLESS,

AC'TIVATE,

AC'TIVE,

AC'TIVELY,

AC'TIVENESS,

AC'TIVITY,

AC'TLESS,

AC'TOR,

AC'TRESS,

AC'TUAL,

AC'TUALITY,

AC'TUALLY,

AC'TUATE,

AC'TUATION.

Ago, actum, to do; to exercise any power or faculty; to perform, to assume a character or part, used extensively in a judicial and legislative sense.—Act signifies a thing done. Action a doing; the former expressing an incident, the latter a habit or process. To actuate, is to influence the act of another.

And this way is cleped penance; of which man shuld gladly herken and enqueren with all his hirte, to wete, what is penance, and whennes it is cleped penance, and how many maneres ben of actions or workinges of penance.

Chaucer Personnes Tale

You, that are king, though he do wear the crown,
Have caus'd him, by new act of parliament,
To blot out me.

Shakespeare's Henry VI.

BOT. Are we all met?

QJIN. Pat, Pat, and here's a marvellous convenient

place for our rehearsal. This green plot shall be our stage, this hawthorn brake our tying house, and we will do it in *action*, as we will do it before the duke.

Shakspeare's Midsummer Night's Dream.

YORK. As in a theatre, the eyes of men,
After a well grac'd actor leaves the stage,
Are idly bent on him that enters next,
Thinking his prattle to be tedious :
Even so, or with much more contempt, men's eyes
Did scowl on Richard.

Shakspeare's K. Richard II.

The world hath had in these men fresh experience, how dangerous such *active* errors are.

Hooker.

Active and stirring spirits live alone,
Write on the others, Here lies such a one.

Herbert.

As wounds once healed leave a scar behind them, so remitted injuries leave commonly in the *actors* a guilty remembrance.

Hall's Contemplations.

This earth is only made for *action*, not for fruition.

Idem.

Only the *actions* of the just,
Smell sweet and blossom in the dust.

Shirley.

It is an *act* of profanation for any unholy person to handle holy things, and holy offices.

Bishop Taylor's Sermons.

Some bend the stubborn bow for victory ;
And some with darts their *active* sinews try.

Dryden.

'Tis virtuous *action*, that must praise bring forth ;
Without which, slow advice is little worth :
Yet they, who give good counsel, praise deserve ;
Tho', in the *active* part they cannot serve.

Denham.

Honour and shame from no condition rise :

Act well your part ; there all the honour lies.

Pope.

The frequent contemplation of death, as it shows the vanity of all human good, discovers likewise the lightness of all terrestrial evil, which certainly can last no longer than the subject upon which it *acts*.

Rambler.

If we consider him in his omnipresence ; his being passes through, *actuates*, and supports the whole frame of nature.

Spectator.

A lively faith is able to anticipate in some measure, the joys of that heavenly society, which the soul shall *actually* possess hereafter.

Couper's Letters.

Act. *Actus*, in physics, an effective exercise or application of some power or faculty. In this sense, *act* stands opposed to power, *potentia*, which is only the capacity of acting, not the exertion of that capacity.—Metaphysicians give various divisions of act; viz. into infinite, as the act of creating ; and finite, as the act of moving :—transient, or those exercised in other beings, as heating ; and immanent, which remain in their own subject, as thinking.

ACTA CONSISTORII, the edicts or declarations of the council of state of the Roman emperors, upon which the senate and soldiers often swore, either through flattery or compulsion, as we do upon the Bible.

ACTA DIURNA, and **ACTA POPULI**, were a sort of Roman gazette, containing an authorized narrative of the transactions worthy of notice which happened at Rome. They differed from Annals in that only the greater and more important matters were recorded in the latter, and

those of less note in the former. Their origin is attributed to Julius Cæsar ; but some trace them to Servius Tullius.

ACTA SENATUS, acts of the senate, were minutes of what passed and was debated in the senate house. These were also called *Commentarii* and *υπομνηματα*.

ACT, in law, an instrument in writing, for declaring or justifying the truth of any thing. In which sense, records, decrees, sentences, reports, certificates, &c. are called acts.

ACT, in logic, is particularly understood of an operation of the human mind. Thus to discern and examine, are acts of the understanding ; to judge and affirm, are acts of the will, &c.

ACT, in the universities, signifies a thesis maintained in public by a candidate for a degree. The candidates for a degree of bachelor and master of arts are to hold philosophical acts ; and those for bachelor of divinity, theological acts, &c. At Oxford, the time when masters or doctors complete their degrees is also called the act ; which is held with great solemnity. At Cambridge, they call it the commencement.

ACT OF FAITH, *Auto da Fé*, in the Romish church, is, or rather was, a solemn day held by the Inquisition, for the punishment of heretics, and the absolution of the innocent. See INQUISITION.

They usually contrived the Auto to fall on some great festival, that the execution might impress the greater awe. A competent number of prisoners in the Inquisition being convicted of heresy, either by their own voluntary or extorted confession, or on the evidence of witnesses, they were, in the morning of the day, brought into the great hall, where they were attired for the procession. This was generally led by Dominican friars ; after which came the penitents, some with san-benitoes, and some without, according to the nature of their crimes ; being all in black coats without sleeves, and bare-footed, with a wax candle in their hands. Then followed the penitents who had narrowly escaped being burnt, who over their black coats had flames painted with their points turned downwards. Next came the negative and relapsed, who were to be burnt, having flames on their habits pointing upwards. After these, such as professed doctrines contrary to the faith of Rome, who, besides flames pointing upwards, had their picture painted on their breasts, with dogs, serpents, and devils, all open-mouthed, about it : each prisoner attended with a familiar of the Inquisition : and those to be burnt having a Jesuit on each hand, who was continually exhorting them to abjure. After the prisoners, came a troop of familiars on horseback ; then the inquisitors, and officers of the court, on mules ; and last of all, the inquisitor-general on a white horse, led by two men with black hats and green hatbands. At the place of execution, the prisoners were placed at one end of a large scaffold, the inquisitors at the other. A sermon was preached, and a priest ascended a desk near the middle of the scaffold, to take the abjuration of the penitents, and recite the final sentence of those who were to be put to death. These were now formally and most hypocritically delivered

to the secular magistrates, who were at the same time besought not to touch their blood, or put their lives in danger! The prisoners were now carried to the secular gaol loaded with chains, and brought thence in an hour or two before the civil judge; who, after asking in what religion they intended to die, sentenced such as professed the religion of Rome, to be first strangled, and then burnt to ashes; and such as died in any other faith, to be burnt alive. Both classes then returned to the place of execution, where stakes were prepared, for such as persisted in their heresy, about four yards high, having a small board towards the top for the prisoner to be seated on. The negative and relapsed being first strangled and burnt, the professed mounted their stakes by a ladder; and the Jesuits, after exhorting them to be reconciled to the church, left them with the assurance that the devil was standing at their elbow to receive their souls, and carry them with him into hell. On this, the cry was, let the dogs' beards be made; which was done by thrusting flaming furzes, fastened to long poles, against the prisoners' faces, till they were burnt to a coal. At last, fire was set to the furze at the bottom of the stake, and the flame seldom reaching higher than the seat they sat on, they were rather roasted than burnt to death, amidst the most savage exclamations of joy!

We have narrated these horrid scenes in the past tense, sincerely hoping and believing they are for ever past, as pretended acts of religion, even in the most devoted popish countries. The inquisition is, in Portugal and Spain, at this time, rather an irregular and badly conducted court for the punishment of civil offences. But the record of these atrocities had need remain awhile before us, that those countries who are most entirely emancipated, may never more return to that domination of the priesthood that originated them.

ACT OF GRACE, in English law, an extraordinary act of the king in council, whereby, at the beginning of a new reign, or on other great occasions, a free pardon has been sometimes granted to criminals.

ACTS OF THE APOSTLES, one of the sacred books of the New Testament, containing the history of the infant church, during the space of twenty-nine or thirty years, from the ascension of our Lord to the year of Christ 63.—It was written by St. Luke, and addressed to Theophilus, the person to whom the evangelist had before dedicated his gospel. The style of this work, which was originally composed in Greek, is much purer than that of the other canonical writers; and it is observable, that St. Luke, in his quotations from the Old Testament, always makes use of the Septuagint version. It may likewise be remarked, that less critical attention has been paid to this book in our own country, than to any other part of the New Testament.

ACTS OF THE APOSTLES, SPURIOUS: Of these there were several, particularly; 1. *Acts*, supposed to be written by Abdias, the pretended bishop of Babylon, who gave out that he was ordained bishop by the apostles themselves, when they were upon their journey into Persia. 2. *The Acts of St. Peter*; from the school of the

Ebionites. 3. *The Acts of St. Paul*. Eusebius, who had seen it, pronounces it of no authority. 4. *The Acts of St. John the Evangelist*; 5. *The Acts of St. Andrew*; 6. *The Acts of St. Thomas the Apostle*; received particularly by the Manicheans. 7. *The Acts of St. Philip*; 8. *The Acts of St. Matthias*.

ACTS OR COUNCILS, in ecclesiastical affairs, contain the proceedings, debates, motions, &c. as well as the canons delivered. Hence we have two kinds of synodical collections, one containing all the acts, or transactions, relating to matters of faith and doctrine; the other, containing only the canons relating to discipline, called the Book of Canons.

ACTS OF PILATE, in ecclesiastical history, a relation said to have been sent by Pilate to the emperor Tiberius, concerning Jesus Christ, his death, resurrection, &c. as testified by Tertullian, in his *Apol.* cap. 5. and 20, 21. The heretics forged Acts in imitation of them, but both the genuine and the spurious are lost.

ACTAEA, in botany, the *Aconitum Racemosum*, *Herb Christopher*, or *Bane-berry*; a genus of the monogynia order, belonging to the polyandria class of plants. Its characters are: CAL. a perianthium consisting of four roundish, obtuse, concave leaves, which fall off. COR. four petals, larger than the calyx, pointed at both ends, and falling off. STAM. numerous capillary filaments; the anthers roundish, erect, and didymous. PIST. an ovate germen; no stylus; the stigma thickish and obliquely depressed. The seeds are very numerous, semiorbicircular, and incumbent in a double order. There are four species; viz.

1. *Actaea Alba*, the American herb christopher, a native of North America.
2. *Actaea Cimicifuga*, a native of Siberia.
3. *Actaea Japonica*, the Japanese herb christopher, a shrub, native of Japan.
4. *Actaea Racemosa*, or American black or wild snakeroot, a native of North America.
5. *Actaea Spicata*, or common herb christopher, a native of several parts of Britain.

ACTAEON, in fabulous history, the son of Aristaeus and Autonoe, a great hunter. He was turned by Diana into a stag, for looking on her while bathing; and was torn to pieces by his own dogs. Also, a Corinthian youth, killed by Archias, one of the Heraclidae, in an attempt to carry him off from his father's house. *Plut. in Amat. Narrat.*

ACTANIA, in ancient geography, an island in the North Sea, west of Holstein, and not far from the mouth of the Eyder and Elbe; now *Heligoland*.

ACTE, in botany, the elder. See *SAMBUCUS*.

ACTE, in mythology, one of the Horæ. 2. In history, a mistress of Nero, of the family of Attalus.

ACTIAN GAMES, in Roman antiquity, solemn games instituted by Augustus, in memory of his victory over Marc Anthony at Actium, A. U. C. 714, B. C. 37. They were celebrated every fifth year. Virgil insinuates them to have been instituted by Æneas. *Aen. iii. v. 280.*

Actaque Iliacis celebramus littora ludis,
By way of compliment to Augustus; attributing

that to the hero from whom he descended, which was done by the emperor himself.

ACTILIA, military utensils.

ACTINE, *actinū*, in botany, a name of the herb bunias, or napus; the brassica napus of Linnaeus.

ACTINIA, in zoology, a genus belonging to the order of vermes mollusca. Its genuine characters are, the body oblong and smooth, attaching itself firmly by its basis to rocks or other solid substances, having a dilatable apex hooked within. The mouth furnished with crooked teeth, the rostrum cylindrical and radiated. There are five species, some of which make a beautiful appearance and are called *Animal Flowers*, *Sea Anemones*, and *Urtica Marina*. They are viviparous, and form one of those wonderful links in the chain of creation, that connect the animal and vegetable kingdoms, by partaking of the nature of both. See **ANIMAL FLOWER**.

ACTINOBLISM, from *actinū*, a sun beam, and *βολή*, a plumb line, in physics, diffusion, or the diradiation of light or sound, by which it flows every way from its centre. Also, applied in medicine, to the diffusion of the animal spirits, by which they convey the dictates of the mind to the organs of voluntary motion.

ACTINOLITE, in mineralogy, the actinotus vitreous of Linnaeus, strahlstein of Werner, and amphibole actinote hexadre of Häuy; having three varieties, the crystallized, the asbestos, and the glassy. It is principally found in primitive districts, with a magnesian basis, never in secondary mountains. It accompanies talc, and some micaceous rocks, and abounds in the Tyrol, Mount St. Gothard, in Saxony, Norway, and Piedmont. It is also found in Cornwall and Wales, and some of the Scottish isles.

ACTIO, in Roman antiquities, an action at law, in a court of justice. The formalities were generally these: The injured person proceeded in *jus reum vocare*, to summon the offending party to the court, who was obliged to go, or give bond for his appearance. He could be summoned *vivā voce*, by the plaintiff. If he would not go willingly, he might compel him, calling any by-standers to bear witness, by asking them *visne antestari*; the by-standers upon this turned their ear towards him in token of their consent. To this Horace alludes, lib. i. sat. 9. See **ANTESTARI**. The parties having met before the prætor, or other magistrate, the plaintiff stated his case, termed *edere actionem*, commonly performed by writing it on a tablet, and offering it to the defendant. Next came the *postulatio actionis*, or the plaintiff's petition to the prætor, for leave to prosecute. This was granted by writing at the bottom of it *actionem do*, or refused by writing *non do*. The petition being granted, the plaintiff *vadabatur reum*, i. e. obliged the defendant to give sureties for his future appearance in court. Meantime, the difference was often made up, either *transactione*, by letting the cause fall as dubious; or *pactione*, by composition. On the day appointed, the parties were summoned by an *accensu*. (See **ACCENSI**.) Upon the non-appearance of either, the defaulter lost his cause: — if they both appeared, the plaintiff proceeded

item sive actionem intendere, i. e. to prefer his suit; and desired judgment of the prætor, that is, to be allowed a *judex* or *arbiter*, or else the *recuperatores* or *centumviri*; which the prætor having assigned by the consent of both parties, and determined the number of witnesses to be admitted; and the judges took a solemn oath to be impartial; and the parties the *juramentum caluniae*. Then the trial began, which was called *discretatio causa*.

ACTION, in commerce, is a term used abroad for a certain part or share of a public company's capital stock: which is sold and transferred much in the same manner as stocks are with us. The proprietor is called an *actionary*.

ACTION, in ethics, denotes the external signs or expressions of the sentiments of a moral agent.

ACTION, in farriery, is spoken of a horse, and expresses the general character of his motion. It is particularly applied to actions of his mouth.

ACTION, in oratory, is the outward deportment of the orator, or the accommodation of his countenance, voice, and gesture, to the subject of which he is treating. See **ORATORY**.

ACTION, in painting and sculpture, is the attitude or position of the several parts of the face, body, and limbs of such figures as are represented, and whereby they seem to be really actuated by passions. Thus we say, the action of such a figure finely expresses the passions with which it is agitated: we also use the same expression with regard to animals.

ACTION, in poetry, the same with subject or fable. Critics generally distinguish two kinds, the principal and the incidental. The principal action is what is generally called the *fable*; and the incidental an *episode*. See **Poetry**.

ACTIONS, among merchants, sometimes signify moveable effects; and we say the merchant's creditors have seized on all his actions, when we mean that they have taken possession of all his assets.

ACTIONARE, in law, to prosecute.

ACTIVE, in chemistry, is sometimes applied to those principles which are supposed to act of themselves, and do not need to be put in action by others: thus salt, sulphur, and mercury, are usually considered as active principles; and phlegm, earth, &c. as passive ones.

ACTIVE POWER, in metaphysics, the power of executing any work or labour: in contradistinction to speculative powers, as those of seeing, hearing, reasoning, &c. See **METAPHYSICS**.

ACTIVE PRINCIPLES. See **ACTIVE** in chemistry.

ACTIVE VERBS, are such as do not only signify doing, or acting, but have also nouns following them to be the subject of the action or impression. Thus *to love*, *to teach*, are verbs active; because we can say; *to love a thing*, or *teach a man*. See **VERB**.

ACTIUM, in ancient geography, a town situated on the coast of Acarnania, famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the same name, in the mouth of the Sinus Ambracius over against Nicopolis. It afterwards became still more famous by Augustus's victory over Antony and Cleopatra; and for quinquennial games instituted there, called *Actia*. See **ACTIAN GAMES**.

ACTIUM, the promontory of, now called *Capo di Figalo, or Figo.*

ACTIUS, in mythology, a surname of Apollo, from Actium, where he was worshipped.

ACTON BURNEL, a village in Shropshire, eight miles from Shrewsbury, so named from the Burnels, who had a castle in it, once a magnificent structure, and now a fine ruin. A parliament was held here, in the reign of Edward I. wherein a statute, called the Statute Merchant, was made for the recovery and assurance of debts.

ACTON, EAST, a small town, 5 miles W. of London, once a place of considerable resort for its mineral waters, which have now fallen into disuse. The Uxbridge canal passes close by. It is a hamlet of.

ACTON, WEST; and both places derive their names from the Saxon *Ae*, or *Aac*, i. e. oak, which once abounded here.

ACTOR, among civilians, the proctor or advocate in civil courts or causes; as, *Actor ecclesiae*, the advocate of the church; *actor dominicus*, the lord's attorney, &c.

ACTOR, in fabulous history, a warrior among the Aurunci, described by Virgil as a hero of the first rank. *AEn.* xii. Also, a son of Myrmidon and Physidice, the father of Menoetius. Patroclus was called, after him, Actorides.

ACTORUM TABULE, in Roman antiquity, tables in which the births of children were registered. They were commenced by Servius Tullius, and kept in the treasury of Saturn.

ACTRESSES, in the drama, appear to have been wholly unknown to the ancients, men or eunuchs always performing the female parts. Charles II. is said to have first encouraged their public appearance in England; but there is evidence that the queen of James I. performed in a court theatre. Originally the drama consisted of nothing more than a simple chorus, who sung hymns in honour of Bacchus. Thespis was the first that, in order to relieve this uniform chorus, introduced a declaimer who repeated some heroic or comic adventure. Eschylus introduced a second, changed the ancient recitals into dialogues, and improved the dresses of his actors. To him is attributed the addition of the cothurnus or buskin. Sophocles added a third, in order to represent the various incidents in a natural manner; and we do not find in any of the Greek tragedies above three persons in the same scene; a rule Horace thus alludes to,

Nec quarta loqui persona labore.

This, however, did not prevent their increasing the number of actors in a comedy. Before the opening of a play, they named their actors in full theatre, together with the part they were to perform. The ancient actors were generally masked. Horace speaks of a kind of secondary actors in his time, whose business it was to imitate the first; and by their inferior performances, become foils to their principal. At Athens, actors were highly honoured. At Rome they were despised, and not only denied all rank among the citizens, but even when any one appeared upon the stage, he was expelled his tribe, and deprived of the right of suffrage. Cicero, indeed, esteems the talent of Roscius; but

he values his virtues still more; virtues which distinguished him so remarkably above all others of his profession, that they seemed to have excluded him from the theatre.

ACTUAL, in philosophy and medicine, is opposed to potential, and is applied to any thing endued with a quality which operates by an immediate power inherent in it. For example, hot iron is called an actual cautery, in contradistinction from chemical caustics, which have a power of producing the same effects on animal solids, as actual fire; and which are called potential. Boiling water is actually hot, and brandy is potentially hot, as it heats the body, though of itself cold.

ACTUARIE NAVES, a kind of ships among the ancient Romans, chiefly designed for swift sailing.

ACTUARIUS, (J.) a celebrated Greek physician of the eleventh, or as some think, of the thirteenth century. Though commonly known by this appellation, (his title, in fact, as the chief medical attendant on the imperial court,) his name was Zacharias. He is distinguished by first introducing and recommending mild cathartics. His works were printed in one volume folio, by Henry Stephens, in 1567; and reprinted at Leyden in 3 vols. 12mo. 1556.

ACTUARIUS, in antiquity, a title of dignity, in the court of Constantinople, peculiar to physicians. See above.

ACTUARIUS, or **ACTARIUS**, in Roman antiquity, an officer appointed to write down the proceedings of a court, assembly, or the like. In the Eastern empire, he kept the military accounts, received the corn from the susceptores or storekeepers, and distributed it among the soldiers, to whom he acted as a kind of broker, or army agent.

ACTUATIO, *actuation*, in medicine, signifies the change wrought on a medicine, or any thing else taken into the body, by the vital heat, which is necessary to make it act, and produce its effect.

ACTUS, in ancient architecture, a measure in length equal to 120 Roman feet. In ancient agriculture, the word signified the length of one furrow, or the distance the plough goes before it turns.

ACTUS INTERVICINALIS, a space of ground four feet in breadth, left between the lands as a path.

ACTUS MAJOR, or **ACTUS QUADRATUS**, a piece of ground in a square form, whose sides were 120, and contents 14,400 feet being equal to half the jugerum. It was also called *modius* and *mina*.

ACTUS MINIMUS, a quantity of land 120 feet in length, and four in breadth; equal to the *sextans*, or sixth part of a jugerum.

ACTUANITES, in ecclesiastical history, a name sometimes given to the **MANICHEES**, from Acua, an alleged disciple of the apostle Thornas.

ACUBENE, in astronomy, a star of the third magnitude, on the southern claw of Cancer; called by Ovid *labia*; and by other writers *acetabulum*.

ACUIHYATLI, in zoology, a large and venomous serpent of America, more usually known by the name of *cucurucu*, or *cucurucuca*, which see.

ACUITION, in grammar, medicine, and pro-sody. See ACUTITION.

ACUL, a sea-port on the north coast of St. Domingo, whence the French were expelled in 1794, by the English, who took it by storm, S. S. W. of Cape François, distant eight miles. Also a small town of St. Domingo, on the south coast, sixteen miles S. W. of Les Cayes.

ACULEATED FINS, in ichthyology, a term applied by naturalists to the fins of fishes, which are armed with prickles. Those which want them are called, *non-aculeated*. Hence the *pug-nitius marinus*, or stickle-back, a small prickly fish in the West Indies, is called also the *Aculeatus longus*.

ACULEOSA, in botany, the *Carduus polycaanthos*, or *Gorteria cibaris* of Linnaeus.

ACULER, in the menage, is the motion of a horse, when in working upon volts, he does not go far enough forward at every motion.

ACULEUS, in zoology, a name sometimes given to the sting of a bee, scorpion, or the like.

ACUMEN, n. { *Acuo*, to sharpen; *acu-*
ACU'MINATE, { *men*, sharpness. Express-
ACU'MINATED, { ing or referring to keenness
ACUMINA'TION. { of the intellectual powers.

The word was much affected by the learned Aristarchus in common conversation, to signify genius or natural *acumen*. *Pope*.

This is not *acuminated* and pointed as in the rest; but seemeth, as it were, cut off.

Brown's Vulgar Errors.

As it is reasonable, and even scriptural, to suppose that there is music in heaven, in those dismal regions perhaps the reverse of it is found; tones so dismal as to make even woe itself more insupportable, and to *acuminate* even despair. *Couper's Letters.*

ACUMEN, in ancient music, was used to signify a sound produced by the intension or raising of the voice.

ACUMINA, in antiquity, a kind of military omen, or auspice, taken from the points, or edges of darts, swords, or other weapons, by examining whether they were bright or solid, sharp or blunted, and predicting the issue of a battle accordingly.

ACUMULO, a small town in Abruzzo Ulterior, seventeen miles N. W. of Aquila.

ACUNA, (Christopher de,) a Spanish Jesuit, born at Burgos, 1587. Having devoted some years to study, he went to make proselytes in Chili and Peru; and to make discoveries respecting the river of the Amazons. He is principally known as the author of a curious work, entitled *Nuevo Descubrimiento de Gran Rio de los Amazonas*, i. e. "A new Description of the Great River of the Amazons." This was published at Madrid, in four parts, in 1641; but all the copies, except two, were destroyed. From one of them a translation was made of the work, into French, and published in 4 vols. 12mo. 1682.

ACUPUNCTURE, in surgery, the operation, common among the Chinese and Japanese, of pricking diseased parts of the body with a gold or silver needle. It is also employed in some parts of America, but rather as an ornament than as a remedy. See *Philosophical Trans.* vol. xiii. No. 148.

ACURON, in botany, a name of the *ALISMA*, or *LINNEAUS*, which see.

ACUS, in ichthyology, a species of *SYNGNATHUS*, of which there are two varieties, viz. the *acus* of Aristotle, or tobacco-pipe fish, and the *acus* of Oppian, or gar fish. See *SYNGNATHUS*.

Acus, in ichthyology, the *Ammodytes*, or Sand-eel.

Acus Moschata, in botany, a name for the *Geranium muscatum*. Also a name of the Scandix.

ACUSILAUS and Damagetus, in history brothers of Rhodes, and celebrated conquerors in the Olympic games. The Greeks strewed flowers over their father, Diagoras, complimenting him for having two such sons.

ACUSILAUS, a Greek historian, who lived, according to Josephus, before the expedition of Darius into Greece. He wrote a work entitled *Ηερι των Γενεαλογιων*, which the Jewish historian often quotes. Also an Athenian, who taught rhetoric at Rome, in Galba's reign.

ACUTE', *adj.* { *Acuo*, to sharpen: made

ACUTE'LY, { sharp, whetted, ingenious,

ACUTE'NESS. { piercing, penetrating, cunning.

PAROLL. I am so full of businesses, I cannot answer thee *acutely*.

Shakspeare's All's Well, fol. 231, act i. sc. 1.

He, that will look into many parts of Asia and America, will find men reason there, perhaps as *acutely* as himself, who yet never heard of a syllogism. *Locke.*

M. Colbert, the famous minister of Louis XIV. was a man of probity, of great industry, and knowledge of detail, of great experience, and *acuteness* in the examination of public accounts.

Smith's Wealth of Nations.

ACUTE ACCENT. See ACCENT.

ACUTE ANGLE, in geometry, is that which is less than a right angle, or which does not subtend ninety degrees.

ACUTE-ANGLED CONE, is according to the ancients, a right cone, whose axis makes an acute angle with its side.

ACUTE-ANGLED TRIANGLE, is a triangle whose three angles are all acute.

ACUTE-ANGULAR SECTION of a cone, is a term sometimes used by the ancient geometricians for the ellipsis.

ACUTE DISEASES, in medicine, are such as come suddenly to a crisis. It is used in distinction from chronic diseases.

ACUTE, in music, is applied to a sound or tone that is sharp or high, in comparison of some other tone. In this sense, *acute* stands opposed to *grave*.

ACUTELLA, in botany, the common ononis, or rest-harrow, a small prickly plant, with red or white flowers, and a tough spreading root.

ACUTIATOR, or *Acutor*, in old writers, a person that whets or grinds cutting instruments.

ACUTITION, or *Acuiton*, in medicine and chemistry, is used for sharpening or increasing the force of any medicine.

ACYROLOGIA, Gr. from *ακυρος*, improper, and *λογος*, speech, an improper acceptation, or expression, wherein a word or phrase is used in

some unusual or oblique sense, hardly reducible to the rules of language. Such is the word *spero*, sometimes used in Roman writers for *timeo*.

AD BESTIAS, in antiquity, a punishment of criminals, condemned to be thrown to wild beasts. It was also applied to gladiators hired to fight with wild beasts, otherwise called *Bestiarii*.

AD EXTRA, in theology, a term used in speaking of the external operations of God; such as, creation, preservation, renovation, &c. See AD INTRA.

AD HOMINEM, in logic, an argument drawn from the principles or prejudices of those with whom we argue, and which of consequence must be conclusive to them, though disbelieved by us.

AD INTRA, in theology, is understood of those acts of the Divine Being, whose term and effect is within his own essence: in which sense, acts or operations, *ad intra*, stand opposed to those *ad extra*.

AD LIBITUM, is sometimes used in music, for at discretion, and is opposed to 'obligato.'

AD LUDOS, in antiquity, a Roman sentence, whereby criminals were condemned to entertain that barbarous people, either by fighting with beasts, or with each other, and thus executing justice on themselves.

AD METALLA, in antiquity, the punishment of being doomed to work in the mines: the criminals were called *metallici*.

AD VALOREM, in commerce, is used in speaking of the duties, or customs, paid for certain commodities; rated according to the value or worth sworn to by the owner.

ADAES, the name of a lake, river, and town of Los Texas, New Mexico, not far from Louisiana. The lake is five leagues broad, ten in circumference, and of great depth. It abounds with fish. The river runs in a south east course, joining the Mexicano. The town of Adaes is 450 miles N. W. of New Orleans.

ADAGE, n. } Etymologists are perplexed
AD'AGY, } with regard to the derivation

ADAG'ICAL. } of this word. It comes immediately from the Latin *adagium*; a saying handed down from antiquity; an antique proverb.

The trite and common *adage* saith, Leave not the certain for the uncertain. *Hall.*

HUCH. But thus you see the old *adage* verified,

Multa cadunt inter—you can guess the rest,

Many things fall between the cup and lip.

Jonson's Tale of a Tub, act iii. sc. 4.

The antithetic parallelism gives an acuteness and force to *adages* and moral sentences; and, therefore, abounds in Solomon's Proverbs.

Louth's Isaiah, Prelim. Diss.

ADAGIO, ADAGEO, *ado*, Ital. in music, softly, leisurely. When repeated, it signifies the slowest of all movement, sometimes called ADAGISSIMO.

ADAJA, a river of Spain, which enters the Douro, between Torderillas and Simancas.

ADARE, an ancient town of Ireland, on the river Maig, over which is a fine old bridge of nine arches. Here also are the remains of two religious houses, and of an ancient castle belonging to the Earl of Desmond. It is eight miles S. W. of Limerick.

ADALIDES, in Spanish history, officers of justice, in military matters. In the laws of king Alphonsus, they are spoken of as officers appointed to direct the marching of the forces in time of war.

ADAM, אָדָם, Heb. red earth, the first of the human race, and the progenitor of all mankind. The particulars of his creation, of his being placed in the garden of Eden, of the trial of his obedience, of his review and nomination of the animals, of the creation and introduction of his wife, of their disobedience, apologies, and punishment, of the birth of three of their children, with the murder of one of them, and Adam's own death, in his 930th year, are briefly narrated by Moses, in the first five chapters of Genesis; and as they are, or ought to be well known to every Christian, need not be here enlarged upon.

ADAM (Melchior.) See MELCHIOR.

ADAM, or ANOM, a town in the Perea, or on the other side the Jordan, over against Jericho, where the Jordan began to be dried up on the passage of the Israelites. *Josk. iii. 16.*

ADAM (Alexander), LL. D. This singularly accomplished scholar was destitute of all the adventitious appendages of fortune, title, or connexion. He was the son of a poor farmer, in the county of Moray, and born on the 6th of June, 1714. When a boy, he followed the occupation of a 'neatherd,' and it is interesting to trace the steps of the rector of the high school of Edinburgh from so humble a calling. When young Adam first visited Edinburgh, his income did not for a considerable time exceed four guineas per annum. This would at first view appear incredible, even in the Scottish capital; but we have taken some pains to ascertain his principal items of expenditure, and they afford so curious a specimen of scholastic economy that we present the whole document to our readers. He lodged in a small room at Restalrig, and for this accommodation paid four pence per week. All his meals, except dinner, uniformly consisted of oat-meal made into porridge. For dinner he usually purchased a penny loaf at the nearest baker's shop; and, if the day was fine, he would despatch his meal in the course of a short walk; and, when this was impracticable, he had recourse to some 'long and lonely stair,' which he would climb, eating his dinner, step by step. By this means all expense for cookery or firing was avoided, and his health preserved by the necessary exercise. Dr. Adam received his diploma in 1780, and continued to hold his office of rector till his death, which occurred in December 1809. He was the author of a Latin Grammar, first ed. Edin., 1772; Summary of Geography and History, 1 vol. 8vo.; Classical Biography, Edin. 1800; Lexicon Linguae Latinae Compendiarum, Edin. 1805.

AD'AMANT, n. s. } A, not, and ἀμάρτω, to
ADAMANTE'AN, adj. } tame. Not to be tamed,
ADAMANTINE. } impressed, or broken; applied by the ancients to hard substances, particularly the loadstone or magnet, the diamond, and most probably the granite: adamantean, impenetrable; extremely hard: adamantine, made of adamant, like adamant; hard.

Away

We'll be as differing as two *adamants*,
The one shall shun the other.

White Devil O. Pl. vi. 315.

Wide is the fronting gate; and, rais'd on high
With *adamantine* columns, threats the sky.

Dryden.

In *adamantine* chains shall death be bound,
And hell's grim tyrant feel th' eternal wound.

Pope.

Tho' *adamantine* bonds the chief restraint,
The dire restraint his wisdom will defeat,

And soon restore him to his regal seat. *Idem*

ADAMANTÆA, in mythology, the nurse of Jupiter in Crete, who suspended his cradle to a tree, that he might not be found either in heaven, earth, or sea, and had drums beat to drown his cries. She is supposed to be the Amalthea of Lactantius, and the Adrastcia of other writers.

ADAMANTIJI, in church history, a name given by some historians to the followers of Origen.

ADAMANTINE SPAR, in mineralogy, a stone of peculiar hardness, (approaching to that of the diamond) which has lately attracted the attention of chymists. It is found in China and Hither India, and as M. Pini alleges, in Italy; and exhibits two principal varieties.

The first, found in China, is of a grey colour of different shades, the larger pieces opaque; its fracture very brilliant, and its texture spathose, which causes its surface to appear striated. Its crystals are covered with a very fine crust of plates of silvery mica, mixed with particles of red felspar: sometimes sulphate of iron has been found on them. It is crystallized in six-sided prisms without pyramids, the length of which varies from half an inch, to an inch; and their thickness is about three-quarters of an inch. This stone will cut glass easily, and mark rock crystal. Its specific gravity is 3.710.

The second variety is the Corundum of Bombay, of a more spathose texture, whiter colour, and having fewer grains of magnetic iron.

'From its hardness,' says Dr. Ure, 'this stone is extremely difficult to analyze. M. Chenevix, by repeatedly heating it red hot, and then plunging it into cold water, caused it to appear fissured in every direction. He then put it into a steel mortar, about three quarters of an inch in diameter, and three inches deep, to which a steel pestle was closely fitted. A few blows of the pestle caused it to crumble, and the fragments were then easily reduced to an impalpable powder by an agate pestle and mortar. This powder was fused in a crucible of platinum with twice its weight of calcined borax; and the glass was dissolved by boiling in muriatic acid about twelve hours. The precipitates from this solution being examined, a specimen from China was found to give from 100 parts, 86.50 of alumina, 5.26 of silex, 6.50 of iron: one from Ava, alumina 87, silex 6.5, iron 4.5: one from Malabar, alumina 86.5, silex 7, iron 4: one from the Carnatic, alumina 91, silex 5, iron 1.5. The Rev. Mr. W. Gregor analyzed a specimen from Thibet, in the collection of Mr. Rashleigh, which gave him alumina 81.75, silex 12.125, oxide of titanium 4, water 0.937, but no iron.'

ADAMAS, in natural history, a name given

by Pliny to the spume or *scoria* of gold; which is cast away as not being malleable.

ADAMAS, **ADAMANT**, in mineralogy, the diamond, is a genus of siliceous earth, composed of carbon and silica; found generally in sand or light earth. It is extremely hard, so as to be the best material for cutting glass, &c., retains the sun's rays in the dark, and consumes altogether as an inflammable substance. It is brought into Europe from Golconda and Brazil.

ADAMBEA, in botany, a genus of plants of the class polyandria and order monodelphia, of which but two species are known. **CAL.** hemispheric, containing five or seven cells. **COR.** from five to seven petals. **CAP.** polyspermous fleshy, covering the calyx. It grows on the coast of Malabar, on stony and mountainous parts.

ADAMI POMUM, in anatomy, a protuberance in the fore part of the throat, the convex part of the thyroid cartilage. Also, in botany, the *citrus aurantium* of Linnaeus.

ADAMITÆ, **ADAMITES**, in ecclesiastical history, the name of a sect of the second century, supposed to have been a branch of the Basilidians and Carpocratians. Epiphanius tells us, that they pretended to re-establish the state of innocence, in which Adam was at the moment of his creation, and imitated him in going naked. That they detested marriage; maintaining, that the conjugal union would never have taken place upon earth had sin been unknown, &c. Dr. Lardner wholly denies the existence of such a sect. See Works, v. ix. Similar absurdities are charged in the twelfth century, upon Tandamus, since known by the name of *Tanchelin*, of Antwerp, who was constantly attended by 3000 profligates in arms. His sect did not, however, continue long; but a similar one arose shortly after, under the name of *Turlupins*, in Savoy and Dauphine, where they committed the most brutal actions in open day. And in the beginning of the 15th century, one Picard, a native of Flanders, spread these notions in Germany, and Bohemia, particularly in the army of the famous Zisca. Some partizans of Picard, in Poland, Holland, and England, assembled in the night, and one of the fundamental maxims of their society, was said to be contained in the following verse:

Jura, perjura, secretum prodere noli.

But see ADAMITISM.

ADAMITISM, the opinions and practices of the Adamites. Beausobre, has shown, that the *Adamitism*, i. e. the nakedness of these people, is a mere calumny, forged by their adversaries, the Calixtines and Papists, at the time when the Vaudois first appeared. Jovet and Moreri speak of *Adamites* in England; and indeed the Romanists and reformed mutually reproach each other with having *Adamites* among them.

ADAMITUM, and **ADIMITA**, the hardest white stones, and stones in the bladder. The former, Paracelsus says, are a species of tartar.

ADAMPE, in geography, a territory on the Gold Coast of Africa, adjoining Agra, and extending to the Volta, and similar in its general character and appearance, but not so fertile.

ADAMPORE, a town of Bengal, in the district of Burdwan.

ADAM'S PEAK, or Hammaled, a lofty mountain of Ceylon, said to be visible 150 miles off, and so named from a tradition of the natives, that Adam here obtained his last view of Paradise. It is sixty miles north-east of Columbo.

ADAM'S APPLE, in botany. See ADAMI POMUM.

ADAM'S BRIDGE, a reef of rocks, which runs between Ceylon and the continent. See ADAM'S PEAK.

ADAM'S NEEDLE. See YUCCA.

ADAMS (Joseph), M. D., was born in 1756 and died June 20th, 1818. He was one of the great supporters of vaccine inoculation, and we are assured that in this respect he effected by his published writings as much as the great Dr. Jenner, its original advocate. Dr. Adams published, 1. Observations on Morbid Poisons, 8vo., 1795, 4to., 1807. 2. A Guide to Madeira, 8vo., 1801. 3. A Popular View of Vaccine Inoculation. 4. A Life of John Hunter, 8vo., 1816; and a new edition of his Treatise on the Venereal Disease, 8vo. He was also for many years editor of the Medical and Physical Journal.

ADAMSON (Patrick), archbishop of St. Andrew's, was born in 1543 at Perth. In 1566 he set out for Paris as tutor to a young gentleman; and, Mary queen of Scots being that year delivered of a son, Mr. Adamson wrote a Latin poem on the occasion, hailing the royal infant as king of England and France, *fa*, which he was confined in France for six months. As soon as he recovered his liberty, he retired with his pupil to Bourges; and there wrote a Latin poetical version of the book of Job, and the Tragedy of Herod in the same language. In 1573 he returned to Scotland, and became minister of Paisley. He was afterwards one of the commissioners for settling the jurisdiction and policy of the church; and chaplain to the earl of Morton, then regent. On the death of bishop Douglas, he was promoted to the archiepiscopal see of St. Andrew's, a dignity which brought upon him great trouble. In 1578 he submitted to the general assembly, which procured him peace for a short time, but the year following they brought fresh accusations against him. Being attacked with a disease, in which the physicians could give him no relief, he happened to take a simple medicine from an old woman which did him service, and who, being charged with witchcraft, he was accused of dealing with witches. In 1583 king James sent him ambassador to queen Elizabeth, at whose court he resided for some years: but, returning to Scotland in 1584, the Presbyterian party was very violent against the archbishop, and excommunicated him. Accused of various frivolous crimes, the king deserted him, and granted the revenue of his see to the duke of Lennox, until, goaded by poverty and oppression, he submitted to the wretched humiliation of recanting his opinions upon church government publicly; which, however, availed him nothing. He died in abject poverty in 1599. His works are contained in a 4to. volume, London, 1619.

ADAMSTOWN, a parish and town in the county of Wexford, Ireland, lamentably memorable on account of Scullabogue Barn, in which 195 Protestants were burnt alive, at the time of the Irish rebellion, in 1798. The remains of this

building are still to be seen.—Also a small town of Pennsylvania, North America.

ADAMUS, a name for the philosopher's stone.

ADANA, an ancient town of Asia, in Natolia, the capital of the province of Aledulia, and seated on the river Choquen or Adana, on the banks of which stands a strong little castle, built on a rock. It has a great number of beautiful fountains, brought from the river by means of waterworks. Over the river there is a stately bridge of fifteen arches. The climate is very pleasant and healthy, and the winter mild and serene; but the summer is so hot as to oblige the principal inhabitants to retire into the neighbouring mountains, where they spend six months among shady trees and grottoes, in a most delicious manner. The adjacent country is rich and fertile, both in corn and fruits. Adana is also a considerable wine market. It is thirty miles north-east of Tarsus on the road to Aleppo.

ADANAD, a town of Hindostan, in the district of Shirnada, and province of Malabar, twenty-five miles south-east of Calicut. It is remarkable as the principal residence or throne of the Alvangheri Tamburacul, the chief of the Namburies, a very proud class of Brahmins, who will take their meals with no other class, and only suffer the elder branches of their families to marry, lest the distinction should be rendered too common.

ADANSONIA, in botany, Ethiopian sour-gourd, or monkey bread, a genus of plants of the order monodelphia, class polyandria; and the characters of which are: CAL. a perianthium one-leaved, half five-cleft, cup form (the divisions revolute), deciduous: COR. five petals, roundish, nerved, revolute, growing reciprocally with the claws and stamina: STAM. of numerous filaments, coalesced beneath into a tube, and crowning it, expanding horizontally; the anthers kidney form, incumbent: PIST. an egged germ; the stylus very long, tubular, variously intorted; the stig mata numerous (ten), prismatic, villous, ray expanded: PER. an oval capsule, woody, not gaping, two celled, with farinaceous pulp, the partitions membranous: the seeds are numerous, kidney-shaped, rather bony, and involved in a friable pulp. There is at present but one known species belonging to this genus, the baobab, abavi, abevo, arbu, or guanabanus, which is perhaps the largest production of the whole vegetable kingdom, and is a native of Africa.

ADAPT, *v. a.* Lat. *adapto*. To fit or suit

ADAPTATION, *n. s.* One thing to another:

ADAP'TION, *n.* Adaptation and adaption

ADEPT', *n. s. & adj.* Mean suitability; the act of fitting or suiting: an adept is one who possesses the qualifications suited to a specific purpose or employ: as an adjective, skilful; well versed.

"Tis true, but let it not be known,
My eyes are somewhat dimmish grown;

For nature, always in the right,

To your decays adapts my sight." Swift.

It is not enough that nothing offends the ear; but a good poet will adapt the very sounds, as well as words, to the things he treats of. Pope's Letters.

From stucco'd walls smart arguments rebound,
And beaux, adept in every thing profound,
Die of disdain, or whistle off the sound. Copper

ADAPTERS, or ADOPTERS. See CHEMISTRY.

ADAR, אָדָר, Heb. mighty, the name of a Hebrew month, answering to the end of February, and beginning of March, the 12th of their sacred, and 6th of their civil year. On the 7th day of it, the Jews celebrate the death of Moses; on the 13th, they have the feast of Esther; and on the 14th, the feast of Purim, for their deliverance from Haman's conspiracy. See VEADAR.

ADARCE, in the *materia medica* of the ancients, a saltish humour concreting about the stalks of reeds, and other vegetables, in Cappadocia and Galatia: we also read of it in Italy; and of a native kind produced in Indian reeds, as sugar in the cane. It was used as a topic to rub the skin in leprosy, sun-burning, freckles, &c.

ADARCON, ADARCONIM, an ancient coin mentioned in Scripture, usually of gold, derived, as some think, from the gold pieces coined by Darius, called *daperxos*. They are valued variously; according to Dr. Bernard, they weighed two grains more than our guinea, but the gold being very fine and little alloyed, it may be taken at worth about twenty-five shillings sterling. There was one in lord Pembroke's cabinet a few years since, which weighed 129 grains.

ADARIDGE, or ADARIGES, in chemistry, sal-ammoniac.

ADARME, in commerce, a small Spanish weight, the sixteenth part of an ounce troy.

ADARNECH, in chemistry, aripigmentum, or orpiment.

ADARTICULATION, in medicine, is used by some physicians for *αρθρωσις*, by others, for *κυρτωσις*. See ARTHRODIA and DIARTHROSIS.

ADATAIS, ADATSI, or ADATYS, in commerce, a fine muslin or cotton cloth, made in Bengal.

ADAUNT, to discourage, subdue. See DAUNT.

King William *adaunted* þat foile of Walys,
And made him bear him truage, and byhote hym
and hys. *R. of Gloucester*, p. 61.

Wherewith the rebel rather was the more
Encouraged than *addaunted*; and begun
T' adventure further than he did before;
Seeing such a monarch had so little done.

Daniel's Civil War, b. iv.

ADAW', of uncertain derivation and obsolete; to daunt, keep under, abate.

But yeilded with shame and grief *adawed*.

Spencer's Shep. Kal. F.b.

ADAYS', on days.

Distillations of celestial days are conveyed in channels not pervious to an eye of sense, and now *adays* we seldom look with other, be the object never so beauteous or alluring.

Taylor's Episcopacy Asserted, Epist. Dcd.

ADCHER, or ADHER, in the *materia medica*, a name given by Avicenna and Serapion, to the Scenanth, or camel's hay; as well as to the common rush.

ADCORDABILES DENARIJ, in old law books, money paid by the vassal to his lord, upon the selling or exchanging of a feud.

ADCOR'PORATE, or } Ad : *corpus*. See

ADCOR'PORATE, v. } INCORPORATE.

ADCREDULITARE, in law, to purge one's self of an offence by oath.

ADCRESCENTES, among the Romans, sol-

VOL. I.

diers entered in the army, but not yet put on duty; from these the standing forces were recruited. See ACCENSI.

ADD', v.

AD'DIBLE,

ADDIBILTY,

ADDITAMENT,

ADDITION,

ADDITIONAL, n. & a.

ADDITIONALLY,

ADDITIONARY,

AD'DITORY.

SAL. To guard a title that was rich before;

To gild refined gold; to paint the lily;

To throw a perfume on the violet;

To smooth the ice, or add another hue,

Unto the rainbow; or with taper light

To seek the beauteous eye of heaven to garnish,

Is wasteful and ridiculous excess.

Shakspeare's King John.

Only retain

The name, and all th' addition to a king;

The sway, revenue, execution,

Beloved sons, be yours; which to confirm,

This coronet part between you.

Shakspeare's King Lear.

Mark if his birth makes any difference;
If, to his words, it adds one grain of sense.

Dryden.

They, whose muses have the highest flown,
Add not to his immortal memory.

But do an act of friendship to their own. *Idem.*

CHAR. Though land and monies be no happiness,
Yet they are counted good additions.

Beaumont and Fletcher.

What is necessary, and what is *additionary*.

Herbert.

The *additory* fiction gives to a great man a larger share of reputation than belongs to him, to enable him to serve some good end or purpose. *Arbuthnot.*

Additionally to this, they [the Jews] observed numberless rites and customs, according to the tradition of the elders. *Bryant.*

ADDEEM', or } From deem and doom. See

ADDOOM'. } DEEM.

For loe, the winged god, that woundeth harts,

Caused me be called to account therfore;

And for reuengement of those wrongful smarts,

Which I to others did infict afore,

Addem'd me to endure this penance sore.

Spenser's Faerie Queene, b. vi. can. 8.

She scorns to be *addeem'd* so worthless base,

As to be mov'd to such an infamy.

Daniel's Civil Wars.

ADDA, in geography, a river of Switzerland and Italy, which rises in the mount Brailio, in the country of the Grisons, and passing through the Valteline, traverses the lake Como, and the Milanese, and falls into the Po, near Cremona. Its navigation was much improved by a canal, dug in 1771.

The Adda gave name, in part, to that portion of the Italian republic and kingdom of Italy, (now subject to Austria,) called the department of the Adda and Oggio, and which contained the northern part of the Bergamasco, and the whole of the Valteline.

ADDA-EL, in zoology, the Arabian name of a small species of lizard, described by Bruce, as found at Atbana, beyond the ruins, near the site of the ancient Mene, and to which many medicinal virtues are ascribed by the natives.

K

ADDACE, in natural history, a name by which the Africans call the common antelope. See GAZELLA.

ADDEPHAGIA, from *Ἄδη*, much, and *φάγω*, eat, in medicine, a term sometimes used to express greediness or voraciousness as a disease.

ADDER, *Ætrop Naðone*, Saxon, a viper, a poisonous reptile; formerly applied to serpents in general.

Or is the adder better than the eel,
Because his painted skin contents the eye?
Shakspeare.

An adder did it; for, with doubl'r tongue
Than thine, thou serpent, never adder stung.
Idem.

The adder teaches us where to strike, by her curious and fearful defending of her head. *Taylor.*

ADDER, in zoology, a venomous reptile of the serpent kind, more usually called a viper. It is sometimes confounded with the asp: thus, the deaf adder, spoken of in the Bible, is not properly the adder, but the asp.

ADDER-BOLT, the dragon fly. See LIBLILLA.

ADDER-NOWED, or KNOTTED, in heraldry, is a particular twisting of the adder in a coat of arms.

ADDER CURLING ERECTED, in heraldry. See HERALDRY.

ADDER, SEA, in ichthyology, the English name of the *synodus typhle*, which see.

ADDER'S-TONGUE, in botany, the *ophioglossum* of Linnaeus, a medicinal plant, so called, either from its resembling the tongue, or curing the bite of a viper. Skinner says, from its serving as a lurking place for adders. No part of the fructification is visible, except the fruit, which is an oblong, double capsule, divided into a great number of cells, each of which opens transversely, and contains a number of small seeds. It is esteemed one of the best vulnerary herbs this country produces.

ADDER, WATER, in zoology, a name given to the coluber.

ADDER-WORT, in botany, snakewood. See POLYGONUM.

ADDEXTRATORES, or ADDEXTRARI, in the court of Rome, the pope's mitre-bearers; thus called, on account of their walking at the pope's right hand, when he rides out.

AD'DICE, or } } A'depe, a kind of axe,
ADZE, } } a crooked instrument used
AXE. } by carpenters, coopers, &c.
for cutting wood under the foot.

The addice hath its blade made thin, and somewhat arching. *Moxon's Mechanical Exercises.*

I had thought I had rode upon addices between this and Canterbury. *Lylly, Moth. Bomb.* c. 10.

ADDICT, v. } Ad: *dico*, to say to; not
ADDICT'EDNESS, } used in English agreeably
ADDICTION. } to its obvious rendering; rather to give one's self up to, to devote, to consecrate. Contrary to the assertion of Johnson, it is used in a good as well as in a bad sense.

To studies good addict of comely grace.
Mir. for Mag. p. 175.

It is a wonder how his grace should glean it;
Since his addiction was to courses vain;

His companies unletter'd, rude, and shallow;
His hours fill'd up with riots, banquets, sports.
Shakspeare.

Aso. Yours entirely, *addicted* Madame.

ARG. I require no more, dearest Asotus; henceforth let me call you mine.

Jonson's Cynthia's Revels.

Ye know the house of Stephanus; that they have *addicted* themselves to the ministry of the saints.

1 Cor. vi. 15.

I am neither author or fautor of any sect: I will have no man *addict* himself to me; but, if I have any thing right, defend it as truth's.

Ben Jonson.

Those know how little I have remitted of my former *addictedness* to make chymical experiments.

Boyle.

ADDICO. See ADDICTIO.

ADDICTI, in Roman antiquity, insolvent debtors, who were adjudged by the twelve tables to a kind of temporary servitude to the creditor.

ADDICTIO, ADDICTION, in the Roman law, the making over goods to another, either by sale or by legal sentence; the goods so delivered were called *bona addicta*.

ADDISON, (Launcelot,) D.D. son of a clergyman of the same name, was born at Maulds Meaburne, in the parish of Crosby, Ravensworth, Westmoreland, and educated at Queen's College, Oxford. He was chosen one of the Terra Fili, in 1658; when his attachment to the exiled royal family, excited him to make some severe reflections in an oration, on the pride and ignorance of his superiors, and exposed him to so strong a feeling of censure, that he could only obtain forgiveness, by recanting the obnoxious expressions publicly, on his knees.

At the restoration, he quickly rose in the royal favour, was made chaplain of Dunkirk, chaplain in ordinary to the king, rector of Milston, in Wiltshire, prebendary of Sarum, dean of Litchfield, and archdeacon of Coventry. His life and writings reflect honour upon his memory, as a Christian, a gentleman, and a clergyman.

He expired on the 20th of April, 1703, leaving three sons: Joseph Addison, Gulston, afterwards governor of Fort St. George; Launcelot, master of arts, and fellow of Magdalen College, Oxford; and one daughter, married first to Dr. Sartre, prebendary of Westminster, and afterwards to Daniel Combes, Esq.

ADDISON, (Joseph,) son of Dr. Launcelot Addison, was born May 1, 1672, at Milston, near Ambresbury, in Wiltshire; of which place his father was rector. As he was from his infancy intended for orders, his domestic culture, he tells us, was judiciously calculated to leave upon his mind the most powerful impressions of religion.

He acquired the rudiments of education under private tutors; but, in his thirteenth year was removed to the Charter-House, then under the care of Dr. Ellis; and, where he first contracted his memorable acquaintance with sir Richard Steele. In 1687, he was entered of Queen's College, Oxford, where some Latin verses which he composed procured him the patronage of Dr. Lancaster, afterwards provost of the College; through whose interest, he was, in 1689, elected demy of Magdalen. All his powers were now

directed to the cultivation of his mind, and his fondness for Latin compositions prevailing, he produced his celebrated *Musæ Anglicanæ*, a collection of poems, from which Boileau, according to Tickel, ever afterwards conceived a high opinion of English genius: and observed that, "he would not have written against Perrault, had he before seen such excellent pieces by a modern hand."

In his twenty-second year, Addison first appeared as an English writer, in verses addressed to Dryden; and published shortly afterwards a translation of part of Virgil's *Georgic* on the Bees, of which Dryden spoke highly. About the same time he composed the arguments prefixed to the several books of Dryden's Virgil. His next paper of verses contained the character of English poets, of the first rank, inscribed to Henry Sacheverell, who if not himself a poet, was, at least, a writer of verses. In this poem, is a very confident and discriminating character of Spenser, whose works, it afterwards appeared, he had never read. About this time, he was diverted from his intention of entering into holy orders, by the influence of Mr. Montague, then chancellor of the Exchequer, to whose friendship he had been introduced by Mr. Congreve. It is evident, that he was now learning the trade of a courtier. Montague had written verses without the slightest claim to excellence; and, Addison joined his name with those of Cowley and Dryden. In 1695, he addressed a poem to king William, with an introductory dedication to lord Somers; and in 1697, produced his Latin poem, on the celebrated peace of Ryswick, dedicated to his friend Montague. This, beside paving the way to a pension of £300 per annum, as been pronounced the best Latin poem since the *Aeneid*. Upon receiving his pension, he resolved upon an excursion to the Continent, and having staid a year at Blois to learn the French language, he proceeded into Italy, where he beheld with the eyes of a classic, and the rapture of a poet, the ancient monuments and remains of Pagan Rome.

His poetical epistle to Lord Halifax, descriptive of this journey, is considered amongst the most elegant of his productions. In Italy, he wrote his Dialogues on Medals, and some acts of his Cato; and after an absence of two years returned to England in pecuniary embarrassment, through the non-payment of his pension. He had also been deprived, by the death of king William, of a small appointment about the person of prince Eugene. Shortly after his return he published his travels, dedicated to Lord Somers; and so great was the popularity of the first edition, that it was enhanced to five times its original price before a reprint could be obtained. Of many parts of this book, however, Dr. Johnson thinks it no severe censure to say, they might have been written at home; but the bold, yet delicate delineations, the elegant language, and charming variety of his style rendered it the favourite of the public, and soon established its fame as a standard English classic.

mented to Lord Halifax, that it had not been sufficiently celebrated; and desired him to men-

tion some superior poet who was capable of doing justice to the theme. Halifax named Addison; and no sooner had the poet read to his patron what he had written as far as the ~~single~~ of the angel, than he was appointed commissioner of appeals. On the following year, accompanying Lord Halifax to Hanover, he was made under secretary of state. About this time, to divert the public from the rage for Italian operas, he endeavoured to introduce a musical drama in our own language, and produced his Rosamond, which on its first appearance was hissed from the stage. Shortly after, the duke of Wharton being appointed Lord Lieutenant of Ireland, Addison became his secretary, and was presented with the additional honour of "keeper of the Records in Birmingham's Tower, with a salary of £300 per annum. Swift observes of him, with respect to this office, that he made it a rule never to return fees to his friends out of politeness! During his residence in Ireland, the publication of the Tatler was commenced by Steele, without any communication of his design; but the insertion of a remark which Addison had given him with respect to a passage in Virgil, discovered the author: and the subject of our memoir became an invaluable auxiliary in this first series of our familiar classics. The Tatler was succeeded in about two months by the Spectator, a series of essays published early every day; designed to guide the flow of daily conversation, and to improve the manners of the fashionable world. In short the Spectator may be considered as a sort of "Arbiter Eleganticum," as Johnson terms it; pouring its small rays and short imperfect strokes of light upon the common walks of familiar life, and is no less calculated to please the imagination by its sprightly and instructive style, than to improve the affections by its refinement and delicacy. The descriptions of living characters which it contained were numerous, and were drawn to such perfection, that many of them were known by the spirit and expression of their portraits, and pointed out by the world. The papers, thus rapidly produced, display considerable depth of literature and criticism, maintained with great justness of thought and dignity of language; and the miscellanies are happily varied with elegant fictions and refined allegories. Addison however, seems not to have completely prosecuted his original design; and this admired work terminated abruptly on the 16th of September, 1712. His Cato, produced in 1713, raised Addison's reputation still higher. As an historical play, it was at first considered to have peculiar political views; and England being then distracted with strong party opinions, it is not to be wondered that it was variously received, or that its performance created some confusion. It had, however, so much merit, that the queen solicited the honour of a dedication of it to herself; it has also been introduced upon foreign stages, and translated into almost all the languages of Europe. Steele took advantage of the fame of Cato, to commence the publication of the Guardian, to which Addison contributed; distinguishing all his papers with a small hand, (as in the Spectator by one of the letters in

the name of the muse Clio. Steele also attributes to Addison the comedy of the Drummer, which he carried for him about this time to the play-house, and of which he afterwards sold the copy for fifty guineas.

Being largely engaged with public affairs, Addison frequently entered with warmth into political discussions, and wrote several pamphlets of which The present State of the War, The Whig Examiner, and The Trial of Count Tariff, were the most remarkable. On the death of Queen Anne, Addison was made secretary to the Regency, and was required to write to the Elector of Hanover, announcing the vacancy of the throne; but he was so long seeking for choice expressions that the Lords grew impatient, and called to Mr. Southwell, a clerk, to dispatch the message, which he immediately did, and not a little valued himself on the occasion.

December 23rd, 1715, he published the Frecholder, in defence of government, a work full of convincing arguments, singular pleasantry, and considerable embellishment. He also gave the world about this time his Tory Fox Hunter, a matchless performance, which can scarcely fail of delighting even bigotry itself. In August, 1716, he married the Countess dowager of Warwick, a union which as it neither found nor made the parties equal, afforded very little or no addition to their happiness. The lady remembering her rank, treated him with a sort of condescending ceremony, and appeared never to forget him as the tutor of her son. Rowe's ballad of the Despairing Shepherd, is said to have been written upon this match.

In 1717, he was made one of the principal secretaries of state, an office for which he was altogether ill adapted, as he could neither speak with boldness nor eloquence; nor had any portion of the readiness of a man of business. He was therefore useless in the house of Commons, and in the office he could not issue an order without wasting his time in search of fine expressions. At last he obtained his dismission with a pension of £1500 per annum.

After his retirement from public business, he laid down plans for his future literary labours, wrote a Defence of the Christian Religion, proposed a Tragedy on the Death of Socrates, an English Dictionary on the plan of the Italian Della Crusca, a Version of the Psalms, &c. These, however, he never completed.

In the decline of his life, a political dispute arose between the subject of our memoir and his friend Steele. It was occasioned by Lord Sunderland's having attempted to introduce a bill for limiting the creation of peers. This being warmly supported by the former and opposed by the latter, produced several pamphlets on both sides, heated with acrimonious expressions; nor could a perfect reconciliation ever afterwards be effected.

At length after an useful but chequered life, Addison felt his end sensibly approaching, and forgetting all human affairs, endeavoured to prepare for his last moments. With a natural wish to die in peace with the world, he sent for Mr. Gay, and told him he had injured him: but if he lived to recover, he would make him ample

recompence. The latter was not sensible of any injury, but supposed he might have been the means of withholding some preferment from him. Lord Warwick, his son-in-law, was a young man of loose opinions and irregular habits, whom Addison had used every effort to reclaim. One experiment however, remained to be tried, the effect of a last interview. He sent for the young nobleman in his dying moments, and on his desiring with great tenderness to know his last injunction, said to him, "I have sent for you, that you may see with what peace a christian can die." Whether this touching interview had any effect upon the young earl, is not known. He died himself shortly after. Tickel alludes to this circumstance in the following lines of his elegy:

He taught us how to live, and oh! too high
The price of knowledge, taught us how to die.

After having given directions to Mr. Tickel respecting the publication of his works, and dedicated them to his friend Mr. Craggs, Addison expired June 17th, 1719, at Holland House in the 47th year of his age, leaving an only child, a daughter.

In the habits and external manners of Mr. Addison, there was a timorous or sullen taciturnity; by some attributed to an extreme, native modesty. Steele mentions, with regret, this remarkable bashfulness. Chesterfield calls him the most timorous and awkward man that he ever saw: and Addison himself, speaking of his deficiency in conversation, used to observe, that with respect to intellectual wealth, he could draw bills to a thousand pounds, though he had not a guinea in his pocket.

Of Addison's life before marriage, Pope has given some details. He had in his house with him Budgel, and perhaps Philips, besides whom, his chief companions were Steele, Cary, Davenant, and Colonel Brett. With some one of these he always breakfasted, afterwards studied all the morning; then dined at a tavern, and went to Button's coffee-house, in the evening. Button had been servant in the countess of Warwick's family; and now, under the patronage of Addison, kept a coffee-house on the south side of Russell-street, two doors from Covent-garden, where the wits of the day used to assemble. From the coffee-house he went again to the tavern, where he often sat late and drank too much wine.

On the whole, the fame of Addison, though never entitling him to exalted rank as a politician or a man of public business, and considerably on the wane perhaps, as a poet, and even as a critic, compared to the estimation his pieces enjoyed at the period of their publication, rests on the solid basis of that real excellence in the style and manner, as well as in the whole tendency of his writings, which will render it all-enduring while the language of his country survives. He can be satirical without being invidious, and witty but not malevolent: calling back the wanderer from the path of virtue, rather by exhibiting new attractions in her charms, than following him with frowns, and threats, and anathemas; and must be ever regarded by impartial history, as one of the soundest patriots and best public writers that our annals can boast.

ADDISON, a county of the state of Vermont, North America, intersected by the Green Mountains: it is bounded on the E. by lake Champlain and divided into two parts by Otter Creek, being thirty miles long, and thirty-seven broad; and contains twenty-one townships and 7000 inhabitants. The capital is Middlebury. Also, a town of the above county on lake Champlain.

ADDITAMENTS, in chemistry and pharmacy, ingredients added to medicines already compounded. It is also an heraldic term signifying any remarkable addition to a coat of arms.

ADDITION, in algebra. See ALGEBRA.

ADDITION, CHARACTER OF, is +, which is usually expressed by plus. Thus $3 + 4$, denotes the sum of 3 and 4; and is read 3 plus 4. See ARITHMETIC.

ADDITION, in music, a dot marked on the right side of a note, signifying that it is to be sounded or lengthened half as much as it would have been without such a mark.

ADDITION OF DECIMALS, fractions, whole numbers, &c. See ARITHMETIC.

ADDITIONS, in distilling, such things as are added to the wash, or liquor, while in a state of fermentation, in order to improve the vinosity of the spirit. See DISTILLING.

ADDITIONS, in heraldry, some things added to a coat of arms, as marks of honour; and therefore directly opposite to abatements. As BORDURE, CANTON, GYRON, PILE, QUARTER, &c. See these articles.

ADDITIONS OF DEGREES, are those we call names of dignity; as knight, lord, earl, marquis, &c.

ADDITIONS OF ESTATE, OR QUALITY, are yeoman, gentleman, esquire, and such like.

ADDITIONS OF PLACE, are the names of the places where persons reside added to their name, such as of Thorpe, of Dale, or of Woodstock. Where a man hath household in two places, he shall be said to dwell in both; so that his addition in either may suffice. By statute 1 Henry V. cap. 5, it was ordained, that in such suits or actions, where process of outlawry lies, such addition should be made to the name of the defendant, to show his estate, mystery, and place where he dwells; and that the writs not having such additions shall abide if the defendant take exception thereto; but not by the office of the court.

ADDITIONAL, something to be added to another.

ADDITIONAL RATIO, in geometry, is, that whose terms are disposed to addition, that is, to composition, in opposition to subtractive ratio, whose terms are disposed to subtraction, i. e. to division.

ADDITIONAL EQUATIONS, in astronomy, those which are to be added to the sun's mean anomaly, in order to find the true one.

AD'DLE, *v. & adj.* Aidlian: Ang. Sax. To be sick or ill; to be useless, to answer no good purpose, to be empty. Applied to eggs, putrid or diseased.

Could your mouldy brain be so addle, to imagine I would marry a stale widow at six and forty?

Ford's Love's Sacrifice.

There's one with truncheon, like a ladle;
That carries eggs too fresh or addle;
And still at random, as he goes,
Among the rabble rout bestows.

Hudibras.

Bare trees, and shrubs, but ill you know
Could shelter them [the birds] from rain or snow
Stepping into their nests, they paddled,
Themselves were chill'd, their eggs were addled.
Cooper's Pairing Time Anticipated.

ADDORSEE', in heraldry, or endorsed, back to back, as lions rampant. Leigh gives a coat of arms of this kind to Achilles, at the siege of Troy.

ADDOUBORS, in law. See REDUBBORS.

ADDRESS', *v. & n.* { *Addresser*. Fr. *Dere-*

ADDRESS'ER, } *car*, Span. to approach in a straight line, to attend to; to employ time in; to apply to, either by speaking or writing; the noun also signifies a person's exterior demeanour.

Uprose from drowsie couche, and him address,
Unto the journey which he had delight.

Sp. F. Q. iii. 8.

It is a most high privilege and advantage to us that we are allowed to pray, and *address* our devotions to God.

Barrow.

The young hero had *addressed* his prayers to him for his assistance.

Dryden.

The prince himself, with awful dread possess'd,
His vows to great Apollo thus *addressed*.

Idem.

His suit was common; but, above the rest,
To both the brother-princes thus *address*.

Idem.

The difficulty of the first *address* on any new occasion, is felt by every man in his transactions with the world; and confessed by the settled and regular forms of salutation which necessity has introduced into all languages.

Rambler

How shall I speak thee, or thy power *address*,
Thou god of our idolatry—the press?

Couper.

ADDUA, in ancient geography, a river of Cisalpine Gaul, now **Adda**, which see.

ADDUBBED, dubbed, created. *Bailey.*

ADDUCE', *v.* { *Ad*: *duco*; to lead to;

ADDUCTION, } to bring forward, to urge, to *ad-*
adducti've. allegae.

The price had, it seems, before the tax, been a monopoly price; and the argument *adduced* to shew that sugar was an improper subject for taxation, demonstrated, perhaps, that it was a proper one.

Smith's Wealth of Nations.

ADDUCENT MUSCLES, or **ADDUCTORS**, from *ad*, to, and *ducere*, to draw, those which bring forward, close, or draw together, the parts of the body, whereto they are annexed.

ABDUCTION, in anatomy, the motion or action of the adducent muscles. Thus the **ADDUCTOR BRACHII** serves to draw the arm toward the trunk of the body; though Winslow finds its office more complicated, and that it acts in concurrence with the flexors and extensors, in bending and extending the arm.

ADDUCTOR INDICIS, is a muscle of the fore-finger, arising from the inside of the bone of the thumb, and inserted into the first bone of the fore-finger, which it draws towards the thumb.

ADDUCTOR MINIMI DIGITI PEDIS; the same as transversalis pedis.

ADDUCTOR OCULI, a muscle of the eye, so called, because it inclines its pupil towards the nose. It is also called *bibitorius*; because it directs the eye toward the cup in drinking.

ADDUCTOR POLLICES, a muscle of the thumb, which arises tendinous, and ascends obliquely towards a broad termination, at the superior part

of the first bone of the thumb. Its office is to bring the thumb near the fore-finger.

ADDUCTOR POLLICIS PEDIS, called also *antithenar*, is a muscle of the great toe, which arises from the inferior part of the os cuneiforme tertium, and is inserted into the internal part of the ossa sessamoidea of the great toe; which it draws nearer the rest.

ADDUCTOR PROSTATE, a name by which Santorini describes a muscle, called by Winslow, prostaticus superior. Albinus, from its office, has called it compressor prostate.

ADDULCE', v. Ad : *dulcis*, to sweeten ; to render sweet or agreeable to the palate.

Thus did the French ambassadors, with great shew of their king's affection, and many sugared words, seek to *addulce* all matters between the two kings.

Bacon's Henry VII.

ADEB, in commerce, an Egyptian weight, used principally for rice, and generally consisting of 210 okes, each of three rotolos. The adeb is altogether equal to about two drams less than the English pound.

ADEC, in chemistry, sour milk.

ADECTOS, a medicine that allays the sense of pain, or the uneasiness created by stimulants.

ADEL, or **ADAILL**, a kingdom on the eastern coast of Africa, extending, according to Mr. Salt, from the town of Zeila to the straits of Babel-mandel. This country produces corn, and feeds a great number of cattle. The inhabitants carry on a trade in gold, silver, ivory, oil, frankincense, pepper, and other merchandises of Arabia and the Indies. The king was formerly a vassal of Abyssinia : but the Adelites being Mahometans, and the Abyssinians a sort of Christians, in 1535 they came to an open rupture, and the Adelites threw off the yoke of their neighbours, seeking protection from the Grand Scignior. They are represented by modern travellers as a very warlike race, and the most formidable enemies of the Abyssinian tribes. The principal towns mentioned by travellers, are Adela, Zeila, and Barbara ; the last two being flourishing seaports.

ADEL, in ichthyology, the lavearetus, or *albula nobilis*. These are generally treated of by authors as two different kinds of fish. But Artedi contends that they are the same species, and distinguishes them by the name of the coregenus, with the upper jaw flat, and longer than the under ; and with fourteen rays in the back fin.

ADELA, a principal town of the kingdom of **ADEL**, which see.

ADELANTADO, Span. the deputy of a province.

ADEFORS, a town and gold mine in the parish of Alsheda, and district of Jonkioping, in the province of Smaland, Sweden. It was first discovered in 1738, but is not very productive.

ADELIA, in botany, a genus of plants of the order monadelphia, class dicotyledons ; the characters of which are : **CAL.** a perianthium, one-leaved, three parted ; the florets sublanceolate and concave. The female calyx is a five-leaved perianthium ; the leaflets sublanceolate, concave, persistent : no **COR.** : **STAM.** many capillary filaments the length of the calyx, conjoined at the base ; the anthers roundish : **PIST.** a roundish germen ; the seeds

solitary and roundish. In the natural method, this genus belongs to the 38th order, tricoccæ. There are three species ; the bernardia, the ricinella, and acidoton, for which we have no proper names in English. They are natives of Jamaica.

ADELIANS, the inhabitants of **ADEL**, which see.

ADELING. See **ATHELING**.

ADELME, or **ALDHELME**, son to Kenred, and nephew to Ina, king of the West Saxons ; after having been educated abroad, he was abbot of Malmesbury thirty years. He is said to have been the first Englishman who wrote in Latin, and who brought poetry into England ; and the first bishop of Sherburn. He lived in great esteem till his death, which happened in 709. He was canonized, and is mentioned with great honour by Camden and Bayle ; William of Malmesbury wrote his life. The last writer says, that Aldhelme, anxious to instruct his countrymen, then semi-barbarous, and half heathens, frequently took his station on the public roads or bridges, and by mixing sacred with lighter topics, won their attention, and meliorated their minds. *Malmesbury*, 3 Gale, 339.

ADELPHI, otherwise **FRATELLI ISLANDS**, four isles of the Grecian Archipelago, E. of Scopelo, in N. lat. 39°, 22'. E. long. 24°, 4'.

ADELPHIANI, in church-history, a sect of ancient heretics, who fasted always on Sundays.

ADELPHIUS, the founder of the sect of Adelphiani.

ADELUNG, (John Christopher,) a distinguished German grammarian, philologist, and general scholar, was born in 1734, at Spantekow, in Pomerania. His education was begun at the public schools of Anclam and Closterbergen, and finished at the University of Halle. In 1759, he was appointed professor of the Academy at Erfurt, which office he relinquished, and settled at Leipsic in 1761. Here he was made librarian to the elector of Saxony in 1787, a situation which he held, with the honorary title of Aulic counsellor, until his death in 1806.

Adelung, as well as a great scholar, was also a bon vivant, and boasted of his cellar as a *bibliotheca selectissima*. It is said to have contained forty kinds of wine. But his literary day consisted regularly of fourteen hours. He was the author of a Grammatical and Critical Dictionary, Leipsic, 1774-1786, 5 vols. 4to ; of which work new enlarged editions appeared in 1793-1801. *Glossarium Manuale ad Scriptores medii et Infimæ Latinitatis*, Halle, 1772-1784 ; three German Grammars ; a Treatise on German Style, 2 vols. 8vo ; Supplements to Jœcher's Dictionary of Literary Men, 2 vols. 4to ; History of Human Folly, or Lives of the most celebrated Necromancers, Alchymists, Exorcists, Diviners, &c. ; a Cyclopaedia in four parts, a work of great merit ; Essay on the History of the Civilization of Mankind ; The History of Philosophy, 3 vols. ; Treatise on German Orthography, 8vo ; The History of the Teutones, their Language and Literature, before the general Migration, 8vo ; Mithridate, or a Universal Table of Languages, with the Lord's Prayer in one hundred Languages, 8vo.

ADEMPTION, in civil law, implies the revocation of a grant, donation, or the like.

ADEN, formerly a rich and considerable town of Arabia Felix. It is seated by the sea-side, a little eastward of the straits of Babel-mandel, and is the capital of a district, or small state, of the same name; but the principal trade it carried on formerly, is now transferred to Mocha. It was taken by the Turks in 1538, and by the Persians in 1605. This district was declared an independent state in 1735, and is governed by its own magistracy. Long. 4°, 0'. E. Lat. 13°, 0'. N.

ADEN, in anatomy, *ἀδην*, Gr. a gland, glandule, or glandular swelling.

ADENANTHERA, in botany, **BASTARD FLOWER FENCE**, a genus of plants of the order monogynia, and class decandria. In the natural method, it belongs to the thirty-third order, *Lomentaceæ*. The characters are: CAL. a perianthium of one very small five-toothed leaf: COR. five, bell-shaped, lanceolate, sessile petals, convex within and concave under: STAM. ten erect subulated filaments, shorter than the corolla; the antherae roundish, incumbent, bearing a globular gland on the exterior top: PIST. a long gibbous germen; the stylus subulated the length of the stamina; the stigma simple: PER. a long compressed membranous legumen. The seeds very numerous, roundish, and remote.

Only one species of this plant is known in Britain; but there is a variety, with scarlet seeds, which is rare, and grows slowly. It is a native of India.

ADENANTHOS, in botany, a genus of plants of the order monogynia, and class tetrandria, found in New Holland, and so named by Labillardière.

Its general characters are, CAL. Involucrum, single flower, from four to eight short leaves. COR. One petal, inferior, tubular, cut round near the base, nectary four glands united with the permanent base of the corolla inside. STAM. four short filaments. ANTHERÆ, oblong, and erect. PIST. Germen superior, round: style thread-shaped, longer than the corolla: stigma thicker than the style. PER. Not turned, one cell, single seed. There are four species of this genus.

ADENAU, a market-town and bailiwick of Neuburg, in the Prussian grand duchy of the Lower Rhine.

AIDENBURGH, or **ALDENBURGH**, a town of Westphalia, in the duchy of Berg, 12 miles N. E. of Cologne, and 17 W. of Bonn.

ADENODUS, in botany, a genus of plants of the order monogynia, and class dodecadandra, so named by Loureiro, but in fact a species of the *ELECARPUS*, which see. It is a native of Cochin China.

ADENOIDES, in anatomy, glandulous, or of a glandular form; an epithet applied to the *PROSTATAE*.

ADENORF, a lordship belonging to Prussia, in the grand duchy of the Lower Rhine.

ADENOSMA, in botany, a New Holland species of the acanthi, or *acanthaceæ*, with a backed capsule. See *ACANTHUS*.

ADENOS, in commerce, a kind of marine cotton, which comes from Aleppo.

ADENOSUS ANCESSUS, in medicine, a crude hard tubercle, proceeding from obstructions, difficult of discussion, and resembling the appearance of a gland.

ADEONA, in mythology, a goddess invoked by the Romans when they undertook a journey.

ADEPHAGIA, in mythology, the goddess of gluttony, to whom the Sicilians paid religious worship. *Ælian* i. 5. 11. c. 27.

ADEPS, in anatomy, fat; an animal oil, secreted from the blood and contained in the membrana adiposa, or, as Boerhaave calls it, the membrana cellulosa; which is a congeries of a great number of membranous lemina, joined irregularly to each other at different distances, so as to form numerous interstices which communicate with each other. Neumann divides fats, from their consistence, into three kinds; the first called *pinguedo* is soft and thin; and is found in birds, reptiles, and fishes. The second is thick, liquefies less readily, and is denominated *axungia*. The third is more hard and firm; when taken from the animal it is called *adeps*, and when freed from the skins, &c. *scum*. The two last kinds of fat are chiefly found in quadrupeds. Animal fats are useful in external applications, for softening and suppling, for abating pains and spasms, and for promoting maturation.

ADEPTI, **ADEPTS**, from *adipisci*, to obtain, a denomination given to the proficients in alchemy; as Ripley, Lully, Paracelsus.

ADEPTISTS. See **ADEPTI**.

AD'EQUATE, v. & *aīj.* { Ad : *aequus*, to lay

AD'EQUATELY, { flat or even to ; to equalize, to make equal.

"To fear God that is wisdom," that is, is the proper and *adequate* wisdom suitable to human nature, and to the condition of mankind.

Hale's Contemplations.

Those are *adequate* ideas, which perfectly represent their archetypes or objects. Inadequate are but a partial or incomplete representation of the archetypes, to which they are referred. *Watts's Logic.*

Gratitude consists *adequately*, in these two things: first, that it is a debt; and secondly, that it is such a debt, as is left to every man's ingenuity, whether he will pay or no. *South.*

Piety is the necessary Christian virtue, proportioned *adequately* to the omniscience and spirituality of that infinite Deity. *Hammond's Fundam.*

ADEQUATE, in logic, is applied to the objects of science. The *adequate* object of a science includes the material and formal object; the material object of a science, is that part which is common to it with other sciences; the formal is that which is peculiar to itself.

ADEQUATE IDEAS, or notions, in metaphysics, are such images or conceptions of an object, as perfectly represent it, or answer to all the parts and properties of it.

ADERAIMIN. See **ALDERAIMIN**.

ADERNO, a town of the Val di Demona, in Sicily, at the foot of Mount *Ætna*: anciently *ADRANUM*, 17 miles W. N. W. of Catania.

ADES, or **HADES**, *ἀδης*, from *a* and *δεινός*, to see, the invisible state. In the heathen mytho-

logy, it comprehends all those regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elysium. See HELL. Strictly, Ades was the god of hell among the Greeks, as Pluto among the Latins.

Dr. Campbell has a long and interesting dissertation on the use of this word, prefixed to his Gospels, in which he contends, that it never means either simply the grave, the place of departed bodies, or a place of punishment for souls, in the New Testament: but solely the intermediate state, or abode of departed spirits generally. Thus, according to his view, both the rich man and Lazarus, in the parable, Luke xvi. 19—23, were in *ἀδης*, only in very different situations.

ADESSENARI^I, ADESSENARI^{II}, from *adesse*, to be present, in church history, a sect of the Reformation, who held Jesus Christ really present in the eucharist; but in a manner different from transubstantiation. They were greatly divided amongst themselves.

AFFECTED EQUATION, in algebra, is that where the unknown quantity is found in two or more different degrees, or powers.

ADFILIATIO, ADFILIATION, a Gothic custom, where a person who has children by a former wife, renders them capable of inheriting equally with the children of the second. This is called, by some, *adoptio per matrimonium*; and is still retained in Germany, under the name *eindkindschaft*, and *uni prolium*.

AD FINES, a town of Switzerland, supposed to be the modern Pfin, not far from the borders of Suabia, about half way between Constance and Frauenfield. It was so called, because after Cecinna, general of Vitellius, had defeated the Helvetii, it formed the border of the Roman empire in this quarter.

ADHA, in mythology, a festival which the Marmetans celebrate on the 10th day of the month *Dhoulegiat*, which is the 12th and last of their year. It signifies the month of pilgrimage, because on that day they sacrifice with great solemnity, at Mecca, and no where else, a sheep, which is called by the same name as the festival itself. The Turks call this festival the Great Beiram. See BEIRAM.

ADHATODA, in botany, the Malabar nut, the *justicia* of Linnaeus. Tournefort enumerates four species.

ADHEL^M, or ALDHEL^M. See ADELME.

ADHELME'S HEAD, (St.) a lofty promontory on the coast of Dorset, 440 feet in altitude, nearly perpendicular to the sea, and exhibiting the ruins of a small chapel.

ADHERE^{v.}

ADHE'RENCE,

ADHE'RENCY.

ADHE'RENT, n. & adj.

ADHE'RER,

ADHE'SION,

ADHE'SIVE.

Ad: *hareo*: to stick to, to be fixed to; to cleave to, hold and maintain; to be attached to.

Good gentlemen, he hath much talk'd of you; And sure I am, two men there are not living, To whom he more adheres. *Shaksp. Hamlet.*

Every man of sense will agree with me, that singularity is laudable; when, in contradiction to a multitude, it adheres to the dictates of conscience, morality, and honour. *Boyle.*

Princes must give protection to their subjects and adherents when worthy occasion shall require it

Raleigh.

The firm adherence of the Jews to their religion is no less remarkable than their dispersion; considering it as persecuted or contemned over the whole earth.

Addison.

If slow, yet sure, adhesive to the tract,
Hot steaming up.

Thomson.

ADHERENCE, ACTION OF, in Scots law; an action competent to a husband or wife, to compel either party to adhere, in case of desertion.

ADHESION, in anatomy, a term for one part sticking to another, which in a natural state are separate. For the most part, if any of those parts in the thorax or belly lie in contact, and inflame, they grow together. The lungs very frequently adhere to the pleura. The dura mater always adheres to the cranium, and there have been instances of adhesion of the intestines.

ADHESION, in philosophy. See COHESION.

ADHIBIT, Ad: *habeo, adhibeo*, to have to or near; to make use of; to pay attention to; to accredit.

To which counsel there were adhibit very few, and they very secret. *Sir T. More's Works*, p. 52.

Salt, a necessary ingredient in all sacrifices, was adhibited and required in this view only, as an emblem of purification.

President Forbes's Letter to a Bishop.

ADHIL, in astronomy, a star of the sixth magnitude, upon the garment *στρυπα*, of Andromeda, under the last star in her foot.

ADJACENCY, n. } Ad: *jacco*, to lie near

ADJA'CENT, n. & adj. } to; lying beside; bordering on something.

And gif thy mynd be ferme therto with me,

I sal this mekil eik to my werke, quod sche

For til induce the cieties adjacent,

Vnto the bargane. *Douglas*, book vii. p. 227

It may corrupt within itself, although no part of it issue into the body adjacent. *Bacon*

Uniform pellucid mediums, such as water, have no sensible reflection but in their external superficies, where they are adjacent to other mediums of a different density. *Newton.*

He, with Palemon, oft recorded o'er
The tales of hapless love in ancient lore,

Recall'd to memory by th' adjacent shore.

Falconer's Shipwreck.

ADIANTHUM, in botany, maiden-hair; a genus of plants of the order filices, and class, cryptogamia. The GEN. CHAR. is, fructifications collected in oval spots under the reflected tops of the fronds. Botanical writers enumerate forty-four species. They are perennials and the following are the most remarkable:

1. ADIANTHUM CAPILLUS VENERIS, or true maiden-hair, is a native of the southern parts of France; likewise said to grow plentifully in Cornwall.

2. ADIANTHUM PEDATUM, or American maiden-hair, a native of Canada.

3. ADIANTHUM TRAPEZIFORME, or black American maiden-hair, a native of Jamaica. Others are the Adiantum reniforme, or monophyllum, the hemionitis, or felis hemionitis, adiantum radiatum, lonchitis ratiata, or trichomanes americanum radiatum, &c.

ADIAPHORISTS, or ADIAPHORIST^E, from

α , privative, and $\delta\alpha\phi\rho\nu\sigma$, different, a name given in the sixteenth century to the moderate Lutherans who adhered to the sentiments of Melanchthon; and afterwards to those who subscribed the Interim of Charles V.

ADIAPHOROUS, ADIAPHORUS, in chemistry, a name given by Mr. Boyle to a kind of spirit distilled from tartar and some other vegetable bodies; and which is neither acid, vinous nor urinous; but in many respects different from any other sort of spirit.

ADIAPNEUSTIA, from α , $\delta\alpha$, and $\pi\nu\epsilon\nu\omega$, I breathe, in medicine, signifies defective respiration, from dense pores, &c.

ADIAPICTOS $\Delta\alpha\pi\tau\tau\otimes\zeta$, firm, a name given by physicians to a remedy for the cholic, consisting of stone parsley, henbane-seed, white pepper, &c. made into an electuary.

ADIARHMEA, from α , $\delta\alpha$, and $\pi\epsilon\nu\omega$, I flow, in medicine, a total suppression of all the necessary evacuations.

ADIATORIX, in history, the Roman governor of Galatia, in the time of Anthony, who, to recommend himself to the favour of that general, put to death in one night the whole of the inhabitants of Heraclea, in Pontus, for which Augustus caused him to be strangled. *Strabo. xii.*

ADJAZZO, or AJACCIO. See AJACCIO.

ADJECT[’]. v. Ad : *jacio, adjicio, adjectum, tum*, to cast or throw to ; to *adjectitious, throw in additionally*; to *adjective, super-add.*
ADJECTIVELY.

That unto every pound of sulphur, an *adjection* of one ounce of quicksilver; or unto every pound of peter, one ounce of sal-ammoniac, will much intend the force, and consequently the report, I find no verity. *Brown's Vulgar Errors.*

It is probable that they made the child's name by *adjecting* the syllable son to the appellation of the father. *Fuller's Worthies.*

There is a gross mistake made between an *adjected* and an *adjective* word ; that is, between a word *laid close* to another word, and a word which *may lie close* to another word. *Tooke's Div. of Porley.*

An ADJECTIVE, in grammar, is defined by Harris, as having no assertion, and denoting only such an attribute as has not its essence either in motion or its privation. It is clearly a word *adjected* or adjoined to another to exhibit its qualities be they what they may. We reserve to the article GRAMMAR, the more full consideration of its functions.

ADIEU[’], à dicu, Fr. to God; I command you to God; Farewell.

We gave him leave to bid that aged sire
Adieu! but nimbly ran her wonted course.
Faerie Queene.

Use a more spacious ceremony to the noble lords ; you restrained yourself within the list of too cold an *adieu* : be more expressive to them. *Shakespeare's All's Well that ends Well.*

While now I take my last *adieu*,
Heave thou no sigh, nor shed no tear;
Lest yet my half-clos'd eye may view
On earth an object worth its care. *Prior.*

ADIGE, a considerable river of Italy, which taking its rise south of the lake Glare among the Alps, runs south by Trent, then east by Verona, in the territory of Venice, and falls into the gulph

of Venice, north of the mouth of the Po; passing in its course, Tyrol, Brixen, Trent, Verona, and Rovigo.

ADILABAD, a town of Hindostan, in the Mahratta dominions, and province of Khandest, on the Poornah river, twenty miles south of Boorhampoor, near which is a lake, held in great veneration by the Hindoos.

ADIMANTUS, in history, 1. a commander of the Athenian fleet taken by the Spartans, whose life alone was spared by the captors. 2. A brother of Plato, mentioned by Diogenes. 3. A Corinthian general who taunted Themistocles. 4. A king struck with thunder, for mocking Jupiter. *Ovid.*

AD INQUIRENDUM, in law, a judicial writ, commanding inquiry to be made of any thing touching a cause depending in the king's court.

ADJOIN[’], v. Ad: *jungo, junctus*, Lat. *joindre joint*, Fr. to *join*. ADJOIN[’]EDLY } Lat. *joindre joint*, Fr. to *join to*; to connect one
ADJOIN[’]ANT, n. & a. } *join to*; to connect one
AD'JUNCT, n. & adj. } with another, to fasten,
ADJUNCTION. } to place near, or contiguous.

Also I bequeath unto as many godchildern as I have lyving in the countie of Essex, and specially in the parishes to my mansion *adivynant*, to every of them viii. *Fabian's Will.*

Here with these grave *adjoynts*
(These learned maisters,) they were taught to see,
Themselves to read the world, and keep their
points. *Dan. Cn. Wars. iv. 59*

As one, who long in populous city pent,
Forth issuing on a sumner's morn to breathe
Among the pleasant villages and farms
Adjoin'd, from each thing met conceives delight. *Milton.*

Learning is but an *adjunct* to ourself,
And where we are, our learning likewise is.
Shakspeare's Love's Labour Lost.

As a massy wheel,
Fixt on the summit of the highest mount,
To whose huge spoke ten thousand lesser things
Are mortis'd and *adjoined*. *Shakspeare.*

Th' adjoining fane the assembled Greeks ex-
press'd.
And hunting of the Caledonian beast. *Dryden.*

In learning any thing, as little should be proposed to the mind at once as is possible; and, that being understood and fully mastered, proceed to the next *adjoining*, yet unknown, simple, unperplexed proposition, belonging to the matter in hand, and tending to the clearing what is principally designed. *Locke.*

Corrections or improvements should be as remarks *adjoined*, by way of note or commentary, in their proper places ; and superadded to a regular treatise. *Watts.*

ADJOINING ANGLES, in geometry. See GEOMETRY.

ADJOURN[’], Ad: *jour, day, ajourner*, Fr. to separate, in order to put off the consideration of business to another day, or time specified, or understood ; to another part of the same day ; also to refer indefinitely ; to postpone, to delay.

To maynten his partie pei hote to help him wele,
He aiorned ham to relie in pe north at Carlele,
After Midesomer's tide borgh comon ordinanc
No lenger sulc pei bide, bote forth and stand to chance. *R. Brunst.*

And vpon y^e viii day of July, kyng [Henry VI.] this yere began his parlyament at Westmynster, and so contynued it till Lammas, and then it was aiourned vnto Seynt Edwardes daye.

Fabyan.

Or how the sun shall, in mid heaven, stand still
A day entire, and night's due course adjourn,
Man's voice commanding.

Milton's Paradise Lost.

During the adjournments of that awfull court, a neighbour of mine was telling me, that it gave him a notion of the English hospitality to see Westminster hall a dining-room.

Tudor.

ADJOURNMENT, in law, from *ad*, to, Lat. and *jour*, day, Fr. The putting off a court, or other meeting till another day. Adjournment and prorogation of the parliament are to be distinguished; the former being an act of each house itself; whereas the latter is an act of royal authority.

ADIPOCIRE, from *adeps*, fat, and *cera*, wax, a chemical substance of a light brown colour, formed by the soft parts of animal bodies after death, and when kept for some time from the atmospheric air, or exposed to water. It is generally formed when a considerable quantity of human bodies have been interred together, and was first noticed in the burial ground of the Innocents at Paris; where the poor had been interred in pits of thirty feet deep, and twenty broad, with nothing but thin planks between them. There have, however, been instances of bodies interred separately, being changed into this substance.

Mary Howard, aged forty-four, died on the 12th May, 1790, and was buried in a grave, ten feet deep, at the east end of Shoreditch church-yard, ten feet to the east of the great common sewer, which runs from north to south, and has always a current of water in it, the usual level of which is eight feet below the level of the ground, and two feet above the level of the coffins in the graves. In August 1811, the body was taken up, with some others buried near it, for the purpose of building a vault, and the flesh in all of them was converted into adipocire or spermaceti. At the full and new moon the tide raises water into the graves, which at other times are dry. To explain the extraordinary quantities of fat or adipocire formed by animals of a certain intestinal construction, Sir E. Home observes, that the current of water which passes through their colon, while the loculated lateral parts are full of solid matter, places the solid contents in somewhat similar circumstances to dead bodies in the banks of a common sewer.—*Philosophical Transactions*, 1813.

Grave diggers assert that near three years are required to change a body into this curious substance. But Dr. Gibbes of Bath, found, that lean beef secured in a running stream was converted into this fatty matter at the end of a month. He judges from facts, that running water is most favourable to this process. He took three lean pieces of mutton, and poured on each a quantity of the three common mineral acids. At the end of three days, each was much changed: that in the nitric acid was very soft, and converted into the fatty matter; that in the muriatic acid was not in that time so much altered; the sulphuric acid had turned the other black. M. Lavoisier

thinks that this process may hereafter prove of great use in society.

The chemical properties of adipocire have attracted some attention, since its discovery on so large a scale, at Paris: and the principal facts established, seem to be, that a true ammoniacal soap is first yielded, composed of ammonia, a concrete oil, and water. An analysis of the oil may be obtained pure from this substance, and to that more strictly, the name adipocire is given.

One French chemist gives the result of the exposure of a human liver to the common air, as terminating in a similar substance. It partly putrified, he says, when first exposed in his laboratory, without emitting any very noisome smell. Larvae of the dermestes and bruchus, attacked and penetrated it in various directions: at last it became dry, and after more than ten years' suspension, it was converted into a white friable substance, resembling dried agaric, which might have been taken for an earthy substance. In this state it had no perceptible smell. M. Pouletier was desirous of knowing the state of this animal matter, and experiment soon convinced him and M. F. that it was very far from being in the state of an earth. It melted by heat, and exhaled in the form of vapour, which had the smell of a very fetid fat; spirit of wine separated a concrescible oil, which appeared to possess all the properties of spermaceti. Each of the three alkalies converted it into soap; and, in a word, it exhibited all the properties of the fatty matter of the burial-ground of the Innocents exposed for several months to the air.

For the following abridgment of M. Fourcroy's experiments on this matter, we are indebted to Dr. Ure.

1. This substance is fused at a less degree of heat than that of boiling water, and may be purified by pressure through a cloth, which disengages a portion of fibrous and bony matter.
2. The process of destructive distillation by a very graduated heat was begun, but not completed on account of its tediousness, and the little promise of advantage it afforded. The products which came over were water charged with volatile alkali, a fat oil, concrete volatile alkali, and no elastic fluid during the time the operation was continued.
3. Fragments of the fatty matter exposed to the air during the hot and dry summer of 1786, became dry, brittle, and almost pulverulent at the surface. On a careful examination, certain portions were observed to be semi-transparent, and more brittle than the rest. These possessed all the apparent properties of wax, and did not afford volatile alkali by distillation.
4. With water this fatty matter exhibited all the appearances of soap, and afforded a strong lather. The dried substance did not form the saponaceous combination with the same facility or perfection, as that which was recent. About two-thirds of this dried matter separated from the water by cooling, and proved to be the semi-transparent substance, resembling wax. This was taken from the surface of the soapy liquor, which being then passed through the filter, left a white soft shining matter, which was fusible and combustible.
5. Attempts were made to ascertain the quantity of

volatile alkali in this substance, by the application of lime, and of the fixed alkalis, but without success: for it was difficult to collect and appreciate the first portions which escaped, and likewise to disengage the last portions. The caustic volatile alkali, with the assistance of a gentle heat, dissolved the fatty matter, and the solution became perfectly clear and transparent at the boiling temperature of the mixture, which was at 185° F. 6. Sulphuric acid, of the specific gravity of 2.0, was poured upon six times its weight of the fatty matter, and mixed by agitation. Heat was produced, and a gas effluvium of the most insupportable putrescence was emitted, which infected the air of an extensive laboratory for several days. M. Fourcroy says, that the smell cannot be described, but that it is one of the most horrid and repulsive that can be imagined. It did not, however, produce any indisposition either in himself, or his assistants. By dilution with water, and the ordinary processes of evaporation and cooling, properly repeated, the sulphates of ammonia and of lime were obtained. A substance was separated from the liquor, which appeared to be the waxy matter, somewhat altered by the action of the acid. 7. The nitrous and muriatic acids were also applied, and afforded phenomena worthy of remark, but which for the sake of conciseness are here omitted. 8. Alcohol does not act on this matter at the ordinary temperature of the air. But by boiling it dissolves one-third of its own weight, which is almost totally separable by cooling as low as 55°. The alcohol, after this process, affords by evaporation a portion of that waxy matter which is separable by acids, and is therefore the only portion soluble in cold alcohol. The quantity of fatty matter operated on was four ounces, or 2304 grains, of which the boiling spirit took up the whole except twenty-six grains, which proved to be a mixture of twenty grains of ammoniacal soap, and six or eight grains of the phosphates of soda and of lime. From this experiment, which was three times repeated with similar results, it appears that alcohol is well suited to afford an analysis of the fatty matter. It does not dissolve the neutral salts; when cold, it dissolves that portion of concrete animal oil from which the volatile alkali had flown off; and when heated, it dissolves the whole of the truly saponaceous matter, which is afterwards completely separated by cooling. And accordingly it was found, that a thin plate of the fatty matter, which had lost nearly the whole of its volatile alkali, by exposure to the air for three years, was almost totally dissolved by the cold alcohol. The concrete oily or waxy substance obtained in these experiments, constitutes the leading object of research, as being the peculiar substance with which the other well known matters are combined. See *Journal de Physique*, tom. xxxviii. &c. *Nicholson's Journal*, vol. iv. p. 135. *Phil. Trans.* 1794, vol. lxxxiv. vol. lxxxv.

ADIPOSA MEMBRANA, in anatomy, a membrane that incloses the *Cellulae Adipose*.

ADIPOSA VENA, in anatomy, a vein, arising from the descending trunk of the cava, which spreads itself on the coat and fat of the kidneys.

ADIPOSE, a term used by anatomists for any cell, membrane, &c., that is remarkable for its fatness. See ADERS.

ADIPOSI DUCTUS, in anatomy, vessels which convey the fat into the interstices of the muscles, or part between the flesh and the skin.

ADIPSON, from the privative *a*, and *δύα*, thirst, in medicine, a name given by Hippocrates, to oxymel, the ptissana, and other medicines, administered for allaying thirst.

ADIPSOS, in botany, the Egyptian palm tree; also, an epithet for the glycerrhiza or liquorice tree of Linnæus. Likewise, in medicine, a catapodium, or pill, composed by Asclepiades, and mentioned by Galen.

ADIRBEITSAN, in geography. See AZZERBIJAN.

ADIRGE, in chemistry, *sal ammoniacum*.

ADIT OF A MINE, the hole or aperture, whereby it is entered and dug, and by which the water and ores are carried away. The term amounts to the same with *cuniculus* or *drift*, and is distinguished from *air-shaft*. See MINING.

ADIT OF A SHIP, in antiquity, was a space in the upper part, where the ship was widest, at which people entered, anciently called *agea*.

ADITS OF A THEATRE, *aditus theatri*, in antiquity, were doors on the stairs, whereby persons entered from the outer porticos, and descended into the seats.

ADITIS, in history, an ancient tribe of Arabs, frequently mentioned in the Koran, and said to have been descended from Ace, the son of Acos, or Uz, *Gcn.* x. 22, 23. Incredible accounts are given of their stature; but see Sales's Introduction to the Koran, and *Kor.* chap. vi.

ADIVE, in zoology, a small jackal, the *canis aureus* of Linnaeus, and resembling, according to Buffon, a small fox.

ADJUDGE', v. { *Ad* : *judico*, to judge, or
ADJUDG'MENT, } sentence to ; to express a
ADJUDICA'TION, } judicial decision ; to determine an affair.

Then the kyng made a promyse by othe, that he wolde be obedient vnto the court of Rome, and stand and obey all things y' the court woll adiuge hym.

Fabian.

To her therefore

The fairest lady was *adjudg'd* for paramore.

Spencer's Faerie Queene.

I have shewed sir Keelman Digby both our translations of Martial's *Vitam qua faciunt beatiorem*, &c. and to tell you true, he *adjudged* your's the better.

Howell's Letters.

ADJUDICATION, in Scots law, the name of that action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself, either in payment or security of his debt; or, that action by which the holder of an heritable right, labouring under any defect of form, may supply that defect.

ADJUNCT, in metaphysics, some quality belonging to either body or mind, whether natural or acquired. Thus thinking is an adjunct of the mind, and growth of the body.

ADJUNCT, in music, a word employed to denote the connection or relation between the

principal mode and the modes of its two-fifths, which, from the intervals that constitute the relation between them and it, are called its adjuncts.

ADJUNCT, in philosophy, something added to another, without being any necessary part of it. Thus water absorbed by cloth or a sponge, is an adjunct, but no necessary part of either of these substances.

ADJUNCTS OF THE GODS, OR ADJUNCT GODS, among the Romans, were a kind of inferior deities, added as assistants to the principal ones. Thus, to Mars was adjoined Bellona and Nemesis; to Neptune, Salacia; to Vulcan, the Cabiri, &c.

AD JURA REGIS, in ecclesiastical affairs, a writ brought by the king's clerk, against him who endeavours to eject him presented to a living, and thus to prejudice the king's right of presentation.

ADJURE, v. } Ad : *juro*, to swear to ; to

JURATION, } put upon oath ; to prescribe the solemnity of an oath ; to charge earnestly, or solemnly.

But Jesus held his peace. And the high priest answered and said unto him, I adjure thee by the living God, that thou tell us whether thou be the Christ, the Son of God. *Matt. ch. xxvi. v. 63.*

SPIRIT. She will be swift

To aid a virgin, such as was herself,
In hard besetting need ; this will I try,
And add the power of some adjuring verse.

Milton's Comus.

A Persian humble servant of the sun,
Who though devout, yet bigotry had none,
Hearing a lawyer grave in his address,
With adjurations every word impress ;
Supposed the man a bishop, or at least,
(God's name so much upon his lips,) a priest,
Bowed at the close with all his graceful airs,
And begged an interest in his frequent prayers.

Couper.

ADJUST, v. } Adjuster, Fr. to dispose ; to
ADJUST'R, } set in order ; fit, adopt, me-
ADJUST'MENT, } thodize, accommodate.

For these ne been yet no remedies of the malady, but they ben a manner norishing of thy sorrows, that rebell ayest thy curacion. For whan time is I shal moue and aiust soch things, that peron hem ful depe.

Chaucer. ii. b. of Boecius.

It is a vulgar idea we have of a watch or clock, when we conceive of it, as an instrument made to shew the hour ; but it is a learned idea, which the watch-maker has of it ; who knows all the several parts of it, together with the various connections and adjustments of each part. *Watts's Logick.*

What, but God ?

Inspiring God ! who, boundless spirit all ;
And unremitting energy pervades,
Adjusts, sustains, and agitates the whole ?

Thomson.

It is observable, that, either by nature or by habit, our faculties are fitted to images of a certain extent, to which we adjust great things by division, and little things by accumulations. *Rambler.*

Promises of friendship are, like all others, useless and vain, unless they are made in some known sense, adjusted and acknowledged by both parties.

Rambler. No. 13.

ADJUTAGE. See AJUTAGE. & HYDRAULICS.

ADJUTANT, in the military art, is an officer, whose duty is to assist the major, by distributing the pay, and overseeing the punishment of the

common men : besides which, he is to receive orders every night from the brigade major ; which, after carrying to the colonel, he delivers out to the serjeants. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous. He also places the guards, receives, and distributes the ammunition to the companies, &c., and, by the major's orders, regulates the price of bread, beer, and other provisions.

ADJUTANT-GENERAL, is an officer of distinction, who aids and assists the general. He forms the several details of duty of the army, with the brigade majors, and keeps an exact state of each brigade and regiment, with a roll of the lieutenant generals, major generals, colonels, lieutenant colonels, and majors. Every day at head quarters, he receives orders from the general officer of the day, and distributes them to the majors of brigades, from whom he receives the number of men they are to furnish for the duty of the army, and informs them of any details which concern them. On marching days, he accompanies the general to the ground of the camp. He makes a daily report of the situation of all the posts placed for the safety of the army, and of any changes made in their posts. In a day of battle, the adjutant-general sees the infantry drawn up, after which he places himself by the general to receive orders. In a siege, he visits the several posts and guards of the trenches, and reports their situation, and how circumstanced ; he gives and signs all orders for skirmishing parties, (if time permit,) and has a serjeant from each brigade, to carry any orders which he may have to send.

ADJUTANTS-GENERAL, among the Jesuits, a select number of fathers, who resided with the general of the order, each of whom had a province or country assigned him, as England, Holland, &c., and their business was to inform the father general of state occurrences in such countries. To this end they had their correspondents delegated, emissaries, visitors, regents, provincials, &c.

ADJUTE,

ADJUTANCY, } Ad : *juro—jutum*, to help to ;
ADJUTANT, } to assist ; to succour ; to promote
ADJUVANT, } the advantage of. Adjute is
ADJU'MENT, } now obsolete.
ADJU'TORS.

Wheron the king a parliament procur'd,
To fix some things whose fall he else might fear,
Whereby he hop'd the queen to have abjur'd,
His son, and such as their adjutors were.

Drayton's Baron's Wars.

ACC. For there be
Sixe batchelors, as bold as he,
Adjuting to his compance,
And each one hath his liverie.

Jonson's King's Entertainment at Welbeck.

I have only been a careful adjuttant, and was sorry I could not be the efficient. *Sir H. Yelverton, 1609.*

He had a due regard for his person ; for in great battles he would set in his pavilion, and maner ill by adjutants.

Bacon's Bury.

As nerves are adjuments to corporal activity, so are laws the hinges on which politique bodies act and move.

Waterhouse.

It was no doubt disposed with all the *adjutancy* of definition and division. *Burke.*

ADJUTORIUM, in anatomy, the humerus shoulder bone. Also, a term used by physicians for any medicine in a prescription but the capital one.

ADJYGIUR, or the impregnable fortress, as the word signifies, an ancient fortress of Hindostan, in the province of Bundelcund, which commands the mountain-pass between Callinger and Pannah. It resisted the British arms for some time in 1809, and cost the besiegers a great number of troops before it was evacuated by the zemindar. On this occasion, the father-in-law of that chieftain, was sent into the female apartments by the British, to announce to the wives of the zemindar the necessity of their leaving the place; when he cut the throats of all the women and children, eight in number, and afterwards his own, without the slightest disturbance being heard without.

ADLE-EGGS. See ADDL.F.

ADLEGATION, in the public law of the German empire, a right claimed by certain states of the empire of adjoining plenipotentiaries, in public treaties and negotiations, to those of the emperor, for the transacting of matters which relate to their common interests. Several princes and states of the empire, enjoy the right of legation, (or sending ambassadors on their own particular affairs,) who have not that of adlegation, and *vicē versā*.

ADLERBERG, or **ARLBURG**, one of the Suabian territories, of the Tyrolese Alps, separating the Tyrol from the country of the Grisons. It gives name to the adjacent lordships of Vorarlberg, and is covered with pines and brushwood. Joseph II. cut a fine road across these hills in 1786.

ADLOCUTION, **ADLOCUTIO**, in Roman antiquity, the address made by generals to their armies, to encourage them before a battle; often expressed on medals by the abbreviation ADLOCUT. CON.—The general is represented as seated on a tribunal, or on a bank or mount of turf, with the cohorts ranged orderly round him.

ADLONGUM, in music, ancient church music written in square notes and semibreves.

ADMIAH, the most easterly of the four cities that were destroyed by fire from heaven with Sodom.

ADMANUENSES, in ancient law books, denote persons who swore by laying their hands on the book, and thus stood opposed to clerks, whose word was, according to Ducange, reputed as their oath.

ADMΕΑSURE, } See MEASURE.
ADMΕΑ'SUREMENT. } See MEASURE.

The antient and most effectual method of proceeding is by writ of *admeasurement* of pasture. **** And upon this suit all the commoners shall be *admeasured*.

Blackstone's Commentaries.

ADMETUS, in mythology, a king of Phœnix Thessaly, whose cattle Apollo kept for nine years, and obtained from the Fates, a dream, that Admetus should never die, if any one could be

found to sacrifice life in his behalf, which Alcestæ his wife, did. *Ovid de Art. Am.* iii Pont. iii. &c.

ADMINICLE, in Scots law, signifies any writing or deed referred to by a party, in action of law, for proving his allegations.

ADMINICULATOR, an ancient officer of the church, whose business it was to attend to, and defend the cause of the widows and orphans.

ADMINISTER, v. } Ad : *ministro*, from
ADMINISTRATE, v. } *minus*, or *minor*, to serve
ADMINISTRATION, } to ; to act as servant,
ADMINISTRATOR, } agent, or deputy ; to officiate under the sanction of law or otherwise ; to give, to help, to supply.

Power me thought yt I had to keep from mine enemies, and mee seemed to shine in glory of renoume, as manhood asketh in mean, for no wight in mine *administracion*, coude none yuels ne trechery by sothe cause on me putte.

Chaucer, Test. of L. b. ii. f. 304.

There are dyuersites of gyftes, yet but one sprete. And ther are differences of *admynistracyōs*, and yet but one Lorde. *Bible*, 1539. 1 Cor. ch. x.

For forms of government let fools contest ;
What'er is best *administer'd*, is best,

Pope's Essay on Man

He [the king] is ours,
T' *administer*, to guard, t' adorn the state,
But not to warp or change it. We are his,
To serve him nobly in the common cause,
True to the death, but not to be his slave.

Couper's Task.

ADMINISTRATION, in anatomy, a name given by Galen and Harvey to the manner of dissecting the human body, particularly the muscles. In which sense, administration is synonymous with *encheiresis*, exercise, &c.

ADMINISTRATOR, in law, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor. An action lies for, or against an administrator, as for, or against an executor; and he shall be accountable to the value of the goods of the deceased, and no farther: unless there be waste, or other abuse chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration.—If a stranger, who is neither administrator nor executor, take the goods of the deceased, and administer, he shall be charged and sued as an executor, and not as an administrator. The administrator, in Scot's law, is a person legally empowered to act for another whom the law presumes incapable of acting for himself. Thus tutors or curators are sometimes styled administrators in law to pupils, minors, or fatuous persons. But more generally the term is used to imply that power, which is conferred by the law upon a father, over the persons and estates of his children during their minority.

ADMIRABILIS SAL, the same with Glau-ber's salt. See CHEMISTRY.

ADMIRAL, *amiral*, Fr. of doubtful etymology. The chief commander of a gretter or smaller number of ships of war, or of the whole naval force of a country.

He also, in battle in sea, overthrew Rodericus Rotundus, *admiral* of Spain, in which fight the *admiral* with his son were both slain, and seven of his gallies taken.

Knolles.
Make the sea shine with gallantry, and all
The English youth flock to their *admiral*.

Waller.

ADMIRAL, in naval politics, an officer who takes the command of a fleet or squadron, or the general government of the king's navy; together with the hearing and determining all causes that may arise, civil or criminal, within the circle of maritime affairs.

With respect to the origin of this title, authors are divided, although the office itself has been established in almost all maritime countries. Some have traced it to the oriental languages; others to the Greek; but the most probable opinion, is that of Spelman, who thinks, that both the name and dignity were derived from the Saracens, and, by reason of the holy wars, brought amongst us; for *admiral*, in the Arabian language, signifies a prince, or chief ruler, and was the ordinary title of the governors of cities, provinces, &c. and therefore they called the commander of the navy by that name, as a name of dignity and honour. And indeed there are no instances of admirals in this part of Europe, before the year 1284, when Philip of France, who had attended St. Louis in the wars against the Saracens, created an admiral. Du Cange assures us, that the Sicilians were the first and the Genoese the next, who gave the denomination of *admiral* to the commanders of their naval armaments; and that they took it from the Saracen or Arabic *Emir*, a general name for every commanding officer.

The name also occurs once in the history of France, in the year 558. *And. Com.* vol. i. p. 23.

The exact time when this word was introduced among us, is uncertain; some think it was in the reign of Edward I. before whose time, the chief naval officer was distinguished by the name of ‘*custos maris*.’ But Sir Henry Spelman is of opinion that it was first used in the reign of Hen. III. because neither the laws of Oleron, made in 1266, nor Bracton, who wrote about that time, make any mention of it; and that the term *admiral* was not used in the charter of the eighth of Hen. III. wherein he granted this office to Richard de Lacey, by these words, *Maritiman Angliae*; but in the fifty-sixth year of the same reign, not only the historians, but the charters themselves, very frequently use the word *admiral*. It is certain, however, that in the reign of Edw. I. who distinguished himself in the naval service of the crusades, the title of *admiral de la mer du roy d'Angleterre*, was conferred for the first time, as a mark of public honour, on W. de Leybourne. Shortly afterwards, the jurisdiction of the English seas was committed to the management of three or four admirals, all of them holding the office *durante bene placito*; and each having particular limits under his charge and government: as *admiral* of the fleet of ships, from the mouth of the Thames, northward, southward, or westward. Besides these, there were admirals of the Cinque Ports, as in the reign of Edward III. when one William Latimer was styled *admiralis quinque*

portuum; and we sometimes find that one person has been *admiral* of the fleets to the southward, northward, and westward, at the same time.

From the reign of Edward II. a regular succession of admirals may be distinctly traced, and in the thirty-fourth of Edward III. John de Beauchamp, lord warden of the Cinque Ports, was created high-admiral of England. There was, however, a title above this, viz. ‘*locum tenens regio super mare*,’ the king's lieutenant-general of the seas. The office of high-admiral was soon after divided for a few years into that of the northern and western admiral. Richard Fitz Alain, son of the earl of Arundel, being made admiral of England, by patent of Richard II. was succeeded by the duke of Albermarle, under the title of high-admiral of the north and west; but the title of *admiralis Angliae*, was resumed in the reign of Henry IV. and conferred upon the king's brother; and the office itself invested with most of its present powers. Persons of high rank, frequently unacquainted with naval concerns, were placed in it, as a post of honour; and thus it continued until 1632, when it was put into commission, as it remained during the protectorate of Cromwell. James II. while yet duke of York, exercised the functions of lord high-admiral for several years, during the reign of his predecessor, and had the merit of making it a most effective and useful office; some of his naval regulations being still observed. In the time of William and Mary, the powers of lord high-admiral were committed, by stat. ii. cap. 2. to the lords commissioners of the admiralty. Prince George of Denmark enjoyed this office a short time, in the reign of queen Anne; and during his commission, a change took place in its perquisites, which, with the exception of £2500 per annum, he alienated to the crown. After his relinquishment, the office returned to seven lords-commissioners, according to the original statute of William and Mary, and the annual income was augmented to £1000 for each; although, at present, that of the first lord is equal to £5000 per annum. The surplus revenue, so deviated, forms what are called the *droits* of admiralty, and is applied at the pleasure of government.

To the office of Lord HIGH ADMIRAL, or Lords Commissioners of the Admiralty of England, belong the universal government and management of the Royal Navy, the decision of all maritime cases, whether civil or criminal, a jurisdiction upon or beyond the sea in all parts of the world; upon the sea coasts in all ports, havens, or harbours, and upon all rivers below the nearest bridge to the sea. According to the terms of the patent, he is empowered “ To preserve all public streams, ports, rivers, fresh waters and creeks, whatsoever, within his jurisdiction, as well for the preservation of the ships as of the fishes; to reform too strait nets and unlawful engines, and punish offenders; to arrest ships, mariners, pilots, masters, gunners, bombardiers, and any other persons whatsoever, able and fit for the service of ships, as often as occasion shall require, and wheresoever they shall be met with; to appoint vice-admirals, judges, and other officers, *durante bene placito*; to remove, suspend,

or expel them, and put others in their places; to take cognizance of civil and maritime laws, and of death, murder, or maim." The Lord Warden of the Cinque Ports has, nevertheless, a jurisdiction exempt from the control of the Admiralty within these ports. The jurisdiction of the Lord High Admiral is confined to the sea; for instance, if a man be killed in any ship riding in great rivers, beneath the lowest bridge towards the sea, he has legal cognizance; but, if a man be killed above the lowest bridge, or upon any arm of the sea where the land can be seen on both sides, the coroner of the county is the proper person to enquire into it, and where a coroner may enquire the admiral has no jurisdiction. Between high and low water mark, also, the common law and the Admiralty have jurisdiction by turns; one upon the water, the other upon the land. The High Admiral is empowered to grant commissions to inferior admirals, enabling them to enforce obedience in all branches of the service, to institute courts martial, to take cognizance of all maritime transgressions committed against the articles of war, under the direction of a deputy Judge Advocate.

The perquisites given to this office by the patent, consist of "treasure, deadands, derelicts, found within his jurisdiction; all goods picked up at sea; all fines, forfeitures, ransoms, recognizances, and pecuniary punishments; all sturgeons, whales, porpoises, dolphins, rigs, and grampusse, and all such large fishes; all ships and goods of the enemy coming into any creek, road, or port, by stress of weather, mistake, or ignorance of the war; all ships seized at sea, salvage, &c. together with his shares of prizes." This officer anciently carried a gold whistle, set with precious stones, at the end of a gold chain; and the office itself is of so great power, honour, and profit, that it has been conferred mostly on princes of the blood. All officers, commanders, and soldiers of ships of war, are bound to observe the commands of the High Admiral, on pain of death, or other punishment. Considering the great power and influence of the office, there is, perhaps, a degree of prudence in its having been put for some years past under the administration of commissioners, who, by W. and M. stat. ii. c. 2. are declared to have the same authority, jurisdiction, and power, as the Lord High Admiral.

ADMIRAL OF SCOTLAND, THE LORD HIGH, was anciently one of the great officers of the crown, and supreme judge in all maritime cases that occurred within that part of Great Britain. In the year 1651 this great officer was dignified with the title of "The King's Lieutenant and Justice General upon the Seas." But since the Union, the powers of this office have been vested in the Admiralty of Great Britain, who appoints a Vice Admiral, or Judge, who executes the duties of it, and presides over an Admiralty court in Scotland.

ADMIRAL OF THE FLEET is the highest naval officer under the British High Admiralty office, distinguished when he embarks by hoisting the union flag at the main top gallant mast head. This office is of considerable authority, and has lately been filled by a member of the royal family.

ADMIRALS being commanders in chief of any fleet, or squadron, rank with field marshals in the army, and always carry their flags at the main top gallant mast head, from which they are designated admirals of the red, of the white, of the blue.

The **VICE ADMIRAL** is a civil officer, appointed by Lords Commissioners of the High Admiralty. There are several of them established in different parts of Great Britain, with judges and marshalls under them, exercising their respective jurisdictions within certain limits. The Vice Admiral of England was formerly the Deputy of the Lord High Admiral, but the place being now a sinecure, is commonly conferred on some officer of distinction. Scotland has one Vice Admiral, Ireland has four, and the Governors of colonies are commonly empowered by a commission to preside over Vice Admiralty Courts. The Vice Admiral carries his flag at the fore top mast head, takes rank with lieutenant generals in the army, and, within his jurisdiction, maintains considerable dignity and influence. His decisions, however, are not final, a right of appeal lying to the High Court of Admiralty in London.

ADMIRAL is also an appellation given to the most considerable ship of a fleet of merchantmen, or of the vessels employed in the cod-fishery of Newfoundland. The vessel that first arrives is also entitled to this appellation, and the commander has the privilege of choosing what place he pleases on the shore to dry his fish; gives proper orders and appoints the fishing-places to those who come after him; and as long as the fishing season continues, carries a flag on his main mast.

ADMIRAL, in zoology, or rather conchology, the name given by authors to a very beautiful and very precious shell fish of the *voluta* genus, belonging to the order of *vermes testacea*. See **VOLUTA**. Of these the curious reckon four species. 1. The grand-admiral. 2. The vice-admiral. 3. The orange-admiral. Aud, 4. The extra-admiral. The first of these is the most esteemed, and a single shell has been sold in Holland for five hundred florins. It is of a very elegant and bright white enamel, and is variegated with bands of yellow, representing in some degree the colours of the flags of a man of war at sea; hence it obtained its name. It is of a very curious shape, and formed with particular elegance about the head; the clavicle being exerted. There runs along the centre of the large yellow band in this shell, a fine denticulated line, which is its distinguishing character. The vice-admiral is an elegant shell, but its head is less beautifully wrought than in the *admiral*, and its broad band wants the denticulated line, so remarkable in that. The orange-admiral has more yellow than either of the others. The extra-admiral has the same bands with these, but they run one into another, and form a more mixed clouding.

ADMIRALTY. The power, or officers appointed to administer the naval affairs of a state. Also the place where they assemble for business.

They requested liberty to cite John Paith to appear by his proctor in the English court of admiralty.

Milton's State Letters.

Having consulted with Mr. Whitlock, the lawyer, about the validity of a commission drawn from a research into the office of the admiralty.

Sir H. Wotton, Rem. p. 418.

ADMIRALTY properly signifies the office of lord high admiral, whether discharged by one single person, or by joint commissioners called *lords of the admiralty*.

ADMIRALTY, COURT OF, is a sovereign court, instituted by Edward III. and held by the lord high admiral, or lords of the admiralty, where cognizance is taken in all maritime affairs, whether civil or criminal.—All crimes committed on the high seas, or on great rivers below the first bridge next the sea, are cognizable in this court only, and before which they must be tried by judge and jury. But in civil cases the mode is different, the decisions being all made according to the civil law. By statute 39. Geo. III. all offences whatsoever committed on the high seas, shall be liable to the same punishments as if committed on shore, and shall be tried and adjudged in the same manner as felonies; and persons wilfully casting away any vessel, or procuring it to be done, are by the 43d of the king declared to be felons, without benefit of clergy: if the offence be committed in the body of a county, they shall be tried as other felons; if upon the seas, under stat. 28 Henry VIII. which gives the criminal jurisdiction to the Admiralty Court. Of late years a regular Admiralty Sessions of Oyer and Terminer has been held twice in the year at the Old Bailey, London. The commission includes the members of the Privy Council, Lords of the Treasury, the Secretary of the Admiralty, some of the City Aldermen, &c. and with the exception that it is limited to maritime causes, is similar to that granted to the judges on other occasions.

An appeal lies from the inferior Courts of Admiralty to the HIGH COURT OF ADMIRALTY OF ENGLAND, also by 8 Eliz. c. 5. appeal lies from the latter court to commissioners appointed by the court of Chancery; and in case of prize decisions, an appeal lies to commissioners of the Privy Council. And this by virtue of divers treaties with foreign nations, by which particular courts are established in the maritime countries of Europe for the decision of this question; whether lawful prize or not? for this being a question between subjects of different states, it belongs entirely to the law of nations, and not to the municipal laws of either country, to determine it. When sentence has been given by a foreign Admiralty, the party may libel for execution here, without the process of another trial; since all Admiralty courts are supposed to be established upon the same general basis, the decisions of those belonging to other nations, are admitted here, and shall not be examined, that ours may be credited there.

VICE ADMIRALTY COURTS are established in all the dependencies of Great Britain, and are of two kinds, *Prize Courts and Instance Courts*. The affair of Prize Courts, is to enquire into all cases of vessels condemned as prizes, detained by neutrals or enemies, lawfully or unlawfully, and all things that affect cases of capture gene-

rally. Courts of this description were established during the late war, at Antigua, the Bahamas, Barbadoes, Bermuda, Bombay, Calcutta, the Cape of Good Hope, Ceylon, Gibraltar, Halifax, Jamaica, Malta, Madras, Newfoundland, and Tortola. Instance Courts are intended to enquire into all misdemeanours in merchant ships, &c. and have been established at Barbice, St. Croix, St. Christopher's, Dominica, Demerara, Essequibo, Granada, Martinique, Trinidad, and St. Vincents.

ADMIRALTY, JUDGE OF THE, an office originally established in 1640, and filled for the most part, by two or three persons. At the revolution a considerable change took place in it; since which it has been restricted to an individual, whose salary is now £2500 per annum. The Judges of the Vice Admiralty courts in the colonies are allowed in some places £2000 a year from the consolidated fund, besides other perquisites.

ADMIRALTY, REGISTRAR OF THE, holds an office of great pecuniary importance by patent of the High Admiral, or the Lords Commissioners, in virtue of which he assists in the judicial proceedings of the Admiralty courts.

ADMIRALTY, MARSHAL OF THE, is an officer who bears the mace before the Admiralty Judge, attends naval executions, arrestships and persons, and commits offenders to the Marshal-sea.

ADMIRALTY, PROCURATORS OF THE, in all the High Admiral's affairs, and suits of the crown, act as solicitors in the High court of Admiralty; since both the *Counsel of the Admiralty*, and the *diplomatic solicitor of the Admiralty*, are chiefly occupied about the military parts of their official duty.

ADMIRALTY BAY, a large bay on the west coast of Cooke's Straits, New Zealand, S. Lat. 40°, 37'. E. Long. 176°, 54'.

ADMIRALTY INLET, an entrance to the supposed straits of Juan de Fuca, on the west coast of New Georgia, in N. Lat. 48°, 30', W. Long. 124°, 15'.

ADMIRALTY ISLANDS, a cluster of islands to the north of New Britain, in the south Pacific Ocean, in about 20°, 18' S. Lat. and 116°, 44' E. Long. These islands were visited by Morello, in 1781, and again by the expedition in search of La Perouse, in 1793, when the natives appeared very friendly. They are blacks, and of large stature.

ADMIRALTY ISLAND, a large island on the west coast of North America, between the shore of that continent and George the Third's Archipelago. It is about 180 miles in circumference, and is inclosed with numerous noble bays, and covered with fine timber, especially of the pine tribe. This island presents strong evidence of the encroachment of the Pacific on the western shores of the neighbourhood; Vancouver's men having traced the remains of a vast forest of trees into the sea. But the inhabitants were of a very hostile disposition, and prevented the French navigator from much close inspection of their domain. N. Lat. 57°, to 58°. W. Long. 134° to 135°

ADMIRE, v.
ADMIRABLE,
ADMIRABLENESS,
ADMIRARLY,
ADMIRANCE,
ADMIRATION,
ADMIRER,
ADMIRINGLY. Ad : *miror*; to wonder at, in a good or bad sense, but more frequently in the former; to look at, observe, or regard with surprise, wonder, pleasure, delight, or veneration, as extraordinary or singular; agreeable, or the contrary.

I.A. You haue displac'd the mirth,
 Broke the good meeting with most *admir'd* disorder.
Shakespeare's Macbeth.

It is very remarkable to see the manufactures in England, not knowing whether more to *admire* the rarity or variety thereof. *Fuller's Worthies.*

As such we lov'd, *admired*, almost ador'd,
 Gave all the tribute mortals could afford,
 Perhaps we gave so much, the pow'rs above
 Grew angry at our superstitious love;
 For when we more than human homage pay,
 The charming cause is justly snatched away.

Dryden's Elegies.
 Enthusiastick *admiration* seldom promotes knowledge. *Sir Joshua Reynold's Discourses.*

Throughout the whole, the author appears to have been a most critical reader; and a most passionate *admirer* of the Holy Scriptures.

Bishop Newton on Paradise Lost.

ADMIT, v. Ad : *mitto*, to let in; to receive into a place where one is; to introduce; to allow or suffer to be brought in or forward; to give credit to; to assent to a statement; to acknowledge the force of an argument.

Let all kyngs beware how, aftir they haue once tasted of God's trewth, they *admitte* siche popish flatterers into their court and counsail.

Expos. of Daniel, by G. Joye, c. ii. fol. 41.

I *admit* the case as possible, but yet as such a case, as I trust in God, this good man shall see the skye fall firste, and catche larkes ere it happē.

Sir Thomas More's Works, p. 82.
 What,

If I do line one of their hands?—tis gold
 Which buys *admittance*.

Shakespeare's Cymbeline.

And, if I give thee honour due,
 Mirth, *admit* me of thy crew,
 To live with her, and live with thee,
 In unreproved pleasures free.

Milton's L'Allegro.

There's news from Bertran: he desires *Admittance* to the king; and cries aloud, This day shall end our fears. *Dryden.*
 My father saw you ill designs pursue;
 And my *admission* shew'd his fear of you.

Idem.

Blindness being a privative term unto sight, this appellation is not *admittable* in propriety of speech, and will overthrow the doctrine of privations.

Brown's Vulgar Errors.
 Suppose that this supposition were *admissible*, this would not any way be inconsistent with the eternity of the divine nature and essence.

Hale's Contemplations.

ADMISSION, in ecclesiastical affairs, the bishop's acknowledgment that he approves the parson presented to a cure, which he gives on examination, by saying *admitto te habilem*.

ADMITTENDO CLERICO, is a writ granted VOL. I.

to him who hath recovered his right of presentation against the bishop in the common pleas.

ADMITTENDO IN SOCUM, in law, is a writ for the association of certain persons to Justices of Assize formerly appointed.

ADMIX', v. Ad : Ang. Sax. *misan*, by contraction *mics*, to mix; to *ADMIX'TURE*. mingle or blend.

My son Pallas, this young lusty syre,
 Exhort I wald to tak the sterc on hand,
 Ne war that of the blude of this ilk land
Admyxt standis he, takand sum strynd,
 Apoun his moderis syde of Sabyne kynd.

Douglas, b. viii. p. 260.

Though many waies may be found to light this powder, yet is there none I know to make a strong and vigorous powder of salt-peter; without the admixtion of sulphur.

Brown's Vulgar Errors.

All metals may be calcined by strong waters; or by admixtion of salt, sulphur, and mercury.

Baon.

The corruption of philosophy, from the admixture of superstition and theology, is much more extensive and pernicious, either to whole bodies of philosophy or their parts.

Idem.

Possibly all metals may be of one species, and the diversity may proceed from the admixture of different bodies with the principles of the metal.

Ray's Wisdom of God in the Creation.

ADMONISH, v.

ADMON'ISHER,
ADMON'ISHMENT,
ADMON'ITION,
ADMON'TIONER,
ADMON'ITIVE,
ADMON'ITOR,
ADMON'ITORY. Ad : *moneo*. In Wiclid we read moneste, in other of our early writers, monish: to put in mind; to advise, apprise, exhort; to reprove gently, in order to prevent evil conduct.

And euery orakyl of Goddis *admonist* eik,
 That we the realme of Italy suld seik.

Douglas, b. iii. p. 80.

God sayth: Love thy neighbour as thyself; that is to say, to salvation both of lif and soule. And moreover, thou shalt love him in word, and in benigne *admonesting*, and chastising, and confort him in his annoyes, and praye for him with all thy herte.

Chaucer Personnes Tale, V. 2. p. 325.

But yet be wary in thy studious care.—

Thy grave *admonishments* prevail with me.

Shakespeare's Henry V. p. 1.

Ambition of great and famous auditories, I leave to those whose better gifts and inward endowments are *admonitioners* unto them of the great good they can do, or otherwise thirst after popular applause.

Hale's Golden Remains

Yet take heed, worthy Maximus, all ears
 Hear not with that distinction mine do; few
 You'll find *admonishers*, but urgurs of your actions.

Beaumont and Fletcher's Valentinian.

To the infinitely Good we owe
 Immortal thanks; and his *admonishment*
 Receive, with solemn purpose to observe
 Immutably his sovereign will, the end
 Of what we are.

Milton.

Horace was a mild *admonisher*; a court satirist, fit for the gentle times of Augustus.

Dryden

Me fruitful scenes and prospects waste,
 Alike *admonish* not to roam;
 These tell me of enjoyments past
 And those of sorrows yet to come.

Couper's Shrubbery

ADMONITIO FUSTIUM, among the Romans, a military punishment, not unlike our whipping, but performed with vine branches.

ADMONITION, in ecclesiastical affairs, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment, or expulsion of delinquents. In case of private offences, it was performed, according to the evangelical rule, privately: in case of public offence, openly, before the church. If either of those sufficed for the recovery of the fallen person, all further proceedings in the way of censure ceased: if they did not, recourse was had to excommunication.

ADMONT, a market-town, in the circle of Judenburg, Upper Syria, between the Ens and Delta, six miles N.E. of Rottweil.

ADMORTIZATION, in the feudal customs, the reduction of the property of lands or tenements to mortmain. See MORTMAIN.

ADMOVE v. } Ad: *moveo*, to move to- } wards, to approach.

If, unto the powder of loadstone or iron, we *admove* the north pole of the loadstone, the powders or small divisions will erect and conform themselves thereto: but if the south pole approach, they will subside, and inverting their bodies, respect the loadstone with the other extremum.

Brown's *Vedgar Errours*.

ADNA'SCENT, v. } Ad: *nascor, natus*, to } grow to; growing to, or } upon.

Moss, which is an *adnascens* plant, is to be rubbed and scraped off with some instrument of wood which may not excoriate the tree.

Evelyn's *Sylva*.

Osteologists have very well observed, that the parts appertaining to the bones, which stand out at a distance from their bodies, are either the *adnate* or the *enate* parts, either the epiphyses, or the apophyses of the bones.

Smith's *Old Age*.

ADNATA, in anatomy, a thick white membrane, investing the ball of the eye; and forming its outermost coat; called also *circumossalnis* and *circumcalvalis*. It is the tunica adnata, that makes what we commonly call the white of the eye: whence it is also called the albuginea. It springs from the pericranium, and grows to the exterior part of the tunica cornea, serving to connect the whole eye both to the palpebrae, and the adjacent bones, and thus keep it fast in the socket. A little round aperture is left in the forepart, called the sight, through which the iris and pupilla appear. The adnata abounds with veins and arteries, which, though ordinarily not visible, are conspicuous in ophthalmies, which are properly inflammations of this part.

ADNATA is also a term used for such things as grow upon animal or vegetable bodies, whether inseparably, as hair, wool, horns, &c. or accidentally, as the several epistical plants. Among gardeners, it denotes those off-sets, which by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards grow to true roots; what the French call cayeux, or stalks.

ADNOUN, **ADNOMEN**, or **ADNAME**, in grammar, another name for an adjective.

ADO, n. See Do.

And when he was come in, he saith unto them, why make ye this *ado*, and weep? the damsels is not dead but sleepeth.

Mark v. 39.

A man that is inquisitive is commonly envious, for to know much of other men's matters cannot be, because all that *ado* may concern his own estate.

Bacon's *Essay on Envy*.

They moved, and in the end persuaded, with much *ado*, the people to bind themselves by solemn oath.

Hooker.

Let's follow, to see the end of this *ado*.

Shakespeare.

I made no more *ado*, but took all their seven points in my target.

Shakespeare's *Henry IV*.

With much *ado*, he partly kept awake; Not suff'ring all his eyes repose to take.

Dryden.

AD OCTO, q. d. to the eighth number; a term used by some ancient philosophers, to denote the highest, or superlative degree.

ADOLESCENCE, n. } Ad: *olesco*, to } grow perceptibly; to advance to adult age or maturity; usually the time of life between twelve and twenty-one. The Romans extended the period to forty years. Livy calls the Tarquins adolescentes, although they were above thirty years of age. Caesar is styled adolescentis, when six and thirty.

Those times which we term vulgarly the old world, were indeed the youth or *adolescence* of it.

Howell's *Letters*.

He was so far from a boy, that he was a man born, and at his full stature, if we believe Josephus, who places him in the last *adolescence*, and makes him twenty-five years old.

ADOLESCENTIA, **ADOLFSCENCE**, from *adolescere*, to grow, the state of growing youth; which has been understood to last as long as the fibres continue to grow, either in magnitude or firmness. It is commonly computed to be between fifteen and twenty-five, or even thirty years of age; though in different constitutions, its terms are very different.—The Romans usually reckoned it from twelve to twenty-five in boys; and, to twenty-one in girls, &c.—And yet, among their writers, *juvenis* and *adolescens* are frequently used indifferently, for any person under forty-five years.

ADOLPHUS FREDERICK SCHACHT, a silver mine in Sweden, which produced a great deal of silver between 1742 and 1747.

ADOLLAM. See ADULLAM.

ADOM, a territory lying toward the interior of the Gold Coast of Africa. It is of small extent and little known.

ADONAI, אֱלֹהִים, Heb. i. e. the Lord, one of the names of the Supreme Being in the Scriptures. The proper meaning of which is, *lords*, in the plural number; as *Adoni* is *lord*, in the singular. The Jews, who either out of respect, or superstition, do not pronounce the name of *Jehovah*, read *Adonai* in the room of it, as often as they meet with *Jehovah* in the Hebrew text. Leigh, (in his Crit. Sacr.) observes, that "the word κυριος, [synonymous with אֱלֹהִים, *Adonai*,] is in the writings of the Apostles simply and absolutely ascribed to Christ saith Zanchius, a thousand times. In the Old and New Testaments

this title is attributed to God, more than a thousand times, saith *Gerhard*. The Hebrew word אֱלֹהִים, *Adonai*, springs from אֵל, *Adon*, and that from *Eden*, which signifieth a base or pillar, which sustaineth any thing; the Greek [κυριος,] one who hath rule or dominion, being a word of relation. Our English word *Lord*, hath much like force with the Hebrew יְהוָה, being contracted of our old Saxon word *Laford*, which is by interpretation, a sustainer." *Leigh's Crit. Sacr.* in verb *kyrios*.

ADONI, a district of Hindostan, in the province of Bejapoore, on the south side of the Toombuddra. It extends between the 15th and 16th degree of N. Lat. and has the Nizam's dominions to the north, and the Gooty hills southward. This is a portion of the Balaghaut districts, part of the Nizam's territory, which he definitively ceded to the British in 1800, and is included in the Bellary collectorship of the government of BOMBAY.

ADONI, a city of Hindostan, in the province of Bejapoore, the capital of the above district. It stands in N. Lat. $15^{\circ} 32'$. and E. Long. $77^{\circ} 16'$. 145 miles S.W. of Hyderabad, (175 travelling miles) 243 from Seringapatam, and 310 from Madras. This town is falling to decay, but is finely and strongly situated on a hill, where numerous fountains of water are found, and the relics of several magnificent structures. It fell to the Mahomedan princes of the Decean, in the sixteenth century, at which period (1568) it was esteemed almost impregnable by its former masters, the rajahs of Bijanagur. A temporary independent state was created in the neighbourhood by the Patans during the last century; to this succeeded the dominion of Bazalet Jung, the brother of Nizam Ali; that of Tippoo, who besieged, and almost destroyed Adoni, in 1787; and finally, that of the British, to whom the city was ceded with the province in 1800.

ADONIA, in antiquity, solemn feasts in honour of Venus and of her beloved Adonis. The Adonia were observed with great solemnity by most nations; Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. From Syria, they are supposed to have passed into India. They were observed at Alexandria in the time of St. Cyril; and at Antioch, in that of Julian the Apostate, who happened to enter the city during the solemnity, which was taken for an ill-omen. The Adonia lasted two days: on the first of which, certain images of Venus and Adonis were carried, with all the pomp and ceremonies practised at funerals: the women wept, tore their hair, beat their breasts, &c. imitating the cries and lamentations of Venus for the death of her paramour. This lamentation they called Αδωνιασμός. The Syrians were distinguished for their dolorous cries on this occasion, shaving their heads, &c. Among the Egyptians, the queen herself used to carry the image of Adonis in procession. St. Cyril mentions an extraordinary ceremony practised by the Alexandrians: a letter was written to the women of Byblus, to inform them that Adonis was found again: this letter was thrown into the sea, which (it was pretended) did not fail punctually to convey it to Byblus in seven days; upon the receipt of which, the Byblian women ceased

their mourning, sung his praises, and made rejoicings as if he were raised to life again. Or rather, according to Meursius, the two offices of mourning and rejoicing made two distinct feasts, which were held at different times of the year, the one six months after the other; Adonis being supposed to pass half the year with Proserpine, and half with Venus. The Egyptian Adonia are said to have been held in memory of the death of Osiris; by others, of his sickness and recovery. Bishop Patrick dates their origin from the slaughter of the first-born in the time of Moses. The Abbé Banier wrote a Memoir on the subject; and among Shakspere's poems, is a long one on Venus's affection for Adonis. The text of the Vulgate in Ezekiel vii. 14. says, that this prophet saw women sitting in the temple, and weeping for Adonis: according to the reading of the Hebrew text, they are said to weep for *Tammuz*, or the *hidden one*. Now among the Egyptians, Adonis was adored under the name of Osiris, who was sometimes called Ammuz, or Tammuz, the concealed, to denote probably his death or burial. The Hebrews also, in derision, call him the *dead*, Psalm civi. 28. and Lev. xix. 28; and at other times, the image of jealousy, Ezekiel viii. 5, because he was the object of the god Mars's jealousy. F. Calmet is of opinion, that the Ammonites and Moabites gave him the name of Baal-peor. See BAAL-PEOR.

ADONIC, in poetry, a short kind of verse, consisting of a dactylus and a spondeus, or a trocheus; such as *rara juvenus*. It is so named from Adonis, having been originally used in the Threnæ, or lamentations for that favourite of Venus.

ADONIDES, in botany, authors who have given descriptions, or catalogues, of the plants cultivated in some particular place. *Linnæus*.

ADONIDIS HORTI, Adonis's gardens, an appellation for gardens beautifully arranged, and more intended for pleasure than profit.

ADONION, among the ancient botanists, a species of southernwood, according to Gorreaus, which used to be set in pots, and served as an ornament for gardens.

ADONIS, or **ADONIUS**, in ancient geography, a river of Phœnicia, rising in mount Lebanon, and falling into the sea, after a north-west course, at Byblus.

ADONIS, in antiquity, a drink made of wine, mixed with flour of roasted *odor*; otherwise called *Cyceon*.

ADONIS, in botany, **BIRD'S-EYE**, or **PHEASANT'S EYE**; a genus of the class polyandria, order polygynia. It is associated with the multisiliqua, or twenty-sixth natural order. The characters are, CAL. a perianthium, consisting of five obtuse concave leaves, somewhat coloured, and deciduous; COR. from five to fifteen oblong petals obtuse and glossy; STAM. very numerous, short, subulate filaments; the anthera oblong and inflected: PIST. numerous germina collected in a head; no styli; the stigmata acute and reflexed; no pericarpium; the receptacle is oblong and spiky. The seeds numerous, irregular, angular, gibbous at the base, reflexed at the top, somewhat prominent, and awlless. The most remarkable species are :

1. ADONIS ANNUA, a native of Kent

2. ADONIS ESTIVALIS.

3. ADONIS APENNINA.

4. ADONIS VERNALIS, or perennial adonis.

ADONIS, in the heathen mythology, the son of Cinyras, king of Cyprus, and the favourite of the goddess Venus. He was said to have been killed by a wild boar, to the inconsolable grief of the goddess, in the Idalian wood. The fables, respecting his fate, after his death, are very contradictory; some representing him as having been turned into a blood-coloured flower; others into a river, which, at certain seasons, flowed with blood; and a third tradition stating, that Venus having applied to Jupiter for his restoration to life, he was allowed to spend one half of the year with her, and the other with Proserpine. See ADONIA.

ADONIS, in zoology, a small fish, of the anguilliform kind, of a cylindric shape, and about six inches long. Ray supposes this fish, which is also called *exocetus* to be the same with the *exocetus*, of Bellonius, or the *gattorugine*. It is remarkable for sleeping on the surface of the water, and near the shores; and Rondeletius affirms, that he has seen them sleeping upon the dry rocks.

ADONISTS. a party among divines and critics, who contend against the Hebrew points.

ADONJUM. See ADONION.

ADONIUS. See ADONIS.

ADONI-ZEDEK, אֲדוֹנֵי־צָדֵק, Heb. i. e. the Lord's Justice, or the Lord of Justice, a heathen king of Jerusalem, who, jealous of the Israelites under Joshua, formed an alliance with four neighbouring princes, to stop their progress.—*Joshua x.*

ADOORS', Adv: At doors, at the door.

— But what, Sir, I beseech ye, was that paper,
Your Lordship was so studiously employed in,
When you came out *adoors*.

Beaumont and Fletcher's Woman Pleased.

If I get in *adoors*, not the power o' th' country, nor all my aunt's curses shall disemboogue me.

Idem, Little Thief.

The other of them came to another of like condition in like manner, as desiring her company, but so as she would go out at doors.

Gataker's Spiritual Watch.

ADOPT', v. } Ad: *opto*, to choose; to ex-
ADOPT'EPLY, } ercise the will and the judg-
ADOPTION, } ment with regard to an object;
ADOPT'IVE. } to prefer; particularly to se-
lect the child of another person, and to provide
for it as one's own. The Roman customs abound
with instances of this practice. See our GENERAL
ARTICLE.

For when Rene, Duke of Anjou, last king of Sicile, departed without any heire male of his wyfe lawfully begotten, he did adopt to his heyre of all his realmes and dominios, Lewes the Eleventh, father to the third kyng Charles.

Hall, p. 457.

To all the duties of evangelical grace, instead of the *adoptive* and cheerful boldness which our new alliance with God requires, came servile and thrall-like fear.

Milton of Ref. in Eng. b. i.

Tythe is not simply a Levitical duty, but respectively; not the natural child of Moses's law, but the *adoptive*. *Squidman's Larger Work of Tythes.*

Adoptedly, as school-maids change their names.
By vain (though apt) affection. *Shakespeare.*

Were none of all my father's sisters left;
Nay, were I of my mother's kin bereft;

None, by an uncle's or a grandame's side;

Yet I could some adopted heir provide. *Dryden.*

Whether, adopted to some neighbouring star,

Thou roll'st above us in thy wand'ring race;

Or, in procession fix'd and regular,

Mov'st with the heaven's majestic pace;

Or call'd to more celestial bliss,

Thou tread'st with seraphims the vast abyss.

Ibid.

We are seldom at ease from the solicitation of our natural or adopted desires; but a constant succession of uneasinesses (out of that stock which natural wants or acquired habits have heaped up) take the will in their turns.

Locke.

Spontaneous joys, where nature has its play,
The soul adopts, and owns their first-born sway;

Lightly they frolic o'er the vacant mind,

Unenvy'd, unmolested, unconfin'd.

Goldsmith's Deserted Village.

I have adopted the Roman sentiment, that it is more honourable to save a citizen, than to kill an enemy, and have been more careful to protect than to attack.

Johnson's Preface to Shakespeare.

ADOPTER, in chemistry. See RECEIVER.

ADOPTIANI, in church history, a sect of heretics of the eighth century, who advanced the notion, that Jesus Christ, is the Son of God, not by nature, but by adoption.

ADOPTION, in antiquity, was a common custom among the ancient Greeks and Romans, yet not practised, but for certain causes expressed in the laws, and with certain prescribed formalities. It was a sort of imitation of nature, intended for the comfort of those who had no children: wherefore he that was to adopt was to have no children of his own, nor to be likely to have children; yet eunuchs were not allowed to adopt; neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature. It was even required that the person who adopted should be eighteen years older than his adopted son, that there might at least appear a probability of his being the natural father.

Among the Greeks it was called *ιδορης filiation*; and was allowed to such as had no issue of their own; excepting those who were not their own masters, e. g. slaves, women, madmen, infants, or persons under twenty years of age. Foreigners being incapable of inheriting at Athens, if any were adopted, it was necessary first to make them free of the city. The adopted had his name enrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the festival Σαργήλια. To prevent rash and inconsiderate adoptions, the Lacedæmonians insisted that adoptions should be confirmed in the presence of their kings. Adopted children were invested with all the privileges, and were obliged to perform the duties, of natural children; they ceased to have any claim of inheritance or kindred in the family which they had left, unless they first renounced their adoption; and by the laws of Solon, they were not allowed to do this, until they had children, to bear the name of the person who had adopted them: If they died without children, the inhe-

•

•

stance could not be alienated from the family into which they had been adopted. It should seem, that by the Athenian law, a person, after having adopted another, was not allowed to marry without permission from the magistrate: in effect, there are instances of persons, who, being ill used by their adoptive children, petitioned for such leave. But it is certain some men married after they had adopted sons: and then their estates were equally shared between the adopted, and the children, if any, of such marriage.

The Romans had two forms of adoption; one before the prætor; the other at an assembly of the people, in the times of the commonwealth, and afterwards by a rescript of the emperor. In the former, the natural father addressed himself to the prætor, declaring that he emancipated his son, resigned all his authority over him, and consented he should be translated into the family of the adopter. The latter was practised, where the party to be adopted was already free; and this was called *adrogation*. The person adopted changed all his names; assuming the prename, name, and surname of the persons who adopted him.—Among the Turks, the ceremony of adoption is performed by obliging the person adopted to pass through the shirt of the adopter. Hence, among that people, to adopt, is expressed by the phrase, *to draw another through one's shirt*. Something like this was anciently observed among the Hebrews; as the prophet Elijah adopted Elisha for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloak or mantle on him. But adoption, properly so called, does not appear to have been practised among the ancient Jews: Moses says nothing of it in his laws; and Jacob's adoption of his two grandsons, Ephraim and Manasseh, is not so properly an adoption, as a kind of substitution, whereby those two sons of Joseph were allotted an equal portion in Israel with his own sons. Besides the formalities prescribed by the Roman law, various other methods have taken place; which have given denominations to different species of adoption, among the Gothic nations, in different ages; such as,

ADOPTION BY ARMS was when a prince made a present of arms to a person, in consideration of his merit and valour. Thus it was that the king of the Heruli was adopted by Theodoric. The obligation here laid on the adoptive son was, to protect and defend the father from injuries, affronts, &c. And hence according to Selden, the ceremony of dubbing knights took its origin as well as name.

ADOPTION BY BAPTISM was introduced into the Greek church, and came afterwards into use among the ancient Franks. The god-father was so far considered as the adoptive father, that his god-children were supposed to be entitled to a share in the inheritance of his estate. The term has sometimes been employed generally to the spiritual affinity contracted between children and their sponsors, in baptism.

ADOPTION BY HAIR was performed by cutting off the hair of a person, and giving it to the adoptive father. Pope John VIII. is said thus to have adopted Boson, king of Arles.

ADOPTION BY MATRIMONY, is the taking the children of a wife or husband by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans; among whom, it is more particularly known, by the name of *einkindschaft*; among their writers in Latin, by that of *unio prolium*, or *union of issues*. But the more accurate writers observe, that this is no adoption. See **ADFILIACTION**.

ADOPTION INTO HOSPITALS, is used for the admission of persons into certain hospitals, particularly that of Lyons; the administrators whereof have all the power and rights of parents over the children admitted.

ADOPTION OF ACADEMIES, is the reception of a new academy into the body of an old one — Thus the French Academy of Marseilles was adopted by that of Paris; on which account, we find a volume of speeches extant, made by several members of the academy of Marseilles, deputed to return thanks to that of Paris for the honour.

ADOPTIVE ARMS, are those which a person enjoys by the gift or concession of another, and to which he was not otherwise entitled. They stand contradistinguished from arms of alliance.

ADOPTIVE GODS, were the gods of other nations, adopted by the ancient Romans, and so styled in contradistinction to domestic ones. They were taken chiefly from the Egyptians: such as Isis, Osiris, Anubis, Apis, Harpocrates, Canopus, &c.

ADOPTIVE WOMEN, in ecclesiastical writers, we find adoptive women, or sisters, (*adoptive feminine*, or *sorores*,) used for those handmaids of the ancient clergy, otherwise called *sub introducte*.

ADOR, *adop*, in botany, a species of corn, called also, *Spelta* and *Zea*.

ADORAIM, a city belonging to the tribe of Judah, near Maresa, on the confines of Idumea. It was taken by Hyrcanus, in his expedition into Syria, to destroy the temple of the Samaritans on Mount Gerezim. *Joseph. Antiq.*

ADORAT, in chemistry, a weight of four pounds.

ADORATION, among the ancients, literally signified, to apply the hand to the mouth; *Mannum ad os admovere*, *q. d.* to kiss the hand: this being, in the eastern countries, one of the great marks of respect and submission. Nothing can more plainly illustrate this primitive mode of adoration than the protestation of Job, chap. xxxi. 26, 27, ‘If I beheld the sun when it shined, or the moon walking in brightness, and my mouth hath kissed my hand, this also, were iniquity.’ In the Hebrew idiom, kissing, (from such a usage perhaps,) commonly signifies adoration.

Herodotus considers the custom of kissing the hand in adoration, to have been adopted by the Greeks from the Persians: it certainly obtained at an early period all over the East.

The Romans practised adoration at sacrifices, and other solemnities; in passing by their temples, altars, groves, &c.: at the sight of statues, images, or the like, whether of stone or wood,

wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, to remind those who went in or out, of the homage due to them. The Roman ceremony of adoration has been thus described : The devotee having his head covered, applied his right hand to his lips, the fore finger resting on his thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss given, was called *osculum labratum*; for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet, or even knees, it being held an incivility to touch their mouths, so that the adoration passed at some distance. Saturn, however, and Hercules, were adored with the head bare: whence the worship of the last was called *institutum peregrinum*, and *ritus Graecanicus*, as departing from the customary Roman method, which was to sacrifice and adore with the face veiled, and the clothes drawn round the head, to prevent any interruption in the ceremony, from the sight of external objects.

The primitive Christians adopted the Grecian rather than the Roman method, and adored always uncovered. Their ordinary posture of prayer was kneeling, but on *sundays* standing; and a superstitious regard to praying towards the east was introduced at an early period. Hence some of their Pagan opponents alleged, that they adored the sun.

STANDING was an early eastern attitude of adoration; the body being inclined forward, and the eyes cast down to the earth; with the hands probably resting on the knees. Thus Solomon "stood before the altar of the Lord, in the presence of all the congregation of Israel, and spread forth his hands toward heaven, 1 Kings viii. 22. This was a posture practised both by the Greeks and Romans.

SITTING, with the under part of the thighs resting on the heels, was an ancient Egyptian practice of this kind; and most, if not all, the figures of Egyptian worshippers in their sacred edifices, are represented in this attitude. See also, 1 Chron. xvii. 16.

KNEELING, common in all ages and countries as a posture of adoration, we need hardly enumerate. It seems naturally to import a person's endeavouring to lessen his own self importance, and his consciousness of intercourse with a superior being.

PROSTRATION, or the casting down of the whole person on the ground, accompanied sometimes by *kissing the ground*, was amongst the Persians the common mode of expressing reverence for their kings. If the party admitted to the royal presence, were a vanquished prince, he kissed, according to Herbelot, the prints of the horse-shoe of his conqueror, repeating this formula : 'The mark that the foot of your horse has left upon the dust, serves me now for a crown. The ring, which I wear as the badge of my slavery, is become my richest ornament. While I have the happiness to kiss the dust of your feet, I shall think that fortune favours me with her tenderest caresses, and her sweetest kisses.' The Jewish commander, Joshua, thus

adored by prostration, Josh. vii. 6, 10., as did Manoah and his wife, Judges xiii. 20. David and his princes, 1 Chron. xxi. 16.; the prophets frequently. Ezek. i. 28; iii. 23, &c.; and Jesus Christ himself, Matt. xxvi. 39. Amongst the Romans, the sick were always directed to lie down in the temple of Esculapius.

Kissing the feet, walking *bare-footed*, and *pulling off the shoes* in a ceremonious way from the feet, are other tokens of adoration practised both in ancient and modern times. For the last, see Exod. iii. 5. The Mahometans always observe this practice when they enter their mosques; and travellers report that there are seen as many slippers and sandals at the doors of an Indian pagoda, as there are hats hanging up in our churches. Mr. Wilkins mentions, upon his expressing a wish to enter the inner hall of the college of seiks, at Patna, he was informed, "it was a place of worship, and it was necessary for him to take off his shoes." Kissing the feet is a token of homage well known to be paid to the pope, and said by some writers to have been borrowed from a custom of the primitive church, in which the bishops were thus honoured; the people exclaiming as they offered this mark of respect, *προσκύνω*, I adore thee. Others derive it from a custom of the imperial court. His holiness is said to wear a crucifix on his slipper, that scrupulous consciences may transfer the homage to Christ. It is recorded of Diocletian, that he had gems affixed to his shoes, that the people might the more readily offer him the honour of adoration in this way.

The following curious account of the modes of Hindoo adoration, which they call *pōōja*, is given by Mr. Ward in his "View of the history, literature, and religion of that people."

"Previously to entering on this act of idolatry, the person bathes: returning home he washes his feet, spreads a blanket, or some other proper thing to sit upon, and then sits down before the idol, having the articles necessary for worship before him: a kosha or metal basin, and a koshee, or smaller one; a small wooden stand, a metal plate, an iron stand to hold five lamps, a censer, a brass stand with a small shell placed on it, a metal plate on which to place flowers, a metal bowl into which the water and flowers are thrown after they have been presented to the idol, a metal jug for holding water, a metal plate to be used as a bell; a shell, or sacred conch, which sounds like a horn; with a number of dishes, cups, and other utensils for holding rice, paint, incense, betel, water, milk, butter, curds, sweetmeats, flowers, clarified butter, &c. Having all these articles ready, the worshipper takes water from the kosha with the koshee; and, letting it fall into his hand, drinks it; he then takes a drop more, and then a drop more, repeating incantations. After this, with the finger and thumb of his right hand, he touches his mouth, nose, eyes, ears, navel, breast, shoulders, and the crown of his head, repeating certain forms. He then washes his hands, makes a number of motions with his fingers, and strikes the earth with his left heel three times, repeating incantations. When this is done, he flings the first finger and thumb of his right hand, waving

his hand toward the ten divisions of the earth; closes his eyes, and repeats incantations to purify his mind, his body, the place where he sits, as well as the offerings about to be presented (which it is supposed may have become unclean by having been seen or touched by a cat, a dog, a shackal, a shoodru, or a Mussulman.) Next, he takes a flower, which he lays on his left hand, and putting his right hand upon it, revolves in his mind the form of the god he is worshipping. He then lays the flower on his head, recites the outward forms of worship in his mind, and presents the offerings:—first, a square piece of gold or silver, as a seal for the god, inviting him to come and sit down, or visit him; and then, asking the god if he be happy, repeats for him “very happy.” After this, he presents water to wash the feet; then rice, a vilwu leaf, eight blades of doorva grass, paint, and water, with incantations. He then presents water to wash the mouth, curds, sugar, honey, water to bathe in; then cloth, jewels, gold, silver, ornaments, bedsteads, curtains, a bed, pillow, cloth, printed cloth; clothes for men, women, or children; shoes, brass drinking cups, candlesticks, and whatever would be proper presents to the brahmuns, &c. &c. &c.—At last the person prostrates himself before the object of worship, and then retires to feast on the offerings with other brahmuns. This is a detail of the form of worship on a large scale, at which time it occupies the officiating brahmun two hours.” Vol. ii. p. 64, *et seq.* 8vo.

The reader will observe from the foregoing historical collections, how various are, and have been, the objects of human adoration. Every gradation of respect and homage has been indicated by it: and its religious character is of course to be estimated entirely by our views of the being or object to whom it is addressed. It can scarcely need to be added that the second commandment seems expressly given to regulate our views of this subject, and to warn all sincere believers in Divine Revelation, of the guilt and danger of transferring any of the honours of ‘a jealous God.’

ADORE', *v.* Ad: *oro*, from *os*, the **ADOR'ABLE**, *n.* mouth, properly to address; **ADOR'ANT**, *adj.* oral prayers, but used more **ADORATION**, *n.* generally, to acknowledge **ADOR'MENT**, *n.* the existence and power of **ADOR'ER**. the supreme Being; to reverence, with sentiments of awe and love; to worship; to invoke; to supplicate; to intreat.

With that my fader vincust stert on fute,
And to the goddis carpis to be our bute,
The haly sterne *adoris* he ryght thare,
Now, now, quod he, I tary no langare,
I follow, and quhidder ze gide me sall I wend.
Douglas, book ii. p. 62, *Aeneid*.

And miche more execrable is it to serue or worship the [images] with any reverent behauour, ether by *adoration*, prostration, knelyng, or kissing.

The Exposition of Daniel by Geo. Joye, fol. 35, col. 2.

Votum in the scriptures hath not one only sygnyfycyon, but many. Some where it is a knowledgyng of Gods Benefyghtes, some where a faythe in hya promyses, some wher an *adoracyon*, u worshypp.

Bale's Apology, fol. 52, col. 1.

Dye rather, die, and dying doe her serue,
Dying her serue, and living, her *adore*;
Thy life shee gave, thy life she doth deserue:
Dye rather, die, than euer from her seruice swerue.

Spencer's Faerie Queene.

— Rejoicing, but with awe,

In adoration at his feet I fell

Submit.

Milton's Paradise Lost.

The priests of elder times deluded their apprehensions with soothsaying, and such oblique idolatries; and even their credulities to the literal and downright *adoration* of cats, lizards, and beetles.

Brown's Vulgar Errors.

The God of nature ordained from the beginning that he should be worshipped in various and sundry forms of *adorations*, which, nevertheless, like so many lines, should tend all to the same centre.

Howell's Letters.

'Tis *adoration*, some say, makes the God,
And who would pay it, where would be their altars,
Were no inferior creatures?

Dryden's Troilus and Cressida.

The mountain nymphs and Themis they *adore*,
And, from their oracles, relief implore. *Dryden*.
The people appear adoring their prince, and their
prince *adoring* God. *Tatler*, No. 57.

Make future times thy equal act *adore*;

And be, what brave Orestes was before.

Pope's Odyssey.

Whilst as th' approaching pageant does appear,
And ech~~ing~~ crowds speak mighty Venus near;
I, her *adorer* too, devoutly stand,
Fast on the utmost margin of the land. *Prior*.

ADOREA, in Roman antiquity, grain, or a kind of cakes made of fine flour, and offered in sacrifice; or a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

ADORN', *v.* and *n.* Ad: *orno*. Orno is of doubtful origin. *Vossius*

ADORN'MENT. Derives it from Gr. *Ωρα*, time in general or any specific period, as Spring. In Greek authors, it also bears the signification of beauty, maturity; and may be applied to whatever is pleasing or agreeable. Wicklif uses *ourn*; to beautify, decorate, dress, or set off to the best advantage; to embellish.

Quhaz till this was the latter dulefull day,
With festuall flouris, and bewis as in May,
Did wele *adorn*, and feise and riot maid,
Throwout the toun, and for myscheif was glaid.
Douglas, b. ii. p. 47.

At his first settynge foote on land, the garter of thorder was set and made faste aboute his [Philip of Spain] legge, whiche was sent vnto hym by the quene, richly *adorned* with precious iewelles.

Fabyan, p. 715.

The holie senate was *adorned* with olde prudent persons: And not without teares I saie, it is at this houre ful of iäglers and liers. *The Golden Booke*.

He hath clothed me with the garments of salvation; he hath covered me with the robe of righteousness; as a bridegroom decketh himself with ornaments, and as a bride *adorneth* herself with her jewels.

Isaiah, c. lxi v. 16.

This attribute was not given to the earth, while it was confused: nor to the heavens, before they had motion and *adornment*. *Raleigh's History of the World*,

Her breast all naked, as net iuory,

Without *adorne* of gold or silver bright,

Wherewith the craftes-man wonts it beautifie,

Of her dew honour, was despoyled quight.

Spencer's Faerie Queene, b. iii. c. 12

She held the very garment of Posthumus in more respect, than my noble and natural person, together with the *adornment* of my qualities.

Shakspeare's Cymbeline.

She'll to realities yield all her shows ;
Made so *adorn*, for thy delight the more.

Milton.

Thousands there are, in darker fame that dwell,
Whose name some nobler poem shall *adorn* ;
For, though unknown to me they sure fough't well.

Dryden.

How negligently graceful he [the noble Montague] unreins

His verse, and writes in loose familiar strains ;
How Nassau's god-like acts *adorn* his lines !

And all the hero in full glory shines'

Addison's Account of the greatest English Poets,

Yet 'tis not to *adorn* and gild each part
That shews more cost than art ;
Jewels at nose and lips, but ill appear.

Cowley.

Let vanity *adorn* the marble tomb
With trophies, rimes, and scutcheons of renown ;
In the deep dungeon of some Gothic dome,
Where night and desolation ever frown.

Beattie.

The task of an author is, either to teach what is not known, or to recommend known truths by his manner of *adorning* them.

Rambler.

ADOS, in chemistry, water in which red hot iron has been cooled.

ADOSCULATION, in botany, a term that has been used to express the impregnation of plants by the falling of the farina fecundans on the pistil.

ADOSSEE, probably from *ad*, to, and *dorsa*, backs, in heraldry, two figures or bearings, placed back to back.

ADOT'ED. See DOTE.

It falleth that the most wise
Ben other while of loue *adoted*.

Gower, Con. A. b. vi.

ADOUR, a river of France, which rises in the mountains of Bigorre, in the upper Pyrenees, and running N. by Tarbes through Gascony, afterwards turns E., and passing by Dax, falls into the bay of Biscay, about three miles below Bayonne.

ADOUY, a market town of Hungary, in the county palatine of Stuhlweissenburg, on the Danube; also the name of several small towns in the counties of Bihar, Beregh, and Saboltch,

ADOWA, a city of Abyssinia, the capital of the province of Tigré, and residence of the sovereign; situated partly on the side, and partly at the foot of a hill, and commanding a magnificent view of the adjacent mountains. The houses are pretty regularly disposed into streets or alleys, and of a conical form, interspersed with trees and small gardens. The population cannot fall short of 8000. Here is a remarkable manufacture of cotton cloths, both coarse and fine, but particularly the former, which are considered to excel those made in any other part of Abyssinia, and which circulate like money. Adowa is the principal commercial town E. of the Tazacze, and the channel by which the communication between the coast and the interior is almost exclusively carried on. The provinces to the south abound in cattle and corn, which, with

salt, constitute their chief articles of barter. About a thousand slaves pass through Adowa, to be shipped at Massuah and other ports on the Red Sea. A considerable number of Mahometans are resident, and visitors here, and are the only class of the population at all animated by the spirit of trade. The inhabitants are more civilized than is usual in Abyssinia. Long. 39°, 5. E. Lat. 14°, 12', 30". N.

ADOWN,'

ADOWN'WARD. { See DOWN.

And stones *adonward* slonge vp hem y nowe,
And myd speres and myd flou vaste of hem slowe,
And myd stuerd and myd ax.

R. Gloucester, p 362.

Whan Phebus dwelled here in erth *adoun*,
As olde booke makem mentiouen,
He was the moste lusty bacheler.
Of all this world, and eke the best archer.

Chaucer. The Manciple's Tale.

Thrice did she sink *adown* in deadly sound ;
And thrice he her revived, with busy pain.

Spencer's Faerie Queene.

In this remembrance, Emily, ere day
Arose, and dress'd herself in rich array ;
Fresh as the month, and as the morning fair
Adown her shoulders fell her length of hair.

Dryden.

Her hair
Unty'd, and ignorant of artful aid,
Adown her shoulders loosely lay display'd,
And in the jetty curls ten thousand' cupids play'd.

Prior's Solomon.

Adown Augusta's pallid visage flow
The living pearls with unaffected woe.
Discons'late, hapless, see pale Britain mourn,
Abandon'd isle ! forsaken and forlorn !

Falconer's Ode on the Duke of York.

ADOXA, tuberous moschatel, hollow-root, or inglorious; in botany, a genus of the tetragynia order, belonging to the octandra class of plants; and in the natural method ranking under the thirteenth order, succulentæ.

The characters of this genus are : CAL. a perianthium beneath, divided into two segments, flat, persistent: COR. composed of one flat petal, divided into four ovate acute segments longer than the calyx: STAM. eight subulated filaments the length of the calyx; with roundish antheræ: PIST. has a germin beneath the receptacle of the corolla; four simple, erect, persistent styli, the length of the stamina; and simple stigmata: PER. a globular four-celled berry between the calyx and corolla. The seeds solitary and compressed. There is but one species, which is a native of the woods in Britain, and Europe.

ADPERCEPTION, in metaphysics, a term used by Leibnitz, to denote the act whereby the mind becomes conscious to itself of a perception.

AD PONDUS OMNIUM, to the weight of the whole; an abbreviation among physicians, signifying, that the last prescribed ingredient is to weigh as much as all the others put together.

AD QUOD DAMNUM, in the English law, a writ directed to the sheriff, commanding him to enquire into the damage which may befall the king, or other person, by granting certain privileges to a place, such as a fair, a market, or the like; or by granting lands in fee-simple to a body politic; or by turning or changing high

ways; in which cases, the party aggrieved may complain to the justices, at next quarter session; failing which complaint, the inquisition is recorded and becomes binding.

ADRA, a district and sea-port town of Granada in Spain, 45 miles S.E. of Granada, and 22 S.W. of Almeira. It was formerly called **ABDARA**, which see. Long. $3^{\circ} 10' W.$ Lat. $36^{\circ} 4' N.$ The river also on which it stands bears this name.

ADRACHNE, in botany, a species of the strawberry-tree, which grows plentifully in the island of Candy. See **ARBUTUS**.

ADRACLA, another name for the preceding shrub.

ADRAGANTH, in medicine, gum dragon. It distils by incision, from the trunk or roots of a plant which grows in the Levant. The gum is of different colours, white, red, grey, and black, and is useful in medicine. Skinners use great quantities of it in preparing their leather, and prefer the red and black. It is the astragalus tragacanthus of Linnaeus.

ADRAMIRE, or **ADRHAMIRE**, in law, to oblige one's self, before a magistrate, to do a thing. *Bailey.*

ADRAMMELECH, אֲדָרְמֵלֶךְ, of אֲדָרָה, greatness, or אַדְרָה, a cloak, and לֶךְ, a king, Heb. i. e. the king's greatness, or cloak, an idol of the Assyrians, sometimes represented by the figure of a peacock, sometimes by that of a mule, to whom they sacrificed their children, by fire, in the most cruel manner. See **MOLUCH**. Also the name of one of the sons of Senacherib, king of Assyria.

ADRAMYTENUS CONVENTUS, assizes or sessions, held at Adramyttium, being the eighth in order of the nine *Conventus Juridici* of the province of Asia.

ADRAMYTENUS SINUS, in ancient geography, a part of the Egean Sea, on the coast of Mysia.

ADRAMYTNIUM, in ancient geography, now Adramiti; a town of Mysia Major, at the foot of Mount Ida. It was an Athenian colony, with a harbour and dock near the Caicus. *Strabo*, l. xiii.

ADRAMYTNIUM, a city on the N. coast of Africa, westward of Egypt.

ADRANA, a river of Germany; now the Eder, rising on the borders of the country of Nassau, to the north-east of Dillenburg, and running through the landgraviate of Hesse into the Fulda. See **EDER**.

ADRANITÆ, or **HADRANITANI**, the inhabitants of Adranum.

ADRANUM, or **HADRANUM**, in ancient geography, now Aderno; a town of Sicily, built by the elder Dionysius, at the foot of mount Etna, 400 years before Christ, and so called from the temple of **ADRANUS**, which see.

ADRANUS, or **HADRANUS**, an idol worshipped by the ancient Sicilians.

ADRANUS, a river of Sicily, now called Fiume d'Aderno.

ADRASTEA, in antiquity, a name given to Nemesis, the goddess of revenge, or the punisher of injustice. The Egyptians placed her above the moon, that she might the more easily observe human actions. King Adrastus first erected a

temple to this goddess, and some suppose gave her this name.

ADRASIA CERTAMINA, in antiquity, public games, instituted by Adrastus king of Argos, at Sicyon, A. M. 2700, in honour of Apollo.

ADRASIA, in botany, a name given by De Candolle, to a plant of New Holland, called also *oceana*, of the class *decandria*, order *dignyia*. Natural order, magnolia, according to Jussieu.

Its characters are, CAL. inferior, of five permanent pointed leaves. PET. five oval, shorter than the calyx. STAM. filaments flat, anthers linear, of two cells. PIST. Germens two, globose. Styles straight and close together, awl-shaped. Seed solitary.

ADRASTUS, king of Argos, son of Talaus and Lysimache, acquired great honour in the famous war of Thebes, in support of Polynices his son-in-law, who had been excluded the sovereignty of Thebes by Eteocles his brother. Adrastus, followed by Polynices and Tydeus another son-in-law, Capaneus, Hippomedon his sister's son, Amphiaraus his brother-in-law, and Parthenopaeus, marched against the city of Thebes; and this is the expedition of the Seven Worthies, which the poets have so often sung. All seven of them lost their lives in this war except Adrastus, who was saved by his horse called Arion. The war was revived ten years after, by the sons of the deceased warriors, and called the war of the Epigones, which ended with the taking of Thebes. In this contest fell Agialeus, son of Adrastus; which afflicted him so much that he died of grief. Also a Phrygian prince, who fled to the court of Cresus, and being made guardian to his son Atys, inadvertently slew him while hunting, and afterwards killed himself. *Herod.* i. 35.

ADRAZZO, the same with **ADJAZZO**, or **AJACCIO**.

ADREAD'. See **DREAD**.

Ther n'as baillif, ne herde, ne other hine,
That he ne knew his sleight and his covinc :
They were *adradde* of him, as of the deth.

Chaucer. The Prologue. The Reve.
And on that o side of the towne
The kynge let make Ilion,
That high toure, that stronge place
Which was *adrad* of no manace
Of quarele, nor of none engyne.

Gouver Con. A. b. v.

ADRETS, (Francis de Beaumont, baron des,) one of the chiefs of the Huguenots in France, who in 1562, signalled himself by many brave exploits, tarnished, however, by detestable cruelties. At some places he obliged his prisoners to throw themselves from the battlements, upon the pikes of his soldiers. When reproaching one of them for shrinking back twice from the fatal leap. "Sir, (replied the man,) I defy you, with all your bravery, to take it in three leaps." This witticism saved the soldier's life. After the peace the baron turned Catholic, and died deservedly hated in 1587. A son of his was concerned in the massacre of Paris.—*Nouv. Dict. Hist.*

ADRIA, an episcopal town in Italy, situated on a peninsula formed by the river Tartaro and an arm of the Po, in that part of the Venetian territory called the Polesino di Rovigo, now belonging to Austria. This once flourishing town, the *Atria* of Pliny and Ptolemy, and the

Adrius of Strabo; and which gave name to the Adriatic sea, is now greatly decayed, and has not above 7200 inhabitants. 15 miles E. of Rovigo. Long. 12°, 2' E. Lat 45°, 2' N.

ADRIAMPATAM, a town on the coast of Tanjore, Hindostan, 37 miles S. by E. of Tanjore. N. Lat. 10°, 20'. E. Long. 79°, 30'.

ADRIAN, or HADRIAN, PUBLIUS AELIUS, the fifteenth emperor of Rome. He was born at Rome, A. D. 76, and left an orphan, at ten years of age, under the guardianship of Trajan, and Cœlius Tatianus, a Roman knight. He began to serve very early in the armies, was tribune of a legion before the death of Domitian, and was chosen by the army, to carry the news of Nerva's death to Trajan, his successor. He accompanied Trajan in most of his expeditions, distinguished himself in the second war against the Dacii, and was successively appointed quaestor, tribune of the people, prator, governor of Pannonia, consul, and governor of Syria. After the siege of Atra was raised, Trajan left him the command of the army, and when he found death approaching, adopted him. Adrian, who was then in Antioch, as soon as he heard of Trajan's death, declared himself emperor, A. D. 117, made peace with the Persians, and from generosity or policy, remitted the debts of the Roman people, which, according to the calculation of those who have reduced them to modern money, amounted to 22,500,000 golden crowns: and that the people might be under no apprehension of being called to an account for them afterwards, burnt all the bonds and obligations relating to those debts. There are medals still extant, in commemoration of this fact, in which he is represented holding a flambeau in his hand, setting fire to the bonds. He visited all the provinces, and did not return to Rome till the year 118, when the senate decreed him a triumph, and honoured him with the title of *Father of his country*; but he refused both, and desired that Trajan's image might triumph. No prince travelled more than Adrian; there being hardly a province in the empire, which he did not visit. In 120 he went into Gaul; from thence to Britain, in order to subdue the Caledonians, who were making continual inroads into the provinces. Upon his arrival, they retired towards the north: when he advanced as far as York, but was diverted from his intended conquest by the description which some soldiers, who had served under Agricola, gave him of the country. In hopes, therefore, of keeping them quiet, by enlarging their bounds, he delivered up to the Caledonians, all the lands lying between the two Friths and the Tyne; and at the same time, to secure the Roman provinces from their future incursions, built the famous wall which still bears his name. See ADRIAN'S WALL. Having thus settled matters in Britain, he returned to Rome, where he was honoured with the title of *Restorer of Britain*, as appears by some medals. Adrian soon after went into Spain, to Mauritania, and at length into the East, where he quieted the commotions raised by the Parthians. Having visited all the provinces of Asia, he returned to Athens, in 125 where he was initiated in the mysteries of

Eleusinian Ceres. From thence he went to Sicily, to view the phenomena of Mount Aetna, and enjoy the extensive prospect from its top. He returned to Rome in 129; and again visited Africa and the East; was in Egypt in 132, revisited Syria, in 133, returned to Athens in 134, and to Rome in 135. The persecution against the Christians was very violent under his reign; but it was at length suspended, in consequence of the remonstrances of Quadratus, bishop of Athens, and Aristides, two Christian philosophers, who presented the emperor with some books in favour of the Christian religion. He conquered the Jews; and, by way of insult, erected a temple to Jupiter on Calvary, placed a statue of Adonis in Bethlehem, and caused images of swine to be engraven on the gates of Jerusalem. At last he was seized with a dropsy, of which he died at Baiae, in the sixty-third year of his age, and the twenty-first of his reign. The Latin verses he addressed to his soul, not long before he breathed his last, are a fine instance of self-possession at such a moment,

Animula, vagula, blandula,

Hospes, comesque corporis,

Quæ nunc abilis in loca

Pallidula, rigida, nudula?

Nec, ut soles, dahis jocos.

Thus given by Pope, and probably supplying to him some of the finest thoughts of his celebrated Ode.

Ah! fleeting spirit! wandering fire,
That long has warmed my tender breast,
Must thou no more this frame inspire?
No more pleasing, cheerful guest!
Whither, ah! whither art thou flying?
To what dark undiscovered shore?
Thou seem'st all trembling, shiv'ring, dying,
And wit and humour are no more!

There are some fragments of other Latin poems of his extant, and some of his Greek verses in the Anthology. He also wrote the history of his own life: to which, however, he did not put his name, but that of Phlegon, one of his freed-men. He had great wit, and an extensive memory; and understood the sciences, but was jealous of others who excelled in them. One of the friends of Favorinus asked the latter, who knew the emperor's foible, why he improperly yielded to Adrian in an argument: "Wouldst thou not have me yield to the master of thirty legions?" he replied. He was also cruel, envious, and lascivious. Antoninus his successor obtained his apotheosis; and prevented the rescission of his acts, which the senate once intended.

ADRIAN, the African, abbot of St. Peter's, Canterbury, in the 7th century, accompanied Theodore, archbishop of Canterbury to England. The united efforts of these learned ecclesiastics, diffused no small degree of light over this dark period of Anglo-Saxon history. Adrian was the preceptor of Aldhelm, and Bede extols the happy time when the island enjoyed his tuition: and Kent "was the fountain of knowledge to the rest of England."

Turner's Anglo-Saxons, v. ii. 381.

ADRIAN IV. (Pope) the only Englishman who ever had the honour of sitting in the papal chair. His name was Nicholas Brekespere; and

he was born at Langley, near St. Alban's, in Hertfordshire. His father having taken the habit of the monastery of St. Alban's, Nicholas was obliged to submit to the lowest offices in that house, for daily support. He desired to take the habit of the monastery, but being rejected by the abbot, resolved to try his fortune in Paris, where, though very poor, he applied himself to his studies with great assiduity. But having still a strong inclination to a religious life, he left Paris, and removed to Provence, where he became a regular clerk in the monastery of St. Rufus. Here, after some time, he recommended himself to the monks by a strict attention to their concerns; which, with the beauty of his person, and his prudent conversation, rendered him so acceptable an inmate, that they entreated him to take the canonical habit. He now distinguished himself by his learning and strict observance of the monastic discipline; and upon the death of the abbot, was chosen superior of the house. Pope Eugenius III. being apprised in 1146 of the great merit of Nicholas, and thinking he might be serviceable to the church in a higher station, created him cardinal bishop of Alba, and in 1148, sent him legate to Denmark and Norway; where, by his fervent preaching, he is said to have converted those nations to the Christian faith; and erected Upsal into an archiepiscopal see. Upon his return to Rome, he was received with great marks of distinction; and on the death of Pope Anastasius, who had succeeded Eugenius, was in 1154, unanimously chosen to the papal chair, when he took the name of Adrian.

The news of his election reaching England, Henry II. sent Robert, abbot of St. Alban's, and three bishops, to Rome, with congratulations; upon which occasion Adrian granted large privileges to the monastery of St. Alban's, particularly an exemption from all episcopal jurisdiction, excepting to the see of Rome. In the beginning of his pontificate, he withheld the attempts of the Romans to recover their ancient liberty under the consuls, and obliged those magistrates to leave the government of the city to the Pope. In 1155, he drove Arnould of Brescia, and his followers, out of Rome, excommunicated William king of Sicily, who had ravaged the territories of the church, and absolved his subjects from their allegiance. About this time, Frederic king of the Romans, having entered Italy with a powerful army, Adrian met him near Sutrium, and concluded a peace. At their interview, Frederic consented to hold the Pope's stirrup, whilst he mounted on horseback: after which his holiness conducted that prince to Rome, and in St. Peter's church placed the imperial crown on his head, to the great mortification of the Romans. The next year a reconciliation was brought about between the Pope and the Sicilian king, that prince taking an oath to do nothing farther to the prejudice of the church, and Adrian granting him the title of *king of the two Sicilies*. This pontiff built and fortified several castles, and left the papal dominions and papal domination considerably improved and increased. But notwithstanding all his prosperity he is said to have been extremely sensible of the

disquietudes of his high station; and declared to his countryman, John of Salisbury, that all the former hardships of his life were mere amusement to the perplexities of the popedom: that he looked upon St. Peter's chair to be the most uneasy seat in the world; and that he constantly felt as if his crown were burning his temples. Some writings, which remain in MS. are attributed to this pope, and various letters and homilies. His letter of licence to Henry II. to conquer Ireland, is in Wilkin's Concil. Britan.; and the treaty of peace which so concerns the Sicilian monarchy, may be seen in Baronius' Annals. Adrian's death is, by some writers, attributed to poison; but is more generally said to have been occasioned by a fly settling accidentally in his throat, and suffocating him. He died in 1156, in the fifth year of his pontificate; and was buried in St. Peter's church.

ADRIAN VI. (Pope,) was born at Utrecht, in 1459. His father was not able to maintain him at school, but entered him at Louvain, in a college in which a certain number of scholars were maintained *gratis*. It is reported that he used to read in the night by the light of the lamps in the churches or streets. He made a considerable progress in all the sciences; led an exemplary life; and never was a man who rose to eminence, less intriguing. He took his degree of D.D. at Louvain; was soon after made canon of St. Peter's, and professor of divinity at Utrecht, and then dean of St. Peter's and vice-chancellor of the university. His academical life he resigned to become tutor to the then archduke Charles V. who, however, made no great progress under him: but never was a tutor more gratefully remembered; for by Charles's influence Adrian was raised to the papal throne. Leo X. had given him the cardinal's hat in 1517. After this pope's death, several cabals in the conclave ended in the election of Adrian; and though many popes have been more popular at Rome, few have been so liberal, and so truly conscientious. He would not change his name, and in every thing shewed a great dislike for ostentation and sensual pleasure; lamented much the inconsistencies of the clergy, and the want of reformation in the church. Having written in early life against the infallibility of the holy see, he reprinted his work without alteration, when pope; and is said steadily to have resisted various persecuting measures to which he was advised against the Lutherans. He died in 1523.

ADRIAN DE CASTELLO, a cardinal priest, was a native of Cornetto in Tuscany. Innocent VIII. sent him nuncio into Scotland and France; and after he had been clerk and treasurer of the apostolic chamber, pope Alexander VI. whose secretary he had been, honoured him with the cardinal's hat. His life was a continued scene of odd incidents. He narrowly escaped death the day Alexander VI. poisoned himself by mistake; that pontiff and his son having, in fact, mingled a poisonous potion for Adrian, which they themselves drank. Afterwards he incurred the hatred of Julius II. so that he was obliged to hide himself in the mountains of Trent. Having been recalled by Leo X. he was so ungrateful, that he

engaged in a conspiracy against him ; which Leo detecting, Adrian was amerced in a fine of 12,500 ducats, and forbidden to quit the papal territory. This order, however, he disobeyed, and all his ecclesiastical honours and preferments were, in consequence, taken from him by public sentence. Whither he fled has never been with certainty ascertained. Castello was one of the first that effectually reformed the Latin style. He studied Cicero with great success, and made many excellent observations on the Roman tongue, in his treatise *Dc Sermone Latino*. He had begun a Latin translation of the Old Testament : and wrote a treatise *De vera philosophia*, which was printed at Cologne, in 1548.

ADRIAN, St. the name of several towns in the Netherlands ; one three miles N. E. of Bruges, another ten miles S. E. of Ghent, &c.

ADRIANI, (Joanni Battista,) was born of a patrician family at Florence, in 1511. He wrote a History of his own Times in Italian ; which is a continuation of Guicciardini, from 1536 ; and funeral orations on the Emperor Charles V. and other noble personages. He died at Florence in 1579.

ADRIANISTS, in ecclesiastical history, disciples of Simon Magus, who flourished about the year 34. Theodore is the only person who has preserved their name and memory ; but he gives us no account of their origin. Probably this sect, and the others which sprung from the Simonians, took their names from the particular disciples of Simon. Also followers of Adrian Hampstead, an anabaptist, who taught in England and Zealand in the 16th century ; and held some particular opinions respecting the person of Christ.

ADRIANNA, a town in the province of Gujarat, much molested by the robbers. of Mallia, and frequently deserted on that account, though containing upwards of 1000 houses. It is nominally subject to the Coolies of Jhingwarra, and is distant from that place about eight miles, but owes its present existence to the protection of the British.

ADRIANO A SIERRA, or mountain of Adriano, in Guipuscoa, a subdivision of the province of Biscay, in Spain. There is a road over it to Old Castile, which is difficult of access. At the beginning is a dark path of 40 or 50 paces cut through a rock. This mountain is one of the highest of the Pyrenees.

ADRIANOPLE, ADRANAH, or EDRENEH, a city of Turkey in Europe, in the province of Romania, and the see of an archbishop under the patriarch of Constantinople, from which it is distant 130 miles N. W. It is about eight miles in circumference, including the old city and some gardens. The houses are low, mostly built of mud and clay, and some of brick : and the streets exceedingly dirty. Here is a beautiful bazaar, or market, half a mile long, called Ali Bassa, having six gates, and 365 well furnished shops ; and another, about a mile in length, also full of shops, which contain all kinds of commodities. Gold and silver articles, jewels, pistols, scimetars, &c. are sold in another parts of the city, in the *Bizestein*, differing little from a bazaar. This contains about 200 shops. The number of inhabitants of all nations and re-

ligions may be about 100,000. The air is wholesome, and the country very pleasant in the summer time, on account of the rivers and streams that run near the city ; the chief of which is the Marizza, which is navigable to the Archipelago. These promote and preserve the verdure of the gardens, meadows, and fields, for a considerable part of the year. In winter there is plenty of game : and wine and fine fruits are large articles of commerce. Sultan Selim's mosque is a noble building in the centre of the city, and to be seen on all sides of it. The grand vizier's palace is nothing more than a convenient house, built after the Turkish manner. The emperor's seraglio is a regular structure, in a plain near the river Tungia. It is two miles in compass, and has seven gates, besides those of the gardens, which are several miles in circumference. The city is governed by a mullah cadi, who has an absolute authority both in civil and criminal matters. In the time of the plague, or war, the grand seignior frequently resides here. The Turks took this city from the Greeks in 1362, and made it the capital of the empire till Mahomet II. took Constantinople, in 1453. It suffered considerably by fires in 1754, and 1778. Lon. 26°, 27' E. Lat. 41°, 45' N.

ADRIANO THERA, in ancient geography a city of Mysia, originally founded by Adrian in a district whither he resorted for the pleasures of the chace. It is the Adriani, probably, where Aristides the sophist was born. See *Dion. Cass.* tom. ii. ed. Keim.

ADRIAN'S WALL, a celebrated Roman work in the North of England. This work, though called by the Roman historians *murus*, which signifies a wall of stone, was only composed of earth covered with green turf. It was carried from the Solway Frith, a little west of the village of Burgh on the Sands, in as direct a line as possible, to the river Tyne on the east, at the place where the town of Newcastle now stands : so that it must have been above 60 English, and near 70 Roman miles in length. It consisted of four parts : 1. The principal *agger*, mound of earth, or rampart, on the brink of the ditch. 2. The ditch on the north side of the rampart. 3. Another rampart on the south side of the principal one, about five paces distant from it. 4. A large rampart on the north side of the ditch—This last was probably the military way to the line of forts on this work. The south rampart might serve for an inner defence in case the enemy should beat them from any part of the principal rampart, or it might be designed to protect the soldiers from any sudden attack of the provincial Britons.—For many ages, this work hath been in so ruinous a condition, that it is impossible to discover its original dimensions with certainty. But from their appearance, it seems probable that the principal rampart was at least ten or twelve feet high, and the south one not much less ; but the north one was considerably lower. The ditch taken as it passes through a lime-stone quarry near Harlow hill, appears to have been nine feet deep, and eleven wide at the top, but somewhat narrower at the bottom. The north rampart was about twenty feet distant from the ditch.

ADRIANSEN, (A.) a Flemish painter of considerable celebrity in fruits, flowers, and fish. He was born at Antwerp, in 1625. *Pilkington.*

ADRIANUM, or **ADRIATICUM MARE**, the Adriatic sea, in ancient geography, now the gulf of Venice, a large bay in the Mediterranean, between Dalmatia, Sclavonia, Greece, and Italy. It is called by the Greeks Ἀδρίας Κόλπος; and *Adria* by the Romans, as *Arbitr Adria notus*, Hor. Cicero calls it *Hadriani Mare*; Virgil has *Hadriacus Undas*. It is commonly called *Mare Adriaticum*, without an aspiration; but whether it ought to have one, is a dispute: if the appellation is from *Hadria*, the town of the Piceni, it must be written *Hadriaticum*, because the emperor's name, who thence derives his origin, is on coins and stones *Hadrianus*; but if from the town in the territory of Venice, as more ancient, and of which that of the Piceni is a colony, this will justify the common appellation *Adriaticum*.

ADRIATIC SEA. See last article, and **VENICE, GULF OF.**

ADRIETARE, or **ADRECTARE**, in law, to satisfy; to make amends, or set right.

ADRIFT. Ang. Sax. *drifan*, *adrifan*, to drive: part. past, *adrifsted*, *adrift*.

And quhat aventure has the hidder *drifft*?

Douglas, b. iii. p. 79.

Then shall this mount

Of Paradise, by might of waves, be moved
Out of his place; push'd by the horned flood
(With all his verdure spoil'd, and trees *adrift*,)
Down the great river, to the opening gulf;
And there take root.

Milton's Paradise Lost.

Be put alone into a boat,
With bread and water only for three days;
So on the sea she shall be set *adrift*,
And who relieves her, dies.

Dryden's Marriage à la Mode.

It seem'd a corpse *adrift*, to distant sight;
But, at a distance, who could judge aright.

Dryden.

Having fallen in with a reef of rocks in their return to the ship, they had been obliged to cut Mr. Banks's little boat *adrift*. *Cook's Voyages.*

ADRIUNE, in botany, the Arabian name for the plant called Cyclamen, or sow-bread.

ADROBOLON, in chemistry, the Indian bellum.

ADROGATION, in Roman antiquity, a species of adoption, whereby a person who was capable of choosing for himself was admitted by another into the relation of a son. The word is compounded of *ad*, to, and *rogare*, to ask; on account of a question put in the ceremony of it. Whether the adopter would take such a person for his son? and another to the adoptive, Whether he consented to become such a person's son?

ADROIT adj. { *Directus*, Lat. *Dritto*, Ital.
ADROIT'LY, } *Adroit*, Fr.—applied to one

ADROITNESS. } who aims directly at his mark, and hits it; right-handed; dexterous, opposed to clumsy: used of both bodily and mental cleverness.

An *adroit* stout fellow, would sometimes destroy a whole family, with justice apparently against him the whole time. *Don Quixote.*

The stoic and the libertine, the sinner and the saint, are equally *adroit* in the application of the telescope and the quadrant. *Horsley's Sermons.*

The skill and *adroitness* of the artist, acquired, as yours has been, by repeated acts, and continual practice. *Horne.*

ADROP, among alchemists, denotes either that precise matter, as lead, out of which the mercury is to be extracted for the philosopher's stone; or the philosopher's stone itself, which is also called saturn, and plumbum, or lead, azar, azane, and lapis ipse.

ADROTERON. See **ALICA.**

ADRUMETUM, or **HADRUMETUM**, in ancient geography, a town of Africa, the capital of Byzacium. It is variously called in ancient authors, *Adrume*, *Adrumetus*, or *Adrumettus*; *Adrymettus*, *Hertius*, and *Hadrito*. It was the Justiniana of the middle empire, and the Heraclea of the lower. According to Sallust, it was founded by the Phoenicians, and derived its name from two Phoenician words, signifying the country that yielded a hundred-fold. It was a fortified city in the third year of the 117 olympiad. *Diod. Sic.*

ADRY.' See **DRY.**

He never told any of them, that he was his humble servant, but his well-wisher; and would rather be thought a malcontent, than drink the king's health when he was not *dry*. *Spectator.*

ADSCITITIOUS. *Ad*: and *sciscere*, *scitus*, to call for; to admit; to associate; hence, taken; assumed to answer a purpose; counterfeit.

All which are additional labour, and take up much room in discourses and books, and are performed by different authors, upon different subjects, and in different kinds of writing, with an infinite variety of methods and forms, according to men's different views and capacities; and many times not without a necessity of some condescensions, *adscititious* advantages, and even applications to the passions.

Wollaston's Religion of Nature.

You apply to your hypothesis of an *adscititious* spirit what he, [Philo,] says concerning this πνεῦμα Ζεον, divine spirit or soul, infused into man by God's breathing. *Clarke's Letter to Dodwell.*

ADSCRIPTS, or **ADSCRIPTA**, a term used by some mathematicians, for the natural tangents, called also, by *Victa*, *prosines*.

ADSIDEELLA, in antiquity, the table at which the priests sat during the sacrifices.

ADSIGNIFICATION, among schoolmen, the act of noting or signifying a thing, with the addition of the time when it happened.

ADSTRICKTION, in medicine, a term used to denote the too great rigidity and closeness of the emunctories of the body; particularly the pores of the skin; also to signify the styptic quality of medicines. See **MEDICINE**.

AD TERMINUM QUI PRÆTERIIT, in law, a writ of entry, which lies where a man, having leased lands or tenements for terms of life, or years, is, after the time expired, held from them by the tenant, or other stranger who enjoys it, and deforseth the lessor. The same writ also lies for the lessor's heir.

ADUACA, or **ATUACA**, anciently a large and famous city of the Tungri, in Belgic Gaul; now a small town, called *Tongre*, in the bishoprick

forage and provison suit. Some write the word *aduar*, and *adouard*. It is said there are 30,000 aduars in the kingdom of Algiers.

ADVENT, *v.* Ad : *venio*, from **ADVENT'ENT**, *βαίνω*, to come to. **AD'VENT**, Of these words, *Ad-* **ADVENTINE'**, *vent*, generally applied to the coming of Christ, and *Ad-* **ADVENTI'TIOUS**, plied to the coming **ADVENTIVE**, *n. & adj.* **ADVENT'UAL**. *adventitious*, are of the most frequent occurrence.

So gret frost þer com in *aduent*, þat þen mygte agryse þat men mygte boþe ryde and go in Temese vpe yse. *R. Gloucester*, p. 463.

A cause, considered in judicature, is styled an accidental cause ; and the accidental of any act is said to be, whatever *advenes* to the act itself already substantiated. *Ayliffe's Parergon*.

Being thus divided from truth in themselves, they are yet farther removed by *advent* deception ; for they are daily mocked into errour, by subtler devisers. *Brown's Vulgar Errors*.

If, to suppose the soul a distinct substance from the body, and extrinsically *advent*, be a great error in philosophy ; almost all the world hath been mistaken. *Glanville's Vanity of Dogmatism*.

As for the peregrine heat, it is thus far true ; that if the proportion of the *adventine* heat be greatly predominant to the natural heat and spirits of the body, it tendeth to dissolution or notable alteration. *Bacon*.

Diseases of continuance get an *adventitious* strength from custom, besides their material cause from the humours. *Bacon*.

I do also daily use one other collect ; as, namely, the collects *adventual*, quadragesimal, paschal, or pentecostal, for their proper seasons. *Bishop Sanderson*.

Though we may call the obvious colours natural, and the others *adventitious* ; yet such changes of colours, from whatever cause they proceed, may be properly taken in. *Boyle*.

If his blood boil, and the *adventitious* fire (Rais'd by high meats, and higher wines) require To temper and allay the burning heat ; Waters are brought, which by decoction get New coolness. *Dryden*.

In the gem kind, of all the many sorts reckoned up by lapidaries, there are not above three or four that are original ; their diversities, as to lustre, colour, and hardness, arising from the different admixture of other *adventitious* mineral matter. *Woodward*.

Death's dreadful *advent* is the mark of man ; And every thought that misses it, is vain. *Young's Night Thoughts*.

Thy saints proclaim thee king, and thy delay Gives courage to their foes, who, could they see The dawn of thy last *advent*, long desir'd, Would creep into the bowels of the hills, And flee for safety to the falling rocks. *Couper's Task*, b. vi.

ADVENT, in the calendar, properly signifies the approach of the feast of the nativity. It includes four Sundays, which begin on St. Andrew's day, or the Sunday before or after it. During advent, and to the end of the octaves of epiphany, the solemnizing of marriage is forbid without express licence. It is appointed to employ the thoughts of Christians on the first advent or coming of Christ in the flesh, and his second advent or coming to judge the world.

The primitive Christians practised great austerity during this season.

ADVENTAILLE. } A surcoat worn over **ADVENTAL**. } the armour. *Chanc.*

ADVENTITIA COENA, in antiquity, an entertainment made by the friends of a person who had been travelling, by way of welcome at his return ; also called *cena adventoria*. *Pitiscus*.

ADVENTITIOUS FOSSILS, in natural history, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong ; such as sea shells, &c.

ADVENTITIOUS, in civil law, is applied to such goods as fall to a man, either by mere fortune, or by the liberality of a stranger, or by collateral, not direct succession. In this sense, it stands opposed to *profectitious* ; by which are signified such goods as descend in a direct line, from father to son.

AD VENTREM INSPICIENDUM, in law, a writ by which a woman is to be searched whether she be with child by a former husband, on her withholding of lands from the next heir, failing issue of her own body.

ADVENTURE, *v* and *n.* Ad : *venio*, *ven-* **ADVENT'URER**, *turn*, *venturus*. To **ADVEN'TUROUS**, expose one's self **ADVENT'UROUSLY**, to whatever may **ADVENT'RY**, be about to come,

in consequence of adopting any particular conduct ; implying hazard and chance of success.

Now is he in þe see with saile on mast vpsette. Toward bis lond þei drouh, to *aventure* his chance, With Normandies inouh, of Flanders and of France. *R. Brunne*, p. 70.

And whan this jape is tald another day
I shal be haldeñ a daffe or a cokenay :
I wol arise, and *auntre* it by my fay :
Unhardy is unseyl, thus men say.

Chaucer. The Reves Tale, v. i. p. 166.

Thus can I nouȝt my selfe counsaile,
But all I set on *aunture*,
And am, as who saith, out of cure.

Gower. Con. A. b. iv.

He is a great *adventurer*, said he,
That hath his sword through hard assay foregone.

Spenser.

The kings of England did not make the conquest of Ireland : it was begun, by particular *adventurers*, and other voluntaries, who came to seek their fortunes.

Sir J. Davies.

He intended, to hazard his own action ; that so the more easilie he might win *adventurers*, who else were like to be less forward. *Raleigh*.

Had it not been for the British, which the late wars drew over ; and *adventurers* or soldiers, seated here ; Ireland had, by the last war and plague, been left destitute. *Temple*.

Their wealthy trade from pirate's rapine free,
Our merchants shall no more *advent'rs* be.

Dryden.

It is good to guard *adventures* with certainties that may uphold losses. *Lord Bacon's Essays*.

At land and sea, in many a doubtful fight,
Was never known a more *advent'rous* knight ;

Who ofter drew his sword, and always for the right.

Dryden.

They are both hanged ; and so would this be, if he durst steal any thing *adventurously*. *Shakeneur's Henry V.*

Be not angry,
Most mighty princess, that I have *adventur'd*
To try your taking of a false report.

Shakspeare.

The tender and delicate woman among you, which would not *adventure* to set the sole of her foot upon the ground, for delicateness and tenderness.

Deut. xxviii. 26.

But I've already troubled you too long ;
Nor dare attempt a more *advent'rous* song :
My humble verse demands a softer theme ;
A painted meadow, or a purling stream.

Addison.

Some bold *adventurers* disdain
The limits of their little reign,
And unknown regions dare deservy.

Gray's Ode to Eton Col.

ADVENTURE BAY, of Van Diemen's land, on the east side of Bruny's isle. It is at the mouth, about six miles wide, and offers between Penguin Island and Cape Frederic Henry, excellent and well-sheltered anchorage for shipping. Captain Cooke says that there is a beautiful sandy beach, about two miles long, at the bottom of Adventure Bay, formed to all appearance by the particles which the sea washes from a fine white sand stone. That behind it is plain, with a brackish lake, which produces bream and trout. The parts adjoining the bay are mostly hilly; and form an entire forest of tall trees, rendered almost impassable by brakes of fern, shrubs, &c. The soil on the flat land, and on the lower part of the hills, is sandy, or consists of a yellowish earth, and in some parts of a reddish clay; but further up the hills, it is of a grey tough cast. The country is dry, and the heat intense. No vegetables that afford subsistence for man, were observed here: and the only quadruped seen, was a species of opossum, about twice the size of a large rat; but some of the inhabitants had pieces of the skin of the kangaroo about them. The inhabitants are mild and cheerful, with little of the wild appearance of savages; but seem almost totally devoid of personal activity, and were remarkably indifferent to presents. Their complexion is a dull black, which they sometimes heighten by smutting their bodies. Their hair is woolly, and clotted with grease and red ochre; their noses broad and full, and the lower part of the face projects considerably. But they are upon the whole well proportioned. Adventure Bay is dangerous of access in winter, from the surf created by the prevalence of southerly winds.—Captain Furneaux first visited it in 1778; then captain Blight in 1788; but the most complete survey of it was made by the French Expedition, that went in search of La Perouse. It is in E. Long. 147° , 30° . S. Lat. 42° 20'.

ADVENTURE, BILL OF, in commerce, a writing signed by a merchant, testifying the goods mentioned in it to be shipped on board a certain vessel belonging to another person, who is to run all hazards; the merchant only obliging himself to account to him for the produce.

ADVENTURE ISLAND, a small island in the South Sea, so called from the ship Adventure, in which Captain Furneaux, the discoverer sailed. Lon. 147° 29' W. Lat. 43° 21' S. See **ADVENTURE BAY**.

ADVENTURERS, THE SOCIETY OF, an ancient

company of merchants and traders, erected for the discovery of lands, territories, trades, &c. unknown. This society had its rise in Burgundy, and its first establishment from John, duke of Brabant, in 1296, being since known by the name of the *Brotherhood of St. Thomas à Becket*. It was afterwards translated into England, and successively confirmed by Edward III. and IV. Richard II. Henry IV. V. VI. and VII. who gave it the appellation of *Merchant-adventurers*; by Henry VIII. and queen Elizabeth, who, in 1564, formed it into an English corporation; and by succeeding kings. Formerly, adventurers making settlements in any part of America belonging to the enemy, might obtain a charter from the king. 13 Geo. II. c. 4. sec. 13.

At one time (1550,) the English Merchant Adventurers had sufficient influence at Antwerp to prevent the establishment of the Inquisition there. They bore for arms, Nebule of urpicus, argent and azure; a chief quarterly *or* and *gules*; in the first and fourth, two red roses; and in the second and third, a lion of England.

AD'VERB, n. { So called from their signification and connexion with **ADVERBIAL**, } verbs.

For thys woerde nouum [Mark, xiv. 25,] seemeth not there to be putte for an *aduerbe*, but is a nowne adjective; and therefore it signifieth some kynde of newenesse in the drinke it selfe.

Sir T. More's Works, p. 1328. col. 2.
An adverb is a word without number, that is joyned to another word : as

Well-learned.

Hee disputeth very *subtely*.

B. Jonson's English Grammar.

Adjectives compared, when they are used *adverbially*, may have the article *the* going before. *Id.*

I should think, alta was joined *adverbially* with *tremit*; did Virgil make use of so equivocal syntax. *Addison.*

ADVERBS, are not purely, or solely additions to verbs. They are frequently joined with adjectives, and even with substantives; thus, we say, he is truly king; he is very sick. Sometimes adverbs modify the meaning of each other, as, *very excellently*, *very justly*, they are very numerous, and have been variously classified; as adverbs of time, place, order, distance, motion, relation, quantity, both continuous and discrete; quality, manner, affirmation, negation, demonstration, interrogation, diminution, doubt, exception, and comparison.

Dr. Lowth contends that in English, they admit of no variation, except some few of them, which have the degrees of comparison, as *soon*, *sooner*, *soonest*; and those irregulars, derived from adjectives in this respect likewise irregular, as *very much*, not *very prudently*. He observes, however, that the formation of adverbs in general with the comparative and superlative terminations, seems to be improper; at least, that it is now become almost obsolete, as *easier*, *stronglier*, *hardliest*, *highliest*, *rightest*, though used by Hooker, Raleigh, Hobbes, and Shafesbury, *Grammar*, p. 112.

In his *Hermes*, they are called by Mr. Harris attributes of attributes, or attributives of the second order: and he defines an adverb, a part of speech, the natural appendage of verbs, extending the signification of the word *verb*, properly so called, to participles and adjectives. After explaining the general nature of adverbs as attributes of attributes, and enumerating their principal forms, amongst which he reckons intension and remission, he shews that adverbs may be derived from almost every part of speech, from prepositions, as *afterwards*, from participles, as *knowingly*, from adjectives, as *virtuously*, from substantives, as *apishly*, and from proper names, as *Socratically*. Adverbs, according to Gaza, in his grammar, may be found in every one of the predicaments, and he thinks that the readiest way to reduce their infinitude, is to refer them by classes to those ten universal genera. The Stoics called the adverb by the name of Ηανδεκτης, with a view to its multiform nature. *Hermes*, p. 192, 210.

But Mr. Tooke, in his *Diversions of Purley*, warmly and with great success, contends that the adverb is ordinarily a corruption of some other word or phrase. Thus *ly* is a corruption of *like*; as *honestly*, is honest-like; *alone* is all-one: *only*, one-like: *awhile*, a compound of the article *a*, and the noun, *while*, a time. We refer the reader to that valuable work for ample illustrations of this view of the adverb.

ADVERBIAL NUMBERS, sometimes denote the numerals *once*, *twice*, *thrice*, &c.

ADVERSARIA, among the ancients, was a book of accounts, like our journal or day-book; and was sometimes synonymous with *opistographia*, *ποιηματα*, or *memoriae*, and stands opposed to *codex*; the former being for occasional matters which were taken down hastily, to be afterwards transcribed into the latter, in a fair regular manner. It is likewise a title given to divers books, containing collections of miscellaneous observations, remarks; *variae lectiones*, *variae observationes*, *loci communes*, *geniales dies*, *vespera*, *selecta*, *miscellanea*, &c. The word is also used for a commentary on some text or writing; because the notes were written on the adverse or opposite page.

ADVERSARIE. *adv.* Contrary. *Chauc.*

ADVERSATOR, in antiquity, a servant who attended rich men in returning from supper, to give them notice of any obstacles in the way, at which they might be apt to stumble.

AD'VERSE, *v. & adj.* { **Ad**: *verto*, *versus*, to turn to, towards, or against. The verb is obsolete. **Adverse** the adjective, signifies turning to or against, in an attitude of resistance or hostility: opposed to *adversity*, is the ill effect of an *adverse* position, i. e. pain, affliction, misery.

At Wyncehestre he held his parlement ilk gere,
And þer men him teld, who was his aduersere.

R. Brunne, p. 82.

Be ye sobre and wake ye, for your *aduersarie* the deuel, as a rorynge lioun, goith about seachinge whom he schal deuoure.

Wyclif. I Potir, c. v.

For slain is man, right as another beest,
And dwelleth eke in prison, and arrest,

VOL. I.

And hath siknesse, and gret *adversite*,
And oftentimes gilteles parde.

Chaucer. The Knights Tale, v. i. p. 53.

MOWRE. Never did captive with a freer heart
Cast off his chains of bondage, and embracē
His golden uncontroll'd enfranchisement,
More than my dancing soul doth celebrate
This feast of battel, with mine *adversary*.

Shakespeare's Richard II.

Sweet are the uses of *adversity*;
Which, like the toad, ugly and venomous,
Wears yet a precious jewel in his head.

Shakespeare.

A remembrante of the great use he had made of prosperity, contributed to support his mind under the heavy weight of *adversity*, which then lay upon him.

Attbury.

Prosperity is the blessing of the Old Testament, *adversity* is the blessing of the New, which carries the greater benediction, and the clearer revelation of God's favour.

Bacon's Essays.

As, when two polar winds, blowing *adverse*,
Upon the Cronian sea, together drive
Mountains of ice.

Milton.

A cloud of smoke envelopes either host;
And, all at once, the combatants are lost;
Darkling, they join *adverse*, and shock unseen;
Coursers with coursers justling, men with men.

Dryden.

For friendship, of itself an holy tie,
Is made more sacred by *adversity*.

Dryden. Hind and Panther.

Let nothing *adverse*, nothing unforeseen,
Impede the bark that ploughs the deep serene; ,
Charg'd with a freight, transcending in its worth
The gems of India, nature's rarest birth,
That flies, like Gabriel on his Lord's commands,
A herald of God's love to Pagan lands.

Couper. Charity.

Truth seems to be considered by all mankind, as something fixed, unchangeable, and eternal; it may therefore be thought, that to vindicate the permanency of truth, is to dispute without an *adversary*.

Beattie's Essay on Truth.

ADVERSATIVE, in grammar, is a term, that has been applied to particles, that express not only a difference, but some opposition, as it is said, between the ideas which precede and follow them: thus, in the sentence, "It is spring, or, it is summer," or simply disjoins; while in the phrase, "It is not summer, but it is winter." *but*, opposes, or contrasts the ideas. It has been further said of *adversative* disjunctives, that, though they imply opposition, there can be no opposition of the same attribute in the same subject; but the opposition must be either of the same attribute in different subjects, as "*Brutus was a patriot, but Caesar was not*"; or of different attributes in the same subject, as "*Georgius was a sophist, but not a philosopher*"; or of different attributes in different subjects, as, "*Plato was a philosopher but Hippas was a sophist*." The conjunctions used for all these purposes may be called *absolute adversatives*, but besides these, there are several others, says Mr. Harris, such as *adversatives of comparison*, expressed by the words *than* and *as*, which mark not only opposition, but that equality or excess, which arises among subjects from their

M

being compared. Such also are *adversatives* adequate and inadequate, of which the principal are **UNLESS** and **ALTHOUGH**, e. g. “*Troy will be taken, UNLESS the Palladium be preserved.*” “*Troy will be taken ALTHOUGH Hector defend it.*” Every cause, says Mr. Harris, is either adequate, or inadequate, when it endeavours without being effectual, and so in like manner is every preventive. Adequate preventives are expressed by such *adversatives* as **UNLESS**: the inadequate are expressed by **ALTHOUGH**. *Hermes p. 251—257.*

Here again Mr. Horne Tooke has afforded some very important light on an intricate subject. He examines with great ingenuity the supposed opposition in adversative disjunctives, and particularly that which is thought to be expressed by the word **BUT**. This, he contends, has two different meanings; one when occurring at the beginning, another and very different one in the middle of a sentence. In the former case it is a corruption of *bot*, the imperative of the Saxon verb *beton*, *to boot, superadd, or supply*; and in the latter it is a contraction of *be utan*, the imperative of *beonutan*, *to be out*. Thus Gawin in Douglas.

*But thy work shall endure in laude and glorie,
But spot or faulte condigne eterna memorie.*

The meaning is “*superadd, (to something said, or supposed to be said before) thy work shall endure in laude and glorie, be out, (i. e. without) spot or fault.*” And in the definite adversative, “*the number three is not an even number but an odd,*” the opposition is not marked, at least directly, by the word *but*, but by the adjectives *even* and *odd*, which denote attributes in their own nature opposite; and the preposition according to the first sense of the word *but*, will be synonymous with this, viz. “*the number three is not an even number, superadd, (it is) an odd number.*” In the indefinite adversative, “*the number of the stars is either even or odd,*” the word *either* is a distributive pronoun, and *or* is a contraction of the Saxon *odor*, q. d. *other*, i. e. something different, and often contrary. As to the adversatives denominated by Mr. Harris adequate and inadequate, and marked by the conjunctions *unless* and *although*, he leads us to conceive that the whole difference between them consists in this, that the expression of the one is more forcible than that of the other. Whereas, the meaning of **UNLESS** is directly opposite to that of **ALTHOUGH**. They are both verbs in the imperative mood: the former signifying *take away or dismiss*; and the latter *allow, permit, yield, assent*. Accordingly the sentence, “*Troy will be taken UNLESS the palladium be preserved,*” is equivalent to “*Remove the palladium be preserved,*” i. e. taking the *palladium be preserved*, as an abstract noun, the preservation of the palladium *Troy will be taken*. Again, “*Troy will be taken ALTHOUGH Hector defend it,*” is the same as “*Troy will be taken ALLOW Hector (to) defend it.*” The idea, therefore, expressed by **UNLESS** is that of the *removal* of one thing to make way for another; and the idea expressed by **ALTHOUGH** is that of *allowing* one thing to co-exist with another, with which it is apparently

incompatible. The conjunction **UNLESS** (says Mr. Tooke,) even in the reign of queen Elizabeth, was written *oneless* or *onelesse*, and more anciently *onles* and *onlesse*: and *onles* is the imperative of the Anglo-Saxon verb *onlesan*, to *dismiss, or remove, les* the imperative of *lesan*, which is synonymous with *onlesan*, is also used by some old writers, instead of *unless*. And this imperative *les* has given to our language the adjectives *hopeless, restless, &c. i. e. dismiss, hope, rest, &c.* The conjunction **ALTHOUGH** (says the same writer) is compounded of *al* or *all*, and *tho' though, thah, or, in the vulgar pronunciation, thaſ, thauf, and thoſ;* the imperative *thaſ, or thaſig* of the verb *thaſian* or *thaſigan*, to *allow, permit, &c.* and *thaſig* becomes *thah, though, thoug, in a transition of the same kind, and as easy as that by which hafuc becomes hawk.*

ADVERSE, in logic, is when two contraries have an absolute and perpetual opposition to each other.

ADVERT', v. Ad: *verto*, to turn to. Of the **ADVERT'ENCE**, same origin as **Adverse**, &c. **ADVERT'ENCY**, but not necessarily implying **ADVERT'ENT**. Opposition: simply turning to, for the sake of observation, consideration, or remark.

*During this tyme Eneas gan advert,
Within ane vail fer thens closit apart
Quhare stude ane wod.*

Douglas, b. vi. p. 180.

For God it wote, her harte on other thing is
Although the body sat emong 'hem there
Her aduertence is alway elis where,
For Troilus full fast her soule sought,
Withouten word, on him alway she thought.

Chaucer. Troilus, b. iv. f. 179, c. 4.

In this life our understanding is weak, our attention trifling, our *advergency* interrupted, our diversions many.

Taylor. On the Doctrine and Practice of Repentance.

Is he rich, prosperous, great? yet he continues safe, because he continues humble, watchful, *adherent*, lest he should be deceived and transported.

Hale's Contemplations.

The mind of man being not capable, at once to *advert* to more than one thing; a particular view and examination of such an innumerable number of vast bodies, will afford matter of admiration.

Ray on the Creation.

—Our low world is only one of those,
Which the capacious universe compose.
Now to the universal whole *advert*;
The earth regard, as of that whole a part.

Blackmore's Creation, b. iii.

Too much *advergency* is not your talent; or else you had fled from that text, as from a rock. *Swift.*

AD'VERTISE, v. Derived as above. **AD'VERTISEMENT**, *vertisment*, Fr. To turn **ADVERTIS'ER**, or call the attention of **ADVERTIS'ING**, another to a subject which has already been noticed by the *advertiser*; to publish in print; inform; to give intelligence.

And now beholde I go vnto my people: come, therfore and I will *advertisse* the, what this people shall do to thy folke I the later dayes.

Bible, 1539, Numeri, c. xxiv.

They were to *advertisse* the chief hero, of the distresses of his subjects occasioned by his absence.

Dryden

As I was then
Advertising, and holy to your business,
 Not changing heart with habit ; I am still
 Attornied at your service.

Shaksp. Measure for Measure.

The bishop did require a respite,
 Wherein he might the king his lord *advertise*,
 Whether our daughter were legitimate. *Shaksp.*

As I by friends am well *advertised* ;
 Sir Edmund Courtney, and the haughty prelate,
 With many more confederates, are in arms.

Shaksp.
 The king was not so shallow, nor so ill *advertised*,
 As not to perceive the intention of the French king. *Bacon.*

TUB. Let me *advertize* you ;
 Your daughter Audrey met I on the way,
 With Justice Bramble in her company ;
 Who means to carry her to Panacea church.

Ben Jonson's Tale of a Tub, act iii.

The great skill in an *advertiser* is chiefly seen in
 the style which he makes use of. He is to mention
 "the universal esteem, or general reputation," of
 things that were never heard of. *Tatler*, No. 224.

Estates are landscapes gaz'd upon awhile,
 Then *advertiz'd*, and auctioneer'd away.

Couper's Task, b. iv.

With respect to his own coming, it seems to be one
 great object of his discourse, to *advertise* the christian
 world, that it is quite a distinct event from the
 demolition of the Jewish temple. *Horsley's Sermons.*

ADVERTISEMENT OF STOLEN GOODS. By the
 statute of 25 Geo. II. cap. 36, and 28 Geo. II.
 cap. 19. the penalty of fifty pounds is inflicted on
 persons advertising a reward with 'No questions
 to be asked,' for the return of things lost or
 stolen ; and likewise on the printer.

ADVIGARUM, a town of Hindostan, in the
 province of Coimbetoor, distant 52 miles S. E.
 from Seringapatam, in N. Lat. 12°, 1'. E. Long.
 77°, 28'.

To ADVIGILATE, *advigilare*, Lat. To watch
 diligently.

ADVISE', v.

ADVICE', Probably from *ad visum*,
 ADVIS'ABLE, to the sight. Unclassical La-
 ADVIS'EDLY, tin, *advisare*, which Junius
 ADVIS'EDNESS, would derive from the Ger-
 ADVISE'MENT, man *wisen*, to shew ; to in-
 ADVIS'ER, struct ; to inform ; to coun-
 ADVIS'ING, csel ; to deliberate with.
 ADVIS'O.

Sir Edwarde's ost, & opere al so nei,
 He aniscke pe ost suipe wel, and poru Gode's grace,
 He hopede winne a day pe maistrie of pe place.

R. Gloucester, p. 558.

Of werre & of batile he was fulle *awise*,
 per wisdom suld awaile was non so trewe als he.

R. Brunne, p. 188.

Amonge the proude there is euer stryfe, but amonge
 those that do all thynges with *aduoyment*, therio is
 wysdome. *Bible*, 1539. *Prouerbes*, c. xiii.

Mote I wote,

What strange adventure do ye now pursue ?
 Perhaps my succour or *aduisenent* meet,

Mote stead you much. *Faerie Queene.*

I will, according to your *aduisenent*, declare the
 evils, which seem most hurtful.

Spenser's State of Ireland.

By that which we work naturally (as, when we
 breathe, sleep, and move) we set forth the glory of

God, as natural agents do ; albeit we have no ex-
 press purpose to make that our end ; nor any *advised*
 determination, therein to follow a law.

Hooper, b. i. p. 49.

In my school-days, when I lost one shaft,
 I shot his fellow of the self-same flight,
 The self-same way, with more *advised* watch,
 To find the other forth ; by vent'ring both,
 I oft found both. *Shaksp. Merchant of Venice.*

You were *advis'd*, his flesh was capable
 Of wounds and scars ; and that his forward spirit
 Would lift him, where most trade of danger rang'd.
Shakespeare.

Such discourse bring on,
 As may *advise* him of his happy state ;
 Happiness in his power, left free to will. *Par. Lost.*

A posting messenger dispatch'd from hence,
 Of this fair troop *advis'd* their aged prince.
Dryden's Aenid.

ZUL. The bold are but the instruments o'th' wise :
 They undertake the dangers we *advise*.
Dryden's Conquest of Granada, part i.

This book *advisedly* read, and diligently followed
 but one year at home, would do more good, than
 three years' travel abroad. *Ascham.*

Surprise may be made by moving things, when the
 party is in haste ; and cannot stay, to consider *ad-
 visedly* of that which is moved. *Bacon, Essay* xxxiv.

Let his travel appear rather in his discourse,
 than in his apparel or gesture ; and in his discourse,
 let him be rather *advised* in his answers, than for-
 ward to tell stories. *Bacon's Essays.*

Th' Almighty Father, where he sits
 Shrin'd in his sanctuary of heav'n secure,
 Consulting on the sum of things foreseen
 This tumult,(and permitted all) *advis'd*.
Par. Lost, b. vi.

Advise if this be worth
 Attempting ; or to sit in darkness here,
 Hatching vain empires. *Idem*, b. ii.

ADULA, in ancient geography, a mountain
 in Rhatia, or the country of the Grisons, part of
 the Alps, in which are the fountains of the Rhine.
 It is now called St. Gothard.

ADULA, in modern geography, a mountain of
 Navarre, in Spain, lying between Pampluna and
 St. Jean de Pied de Port.

ADULAT'ION, n. } *Adulor*, to use sweet

ADULAT'ORY. } words. Of uncertain de-
 rivation ; most probably from *adulatio*, dorick
 dialect for *ηδολαζω*, from *ηδω*, sweet. *Adulatoire*,
 Fr. ; to use fawning language ; to glaze ; to be
 excessively courteous and complimentary ; to
 transgress the bounds of truth and justice, in be-
 stowing praise.

When hee came to man's estate, hee exercised
 feates of knighthood, hee loued discipline, and hated
adulation. *Golden Booke*, g. 3.

While eache partie laboureth too bee chiefe flatterer,
adulation shall then haue more place then plaine and
 faithful aduise, of whiche he muste needes ensue
 the euill bryngynge vp of the prince, whose mynde
 in tender youth infecte, shall redely fall to mischiefe
 and riotte, and drawe downe this noble realme to
 ruine. *Hall*, p. 344.

There he beheld how humbly diligent
 New *adulation* was, to be at hand ;
 How ready falsehood stept ; how nimblly went
 Base pick-thank flattery, and prevents command.
Daniel's Civil Wars, b. ii.

O be sick, great Greatness !
 And bid thy ceremony give thee cure.
M 2

Think'st thou the fiery fever will go out
W^mn titles blown from *adulation*?

Shakespeare's Henry V.

They, who flattered him most before, mentioned him now w^ts the greatest bitterness; without imputing the least crime to him, committed since the time of that exalted *adulation*; or that was not then as much known to them, as it could be now.

Clarendon.

Adulatory verses of this kind, however well written, deserve not to be transmitted to posterity.

Mason. Note on Gray's Lett.

Spenser, in compliance with a disgraceful custom, or rather in obedience to the established tyranny of patronage, pre-fixed to the Faerie Queene fifteen of these *adulatory* pieces [sonnets].

Warton. Hist. Eng. Poetry, iii. 445.

Flattery corrupts both the receiver and the giver; and *adulation* is not of more service to the people than to kings.

Burke on the French Revolution.

ADULE, or ADULIS, in ancient geography, a town of Egypt built by fugitive slaves, distant from its port on the Red Sea twenty stadia.

ADULICUS SINUS, a port of the Red Sea, so called from Adule.

ADULITÆ, the inhabitants of Adule.

ADULITANUM, MONUMENTUM, the statue of Ptolemy Euergetes, the inscription on which was published by Leo Allatius, at Rome, in 1631.

ADULLAM, in scripture geography, a cave near the city of that name, belonging to the tribe of Judah, in which David hid himself to avoid the fury of Saul.

ADULLAM, originally a kingdom of Canaan, afterwards a city of Judah, situated south west of Jerusalem, near Jarmuth, and Azekah. It is styled by Micah, chap. i. ver. 14. the glory of Israel: and was a place of some consequence in the time of Judas Maccabeus, and even so late as the fourth century, though it is now in ruins.

ADULT', n. & adj. } Ad: *olesco, adulitus,*

ADULT'ED. } grown up to; past the age of childhood,—having arrived at manhood, or attained years of maturity.

Now that we are not only *adulted*, but ancient Christians, I believe the most acceptable sacrifice we can send up to heaven, is prayer, and praise; and that sermons are not so essential as either of them to the true practice of devotion.

Howell's Letters.

The earth (by these applauded schools 'tis said,) This single crop of men and women bred; Who grown adult, so chance (it seems) enjoin'd, Did male and female, propagate their kind.

Blackmore.

So language in the mouths of the adult, (Witness its insignificant result,) Too often proves an implement of play, A toy to sport with, and pass time away.

Couper's Conversation.

ADULT BAPTISM. See BAPTISM.

ADULT, in civil and Scots law, a youth between fourteen and twenty-five years of age. In this sense, *adulitus* is synonymous with *juvenis, adolescens, or adulescens*.

ADULT PLANTS, Terenzoni observes, differ from immature ones, in that they contain more oil, and less salt.

ADULT'ER,

ADULT'ERATE, v. & adj.

ADULTERATION.

ADULT'ERER,

ADULT'ERESS,

ADULT'ERINE,

ADULT'EROUS,

ADULT'EROUSLY,

ADULT'ERY.

Ad: *alteram, (feminae,) or, ad: alterum, (hominem,)*

according as the individuals being married, betake themselves to any other than their lawful consort. *Advo- tric, avoutric, voutrer, voutresse*, from the Norman French, are used by Chaucer, and others. Spouse-breaker, spouse-breaker, and wedlock-breaker, are old English terms, synonymous with those now in use. See the following illustrations. *Adulterate*, and its cognate words, are applied to that which is rendered impure, or counterfeited by debasing admixtures.

gef alle luþer holers were y serued so,
Me schulde fynde þe les such spouse bruche do.

R. Gloucester, p. 26.

An yvel kyndrede and a spouse breker sekith a tokene, and a tokene schal not be goven to it.

Wyclif. Matt. xii.

Was I not gouernour, and chief ledar thare,
The time quhen that the Troiane adulterare
Umbesiget the cite of Spartha,
And the queene Elene reft and brocht awa?

Douglas, b. x. p. 316, *Aeneid.*

Therefore seing the punishment of *aduotry* is a meate that a mæ can not chew, let eury man contydre by hym selfe, how lothe another man wold be therof, and let him not touche another mæs wyfe, so shal his also not be meddled withall.

Couerdale's Christen State of Matrymonye, fol. 38, col. 1.

This staff was made to knock down sin. I'll look There shall be no *aduotry* in my ward But what is honest.

O. Pl. x. 299.

At home, because Duke Humfrey aye repined, Calling this match *aduotrie*, as it was.

Mirror for Mag. p. 342.

It was in that poynþ like unto the church y^t the Jewes had agaynst the cōming of Christ, infected by many false folke w^t false doctrin, & the Scripture adulterate and vitiate with false glosses and wronge exposicions.

Sir T. More's Works, p. 636, col. 2.

To make the compound pass for the rich metal simple, is an *adulteration* or counterfeiting.

Bacon's Nut. Hist.

He was the most perfidious man upon the earth; and he had made a marriage compounded between an *aduotry* and a rape.

Bacon's Henry VII.

—That incestuous, that adulterate beast.

Shaksp.

The adulterous Antony, most large

In his abominations, turns you off;

And gives his potent regiment to a trull,

That noses it against us.

Shaksp. Ant. and Cloop.

A knave apothecary, that administers the physick, and makes the medicine, may do infinite harm, by his old obsolete doses, adulterine drugs, bad mixtures, &c.

Burton's Anatomy of Melancholy.

An adulterous person is tied to restitution of the injury, so far as it is reparable; and to make provision for the children, that they may not injure the legitimate.

Taylor.

The Spartan lady replied, when she was asked, What was the punishment for *adulteresses*? There are no such things here.

Govern. of the Tongue, sect. 3.

Think on whose faith th' adulterous youth rely'd;

Who prounis'd, who procur'd the Spartan bride.

Dryden's Aeneid.

All thy domestic griefs at home be left,

The wife's adulter^y, with the servant's theft;

And (the most racking thought which can intrude)
Forget false friends, and their ingratitude.

Dryden's Juvenal.

Helen's rich attire,
From Argos by the fam'd *adult'ress* brought,
With golden flowers and winding foliage wrought.

Dryden's Virgil.

ADULTERATION, in law, from *adulterate*, to corrupt; mingling something foreign to any substance. We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, beer, bread, wax, hair-powder, &c.

ADULTERATION, in pharmacy, denotes a fraudulent corruption of medicines, by substituting ingredients of less value, for the sake of greater gain. This practice the dealers are but too well acquainted with. Pharmaceutical authors give numerous instances of *adulterations*, both in simple and compound medicines.

ADULTERATION OF COIN, properly imports the making of it, with too much alloy. This is effected by forging another stamp, by mixing impure metals with the gold or silver, by an undue alloy, or too great an admixture of the base metals. Evelyn gives rules both for adulterating and detecting adulterated metals, &c.—Adulterating as well as debasing, which includes diminishing, clipping, &c. are capital crimes in all nations.—The ancients punished them with great severity: among the Egyptians both hands were cut off; and by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted, that counterfeiting the coin should be capital; and under Constantine, it was made treason, as it is also among us. Women have, in modern times, been burnt for coining shillings; but, to the honour of our present legislators, this barbarous punishment has been abolished by Act of Parliament.

ADULTERATION OF GEMS, is a curious art, and the methods of detecting it no less curious than useful; for which, See Nichol's Lapidary, p. 18.

An **ADULTERESS**, by our law, undergoes no temporal punishment whatever, except the loss of her dower; and she does not lose even that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offence is committed. 13 Edward I. cap. 34. But it is to be observed, that adulteresses are such, either by the canon or civil law. According to the former, a woman is an adulteress who, either being herself married, converses carnally with another man; or, being single herself, converses with a man that is married. According to the latter, she is not an adulteress, if she be not herself in the married state, though she converses with a man that is. The crime, in this case, was more properly called *stuprum* than *adulterium*. Hence, among the Romans, the word *adultera*, adulteress, differed from *pellax*, which denoted a single woman who cohabited with a married man: and *pellax* differed from *concubina*, which signified her who had only intercourse with an unmarried man. The former was reputed infamous, and the latter innocent. See **ADULTERY**.

ADULTERINE, in the civil law, is particularly applied to a child, the issue of an adulterous amour. Adulterine children are more odious than the illegitimate offspring of single persons.

—The Roman law even refused them the title of natural children: as if nature disowned them.—Adulterine children are not easily dispensed with for admission to orders.

ADULTERINE MARRIAGES, in St. Augustine's sense, denote second marriages, contracted after a divorce.

ADULTERY, and fornication, are sometimes used synonymously in scripture; and the former is applied in a more extensive sense, to any species of impurity or crime, against the virtue of chastity. In this sense divines understand the seventh commandment. The word is also used in ancient customs, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it. In which sense, *adulterium* amounts to the same with what the Saxons call *tegeriuta*.

The crime of adultery has been punished in most ages and nations, though with different degrees of severity. In many it has been capital; in others venial, and only attended with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others, of a jocose and humorous kind. Even contrary laws have been enacted as punishments for adultery. By some, the criminals were forbid marrying in case they became single; by others, they were forbid to marry any besides each other; by some, they have been incapacitated from ever committing the like crime again; by others, they were glutted with it till it became quite nauseous. Among the Egyptians, adultery in the man was punished by 1000 lashes; and in the woman, by the loss of her nose. By the Jewish law, it was punished by death in both parties, whether the woman was married, or both. The Jews had a particular method of trying an adulteress, or a woman suspected of the crime, by making her drink the bitter waters of jealousy: which, if she was guilty, made her swell. For the most probable solution of this curious point of biblical criticism, see **JEALOUSY**. In Arabia Felix, according to Strabo, death was also the punishment of adultery. Homer speaks of adulterers being stoned to death, a punishment denominated *λατυος κτενων*, a stone coat. Solon, as well as Draco, placed the offenders when caught, at the mercy of the party injured. Adulterers were not suffered to enter the theatres of Greece, nor to wear showy garments at any time. Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dower he had received from her husband, which some think was refunded by the adulterer. Another punishment among those people was, putting out the eyes of adulterers. See **ZALEUCUS**.

The Spartans, indeed, may be said to have tolerated adultery, since they laughed at those who thought the violation of the marriage bed an insupportable affront; and the crime became disgracefully common. At Gortyna, in Crete, adulterers were covered with wool, an emblem of the softness and effeminacy of their disposition, and in that dress carried through the city to the magistrate's house, who sentenced them to be deprived of all their civil privileges.

There has been some controversy respecting the ancient punishment of adultery among the

Romans. Some consider it to have been made capital by a law of Romulus, and again by the twelve tables. Others, that it was first made capital by Augustus; and others again, not before the emperor Constantine. The truth is, the punishment in early ages was very various, much being left to the discretion of the husband and parents of the adulterous wife; who exercised it differently, rather with the silence and countenance of the magistrate, than by any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killing both together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far: but mutilating, cutting off the ears, noses, &c. followed. The punishment allotted by the *lex Julia*, was not, as many have imagined, death; but rather banishment, or being interdicted fire and water: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. Under Macrinus, many were burnt at a stake. Constantine, by law, made the crime capital. Under Constantius and Constans, adulterers were burnt or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Justinian, granted a further mitigation, at least in favour of the wife, who was only to be scourged, lose her dower, and be shut up in a monastery: after two years, the husband was at liberty to take her back again; if he refused, she was shaven, and made a nun for life: but it still remained death for the husband. The reason alleged for this difference was, that the woman is the weaker vessel. Matthæus declaims against the empress Theodora, who is supposed to have been the cause of this law, as well as of others procured in favour of that sex from the emperor. Under Theodosius, women convicted of this crime were punished after a very singular manner, viz. by a public constupration; being locked up in a narrow cell, and forced to admit to their embraces, all the men that would offer themselves. This custom was again abolished by the same prince. In Spain, adultery in men was punished by castration, or amputation of the offending member. In Poland, before Christianity was established, they carried the criminal to the market-place, and there fastening him by the testicles with a nail, placed a razor within his reach, and left him under a necessity either of doing justice upon himself, or of perishing in that condition. The Saxons formerly burnt the adulteress, and over her ashes erected a gibbet, whereon the adulterer was hanged. King Edmund ordered adultery to be punished in the same manner as homicide; and Canute, that a man who committed adultery, should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals.

Alfred introduced a modification of the law of adultery, which he punished wholly by fines, according to the rank of the husband injured. If he was a twelf-hyndman, the offender paid one hundred and twenty shillings; if a six-hyndman, one hundred shillings; if a ceorl, forty shillings. "But the most curious part of Alfred's regulations, on this subject," says Mr. Turner, "was the refinement with which he distinguished the different steps of the progress towards the completion of the crime. To handle the neck of a ceorl's wife incurred a fine of five shillings. To throw her down without further consequences, a penalty of ten shillings; and for a subsequent commission of the crime, sixty shillings."—*Anglo Sax. c. xi. p. 254.*

Among the Mingrelians, according to Chardin, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulteress, and the husband. In some parts of India, it is said any man's wife is permitted to prostitute herself for an elephant; and it is reputed no small glory to have been rated at so high a price. Adultery is so frequent at Ceylon, according to some writers, that there is not a woman who does not practise it, notwithstanding its being punishable with death. Among the Japanese, and divers other nations, adultery is only penal in the woman. Among the Abyssinians, the crime of the husband is punished on the innocent wife. In the Marian islands, on the contrary, the woman is not punishable for adultery; but if the man go astray he pays severely: the wife and her relations waste his lands, turn him out of his house, &c. Among the Chinese, there is reason to conclude that adultery is not capital; for it is said that fond parents will make a contract for the future husbands of their daughters, to allow them the indulgence of a gallant. In Britain, adultery is reckoned a spiritual offence, and is cognizable by the spiritual courts, where it is punished by fine and penance. The common law takes no farther notice of it, than to allow the party grieved an action and damages. This practice is often censured by foreigners, as making too light of a crime, the bad consequences of which, public as well as private, are so great. It has been answered, that perhaps this penalty, by civil action, is more wisely calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a severer punishment. He that by a judgment of law is, according to circumstances, stripped of great part of his fortune, thrown into prison till he can pay it, or forced to fly his country, will no doubt, in most cases, own that he pays dearly for his disgraceful pleasures.

ADULTERY, morally considered, is a crime certainly of the deepest dye; involving on the part of a man, who violates the marriage bed of his neighbour, as Dr. Paley has observed, *seduction*; injury incurable to the innocent husband; and on the part of the wretched wife, if a mother, shame and countless miseries for her children. In all cases, too, attended with little short of *perjury*, breaking a vow undertaken with the sanction of religion, and of the nature of an oath. *Moral Philosophy*, vol. ii.

That learned writer has devoted a considerable portion of his chapter on this subject, (and some of our predecessors have copied him) to prove that our Saviour did not consider this a venial offence; although he dismissed the woman taken in adultery, without judicially condemning her. Christ's own phrase would seem a sufficient answer to this supposition.—He expressly brands her action as a “*sin*;” only he declines to act judicially in it. The Saviour did, perhaps, condemn the crime more extensively and decidedly than our authorised version would convey to the reader. Knowing the prevalence of that crime, and similar ones, at that period, he said to her accusers, ‘He that is without sin *avaparētōc*, the same kind of sin among you, let him first cast a stone at her.’ Kypke has proved the best Greek writers to use the verb *avaparētēv*, in this sense, ‘And they, being convicted by their own conscience, went out,’ &c.

ADULTERIA ARBORUM, in botany, adulteries of trees, an expression used by ancient naturalists, for the act of ingrafting one plant upon another. In this sense, Pliny speaks of the adulteries of trees, as contrary to nature, and a piece of luxury, or needless refinement.

AD'UMBRATE, *v.* Ad: *umbra, adumbro*;

ADUMBRA'TION. To shadow forth to; to communicate a faint and superficial knowledge, by obscure signs and symbols; to typify.

To make some *adumbration* of that we mean; it is rather an impulsion or contusion of the air, that an elision or section of the same.

Bacon's Natural History, No. 187.

The observers view but the backside of the hangings; the right one is on the other side the grave: and our knowledge is, but like those broken ends; at best, a most confused *adumbration*.

Glanville's Scepsis Scientifica.

Those of the first sort have some *adumbration* of the rational nature, as vegetables have of the sensible.

Hale's Origin.

Heaven is designed for our reward, as well as rescue; and therefore is *adumbrated* by all those positive excellencies, which can endear or recommend.

Decay of Piety.

ADUMBRATION, in heraldry, is the shadow of any beast or charge, outlined, and painted of a darker colour than the field. It is often mentioned by French and German authors.

ADUMMIM, a mountain and city near Jericho, in the tribe of Benjamin, which lay in the road from Jerusalem, and was much infested with robbers; whence our Saviour has been supposed to lay the scene of his parable here, of the man that fell among the thieves. Its name is retained by a village in the same direction, and signifies the place of blood, from the frequent assassinations committed at it; and the ruins of a spacious khan or inn are shown in the neighbourhood, called the Samaritan's khan, whether it is supposed the Samaritan conducted the sufferer of the parable. Not far from the khan are the remains of a castle, surrounded by a ditch excavated from the solid rock, also called the Samaritan's castle. Adummim, and the neighbourhood, are still very dangerous to travellers who do not obtain a sufficient escort. A decayed chapel is in the vicinity.

ADUN'A'TION. Ad: *unus*. To one.

When by glaciation, wood, straw, dust, and water, are supposed to be united into one lump, the cold does not cause any real union or *adunation*; but, only hardening the aqueous parts of the liquor into ice, the other bodies (being accidentally present in that liquor) are frozen up in it, but not really united.

Boyle.

ADUN'CITY, } Ad: *uncus, (quasi uncus ad*

ADUN'QUE. } *nos, versus nos.) Hooked towards us; shaped like a hook; crooked.*

There can be no question, but the *aduncity* of the pounces and beaks of the hawks, is the cause of the great and habitual immorality of those animals.

Arbutnot and Pope's Mart. Scrib.

The birds, that are speakers, are parrots, pies, jays, daws, and ravens; of which, parrots have an *adunce bill*, but the rest not.

Bacon's Nat. Hist. No. 238.

ADVOCARIA, in old law, a tax paid the lord for his protection; sometimes also called *salvamentum*.

ADVOCATE, *v. & n.* Ad: *voco, vocatus:*

AD'VOCACY,) called upon for assis-

AD'VOCATESHIP,) tance: *Advocatus,*

AD'VOCATESS,) among the Romans,

ADVOCAT'ION.) he that was pre-

sent at the trial of a cause, to assist his friend with his presence and counsel.

This sense is retained in the English word, which besides its mere forensic application, is applied to one, who on any occasion espouses the interests, and pleads the cause of another. In a sacred sense, it designates the offices sustained by the Redeemer.

O thou that art so faire and ful of grace,
Bin thou min *advocat* in that high place,
Ther as withouten ende is songe Osanne,
Thou Cristes mother, daughter dere of Anne.

Chaucer. The Second Nonnes Tale, v. ii. p. 204.

But if ony man synneth, we han an *advocat* anentis the fadir Jesu Crist, and he is the forgisnesse for oure synnes.

Wyclif, 1 Jon. ii.

An *advocate*, in the general import of the word, is that person who has the pleading and management of a judicial cause. In a strict way of speaking, only that person is styled *advocate*, who is the patron of the cause, and is often, in Latin, termed *togatus*, and, in English, a person of the long robe.

Ayl. Par.

Be thou an *aduocate*, and stande in iudgment thy selfe, to speake for all soch as be domme and socourles.

Bible, 1539. Prou. xxxi.

If she dares trust me with her little babe,
I'll shew't the king, and undertake to be
Her *advocate* to th' loudest.

Shakespeare.

It is a strange thing to see, that the boldness of *advocates* should prevail with judges; whereas they should imitate God in whose seat they sit, who represseth the presumptuous, and giveth grace to the modest.

Lord Bacon's Essays.

PRU. Leave your *advocateship*,
Except that we shall call you Orator Fly,
And send you down to dresser, and the dishes.

Ben Jonson. New Inn.

If any there are, who are of opinion, that there are no antipodes, or that the stars do fall; they shall not want herein the applause or *advocacy* of Satan.

Brown's Vulg. Errors, b. i

Of the several forms of government, that have been or are in the world, that cause seems commonly

the better, that has the better *advocate*, or is advanced by freer experience.

Temple's Miscellanies.

Learn, what thou ow'st thy country and thy friend ;
What's requisite to spare, and what to spend :
Learn this, and after, envy not the store
Of the greas'd *advocate* that grinds the poor.

Dryden's Persius.

Our poet, something doubtful of his fate,
Made choice of me to be his *advocate* ;
Relying on my knowledge in the laws ;
And I as boldly undertook the cause

Dryden's Epil. to Mauden Queen.

ADVOCATE, from *ad*, to, and *vocare*, to call, among the Romans, a person skilled in the law, who undertook the defence of causes at the bar. The Roman advocates answered to one part of the office of a barrister in England, viz. the pleading part; for they never granted counsel, that being the business of the *jurisconsulti*. The Romans, in the first ages of their state, held the profession of an advocate in great honour; and the seats of their bar were crowded with senators and consuls; they, whose voices commanded the people, thinking it an honour to be employed in defending them. They were styled *comites honorati, clarissimi*, and even *patroni*; as if their clients were no less obliged to them than freed men to their masters. The bar was not at that time venal. Those who aspired to honours and offices took this way of gaining an interest in the people, and always pleaded gratis. But no sooner were luxury and corruption introduced into the commonwealth, than the bar became a sharer in them. Then it was that the senators let out their voices for pay, and zeal and eloquence were sold to the highest bidder. To put a stop to this abuse, the tribune Cincius procured a law to be passed, called from him *Lex Cincia*, whereby the advocates were forbid to take any money from their clients. They had been prohibited from taking any gratuities for pleading. The emperor Augustus added a penalty: notwithstanding which, the advocates played their part so well, that the emperor Claudius thought it an extraordinary circumstance, when he obliged them not to take above eight great sestertes, which are equivalent to about sixty-four pounds sterling, for pleading each cause. Advocate is still used in countries and courts where the civil law obtains, for those who plead and defend the causes of clients entrusted to them.

ADVOCATE, in church history, a person appointed to defend the right of a church or religious house. The word *advocatus*, or *advowee*, is still retained for what we usually call the patron, or him who has the advowson, or right of presentation in his own name.

ADVOCATE, in English courts, is more generally called *counsel*. See *COUNSEL*.

ADVOCATE, FISCAL, *fisci advocatus*, in Roman antiquity, an officer of state under the Roman emperors, who pleaded in all causes wherein the *fiscus*, or private treasury, was concerned.

ADVOCATE, KING'S, OR LORD ADVOCATE, one of the eight great officers of state in Scotland, who as such sat in parliament without election. He is the principal crown lawyer in Scotland. His business is to act as a public prosecutor, and

to plead in all causes that concern the crown; but particularly in such as are of a criminal nature. The office of king's advocate is not very ancient: it seems to have been established about the beginning of the sixteenth century. Originally he had no power to prosecute crimes without the concurrence of a private party; but in the year 1597, he was empowered to prosecute crimes at his own instance. He has the privilege of pleading in court with his hat on. This privilege was first granted to Sir Thomas Hope; who having three sons lords of session, it was thought indecent that the father should plead uncovered before the sons, who as judges sat covered.

ADVOCATE OF A CITY, in the German polity, a magistrate appointed in the emperor's name to administer justice.

ADVOCATE, CONSISTORIAL, officers of the consistory at Rome, who plead in all oppositions to the disposal of benefices in that court; they are ten in number.

ADVOCATES, ELECTIVE, chosen by the abbot, bishop, or chapter; a particular licence being had from the king or prince for that purpose. The elections were originally made in the presence of the court of the province.

ADVOCATES, FACULTY OF, in Scotland, a respectable body of lawyers, who plead in all causes before the Courts of Session, Justiciary, and Exchequer. They are also entitled to plead in the house of peers, and other supreme courts in England.—A candidate for the office of an advocate undergoes three several trials: The first is in Latin, upon the civil law, and Greek and Roman antiquities; the second, in English, upon the municipal law of Scotland; and in the third, he is obliged to defend a Latin thesis, which is impugned by three members of the faculty. Immediately before putting on the gown, the candidate makes a short Latin speech to the lords, and then takes the oaths to the government and *de fidei*. The faculty consists of about 240 or 250 members. As an advocate is esteemed the gentlest profession in Scotland, many gentlemen of fortune take the degree of advocate, without having any intention of practising at the bar. This circumstance greatly increases their number, gives dignity to the profession, and enriches their library and public fund. It is from this respectable body that all vacancies on the bench are generally supplied.

ADVOCATES, FEUDAL, these were of the military kind, who, to make them more zealous for the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. They were to lead the vassals of the church to war, not only in private quarrels of the church itself, but in military expeditions for the king's service, in which they were the standard-bearers of their churches.

ADVOCATES, JURIDICAL, in the middle age, were those who, from attending causes in the court of the province, became judges themselves, and held courts of their vassals thrice a-year, under the name of the *tria placita generalia*. In consideration of this further service, they had a particular allowance of one third part of a

fines, or mulcts, imposed on defaulters, &c. besides a proportion of diet for themselves and servants.

ADVOCATE'S LIBRARY. In the year 1660, the faculty of advocates, in Edinburgh, founded a library upon a very extensive plan, suggested by Sir George M'Kenzie of Roschaugh, advocate to king Charles II. and king James II. who enriched it with many valuable books. It has been daily increasing since that time, and now contains not only the best collection of law-books in Europe, but a very large collection of books on all subjects. It also possesses a great number of original manuscripts, and a vast variety of Jewish, Grecian, Roman, Scots, and English coins and medals.

ADVOCATES, MATRICULAR, were the advocates of the mother or cathedral churches.

ADVOCATI, MILITARY, were appointed for the defence of the church, rather by arms and authority than by pleading and eloquence.—These were introduced in the times of confusion, when every person was obliged to maintain his own property by force; bishops and abbots not being permitted to bear arms, and the scholastic or gowned advocates being equally unacquainted with them, recourse was had to knights, noblemen, soldiers, and even to princes.

ADVOCATES, NOMINATIVE, those appointed by a king or pope. Sometimes the churches petitioned kings, &c. to appoint them an advocate; at other times this was done of their own accord. By some regulations, no person was capable of being elected advocate, unless he had an estate in land in the same county.

ADVOCATES, SUBORDINATE, those appointed by other superior ones, acting under them, and accountable to them. There were various reasons for the creation of these subordinate advocates; as, the superior quality of the principal advocate, his being detained in war, or being involved in other affairs; but chiefly the too great distance of some of the church lands, and their lying in the dominions of foreign princes.

ADVOCATES, SUPREME, or SOVEREIGN, were those who had the authority in chief; but acted by deputies or subordinate advocates. These were called also principal, greater, and sometimes general advocates. Such in many cases were kings, &c. when either they had been chosen advocates, or became such by being founders or endowers of churches. Princes had also another title to advocacyship, some of them pretending to be *advocati nati*, born advocates, of the churches within their dominions.

AVOCATION, BILL OF, in Scots law, a writing drawn up in the form of a petition; whereby a party, in an action before the inferior court, applies to the supreme court, or court of session, for calling the action from the inferior court before itself.

AVOCATION, LETTERS OF, in Scots law, the decree or warrant of the court of session upon cognisance of the facts set forth in the bill, drawn up in the form of a summons, and passing under the signet, discharging the inferior judge and all others from further procedure in the cause, and advocating it to itself.

ADVOCATIA, in the feudal law, the procuration of some public business, committed by a superior to his substitute. It is also used for patronage and protection of a church, college, monastery, and the like. In this sense it is the same with advowson. It is likewise used for the defence of lay persons, estates, &c.

ADVOCATIONE DECIMARUM, in ecclesiastical affairs, a writ which lies for the claim of the fourth part or upward, of the tithes that belong to any church.

ADVOCATISSÆ, female advowees. See ADVOWEE.

ADVOCATURA, in old law, an inferior kind of jurisdiction, exercised by advocates within the districts of their respective churches, &c. The word is sometimes synonymous with *advocatia*.

ADVOWEE, from *avouer*, to own, in ancient law, the advocate of a church, religious house, or the like. Thus, Charlemagne had the title of *advowee* of St. Peter's; king Hugh, of St. Riquier; and Bolandus mentions some letters of pope Nicholas, by which he constituted king Edward the Confessor, and his successors, *advowees* of the monastery at Westminster, and of all the churches in England. These *advowees* were the guardians, protectors, and administrators of the temporal concerns of the churches, &c. Under their authority were passed all contracts which related to them, and the donations to churches were conferred on the persons of the *advowees*. They always pleaded the causes of the churches in court, and distributed justice for them, in the places under their jurisdiction. They also commanded the forces furnished by their monasteries, &c. for war; and even were their champions, and sometimes fought duels for them. This office is said to have been first introduced in the fourth century, in the time of Stillico; though the Benedictines do not fix its origin before the eighth century. By degrees, men of the first rank were brought into it, either to defend with arms, or protect by authority. In some monasteries they were only called conservators; but these, without the name, had all the functions of *advowees*. There were also sometimes several sub-*advowees*, or sub-*advocates*, in each monastery, who officiated instead of the *advowees* themselves; which, however, proved the ruin of monasteries; those inferior officers running into great abuses. Hence also, husbands, tutors, and every person who undertook the defence of another, were denominated *advowees*, or *advocates*. Thus, several cities had their civil *advowees*; which were established long after the ecclesiastical ones, and doubtless from their example; such as the *advowees* of Augsburg, of Arras, &c. The *vidames* assumed the qualities of *advowees*; and hence several historians of the eighth century confound the two functions together. Several secular lords in Germany bear mitres for their crests, as having anciently been *advowees* of the great churches.

Spelman distinguishes two kinds of ecclesiastical *advowees*. The one, of causes or processes, *advocati causarum*; the other, of territory or lands, *advocati soli*. The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries.

The other, which still subsist, and are sometimes called by their primitive name, advowees, though more usually patrons, were hereditary; as being the founders and endowers of churches, &c. Women were sometimes advowees. The canon law mentions some who had this title, and who had the same right of presentation, &c. in their churches, which the advowees themselves had. In a stat. 25, Edw. III. we meet with *advowee paramount* for the highest patron; that is, the king.

Advowson, APPENDANT, that which depends upon the manor, as an appurtenance.

Advowson in Gross, the right of presentation, which is principal or absolute, and does not belong to any manor as part of its right.

Advowson. Though the nomination of fit persons to officiate in the dioceses, was originally in the bishops, yet they were content to let the founders of churches have the nomination of the persons to the churches so founded, reserving to themselves a right to judge of their fitness. Advowsons formerly were most of them appendant to manors, and the patrons were parochial barons: the lordship of the manor, and patronage of the church, were seldom in different hands, until advowsons were given to religious houses. But of late the lordship of the manor, and advowson of the church, have been divided. Advowsons are presentative, collative, or donative: presentative, where the patron presents or offers his clerk to the bishop of the diocese, to be instituted in his church; collative, where the benefice is given by the bishop, as original patron thereof, or by means of a right he has acquired by lapse; donative, as where the king or other patron does, by a single donation in writing, put the clerk into possession, without presentation, institution, or induction. Anciently, the patron had sometimes the sole nomination of the prelate, abbot, or prior; either by investiture, (i. e. delivery of a pastoral staff,) or by direct presentation to the diocesan; and if a free election was left to the religious, yet a *conge d' clerc*, or licence of election, was first to be obtained of the patron, and the person elected was confirmed by him. If the founder's family became extinct, the patronage of the convent went to the lord of the manor. Unless the several colleges in the universities be restrained in the number of advowsons they may receive, it is argued they will in time acquire such a stock, as to frustrate the design of their foundation, (the education of youth,) by creating too quick a succession of fellows; so that there will not be in the colleges a sufficient number of persons of competent age, knowledge, and experience, to instruct and form the minds of the youth. In some colleges the number of advowsons is said to be already two thirds, or more, of the number of fellows. It is objected, on the other side, that the succession of fellows may be too slow as well as too quick; whereby persons well qualified may be detained so long in colleges as not to have strength or activity enough left for the discharge of parochial functions. Colleges holding more advowsons in number than a moiety of the fellows, are not capable of purchasing more. Grants of advowsons by Papists are void. Advowsons are tem-

poral inheritances, and lay fees; they may be granted by deed or will, and are assets in the hands of heirs or executors. Presentations to advowsons for money, or other reward, are void. In Scotland, this right is called patronage. See PATRONAGE.

ADVOWTRIE. See ADVOUTRY.

ADUN, in music, the key of A major; one of the twenty-four keys in modern music, called by the French, la majeur, and the Italians, la maggior.

ADURE', v. } Ad: *uro, ustus*. The verb is
ADUST, } obsolete: burnt, scorched, hot;
ADUST'ED, } dried with fire.
ADUS'TION.

And althoughe, that to touche and se them wythout,
and throughte the bodyes; they were not exceedinge
hotte nor pale, but that thair skynne was as redde
colour *adusted*, full of a lytle thynne blaynes.

Nicoll's *Thucidides*, f. 57, col. 2.

Such a degree of heat, which doth neither melt
nor scorch, doth mellow, and not *odure*.

Bacon's *Nat. Hist.* No. 319.

By this means, the virtual heat of the water will
enter; and such a heat, as will not make the body
adust, or fragile.

Bacon.

Which with torrid heat,

And vapours, (as the Libyan air,) *adust*,

Began to parch the temperate clime.

Milton's *Paradise Lost*.

Sulphurous and nitrous foam
They found, they mingled; and, with subtle art,
Concocted and *adusted*, they reduced
To blackest grain, and into store convey'd.

Idem.

They are but the fruits of *adusted* choler, and the
evaporations of a vindictive spirit.

Houell.

Such humours are *adust*, as by long heat become
of a hot and fiery nature; as choler and the like.

Quinney.

To ease the soul of one oppressive weight,
This quits an empire, that embroils a state.

The same *adust* complexion has impell'd
Charles to the convent, Philip to the field. Pope.
This is ordinarily a consequent of a burning colligative fever; the softer parts being melted away,
the heat continuing its adusion upon the drier and
fleshy parts, changes into a marcid fever.

Harvey on *Consumptions*.

ADUSTION, in medicine, an inflammation of the parts about the brain, and its membranes, attended with a hollowness of the sinciput and eyes, a pale colour, and dryness of the body. The yolk of an egg, with oil of roses, applied by way of cataplasm, is recommended for this disorder; or the leaves of turnsol, the parings of a gourd, or the pulp of a pompon, applied in the same manner with oil of roses.

ADY, in natural history, the palm tree of the island of St. Thomas. It is tall, with a thick, bare, upright stem, thin and light, growing single on its root, and full of juice. The head shoots into a vast number of branches, which being cut off, or an incision made, afford a great quantity of sweet juice, which fermenting, supplies the place of wine among the Indians. The frun, which is called *abanga*, is of the size and shape of a lemon; and is eaten roasted. The raw kernels are often mixed with mandioc meal, and are judged to be cordial. An oil is also prepared from this fruit, which answers the purpose

of butter, and is used for anointing stiff parts of the body. See ABANGA.

ADYNAMIA, from *a* privative, and δυναμις, strength, in medicine, debility, or weakness, from sickness.

ADYNAMON, among ancient physicians, a kind of weak factitious wine, prepared from must boiled down with water; to be given to patients to whom genuine wine might be hurtful.

ADYTUM, from *a*, not, and δων or δυνω, to enter, in pagan antiquity, the most retired and sacred place of their temples, into which none but the priests were allowed to enter. They were sometimes in the rear of, and sometimes under the temple. The only well preserved adytum is that of the little temple at Pompeii. See POMPEII. The statue of Diana of Portici was found in its interior, elevated a few steps at the back of the temple, and was kept in perfect darkness. The *Sanctum Sanctorum* of the temple of Solomon, was of the nature of the pagan adytum, none but the high priest being admitted into it.

ADZENOTA, a small town of Valencia, in Spain, seated on the mountains Pegna Golosa, abounding with medicinal plants.

ÆA, in ancient geography, a celebrated city and port of Colchis, fifteen miles from the sea, according to Pliny. It was famous for containing the golden fleece of Jason at the time he reached this country. Some authors have considered it as the Æropolis of Ptolemy; from the Greek αει, earth, or the Heb. אֵא, island. From this city the Circe obtained the appellation of Æra. *Hom. Odys. l. i. v. 32. Virgil, l. iii. v. 386.*

ÆACFA, in Grecian antiquity, solemn festivals and games celebrated at Ægina, in honour of Æacus.

ÆACIDES, in ancient history, an appellation given to Pyrrhus, king of Epirus, as the descendant of Æacus, by the Oracle, in the famous equivocal response, which led that monarch to his destruction. See PYRRHUS.

ÆACUS, in fabulous history, the son of Jupiter by Ægina, and king of the island Cenopia, which he named Ægina after his mother. When the isle was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called Myrmidons, from μύρμηξ, an ant. The foundation of the fable is said to be, that when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and by commerce and industry to recover what they had lost. His character for justice was such, that in a time of universal drought, he was nominated by the Delphic oracle to intercede for Greece, and his prayer was answered. See ÆGINA. It was also imagined that Æacus, on account of his impartial justice, was appointed by Pluto one of the three judges of the dead; and that it was his province to decide the fate of Europeans.

ÆBUDÆ. See HEBRIDES.

ÆBURA, in ancient geography, a town of Spain in Estremadura, on the river Guadiana,

to the W. of Merida, now called Talavera. Long. 7°, 15' W. Lat. 38°, 40' N.

ÆCHMALOTARCHA, in antiquity, a Greek term, signifying the chief or leader of the Jewish captives in Babylon. The Jews, who refused to follow Zerubbabel to Jerusalem, after the Babylonish captivity, elected a magistrate to govern them, whom they called נָשָׁר, rosch, galuth, q. d. chief of the captivity, which Origen and others translate by a Greek name of the like import, αιχμαλωταρχος, formed from αιχμαλωτος, captive, αιχμη, war, and αρχων, commander. The Jewish writers assure us, that the achmalotarchæ were only chosen out of the tribe of Judah. The eastern Jews had their princes of the captivity, as the western Jews had their patriarchs. The Jews are still said to have an æchmalotarch at Babylon, but without the authority of the ancient ones.

ÆCIDIUM, in botany, of ακια, a wound or injury, (because, wherever this fungus attaches itself, the plant becomes diseased and tumid,) a species of parasitical fungi. Class and order cryptogamia fungi.

The essential characters are: head conspicuous, sessile, round, membranous, and at length bursting with a toothed orifice. Seeds mealy, naked. Persoon defines twenty species, to which Mr. Sowerby makes several additions.

ÆCLANUM, or ÆCULANUM, in ancient geography, a town of the Hirpini in Italy, at the foot of the Apennines, to the E. of Abellinum, situated between Beneventum and Tarentum. It is now called Fricento, and lies 47 miles E. of Naples.

ÆCLANENSES, or ÆCULANI, the inhabitants of Æculanum.

ÆCLUS, in entomology, a species of papilio, found at Amboyna, of black wings above, cinereous beneath, waved with black, and having a yellow spot.

ÆD, in ancient inscriptions, an abbreviation for ÆDILATUS, which see.

ÆDES, in antiquity, a chapel or inferior kind of temple, distinguished by this, that it was not consecrated by the augurs, as those properly called temples were. Such was the æarium, or treasury; called Ædes Saturni.

ÆDESSA. See ÆGÆA.

ÆDICULA, in ancient architecture, the inner part of the temple, where the altar and statue of the deity stood: it is merely, perhaps, a diminutive of ædes, sometimes it signifies a small house. *Ædiculae* are often found on medals; and ancient sculptures contain the figure of the prince or founder of a temple or church, holding in his hand an ædicula or model of the building. The Romans erected one which they called ædicula ridicula to the god of mirth, in commemoration of the repulse of Hannibal by severe weather after the battle of Cannæ, when he was advancing upon Rome.

ÆDILATUS, ÆDILATE, the office of ædile See next article.

ÆDILE, ÆDILIS, from *aedes* a house, in Roman antiquity, a magistrate whose business it was to superintend buildings of all kinds, especially public ones, as temples, aqueducts,

bridges, &c. to take care of the highways, public places, weights and measures, &c. to fix the prices of provisions, take cognizance of debauchees, punish lewd women, and such as frequented gaming houses. They had the inspection of comedies and other pieces of wit; and were obliged to exhibit magnificent games to the people, at their own expence, whereby many of them were ruined. To them also belonged the custody of the plebsita, and the examination and censure of books. They had the power, on certain occasions, of issuing edicts; and, by degrees, they obtained a considerable jurisdiction, the cognizance of various causes, &c. This office ruined numbers by its expensiveness; so that, in Augustus's time, even senators declined it on that account.

All these functions, which rendered the ædiles so considerable, belonged at first to the ædiles of the people, ædiles plebeii, or minores; these were only two in number, and were first created in the same year as the tribunes: for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers, with whom they might entrust matters of less importance; and accordingly two ædiles were created; and elected every year at the same assembly as the tribunes. But these plebeian ædiles having refused, on a particular occasion, to treat the people with shows, as being unable to support the expence, the patricians offered to do it, provided they would admit them to the honours of the adilite; which being agreed upon, two patrician ædiles were created, in the year of Rome 588; who were called ædiles curules, or majores; as having a right to sit on a curule chair, enriched with ivory, when they gave audience; whereas the plebeian ædiles only sat on benches.—Besides sharing all the ordinary functions with the plebeians, their chief employ was to procure the celebration of the grand Roman games, and to exhibit comedies, shows of gladiators, &c. to the people; and they were also appointed judges in all cases relating to the selling or exchanging estates. To ease these four first ædiles, Caesar created a new kind, called ædiles cereales, as being deputed chiefly to take care of the corn. These ædiles cereales were also taken out of the order of patricians. In the municipal cities there were ædiles, and with the same authority as at Rome. We also read of an ædiles alimentarius, whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office.—In an ancient inscription we likewise meet with ædile of the camp, ædiles castrorum.

ÆDILIS, in entomology, a species of cerambyx, found in the trunks of trees, and called also capricornus rusticus.

ÆDILITAS. See **ÆDILATUS**.

ÆDILITIUM *EDICTUM*, among the Romans, was that whereby a remedy was given to a buyer, in case a vicious or unsound beast, or slave, was sold him. It was called adilitium, because the preventing of frauds in sales and contracts belonged especially to the ædiles.

ÆDITUA, in antiquity, a female officer who

attended the temples of the goddesses. See next article.

ÆDITUUS, from *aedes*, a temple, and *tueor*, to defend, in Roman antiquity, an officer belonging to the temple, who had the charge of the offerings, treasure, sacred utensils, and records. His duty was somewhat similar to that of our verger or beadle, but of superior trust and distinction.

ÆDON, in ancient mythology, a daughter of Pandarus, who being jealous of her sister Niobe, having more children than herself, attempted to kill the eldest of them, but in the attempt slew her own son; and was changed into a goldfinch as she endeavoured to kill herself. *Hom. Od. xix. 518.*

ÆDUI, in ancient history, a brave nation of Celtic Gaul, celebrated as the first allies of Caesar in his invasion of Gaul. They were found between the 46° and 47° latitude.

ÆGADES, three small islands, lying on the west side of Sicily, opposite to the main land between Marsalla and Trapani. Their names are Levenzo, Favignana, and Maretimo.

ÆGAEA, or *Ægæa*, in ancient geography, the name of Ædessa, so called from the following adventure: Caranus, the first king of Macedonia, being ordered by the oracle to seek out a settlement in Macedonia, under the conduct of a flock of goats, surprised the town of Ædessa, during a thick fog and rainy weather, in following the goats that fled from the rain; which goats ever after, in all his military expeditions, he caused to precede his standard; and in memory of this he called Ædessa, *Aιγας*, *Ægæa*. Hence probably, in the prophet Daniel's vision, the he-goat is the symbol of the king of Macedon.

ÆGADEÆ, the inhabitants of *Ægæa*. See last article.

ÆGÆON, in ancient mythology, a huge giant, the son of Titan and Terra, who was fabled to have had 100 hands, with which he threw 100 rocks at once, at Jupiter, who, when he had overcome him, bound him with 100 chains.

ÆGÆUM MARE. See **ÆGEAN SEA**.

ÆGAGROPILA, or *Ægagropilus*, from *αιγαρης*, the rock goat, and *πτλος*, a ball, in natural history, a ball generated in the stomach of the *rupicapra*, or chamois goat, hard on the outside, and consisting of a substance like hair; similar to those sometimes found in cows, hogs, &c. It is sometimes called *bezoor Germanicum*, or the German bezoor.

ÆGEA, a queen of the Amazons, who was drowned in the *Ægean Sea*.

ÆGEAN SEA, in ancient geography, now the Archipelago, a part of the Mediterranean, which separates Europe from Asia and Africa; washing on the one hand, Greece and Macedonia; on the other, Caria and Ionia. It is uncertain whether the name is derived from *Ægea*, queen of the Amazons, or *Ægeus* king of Athens, who both perished in it, or from its various isles appearing like a flock of goats at a distance. See **ÆGEA** and **ÆGEUS**.

ÆGELETIIRON, in botany, a name used by some authors for the common *mercurialis*, or English mercury, an eatable wild herb.

ÆGELSTAWICK, a good harbour, lying about half a mile from the town of Sodertledge, in Sudertorn, a district of Sudermania, in Sweden.

ÆGERITA, in botany, from *aγειρος*, *a poplar*, or *alder tree*, because the first-discovered species of this genus grows on the wood of the alder, and was thence called *Sclerotium Ægerita*, which last word, on the establishment of the present genus, was taken for its generic name.—Class and order, *Cryptogamia Fungi*. Its Ess. CHAR. are sessile granulations solid, filled with a somewhat mealy powder.

ÆGEUS in fabulous history, king of Athens, and father of Theseus. The Athenians having basely killed the son of Minos, king of Crete, for carrying away the prize from them, Minos made war upon them; and being victorious, imposed this severe condition on Ægeus, that he should annually send into Crete seven of the noblest Athenian youths, chosen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theseus: or, as others say, he himself intreated to be sent. The king, at his son's departure, ordered that as the ship departed with black sails, it should return with the same in case he perished; but, if he became victorious, he should change them into white. When Theseus returned to Athens, after killing the Minotaur, he forgot to change the sails, and his father, supposing him dead, cast himself headlong into the sea, which afterwards obtained the name of the *Ægean Sea*. The Athenians decreed Ægeus divine honours; and sacrificed to him as a marine deity, the adopted son of Neptune,

ÆGIALITIS, in botany, *aγιαλίτης*, an inhabitant of the coast, alluding to its place of growth.—A genus of plants, of the class and order, *pentandria pentagynia*. Its Ess. CHAR. CAL. one leaf, coriaceous, five-toothed, with folded angles: PET. five, their claws combined at the base, bearing the stamens: STIG. capitate. Pericarp prominent, angular, nearly cylindrical, coriaceous, without valves. Seed germinating, without albumen, and plumula conspicuous.

ÆGIAS, in medicine, a white speck on the pupil of the eye, which occasions a dimness of sight.

ÆGICERAS, in botany, so called from *aγις*, a goat, and *κέρας*, a horn, in allusion to the horn-like shape of the seed-vessel, a genus of plants of the class *pentandria*, and order *monogynia*. Its Ess. CHAR. CAL. five, deep imbricated segments: COR. salver-shaped, five-cleft, reflexed. Filaments joined at the base: STIG. simple. Follicle coriaceous, cylindrical. Seed solitary, with a hooded tunic. The last two plants are both natives of New Holland.

ÆGIDA, in ancient geography, now *Capo d'Istria*, the principal town on the north of the territory of Istria, situated in a little island, joined to the land by a bridge. In an old inscription, it is called *Ægidis Insula*. It was afterward called *Justinopolis*, after the emperor Justin. Lon. 14°, 20° E. Lat. 45°, 50° N.

ÆGIDES, in medicine, a disorder of the eyes mentioned by Hippocrates, occasioned by small white cicatrices in the eye, arising from an efflux of corrosive humour. See ALBUGO.

ÆGIDION, in pharmacy, *collyrium* for inflammations and defluxions of the eyes.

ÆGILOPS, *aγιλωψ*, Gr. signifying goat-eyed, the goat being subject to this ailment. A tumour or swelling in the great corner of the eye, by the root of the nose, either with or without an inflammation. Authors frequently use the words *ægilops*, *anchilops*, and *fistula lachrymalis*, synonymously: but the more accurate, after Aginceta, make a difference.—The tumour, before it becomes ulcerous, is properly called *anchilops*; and, after it has got into the lachrymal passages, and has rendered the *os lachrymale* carious, *fistula lachrymalis*. If the *ægilops* be accompanied with an inflammation, it is supposed to take its rise from the abundance of blood, which a plethoric habit discharges on the corner of the eye.—If it be without an inflammation, it is supposed to proceed from a viscous pituitous humour, thrown upon this part. The method of cure is the same as that of ophthalmia. But before it has reached the lachrymal passages, it is managed like other ulcers. If the *ægilops* be neglected, it bursts, and degenerates into a fistula, which eats into the bone.

ÆGILOPS, in botany, the *cerrus*, or *holm oak*, a species of *QUERCUS*, which see.

ÆGILOPS, WILD FESTUC, a genus of the monocotyledonous order belonging to the polygamia class of plants, and ranking under the fourth natural order, *Gramina*.—The characters are: CAL. hermaphrodite, a two-valved glume, triflorous: COR. a two-valved glume, the outermost valve terminated by three aristæ, or awns, the interior awnless: STAM. three capillary filaments, style, two: Seed, one, oblong. Male calyx and cor. each a glume as in the former; and stamens, the same number.—There are seven species, natives of Italy, and some other parts of Europe. The flour of the *ægilops cerris*, or *festuca*, has been reputed a remedy for the above-mentioned disease of the eye.

ÆGIMURUS, in ancient geography, an island in the bay of Carthage, about thirty miles distant from that city, now *Goletta*. This island being afterwards sunk in the sea, two of its rocks remained above water, which were called *Arae*, as mentioned by Virgil, because the Romans and Carthaginians entered into an agreement to settle their mutual boundaries at these rocks.

ÆGINA, in fabulous history, the daughter of Æsopus, king of Bœotia, was beloved by Jupiter, who debauched her in the form of a lambent flame, and carried her from Epidaurus, to a desert island called *Enope*, which was named after her.

ÆGINA, in geography, an island in the Saronic Bay, twenty miles from the Piræus, formerly vying with Athens for naval power, and at the sea-fight of Salamis, disputing the palm of victory with the Athenians. The Greeks had a common temple in it dedicated to Jupiter. It was surrounded by Attica, the territory of Megara, and the Peloponnesus, each distant about 100 stadia, or twelve miles and a half. In circumference, it was reckoned 180 stadia, or twenty-two miles and a half. It was washed on the E. and S. by the Myrtoan and Cretan seas. It is now called *Eyina*, or *Egina*. The temple

above-mentioned, is situated on the summit of a mountain called *Panhellenius*, about an hour's walk distant from the shore. The Æginetans affirm it was erected by Æacus; in whose time Hellas being terribly oppressed by drought, the Delphic oracle was consulted, and the response was, That Jupiter must be rendered propitious by Æacus. The cities entreated him to be their mediator: he sacrificed and prayed to Jupiter Panhellenius, and procured rain. The temple was of the Doric order, and had six columns in front. Twenty-one of the exterior columns were lately standing, with two in the front of the pronaos and of the posticum, and five of the number which formed the ranges of the cell. The entablature, except the architrave, is fallen. The stone is of a light brownish colour, much eaten in many places, and indicating very great age. Some of the columns have been injured by boring to their centres for the metal. In several, the junction of the parts is so exact, that each seems to consist of one piece. This ruin Mr. Chandler considers as scarcely to be paralleled in its claim to a remote antiquity. Near the shore is a barrow, raised, according to tradition, in memory of Phocus, the son of Æacus, who was killed by his brother Peleus. See PELEUS. This barrow in the second century, when seen by Pausanias, was surrounded with a fence, and had on it a rough stone. The terror of some dreadful judgment to be inflicted from heaven, had preserved it entire and unaltered to his time; and in a country depopulated and neglected, it may still endure for many ages. The soil of this island, as described by Strabo, is very stony, especially the bottoms, but in some places, not unfertile in grain. Besides corn, it produces olives, grapes, and almonds; and abounds in pigeons and partridges. It has been related, that the Æginetans annually break their eggs, to prevent their multiplying, and occasioning a famine. They have no hares, foxes, or wolves. The rivers in summer are all dry. The vauwode or governor farms the revenue of the grand seignior; of which, about half is paid by a carat-ch-inoney, or poll-tax.

ÆGINA, was the capital of the above island. Its site has been long forsaken. A remnant of a temple of Venus, is situated near the port, which was principally frequented. The theatre resembled that of the Epidaurians both in size and workmanship. The walls belonging to the ports and arsenal were of excellent masonry, and may be traced to a considerable extent, above, or nearly even with, the water. Here is a small chapel of St. Nicholas, several mean churches, and a square tower with a draw-bridge. This structure, was erected by the Venetians, while at war with the Turks in 1693. This island is generally garrisoned with about 800 men.

ÆGINETA, in botany, a genus of plants, belonging to the class and order, didynamia angiospermia; the characters of which are; the cup an oval, inflated, and coloured spathe; univalve; opening longitudinally near the top. The flower consists of one petal. Its base large, round, and inflated. The tube short, cylindric, and open; and the mouth small, but expanded, and turns back at the edge. The STAN. four

crooked filaments; two of them of the length of the flower, and the other two a little shorter. The antheræ are oblong, and stand close to one another at their top. The germen of the pistil is oval; the style is subulated, and of the length of the stamna; and the stigma is large, round and bending. The Hortus Malabaricus is the only work in which we have a description of the plant.

ÆGINETA, (Paulus,) a celebrated surgeon of the island of Ægina, from whence he derived his name. According to M. Le Clerc's calculation, he lived in the fourth century; but Abulpharagius, who is allowed to give the best account of those times, places him with more probability in the seventh. His knowledge in surgery was great, and his works are deservedly famous. Fabricius ab Aquapendente has transcribed his remarks in a variety of places. He is the first writer who takes notice of the cathartic quality of rhubarb; and, according to Dr. Milward, is the first in antiquity, who deserves the title of a man-midwife.

ÆGINETÆ, or ÆGINENSES, the inhabitants of Ægina; they applied early to commerce, and were the first who coined money, which from them was called *Noμερα Αγινατον*, Æginetan coin. From their industry, they got the title of *Myrmidons*, or the nation of ants. See ÆACUS and ÆGINA.

ÆGINETICUM ÆS, the money of Ægina, which was much esteemed in ancient Greece.

ÆGINHARD, the celebrated secretary and supposed son-in-law of Charlemagne. He is said to have been carried through the snow on the shoulders of the affectionate and ingenious Imma, to prevent his being traced from her apartments by the emperor her father: a story which the elegant pen of Addison has copied and embellished from an old German chronicle, and inserted in the third volume of the Spectator—This happy lover seems to have possessed a heart not unworthy of so enchanting a mistress, and to have returned her affection with the most faithful attachment; for there is a letter of Æginhard's still extant, lamenting the death of his wife, which is written in the tenderest strain of conubial affection. He was a native of Germany, and was educated by the munificence of his imperial master, of which he has left the most grateful testimony in his preface to the life of that monarch. Æginhard, after the loss of his wife, is supposed to have passed the remainder of his days in religious retirement. His life of Charlemagne, his annals from 741 to 889, and his letters, are inserted in the second volume of Duchesne's *Scriptores Francorum*. There is an improved edition of this valuable historian, with the annotations of Hermann Schmincke, in 4to, 1711.

ÆGIPAN, from *Aig*, a goat, in heathen mythology, a denomination given to the god Pan, because he was represented with the horns, legs, feet, &c. of a goat.

ÆGIPANES, in ancient history, a sort of monsters mentioned by Pliny, Solinus, and Pomp. Mela. Salmasius, in his notes on Solinus, takes *Ægipan* to have signified the same, in Libya, with *Sylvanus* among the Romans.

Vossius rejects the opinion, and shews, that the *Ægipanes* had not faces like men, as the *Sylvans* had, but like goats. The whole upper part of the body resembled that animal; and the lower, they painted with a fish's tail. The monster represented on some medals of Augustus, by antiquaries called *Capricornus*, appears to be the true *Ægipan*.

ÆGIPHILA. GOAT-FRIEND; in botany, a genus of the monogynia order, belonging to the tetrandria class of plants; the characters of which are: CAL. a single-leaved perianthium, bell shaped, four-toothed, loose, very short, and persistent: COR. one petal; the TUBUS cylindric, narrower and longer than the calyx; the border divided into four segments, flat and equal; the divisions oblong; STAM. four erect capillary filaments; the anthera incumbent and squared: PIST. a germen above; a capillary, two-cleft, middle sized stylus; and a simple stigma: the pericarpium is a roundish unilocular berry; the seeds four. There is only one species, a native of Martinico.

ÆGIPYROS, in botany, buck wheat.

ÆGIS, in ancient mythology, the shield of Jupiter and Minerva. The goat Amalthea, which had suckled Jove, being dead, that god is said to have covered his buckler with the skin: whence the appellation *Ægis*, from *αἴξ, αὐγός, a she-goat*. Jupiter, afterwards restoring the beast to life again, covered it with a new skin, and placed it among the stars; and gave his buckler to Minerva; whence her shield is also called *ægis*. Minerva, having killed the Gorgon Medusa, nailed her head in the middle of the *ægis*, which henceforth had the faculty of converting into stone all those who looked thereon; as Medusa was said to have done during her life. Some critics, particularly Servius, take the *ægis* not to have been a buckler, but a cuirass, or breast-plate, which is more agreeable to Virgil's description of Minerva's; *Æn.* viii. v. 435. But Jupiter's *ægis* is expressly described as a buckler, v. 354.

ÆGISTHUS, in ancient fabulous history, the son of Thystes, by his own daughter Peleopeia, who, to conceal her shame, exposed him in the woods; where he was suckled by a goat, and hence called *Ægisthus*. He corrupted Clytemnestra, the wife of Agamemnon; and with her assistance, slew her husband, and reigned seven years in Mycenæ. He was, together with Clytemnestra, slain by Orestes.

ÆGITHALLUS, in ancient geography, a promontory and citadel of Sicily, between Drepanum and the Emporium Aegistanus, afterwards called *Acellus*; corruptly written *Aegitharsos*, in Ptolemy, situated near Mount Erix, and now called *Capo di Santo Theodoro*.

ÆGIUM, in ancient geography, a town of Achaea Propria, five miles from the place where Helice stood, and famous for the council of the Achæans, which usually met there on account either of the dignity or commodiousness of its situation. It was famous also for the worship of *Ομαγνυπος Ζευς*, *Conventional Jupiter*, that god having been supposed to be suckled here by the she-goat Amalthea, and of *Panachæan Ceres*. The territory of *Ægium* was watered by two rivers,

viz. the Phœnix and Meganites. The epithet is *Ægiensis*. There is a coin in the cabinet of the king of Prussia, with the inscription *ÆILI*, and the figure of a tortoise, which is the symbol of Peloponnesus, and leaves no doubt as to the place where it was struck.

ÆGLEFINUS, in ichthyology, a name given, by the generality of authors, to the haddock, called by others, the *onus*.

ÆGLEUS, in botany, the white chamæleon thistle. It is derived from the Greek *αγλητος* of Galen; by which he distinguishes the white chamæleon, which was an esculent and medicina plant, from the *ερεβεννος* or *erebenus*, which was what we call the black chamæleon thistle, and was esteemed poisonous.

ÆGLIA. See *ÆGIAS*.

ÆGOBOLIUM, in antiquity, the sacrifice of a goat offered to Cybele. The *ægobolium* was an expiatory sacrifice, which bore a near resemblance to the *taurobolium* and *criobolium*, and seems to have been sometimes joined with them.

ÆGOCEPHALUS, in ornithology, the name by which the generality of authors call the bird, known in England by the name of the god-wit, and in some places the stone-plover, the yerwhep, or *yarwhip*.

ÆGOCERAS, in botany, a name given to fenugreek, and also to bouceras, because of their corniculated fruit, the word originally signifying goat's horn.

ÆGOLETHRION, in botany, a plant mentioned by Pliny; which appears to be the same with what Tournefort describes under the name of *chameroiodendros, pontica, maxima, mespili folio, floreo luteo*. The ancients attribute dangerous qualities to it.

ÆGOMANTIA, in antiquity, a species of divination performed by means of a goat.

ÆGONYCHUS, *Ἄγος οὐνή*, the nail or hoof of a goat, in natural history, a plant mentioned by Pliny, as a synonyme of the *lithospermum*, or gromwell. The ancients called this plant, *exonychion*; by which they expressed its being like the exterior parts of the nails on the fingers.

ÆGOPHTHALMUS, in mineralogy, the goat's eye stone, a name given to those species of agate, or other semipellucid gems which have circular spots in them, resembling the eyes of that animal in colour, and in their round figure.

ÆGOPODIUM, small wild angelica, gout-wort, goat's-foot, herb gerard, or ashweed; a genus of the digynia order, belonging to the pentandria class of plants; the characters of which are: CAL. a manifold convex umbel; the partial one, consimilar and flat; there is no involucrum; and the proper perianthium is scarcely discernible; the COR. uniform, the florets all fertile; the proper one has five inverse ovate, concave, equal petals, inflected at the top: STAM. five simple filaments twice the length of the corolla; the ANTHÆ, roundish: PIST. a germen beneath; two purple erect styli the length of the corolla; the stigmata are headed: no pericarpium: the fruit is ovate, striated, and bipartite: the seeds are two, ovate, on one side convex and striated, and flat on the other. There is but one species, a native of Britain and other parts

of Europe. It is very common under hedges and about gardens.

ÆGOPOGON, in botany, a name used by Tragus and others, to express the ulmaria, or common meadow-sweet.

ÆGOPRICON, a genus of the monœcious order, belonging to the diandria class of plants; the characters of which are; CAL. both of male and female a tubula perianthium of one leaf divided into three segments; COR. wanting; STAM. a single erect filament longer than the calyx, with an ovate anthera; RIS. an ovate germen, three divaricatus styli, the simple persistent stigmata: the pericarpium a globular berry, three-grained within, and three-celled: the seeds solitary and angular on one side. There is but one species, a native of Surinam.

ÆGOPROSOPON. See ÆGIDION.

ÆGOSPOTAMOS, in ancient geography, a river in the Thracian Chersonesus, falling into the Hellespont, to the north of Sestos.

ÆGOSPOTAMOS, a town, station, or road for ships, at the mouth of the above river. Here the Athenians under Conon, through the fault of his colleague Isocrates, received a signal overthrow from the Lacedemonians, under Lysander, which was followed by the taking of Athens, and put an end to the Peloponnesian war. See LYSANDER.

ÆGREFINUS. See ÆGLEFINUS.

ÆGRITUDO BOVINA. See BOVINA AFFECTIO.

ÆGYPT. See EGYPT.

ÆGYPTIACA, the Papyrus.

ÆGYPTIACUM, in pharmacy, a name given to various ointments of the detergent, or corrosive kind; such as the black, red, white, simple, compound, or magistral, Ægyptiacum. Of these the principal are:

ÆGYPTIACUM ALBUM, a composition of lily roots mixed up with aromatics; it is mentioned by Hippocrates, and is the same with what other ancients call *cicinum*. It was used by the ladies of those days to smear over their faces, to preserve their complexions. Hippocrates also speaks of another composition of the Egyptian thorn.

ÆGYPTIACUM COMPOSITUM MAGISTRALE, wherein treacle, mithridate, camphor, &c. are ingredients. It is much used in the German dispensatories.

ÆGYPTIACUM RUBRUM, and NITRUM, the red and black kind, are chiefly used by farriers, to soften the hoofs of horses, when too hard.

ÆGYPTIACUM SIMPLEX, usually found in our shops, is a composition of verdigrise, vinegar, and honey, boiled to a consistence. It takes its name from its dusky colour, wherein it resembles that of the natives of Egypt. It is improperly called an unguent; as there is no oil in it. Some call it *Mel Egyptiacum*. It is chiefly used in eating of rotten flesh, and cleansing foul ulcers; particularly venereal ones in the throat, &c. It also destroys those cancerous erosions apt to grow in children's mouths.

ÆGYPTILLA, in natural history, the name of a stone said, by the ancients, to have the remarkable quality of giving water the colour and taste of wine. This seems a very imaginary

virtue, as are indeed too many of those in former ages attributed to stones. This remarkable fossil was described as variegated with veins of black, white, and bluish, with sometimes a vein of whitish red. The authors of these accounts seem to have understood by this name the stones of the onyx, sardonyx, and camæa kind; all which we have at present common among us, but none of which possess any such strange properties.

ÆGYPTION, a tropical remedy used by the ancients in uterine disorders.

ÆGYPTIUM PHARMACUM AD AURES. Aetius speaks of this as excellent for deterring fetid ulcers of the ears, which he says it cures, though the patient were born with them.

ÆGYPTUS, in fabulous history, the son of Belus, and brother of Danaus. See BELIDES.

ÆHIOITULLA, in zoology, the name of an East Indian species of serpent, found frequently in the island of Ceylon; it is very long and slender, sometimes wholly of a fine green, sometimes green and white, and lives principally on trees and among bushes.

ÆICHRYSON, in botany, a name sometimes given to the *Sedum majus*.

ÆINAUTÆ, from *Aetnavrat*, always mariners, in antiquity, senators of Miletus, who held their deliberations on board a ship, far from shore, and, till their business was decided, never returned to land.

ÆIPATHY, from *aet*, always, and *παθος*, affection, Gr. a passion of long continuance.

ÆITHIALES, in botany, another name for the *Sedum majus*.

ÆIZOON, *aetιων*, from *aet*, always, and *ζωη*, life; *Sempervivum, sedum*, houseleek.

ÆLF, (which according to various dialects, is pronounced *ulf*, *welph*, *hulp*, *hilp*, *helfe*, and, at this day *help*,) implies assistance. So *Ælfwin*, is victorious, and *Ælfwold*, an auxiliary governor: *Ælfgifa*, a lender of assistance: with which *Bacotius*, *Synmachus*, *Epicurus*, &c. bear a plain analogy. Gibson's *Canden*.

ÆLFRED. See ALFRED.

ÆLFRIC, archbishop of Canterbury in the tenth century, was the son of an earl of Kent, who, receiving the usual education, assumed the habit of the Benedictine order of monks in the monastery of Abingdon, over which Athelwold then presided, and the latter being subsequently made bishop of Winchester, took Ælfric with him to aid in the education of the youth of his diocese. He composed a Latin Saxon Vocabulary, and some Latin colloquies, the former of which was printed by Somner, under the title of A. Glossary, Oxon. 1659. Ælfric also during his residence in Winchester, translated from the Latin into Saxon, most of the historical books of the Old Testament, and Canons for the regulation of the Clergy, which are inserted in Spelman's Councils. He afterwards became abbot of St. Albans, (where he composed a liturgy for the service of his abbey, which was used in Leland's time,) bishop of Wilton, and, in 994, was translated to the see of Canterbury. He frequently assisted his country in a spirited resistance of the Danish invaders, and died highly venerated, Nov. 1005.

ÆLIA CAPITOLINA. See JERUSALEM.

AELIAN, (Claudius,) born at Prænestine in Italy, taught rhetoric at Rome, under Alexander Severus. He was surnamed Μέλιγλωσσος, Honey-mouth, on account of the sweetness of his style, and entitled *Sophist*, an appellation in his days given only to men of learning and wisdom. He loved retirement, and studied Plato, Aristotle, Isocrates, Plutarch, &c. and, though a Roman, gave the preference to the Greek authors. His most celebrated works are, his *Various History*, and *History of Animals*; though he also wrote a book on Providence, and another on Divine Appearances.

AELII PONS, in ancient geography, one of the fortresses near Adrian's Wall, now called Portland in Northumberland, between Newcastle and Morpeth.

AELIUS PONS, now *il Ponte S. Angelo*, a stone bridge at Rome, over the Tyber, which leads to the Burgo and Vatican from the city, along Adrian's mole, built by the emperor Adrian.

AELMEFOCHI, in ecclesiastical affairs, the tribute of a penny from each house, anciently paid to the Pope, and thence called *Peter-pence*.

AELPUTIE, **AELMOPER,** and **AELMUITER,** names of the Eelpout. See next article,

AELQUAPPE, in zoology, the common name, among the German nations, of a fish of the Mustela kind, the viviparous eel-pout, called by Schonefeldt *mustela vivipara*. It is usually a foot long or more. Its skin is perfectly smooth, and the colour of its back and head a brownish yellow, marked with blotches of black; the colour of the back grows paler on the sides, and on the belly is whitish. It has four gills on each side, and the head is shaped like that of the eel; the back fin reaches the whole length of the body, terminating near the tail. The belly fin begins at the anus, and reaches to the extremity of the fish, ending in a fine, slender, and somewhat reddish tail. Beside these, it has two pairs of fins, one at the bottom of the gills, which are somewhat broad, and the other very fine and slender under the throat. The young of this species are often found alive, to the number of 300 in one individual: they are found of two fingers breadth long, and live sometimes after they are taken out.

AELST, (Evert Van,) a celebrated Dutch painter of still life, born at Delft, in 1602. He acquired a great reputation for delicacy of manner and exactitude in copying nature, as well as for the beautiful lustre he gave to his representation of metals.

AELUROPO, in pharmacy, a syrup made of the herb cats-foot, a species of *gnaphalium*.

AELURUS, in Egyptian mythology, the god of cats; represented sometimes like a cat, and sometimes like a man with a cat's head. The Egyptians had so superstitious a regard for this animal, that the killing it, whether by accident or design was punished with death; and Diodorus relates, that, in the time of extreme famine, they chose rather to eat one another than touch those sacred animals.

AEM, **AM,** or **AME,** a liquid measure used in most parts of Germany: but different in different towns: the aem commonly contains twenty

vertils, or eighty masses: that of Heidelberg is equal to forty-eight masses; and that of Würtemberg to 160 masses. See **ΔΑΜ.**

ÆMILIANUS, **ÆMILIUS,** or **C. JULIUS**, an obscure native of Mauritania, who by his valour and prudent conduct, raised himself to become successively first consul and emperor of Rome. He succeeded Decius, and marched against Gallus and Valerian, who were murdered by their own troops, a fate which he also shortly suffered.

ÆMILIANUS. See **SCIPIO.**

ÆMILIUS, (Paulus,) the son of Lucius Æmilius, who was killed at the battle of Cannæ, was twice consul. In his first consulate, he triumphed over the Ligurians; and in the second, subdued Perseus king of Macedonia, and reduced that country to a Roman province, on which he obtained the surname of Macedonicus. He returned to Rome, loaded with glory, and triumphed for three days. He died 168 years before Christ.

ÆMILIUS, (Paulus,) a celebrated historian, born at Verona, who obtained such reputation in Italy, that he was invited into France by the cardinal of Bourbon, in the reign of Louis XII. to write the history of the kings of France in Latin, and was given a canonry in the cathedral of Paris. He was near forty years in writing that history, which has been greatly admired; and died at Paris in 1529.

ÆMOBOLIUM, in antiquity, the blood of a bull or ram offered in the sacrifices, called *taurobolia* and *cribolia*; in which sense the word occurs, in ancient inscriptions. Some read it *Egobolium*, which see.

ÆNARIA, in ancient geography, an island in the bay of Cumæ, Italy. It was also called *Inarime*, and now *Ischia*; and is twenty miles in compass. It is one of the Oenotrides, and fenced round by very high rocks, so as to be inaccessible but on one side: it was formerly famous for its earthenware. See **ISCHIA.**

ÆNEAS, in fabulous history, a famous Trojan prince, the son of Anchises and Venus. At the destruction of Troy, he bore his aged father on his back, and saved him from the Greeks; but being too solicitous about his son and household gods, lost his wife Creusa in the escape. Landing in Africa, he was kindly received by queen Dido, to whom he made a very ungrateful return. Quitting her coast, he arrived in Italy, where he married Lavinia, the daughter of king Latinus, and defeated Turnus, to whom she had been contracted. After the death of his father-in-law, he was made king of the Latins, over whom he reigned three years: but joining with the Aborigines, he was slain in a battle against the Tuscans. See **ÆNEID.**

ÆNEAS SYLVIUS. See **PIUS II.**

ÆNEATORES, in antiquity, the musicians in an army; including those who played trumpets, horns, *litui*, *buccina*, &c. The word is formed from *aeneus*, on account of the brazen instruments used by them.

ÆNEID, the name of Virgil's celebrated epic poem. The subject, the establishment of *Æneas* in Italy, is extremely happy. Nothing could be more interesting to the Romans, than to look

back to their origin from so famous a hero. While the object itself was splendid, the traditional history of this country opened interesting fields to the poet; and he could glance at all the recent and really great exploits of the Romans, in its ancient and fabulous state. The unity of action is perfectly preserved in the *Aeneid*. The settlement of *Aeneas*, by the order of the gods, is constantly kept in view; and the episodes are linked properly with the main subject. The nodus, or intrigue of the poem, is also happily managed. The wrath of Juno, who opposes *Aeneas*, gives rise to all his difficulties, and connects the human with the celestial operations, throughout the whole poem. One great imperfection, however, is, that there are no strongly marked characters in *Aeneid*. Achates, Cloanthes, Gyas, and other Trojan heroes who accompanied *Aeneas* into Italy, are insipid. Even *Aeneas* himself is without interest. The character of Dido is the best supported in the whole *Aeneid*. The principal excellency of the *Aeneid* of Virgil is tenderness. His soul was full of sensibility. He must have felt himself all the affecting circumstances in the scenes he describes; and he knew how to touch the heart by a single stroke. In an epic poem this merit is next to sublimity. The second book of the *Aeneid* is one of the greatest master-pieces that ever was executed. The death of old Priam, and the family-pieces of *Aeneas*, Anchises, and Creusa, are as tender as can be conceived. In the fourth book, the unhappy passion and death of Dido are admirable. The episodes of Pallas and Evander, of Nisus and Euryalus, of Lausus and Mezentius, are superlatively fine. In his battles, Virgil is inferior to Homer. But, in the important episode, the descent into hell, he has surpassed Homer by many degrees. There is nothing in antiquity, that equals the sixth book of the *Aeneid*.

ÆNGINA, one of the islands of the Archipelago. See *AGINA*.

ÆNIGMA, *ἀνίγμα*, a riddle. An obscure and difficult question.

The dark *enigma* will allow
A meaning; which, if well I understand,
From sacrifice will free the god's command.

Dryden.

A custom was amongst the ancients of proposing an *enigma* at festivals, and adjudging a reward to him that solved it.

Pope.

ÆNIGMA. See *ENIGMA*.

ÆNIGMA, *Ἄνιγμα*, formed of *αἰρττεσθαι*, *obscure innuere*, to hint a thing darkly, and of *επος*, an obscure speech, denotes any dark saying, wherein something is concealed under obscure language. The popular name is riddle; from the Belgic *rædien*, or the Saxon *raeðan*, to interpret. Fa. Bouhours, in the memoirs of Trevoux, defines an *enigma*: A discourse, or painting, including some hidden meaning, which is proposed to be guessed.

ÆNIGMAS, *VERBAL*, are witty, artful: and abstruse descriptions of any thing. In a general sense, every dark saying, every parable, may pass for an *enigma*. Hence, obscure laws are called *Ænigmata Juri*; and, the alchemists are great dealers in a ñigmatic language, their pro-

cesses for the philosopher's stone being generally wrapt up in riddles: e.g. *Fac ex mare et feniua circulum, inde quadrangulum, hinc triangulum, fac circulum, et habebis lapidem philosophorum*. F. Menestrier has attempted to reduce the composition and resolution of ænigmas to a kind of art, with fixed rules and principles, which he calls the philosophy of ñigmatic images. Puerile as, in modern times, the exercise of resolving ænigmas may appear, it is certain that the practice of their proposition and explanation has existed in the most remote, and the most learned ages of the world. The greater part of the Egyptian learning is said to have been comprised in ænigmas; and that of the sphinx, and the supposed discovery of its celebrated riddle by Oedipus, appears to be testified by the numerous Egyptian statues of that fabulous monster. The story is this:—a certain monster, having the head and breasts of a woman, the wings of a bird, the claws of a lion, and the body of a dog, had long ravaged the country about Thebes, and could not be destroyed until this riddle was solved: *What animal is that which walks on four legs in the morning, at noon on two, and at night on three?* The answer of Oedipus was, it is a man: when the monster, in despair, dashed out his brains against a rock. Sphinxes themselves, indeed, were ñigmatical of the rising of the Nile; the head of a woman, and the body of a lion, indicating the overflow of that river, when the sun passed through the signs of Virgo and Leo in August; Gale thinks, the Jews borrowed their ñigmatical forms of speech, (see Numbers xii. 8. Judges xiv. 12.) from the Egyptians. The New Testament says, "Now (in this state) we see through a mirror *εν ανύγματι*, in an *ænigmatical* manner, but then (in an eternal state) face to face." 1 Cor. xiii. 12.

Some ænigmas of antiquity have furnished considerable employment to critics. We subjoin:—

1. The celebrated sybilline ænigma:

Ἐνίρια γράμματ' ἔχω, τετρασύλλαβός είμι, νόιμη.
Αἱ τρεῖς αἱ πρώται δύο γράμματ' ἔχονται εκάστη,
Ἡ δοπτὲ δὲ τὰ δοιπά, καὶ εἰσὶν ἄφωνα τὰ πέντε.
Τα παντὸς δὲ ἀρθροῦ ἑκατοντάδες εἰσὶ δις ἐπτά,
Καὶ τρεῖς τρις ἕκακτες καὶ δις τρια. Γνως δὲ τις εἴμι,
Οὐκ ἀμύνος ἐσθ τῆς παρ̄ ἐμα σοφίης.

Thus translated by M. Leibnitz.

Literalis noscitur quadrisyllabus ipse novenisi:
Syllaba habet binas, nisi quod tenet ultima ternas.
Vocales quatuor, quinis non propria vox est.
Bis septem vicibus numerum centuria totum
Inreditur, decadescque novem, tum bis tria. Si me
Noveris, hinc aditus ad sacra nostra patent.

A mystical solution has been given of this ænigma. Moret will have it signify the name Jehovah, which, according to him, comprehends the number 1696, abating one, the number contained in the ænigma. Brentius maintains, that the whole sum amounts to 1711, and that it represents the word φοσφορος. The generality understand it of, the word arsenic, or ΑΡΣΕΝΙΚΟΝ.

2. An ingenious ænigma on the operation of cupping, by a machine of brass:

Ἀνέρ εἰδον πυρι χαλκὸν επ' ἀνέσι κολλησαντα;

" I saw a man, who, unprovok'd with ire,
Stuck brass upon another's back by fire."

Arist. Rhetor. l. iii. c. 2. t. 2. p. 586. ed. Duval.

3. The celebrated Spanish ænigma from the Bologna marble, preserved in the Voltaian family, is perhaps, the most famous specimen of this kind of learning:

D. M.

ÆLIA LÆLIA CRISPIS.

Nec vir, nec mulier, nec androgyna.

Nec puella, nec juvenis, nec anus.

Nec casta, nec meretrix, nec pudica.

SED OMNIA.

Sublata.

Neque fame, neque ferro, neque veneno.

SED OMNIBUS.

• Nec calo, nec aquis, nec terris.

SED UNIQUE JACET.

Nec maritus, nec amator, nec necessarius,

Neque mærens, neque gaudens, neque flens,

Hanc,

Nec molem, nec pyramidem, nec sepulchrum.

SED OMNIA.

Scit, et nescit cui posuerit;

LUCIUS AGATHO PRISCUS.

That is to say, "To the gods' manes. Ælia Lælia Crispis, neither man, nor woman, nor hermaphrodite; neither girl, nor young woman, nor old; neither chaste, nor polluted, nor a modest woman; but all these: killed neither by hunger, nor steel, nor poison; but by all these: rests neither in heaven, nor on the earth, nor in the waters; but every where. Lucius Agatho Priscus, neither her husband, nor lover nor friend; nor sorrowful, nor joyful, nor weeping; certain, and uncertain, to whom he rears this monument, neither erects her a temple, nor a pyramid, nor a tomb, but all these." In the MS. at Milan, instead of D. M. we find A. M. P. P. D. and at the end the following addition:

" Hoc est sepulchrum intus cadaver non habens,
Hoc est cadaver sepulchrum extra non habens,
Sed cadaver idem est et sepulchrum."

Which signifies, " This is the grave that has no corpse within: This is the corpse that has no grave without; but the corpse and the grave are the same."

We find near fifty several solutions of this ænigma advanced by learned men. Marius Michael Angelus maintains, Ælia Lælia Crispis, to signify rain water falling into the sea. R. Vitus first explained it of Niobe turned to a stone, afterwards of the rational soul, and afterwards of the Platonic idea; Jo. Turrius, of the *materia prima*; Fr. Schottus, of an eunuch, &c. &c. &c.

4. We cannot omit, lastly, this elegant little ænigmatical epitaph:

ON FAIR ROSAMOND.

Hic jacet Rosa munda, non Rosa mundi,
Non redolit, sed olcit, quæ redolere solet.

ÆNIGMATICAL, something that relates to, or partakes of, the nature of ænigma. The philosophy of the Druids was altogether ænigmatical. The ancient sages in general, affected an ænigmatical way of writing, to conceal their doctrines from the populace. The Romans in Nero's time, were obliged to have recourse to the like

method, though for different reasons. We read of an ænigmatical medal presented by the Huguenots to Henry III. Schott has published an explication of an ænigmatical coin of the emperor Augustus, concerning which antiquaries have been long divided.

ÆNIGMATOGRAPHER, or ÆNIGMATIST, a maker or explainer of ænigmas. Hardouin, Vander Hardt, &c. are great ænigmatists.

ÆNIGMATOGRAPHY, or ÆNIGMATOLOGY, from *Ἄνιγμα*, and *γράφω*, to describe, or *λογος*, speech, the art of resolving or making Ænigmas.

ÆNII, the inhabitants of *Ænos*.

ÆNITHOLOGIUS, in poetry, a kind of verse, consisting of two dactyls, and three trochæ; Such as,

Praelia dira placent truci juventæ,

ÆNOBARBUS, in ancient history, the agnomen or surname of Domitius, who was so called from his beard, which, according to tradition, was changed by Castor and Pollux, from brown to red, because he did not believe then, when they revealed to him a victory that was obtained.

ÆNONA, in ancient geography, a city of Liburnia, called by Pliny *Civitas Prasini*, the reason of which is unknown; also *Enona*, and now *Nona*; on the Adriatic, by which it is for the greater part surrounded, over against the island Gissa, from which it is distant four miles to the west.

ÆNOS, ÆNUM, or ÆNUS, in ancient geography, a town of Thrace, situated on the east mouth of the Hebrus, and said to be built by the Cumæans. It was a free town, in which stood the tomb of Polydorus. Here the brother of Cato Uticensis died, and was honoured with a monument of marble, in the forum of the *Enii*. Livy says, that the town was otherwise called *Absynthus*. It is now called *Eno*.

ÆNUS, in ancient geography, now the *Inn*, a river of Germany, which rising in the country of the Grisons, out of the Rhœtian Alps, runs through the Grisons, the Tyrol, the duchy of Bavaria, and through Passau, into the Danube.

ÆOLIA. See ÆOLIS.

ÆOLIE INSULÆ, now *Isole di Lipari*, in ancient geography, seven islands, situated between Sicily and Italy, so called from *Aëolus*, who reigned there about the time of the Trojan war. The Greeks call them *Hephæstides*; and the Romans *Vulcania*, from their fiery eruptions. They are also called *Lipariorum Insulæ*, from their principal island Lipara.

ÆOLIAN, or ÆOLIC, in grammar, one of the five dialects of the Greek tongue. It was first used in Bœotia; whence it passed into Æolia, and was that in which Sappho and Alæsus wrote. The Æolic dialect generally throws out the aspirate or sharp spirit, and agrees in so many things with the Doric, that the two are usually confounded together.

ÆOLIAN HARP. In our article ACOUTICS, we have mentioned an instrument of this invention of which has been generally attributed to Kircher. But the fact is, that it was known and used at a much earlier date, as Mr. Richardson has proved, (*Dissertation on the Manners and Customs of the East*;) in various eastern countries. There is a Rabbinical story,

(Berach vi.) of the aerial harmony of the harp of David; which when hung up at night, was played upon by the north wind. Kircher wrote a book describing his instrument, entitled *Magia Phonotactica et Phonurgia*.

In England, where it was introduced about the middle of the last century, it is generally a simple box of thin fibrous wood (often of deal,) to which are attached a certain number of fine catgut strings, sometimes to the number of fifteen, of equal size and length, and consequently unisons, stretched on low bridges at each end. Its length is made to correspond with the size of the window or aperture in which it is intended to be placed; its width is about five or six inches, and its depth two or three. The sash must be raised to admit it with the strings uppermost, under which is a circular opening in the centre, as in the belly of the guitar. When the wind blows athwart the strings, it produces the effect of a choir of music in the air, sweetly mingling all the harmonic notes, and swelling or diminishing its sounds according to the strength or weakness of the blast.

A Mr. Crossthwaite has suggested a more simple instrument, having no sounding board; but being in fact nothing but a number of strings introduced between two deal boards. From this he produced, he states, most delicious harmony.

Various improvements of the instrument have been suggested, but it is not in the whole suitable to the changeable and humid climate of England; and, its theory appears, as hitherto to have been but very imperfectly understood. Robert Bloomfield, the author of the Farmer's Boy, is said to have been a successful manufacturer of this instrument, and published a collection of extracts and observations respecting it. He tried to cover the strings with silver wire, which appeared to deaden the sounds; while a covering of oil wholly stopped them. Silk strings he says will give a most delicate note, but are with difficulty made to endure sufficient tension; and advises that the instrument be so placed as to catch the wind rather in a vertical than a horizontal direction.

Mr. Young in his Enquiry into the Principal Phenomena of Sound and Musical Strings, (London, 1784, 8vo.) has furnished some ingenious observations on the order of the notes produced by the Æolian harp. To ascertain this, he took off all the strings but one; and, placing it in a proper situation, was surprised to hear a great variety of notes, and frequently such as were not produced by any aliquot part of the string. Sometimes there was a chord of two or three notes from this single string. Perplexed by these complex and extraordinary phenomena, he almost despaired of being able to account for them on the principle of aliquot parts. On further examination, however, he found that they all flowed naturally and easily from this principle. He observed that a current of air rushing against the middle of a stretched elastic string, moved the whole of it from its rectilinear position; and that the string, by its elasticity, returned to its former position, vibrat-

ting and exciting pulses in the air, so as to produce the tone of the entire string; that if the current of air be too strong and rapid, when the string is bent, it will retain its curvature. But though the whole string cannot perform its vibrations in this case, the subordinate aliquot parts may; and these will be of different lengths according to the rapidity of the blast. Thus, when the velocity of the current increases so as to prevent the vibration of the whole string, those particles which strike against the middle points of the halves of the string agitate those halves, as in the case of sympathetic and secondary tones: and as these halves vibrate in half the time of the whole string, though the blast may be too rapid to admit of the vibration of the whole, yet it can have no more effect in preventing the motion of the halves than it would have on the whole string if its tension were quadruple: for the times of vibration in strings of different lengths, and agreeing in other circumstances, are directly as the lengths; and in strings differing in tension, and agreeing in other circumstances, inversely, as the square roots of the tensions: and, therefore, their vibrations may become strong enough to excite such pulses as will affect the drum of the ear: and the same may be said of other aliquot divisions of the string. Those particles which strike against such points of the string as are not in the middle of aliquot parts, will interrupt and counteract each other's vibrations, as in the case of sympathetic and secondary tones, and therefore will not produce a sensible effect. See the work above mentioned.

ÆOLIC DIGAMMA, is a name given to the letter F, which the Æolians used to prefix to words beginning with vowels, as Φοινος for οινος; or to insert between vowels, as οφε for οε.

ÆOLIC VERSE, in prosody, a verse consisting of an iambus, or spondee; then of two anapests, separated by a long syllable; and, lastly, of another syllable, either long or short, such as, O stelliferis conditor orbis. This is otherwise called eulogic verse; and from the chief poets who used it Archilochian and Pindaric.

ÆOLII, or **ÆOLES**, the inhabitants of Æolis.

ÆOLIPILA, or **ÆOLIPILE**, Lat. the ball of Æolus, in hydraulics, a hollow ball of metal formerly used in courses of experimental philosophy, to demonstrate the possibility of converting water into an elastic steam or vapour by heat. The instrument consists of a slender neck, or pipe, having a narrow orifice inserted into the ball by means of a shouldered screw. The pipe being taken out, the ball was filled almost full of water, and the pipe being again screwed in, the whole was placed on a pan of kindled charcoal, where it was well heated, and there issued from the orifice a vapour, with prodigious violence and great noise, which continued till all the included water was discharged. The stronger the fire, the more elastic and violent will be the steam; but care must be taken that the small orifice of the pipe be not, by any accident, stopped up; because the instrument would in that case infallibly break in pieces, with such violence as would greatly endanger the lives of the persons near

it. Another way of introducing the water was to heat the ball red-hot when empty, which will drive out almost all the air; and then by suddenly immersing it in water, the pressure of the atmosphere forces in the fluid till it is nearly full. Des Cartes and others have used this instrument to account for the natural cause and generation of the wind. Chauvin suggests some farther uses of the *Æolipile*.—He thinks it might be applied, instead of a bellows, to blow the fire, where a very intense heat is required. Dr. Lewis on the contrary condemns this use of the *Æolipile*, and says, that upon trial he always found that instead of exciting, it extinguished the fire. But it might serve to scent or fumigate a room, if filled with perfumed, instead of common water, and an *Æolipile* has been sometimes placed in a chimney, where it can be heated, that the vapour may serve to drive the smoke up the chimney. Dr. Plott says, the lord of the manor of Essington is bound by his tenure to drive a goose every New-year's day three times round the hall of the lord of Hilton, while Jack of Hilton (a brazen figure having the structure of an *Æolipile*) blows the fire! In Italy it is said, that the *Æolipile* is commonly made use of to cure smokey chimneys. Some authors have discovered a still more extraordinary use, to which the frauds of the heathen priesthood applied the *Æolipile*, viz. the working of sham miracles. Besides Jack of Hilton, which had been an ancient Saxon idol, Mr. Weber shews, that *Pluster*, a celebrated German idol, is also of the *Æolipile* kind; and in virtue thereof, could do noble feats; being filled with a fluid, and thus set on the fire, it would be covered with sweat; and as the heat increased, would at length burst out into flames. There can be no doubt that much concealed knowledge of natural philosophy was artfully used in ancient times, to palm the miracles of different priesthoods on the world.

ÆOLIS, or *ÆOLIA*, in ancient geography, a country of Asia, settled by colonies of *Æolian* Greeks. At large it comprehended all Troas, and the coast of the Hellespont to the Propontis, because in those parts there are several *Æolian* colonies: more strictly, it was situated between Troas to the north, and Ionia to the south.

ÆOLIUM MARE, in ancient geography, the *Æolian* Sea, a part of the Egean Sea, washing *Æolis*; called also *Mysium*, from *Mysia*; now called *Golfo di Smyrna*.

ÆOLOPYLÆ, from *Αἰολες πύλαι*, the gates of *Æolus*, the same with *ÆOLIPILA*, which see.

ÆOLUS, in heathen mythology, the god of the winds, was said to be the son of Jupiter by Acasta, or Sigezia, the daughter of Hippotus: or, according to others, the son of Hippotus by Meneclea, daughter of Hyllus king of Lipara. He dwelt in the island Strongyle, now called *Stromboli*, one of the seven islands called *Æolian* from their being under the dominion of *Æolus*. Others say, that his residence was at Regium, in Italy; and others again place him in the island Lipara. He is represented as having authority over the winds, which he held enchain'd in a vast cavern, to prevent their continuing the devastations they had been guilty of before they were put under

his direction. Mythologists explain the original of these fables, by saying, that he was a wise and good prince; and, being skilled in astronomy, was able, by the flux and reflux of the tides, and the nature of the volcano in the island Strongyle, to foretel storms and tempests.

ÆOLUS, in mechanics is also a name given to various mechanical contrivances for refreshing and changing the air in rooms.

ÆON, *ΑΙΩΝ*, Gr. age; the duration of any thing.

The term *αιων*, originally signified an age, the life or duration of any person or thing. “Possessing an immutable being,” says Aristotle, speaking of the gods, “free from external impressions, happy and self-sufficient, they exist throughout all *αιώνα*, eternity.” “This word,” he adds, “has been divinely spoken by the ancients: for the consummation containing the time of every life is called *its age*, (its period of duration.)” For the same reason, the consummation of the whole heaven, and the consummation containing the unlimited duration, and the immensity of all things is *eternity*, deriving its name from *always being*—immortal and divine.” Lib. i. *Cal. c. 10.*

The term was, by a natural metonymy, transferred at later periods to the beings spoken of themselves, and the early heretics, as we have seen, transferred these heathen fables into the Christian system. See *Mosheim*, vol. i.

ÆOS, among the followers of Plato, was used to signify any virtue, attribute, or perfection; hence they represented the deity as an assemblage of all possible wons; and called him *Pleroma*, a Greek term signifying fulness. The *Valentinians*, who, in the first ages of the church, blended the conceits of the Jewish cabalists, the *Platonists*, and the *Chaldean* philosophers, with the simplicity of the Christian doctrine, invented a kind of *Theogony*, or *Genealogy of Gods*, (not unlike that of *Hesiod*,) whom they called by several glorious names, and all by the general appellation of *ÆONS*: among whom they reckoned *Ervota*, *Thought*, *Στήν*, *Silence*, *Χαρις*, *Grace*, *Νέος*, *Understanding*, *Αληθεια*, *Truth*, *Σωφρα*, *Wisdom*, *Ζωη*, *Life*, *Λογος*, *Word*, *Μονογενης*, *Only-begotten*, *Πληρωμα*, *Fulness*, and many other divine powers and emanations, amounting in number to thirty: which they fancied to be successively derived from one another; and all from one self-originated deity, nained *Bythus*, i. e. *profound* or *unfathomable*; whom they called likewise *The most high and ineffable Father*. See *VALENTINIAN*.

ÆON, in anatomy, the spinal marrow.

ÆON, in the Phœnician theology, was the first created woman.

ÆORA, in ancient medical writings, is used for a species of exercise often prescribed by physicians, wherein the limbs were at rest, while the body was moved from place to place, in such a manner as the physician prescribed. Sometimes the patient was laid in a sort of hammock, supported by ropes, and moved backward and forward; sometimes his bed run nimbly on its feet. And besides these, the several ways of travelling were accounted species of the æora, whether in the litter, in a boat or ship, or on even ground.

in a chariot. Asclepiades was the first who brought this mode of exercise into practice, and used it as a means to recover strength after a fever, &c.

ÆQUA, or ÆQUANA, in ancient geography, a town of Naples, which, being destroyed, was rebuilt, and called *Vicus*, now *Vicho di Sorrento*.

ÆQUALIS POLYGAMIA, in botany*, the first order in the class *syngenesia*, of Linnaeus, containing such compound flowers as have all their florets hermaphrodite and alike. The following are the genera it includes:—

Scolymus, Golden Thistle,
Cichorium, Succory,
Catananche,
Seriola,
Hypocharis, Cat's-ear,
Geropogon, Old Man's beard
Rothia,
Andryala,
Triptilon,
Tragopodon, Goat's beard,
Helminthia,
Picris, Ox-tongue,
Apargia,
Scorzonerá, Viper's-grass,
Leontodon, Dandelion.
Crepis, Hawk's beard,
Chondrilla, Gum Succory
Prenathes,
Lactuca, Lettuce
Heracium, Hawk's-weed
Sonchus, Sow-thistle,
Lacintha,
Lapsana, Nipple-wort,
Rhagadiolus,
Krigia,
Hyoscyamus, Swine's Succory
Hedypnois, Hawkbit
Thrineia,
Tolpis,
Atractylis,
Acarna,
Serrula, Saw-wort,
Carthamus, Bastard Saffron
Carlina, Carline Thistle
Aretium, Burdock
Pteronia,
Stoebe,
Lachnosperrum,
Barnadesia,
Cynara, Artichoke,
Johannia,
Cnicus,
Carduus, Thistle,
Onoseris,
Stokesia,
Leatris,
Vernonia,
Onopordon, Cotton Thistle,
Steholina,
Haynei,
Calea, Halbert-weed
Bidens, Bur Marygold,
Spilanthes,
Athanasia,
Santolina, Lavender-cotton,
Xerulia,
Farchonanthus, African,

Flea-bane,
Kuhnia,
Eupatorium, Hemp,
Agrimony
Chrysocoma, Goldilocks
Mikania,
Kleinia,
Cacalia,
Lavaria,
Ageratum,
Stevia,
Hymenopappus,
Cephalophora,
Pentzia,
Ethulia,
Piqueria,
Balsamita.

ÆQUANA JUGA, in ancient geography, mountains of Picenum, in the kingdom of Naples, now called *Montagna di Sorrento*.

ÆQUI, in ancient geography, a people of Italy who dwelt between the Sabines and Latins, having a capital called Bola.

ÆQUIMILII AREA, or ÆQUIMELIUM, in antiquity, a place in Rome, where stood the house of Spurius Melius, who, by largesses corrupting the people, affected the supreme power, refusing to appear before the dictator Cincinnatus, he was slain by Servilius Ahala, master of the horse, and his house razed to the ground.

ÆRA, supposed to be derived from *Annus erat Augusti*. The point of time at which Spain was conquered by the Romans, adopted as the period for computing the annals of the Spaniards

From the blessings they bestow,
Our times are dated, and our eras move :
They govern and enlighten all below,
As thou do'st all above. Pope.

ÆRA, or ERA, a fixed point of time from whence any number of years is begun to be counted. The origin of the term is contested, though it is generally allowed to have had its rise in Spain. Sepulveda supposes it formed from A. E.R. A. the notaæ or abbreviations of the words, *annus erat Augusti*, occasioned by the Spaniards beginning their computation from the time their country came under the dominion of Augustus, or that of receiving the Roman calendar. This opinion, however ingenious, is rejected by Scaliger, because in the ancient abbreviations A never stood for *annus*, unless when preceded by V for *vixit*; and it seems improbable they should put ER for *erat*, and the letter A, without any discrimination, both for *annus* and *Augustus*. Vossius nevertheless favours the conjecture. From the plural *era*, came by corruption *era*, *eram*, in the singular; as *Ostia*, *Ostiam*, the name of a place, from *Ostia*, the mouths of the Tyber. The difference between the terms *era* and *epoch* is, that the æras are certain points fixed by some people, or nation; and the epochs are points fixed by chronologists and historians. An æra comprehends also a certain succession of years proceeding from a fixed point of time, and the epoch is that point itself. Thus the Christian æra began at the epoch of the birth of Jesus Christ. See CHRONOLOGY.

ÆRA, in botany, cockle or darnel.

ÆRA, the Christian. It is generally allowed by chronologers, that the computation of time from the birth of Christ was not introduced till the sixth century, in the reign of Justinian, and is commonly ascribed to Dionysius Exiguus. This computation then came in use in deeds, &c. before which time either the Olympiads, the year of Rome, or that of the reign of the emperors, were used.

ÆRA, the Spanish, was introduced after the second division of the Roman provinces, between Augustus, Anthony, and Lepidus, in the year of Rome 714, the 4676th year of the Julian period, and the 38th year before Christ. We find frequent mention of it in the Spanish affairs; their councils, and other public acts, being all dated according to it. Some say it was abolished under Peter IV. king of Arragon, in the year of Christ 1358, and the Christian æra substituted in its place. Mariana observes, that it ceased in the year of Christ 1383, under John I. king of Castile. The like was afterwards done in Portugal. If to the year of the Spanish æra we add the number 4675, the sum is the Julian year; or if from the same year we subtract 38, the remainder is the year of the Christian æra.

ÆRARIUM, in history, the public treasury of the Roman state. The temple of Saturn at Rome being the great treasury of the state, was first called ærarium; from *aes*, *aris*, copper; that being the only money in use before A. U. 483, when silver began to be coined. It was first erected under Augustus, and maintained by a yearly voluntary contribution; but that proving insufficient, the twentieth part of all legacies and inheritances, except such as fell to the next of kin, or to the poor, were consigned to this treasury. For the custody thereof, three of the emperor's life-guards were constituted *prefecti ærarii*. Ærarium differs from *fiscus*, as the first contained the public money, the second that of the prince; yet the two are sometimes used indiscriminately.

ÆRARIUM ILTHIÆ, or of Juno Lucina, was erected by Servius Tullius, and composed of money paid by parents, for the birth of each child.

ÆRARIUM PRIVATUM, or the privy purse, contained the money and effects which the prince was master of before his accession to the empire. This was under the care of the *comes rerum privatuarum*.

ÆRARIUM SANCTIUS, was an appendage to the public treasury, added on occasion of the growth of the Roman state, when there was not room enough for lodging all the public monies, and the public acts, which were deposited with it. It was called *sanctius*, i. e. more sacred, because placed in an inner and safer part of the temple.

ÆRARIUM VENERIS, JUVENTUTIS, LIBITINÆ, and other lesser treasures *æaria minoru*, were established in the provinces.

ÆRARIUM VICESIMARUM, the place where the money arising from the taxes levied from foreign countries was laid up, so called because it most commonly consisted of a twentieth part of the produce.

ÆRARIUS, in antiquity, 1. An officer in-

stituted by Alexander Severus, for the distribution of the money given in largesses to the soldiery, or people. 2. A person whose name was struck out by the censors from the *album*, or list of his century, and was only considered as a citizen, so far as to make him subject to pay *æra* taxes, without being entitled to any privileges, or advantages from the commonwealth. Hence the phrases, *ærarium facere*, *inter aerarios referre*, *aeraris eximere*, &c.—Not only plebeians, but knights and senators, were subject to this kind of degradation. The *ærarii* were incapable of making a will, of inheriting, of voting in assemblies, of enjoying any post of honour or profit: in effect, were only subject to the burdens, without the benefits of society; yet they retained their freedom, and were not reduced to the condition of slaves. To be made an *ærarius* was a punishment reputed one degree more severe than to be expelled a tribe, *tribo moriri*. 3. *Ærarius* was likewise used for a person employed in coining, or working brass. These were sometimes called *ærarii fusores*: at other times, *ærarius* was distinguished from *fusor*; the former answering to what we now call copper-smiths, the latter to founders; a word derived from *fundere*, to cast metals. 4. The word was also applied to a soldier, who received pay.

ÆRATA AQUA, ziment water.

ÆREOLUS, answering to the Greek *χαλκος*, was a weight according to Diodorus and Suidas equal to one-sixth, or according to others, one-eighth of the obolus, which was $9\frac{1}{2}$ grains.

AERIA, or **EERIA**, in ancient geography, Thessaly, Egypt, or Ethiopia. The scholiast on Apollonius Rhodius, says, that not only Thessaly, but Egypt was called *Aeria* by the Greeks, which Eusebius confirms: and hence Appollonius, in his translation of the 114th psalm, uses it for Egypt. Hesychius applies this name to Ethiopia.

AERIAL PERSPECTIVE, is that which represents bodies weakened and diminished, in proportion to their distance from the eye. It chiefly respects the colours of objects, whose force and lustre it more or less takes off, to make them appear as if more or less remote. The reason is, that the longer the column of air an object is seen through, the more feebly do the visual rays emitted from it affect the eye.

AERIAL SUBSTANCE. The Essenes, the most refined and rational sect among the Jews, held that the human soul consisted of an aerial substance. And the Rosicrucians, and other visionaries, fill the atmosphere with aerial inhabitants.

AERIANS, in church history, a sect of Arians, who to the doctrines of that party, added some peculiar dogmas of their own; and made no difference between bishops and priests. The sect received its denomination from **AERIUS**, who founded his doctrine upon certain passages in St. Paul: as 1 Tim. iv. 14. where the apostle exhorts him not to neglect "the gift he had received by the laying on of the hands of the Presbytery," &c. Here, observes Aerius, are no mention of bishops: on the contrary, Timothy evidently received his ordination from the presbyters or priests.—Epiphanius zealously maintains the superiority of bishops against the

Aerians. The word *presbytery*, used by the apostle, he observes, includes both bishops and priests; the whole senate or assembly of the ecclesiastics of the place.

ÆRICA, or ERICA, in natural history, a name given by Gaza, and others, to the common herring.

ÆRIRUSA, in mineralogy, the ancient name for the sky-coloured Jasper.

ÆRIS FLOS, among alchemists, small scales procured from copper, melted by a strong heat; it is sometimes used for ærugo or verdigrise.

AERIUS, an Armenian priest of the fourth century, the founder of the sect of AERIANS, which see.

AEROGRAPHY, from *aηρ*, air, and *γραφω*, I describe, a description of the air, or atmosphere, its limits, dimensions, properties, &c. It is the same with æriology, unless we suppose the latter to enter into the rational, and the former to confine itself to a description of the more obvious affections thereof. See ATMOSPHERE.

AEROLOGICA, that branch of medicine, called by some *disostica* or the *non-naturals*, which treats of air, its properties and use in the animalconomy, and its efficacy in preserving and restoring health.

AEROLOGY, of *ἀηρ* and *λόγος*, the doctrine or science of AIR, is a term under which philosophers have sometimes treated of the nature of that element, its various species, constituent parts, properties, and phænomena; but, on investigation, atmospheric air has been demonstrated to be an exceedingly heterogeneous substance. It cannot therefore, be consistently treated as one integral element of nature; and the more accurate modern writers have, in the investigation of GASES, analyzed all the constituent parts of the atmosphere. To GAS, therefore, we refer for a philosophical exhibition of the different kinds of air; and to AIR, and ATMOSPHERE, for that particular combination of them, which surrounds our globe.

A E R O M A N C Y.

AEROMANCY, n. s. *ἀηρ* and *μαντεία* Gr. in antiquity, included the business of *angury* and *auspicio*; the rules of prediction from uncommon winds, storms, showers, and other changes of the atmosphere. Modern authors speak of a more rational *aeromancy*, meaning by it, the art of foretelling the changes and variations of the air and weather, by means of a regular series of meteorological observations. But though many have been instituted and recorded with much care; very small progress has hitherto been made in this art. Barometers, thermometers, hygrometers, and anemometers, are of considerable use in this kind of aeromancy, under the title of ÆROMANTIA. Mizoldus has published a body

of rules for foretelling storms, &c. drawn partly from vulgar observations, and the experience of mariners, partly from astrological considerations.

Some philosophers of eminence have endeavoured to illustrate the observations of seamen, and other persons practically acquainted with the changes of weather. Lord Bacon supplies 'Rules for prognosticating the weather from the appearances of the moon,' and the following table, from the European Magazine, v. IX. has been ascribed to the late Dr. Herschel.

TABLE of the kind of weather which will most probably follow the moon's entrance into her quarters.

NEW OR FULL MOON.

If it be new or full moon, or the moon enters into the first or last quarters at the hour of 12..
Or between the hours of

	IN SUMMER.	IN WINTER.
2 and 4	Changeable	Fair and mild.
4 . . 6	Fair	Fair.
8 . . 10	{ Fair, if wind N. W.	Fair & frosty, if N. or N. E.
10 . . Midnight	{ Rainy, if S. or S. W.	Rainy, if S. or S. W.
Midnight . . 2	Ditto	Ditto.
2 . . 4	Fair	Fair and Frosty.
4 . . 6	Ditto	{ Hard frost, unless Wind S. or S. W.
6 . . 8	Cold, with freq. showers	Snow and stormy.
8 . . 10	Rain	Ditto.
10 . . Noon	Wind and rain	Stormy.
	Changeable	Cold, Rain if W. Snow if E.
	Frequent showers	Cold, with high wind.

The rising and setting of the moon, says Mr. Taylor, in his Weather Guide, as well as its superior and inferior passage of the meridian, may serve as a rule for foretelling the times of

rain. These situations are called the moon's angles.

The times most exposed to rain are the rising and setting; those most favourable to good

weather, the passage of the meridian. It has been remarked that, during rainy days, bad weather is always a little interrupted about the time when the moon passes the meridian. We must, however, make an exception to this rule as often as the angle of the moon does not coincide with that of the sun. As these observations may be very easily made, by means of astronomical tables, in which the angles of the moon and sun are marked, they are exceedingly well calculated to prove the truth of this system. No one, for instance, will refuse assent to it, when the daily changes correspond with the angles of the moon; and when independently of the effects of the moon's situation, the horizontal effect of the moon at rising and setting is different from that produced by its passage over the meridian.

It rains oftener in the day time than in the night, and oftener in the evening than in the morning.

Linnæus advised his countrymen to observe with care the opening of the buds, and the unfolding of the leaves of trees, as a method of judging the forth-coming weather. The ignorant farmer, says he, tenacious of the ways and customs of his ancestors, fixes his sowing-season generally to a month, and sometimes to a particular day, without considering whether the earth be duly prepared to receive the seed; hence it frequently happens, that the fields do not yield a produce correspondent to his sanguine expectations. The wise economist should therefore fix certain signs by which to judge of the proper time for sowing. We look up to the stars, and, without reason, suppose that the changes on earth will answer to the heavenly bodies: entirely neglecting the things which grow around us. We see trees open their buds, and their leaves expand, whence we conclude that the spring is approaching, and experience supports us in the conclusion; but no one has yet been able to shew what trees Providence intended should be our kalender, so that we might ascertain on what day the countryman ought to sow his grain. Although it cannot be denied but that the same power, which brings forth the leaves of trees, will also cause the grain to vegetate: nor can any one justly assert that a premature sowing will uniformly accelerate a ripe harvest. No means therefore seem to promise success so much, as the taking of our rule for sowing from the leafing of trees. With this view it must be observed in what order every tree puts forth its leaves, according to its species, the heat of the atmosphere, and the quality of the soil. Afterwards by comparing together the observations of several years, it will not be difficult to determine, from the foliation of trees, (if not certainly, at least probably,) the time when annual plants ought to be sown. It will be necessary likewise to remark what sowings made in different parts of the spring produce the best crops, in order that by comparing these with the leafing of trees, it may appear which is the most proper time for sowing; nor will it be amiss in like manner to note at what times certain plants, especially the most remarkable in every province or country, blow; in order that it may be known whether the year makes a quicker or slower progress.

Pliny has similar observations, Why, says he, does the husbandman look up to the stars, of which he is ignorant, whilst every hedge and tree point out the season by the fall of their leaves? This circumstance will indicate the temperature of the air in every climate, and shew whether the season be early or late. This constitutes an universal rule for the whole world; because trees shed their leaves in every country according to the difference of the seasons. This gives a general signal for sowing; nature declaring that she has then covered the earth against the inclemency of the winter, and enriched it with this manure. *Nat. Hist.* l. xviii. c. 25.

Virgil counsels us on this subject.

Mark well the flowering almonds in the wood;
If od'rous blooms the bearing branches load,
The glebe will answer to the sylvan reign,
Great heats will follow, and large crops of grain.
But if a wood of leaves o'ershade the tree,
Such and so barren will thy harvest be.
In vain the hind shall vex the threshing-floor,
For empty chaff and straw will be thy store.

Dryden. Georgic, i. l. 272.

Mr. Kirwan, an ingenious contributor to the Transactions of the Royal Irish Academy, (vol. v. p. 20, &c.) has endeavoured to discover rules for prognosticating the different seasons in Great Britain and Ireland, from tables of observations alone. On comparing a number of observations taken in England from 1677 to 1789, (a period of 112 years) he found:

1. That when there has been no storm before or after the vernal equinox, the ensuing summer is generally *dry*, at least five times in six
2. That when a storm happens from an easterly point, either on the 19th, 20th, or 21st of May, the succeeding summer is generally *dry* at least four times in five.
3. That when a storm arises on the 25th, 26th, or 27th of March (and not before) in any point, the succeeding summer is generally *dry*, four times in five.
4. If there be a storm at south-west, or west-south-west, on the 19th, 20th, 21st, or 22d of March, the succeeding summer is generally *wet*, five times in six.

In this country winters and springs, if dry, are most commonly cold; if moist, warm:—On the contrary, dry summers and autumns are usually hot, and moist summers cold; so that, if we know the moistness or dryness of a season, we can form a tolerably accurate judgment of its temperature. In this country Mr. Kirwan remarks, that it generally rains less in March than in November, in the proportion at a medium of seven to twelve. It generally rains less in April than October, in the proportion of one to two, nearly at a medium. It generally rains less in May than September; the chances that it does so, are, at least, four to three; but, when it rains plentifully in May (as 1.8 inches or more,) it generally rains but little in September; and when it rains one inch, or less in May, it rains plentifully in September.

From a table kept by Dr. Rutty, in Dublin, for *forty-one years*, this author endeavours to calculate the probabilities of particular seasons being followed by others: and although his rules chiefly relate to Ireland, as there exists but little

difference between that island and Great Britain in the general appearance of the seasons, we subjoin his conclusions.

In forty-one years there were

6 Wet springs, 22 dry, and 13 variable;
20 Wet summers, 16 dry, and 5 variable:
11 Wet autumns, 11 dry, and 19 variable.

A season, according to Mr. Kirwan, is accounted *wet*, when it contains two wet months. In general, the quantity of rain, which falls in dry seasons, is less than five inches, in wet seasons more; *variable* seasons are those, in which there falls between thirty and thirty-six pounds, a pound being equal to 157639 of an inch.

The order in which the different seasons followed each other was, as in the following table,

A dry spring has been followed by a

dry summer	11 times
wet	8
variable	3

A wet spring has been followed by a

dry summer	0
wet	5
variable	1

A variable spring has been followed by a

dry summer	5
wet	7
variable	1

A dry summer has been followed by a

dry autumn	5
wet	5
variable	6

A wet summer has been followed by a

dry autumn	5
wet	3
variable	12

A variable summer has been followed by a

dry autumn	1
wet	3
variable	1

Hence Mr. Kirwan deduced the probability of the kind of seasons that would succeed others, to be as follows.

In the beginning of any year.

I. The probability of a *dry spring* is 22-41
of a *wet* 6-41

of a *variable* 13-41

II. The probability of a *dry summer* is 16-41
of a *wet* 20-41

of a *variable* 5-41

III. The probability of a *dry autumn* is 11-41
of a *wet* 11-41

of a *variable* 19-41

IV. After a *dry spring*, the probability of a

dry summer	1-22
wet	8-22
variable	3-22

V. After a *wet spring*, the probability of a

dry summer	0
wet	5-6
variable	1-6

VI. After a *variable spring*, the probability of a

dry summer	5-13
wet	7-13
variable	1-13

VII. After a *dry summer*, the probability of a

dry autumn	5-16
wet	5-26
variable	6-16

VIII. After a *wet summer*, the probability of a

dry autumn	5-20
wet	3-20
variable	12-20

IX. After a *variable summer*, the probability of a

dry autumn	1-5
wet	3-5
variable	1-5

But the probability of the autumnal weather will be attained much more perfectly, by taking in the consideration of the preceding spring also; in order to which Mr. Kirwan observes that

A *dry spring* and *dry summer* were followed by a

dry autumn	3 times
wet	4
variable	4

A *dry spring* and *wet summer* were followed by a

dry autumn	2
wet	0
variable	6

A *wet spring* and *dry summer* were followed by a

dry autumn	0
wet	0
variable	0

A *wet spring* and *wet summer* were followed by a

dry autumn	2
wet	1
variable	1

A *wet spring* and *variable summer* were followed by a

dry autumn	1
wet	0
variable	0

A *dry spring* and *variable summer* were followed by a

dry autumn	0
wet	2
variable	1

A *variable spring* and *dry summer* were followed by a

dry autumn	2
wet	0
variable	1

A *variable spring* and *dry summer* were followed by a

dry autumn	2
wet	0
variable	2

A *variable spring* and *wet summer* were followed by a

dry autumn	1
wet	1
variable	5

A *variable spring* and *variable summer* were followed by a

dry autumn	0
wet	1
variable	0

X. Hence after a *dry spring* and *dry summer*, the probability of a

dry autumn	3-11
wet	4-11
variable	4-11

XI. After a <i>dry spring</i> and <i>wet summer</i> , the probability of a	dry autumn is	2-8	dry autumn is	1-7	
	wet	0-11	wet	1-7	
	variable	6-8	variable	5-7	
XII. After a <i>dry spring</i> and <i>variable summer</i> , the probability of a	dry autumn is	0-0	XVIII. After a <i>variable spring</i> and <i>variable summer</i> , the probability of a	dry autumn is	0-41
	wet	2-3		wet	0-41
	variable	1-2		variable	0-1
XIII. After a <i>wet spring</i> and <i>dry summer</i> , the probability of a	dry autumn is	0-41			
	wet	0-41			
	variable	0-41			
XIV. After a <i>wet spring</i> and <i>wet summer</i> , the probability of a	dry autumn is	2-5			
	wet	1-5			
	variable	2-5			
XV. After a <i>wet spring</i> and <i>variable summer</i> , the probability of a	dry autumn is	1-41			
	wet	0-41			
	variable	0-41			
XVI. After a <i>variable spring</i> and <i>dry summer</i> , the probability of a	dry autumn is	2-4			
	wet	0-41			
	variable	2-4			
XVII. After a <i>variable spring</i> and <i>wet summer</i> , the probability of a					

After all, some of our readers may think this subject hardly worth pursuing to such an extent; but, we were not willing to omit so considerable a list of practical observations on facts, occasionally interesting to all men. See BAROMETER, CLOUDS, METEOROLOGY, and WEATHER.

AEROMELI, in natural history, a name given to honey, and also to manna. See DROSOMELI.

AEROMETRY, comprehends not only the doctrine of the air itself, considered as a fluid body; but also its pressure, elasticity, rarefaction, and condensation. But the term is at present not much in use, this branch of natural philosophy being more frequently called PNEUMATICS, which see. C. Wolfius, professor of mathematics at Halle, having reduced many of the affections of this fluid to geometrical demonstration, first published Elements of Aerometry, at Leipsic, in 1709, in High Dutch, and afterwards, more largely in Latin.—Thus is the doctrine of the air incorporated into the mathematical sciences.

AERONAUT, a person who mounts in, and guides an air balloon. See AEROSTATION AIR BALLOON and HYDROSTATICS.

A E R O N A U T I C S.

I. AERONAUTICS, or AERONAUTICA, of *aerop*, and *vavrikn*, from *vauc*, a ship, the art of sailing in, or navigating the air. This term has superseded that of aerostation in scientific treatises, as more correctly expressing the art of guiding aerostatic machines; aerostation more perfectly denoting the weighing of air, or of bodies suspended therein. Our plan, in treating of this art is,

I. To furnish a sketch of its PROGRESSIVE HISTORY, or the various early attempts of Aeronauts.

II. Of attempts to improve the STRUCTURE of AERONAUTIC MACHINES.

III. Of the PRINCIPLES of their CONSTRUCTION.

IV. Of the actual MAKING, and FILLING BALLOONS.

The principle of all aeronautic machines was no doubt, first suggested by fact. Certain bodies were seen to ascend.—Fact led to experiment. Aerostatic machines ascend not because they are freed from the influence of gravitation, and therefore have no weight, but because the gas with which they are filled, is specifically lighter than the surrounding air. It is a doctrine of Hydrostatics, that if a body be lighter than a fluid, in equal proportions, that fluid will bear it up, and it will float upon the surface, as the cork swims upon the water; and, hence a body lighter than our atmosphere, will float upon the atmosphere

and ascend. If the higher and lower regions of the air were every where equally dense, a lighter body would ascend directly to the surface, and there remain perfectly quiescent, and would have no more tendency to descend into the inferior regions, than a blown bladder has to sink into the water; which it cannot do, unless oppressed by the weight of some more solid adjunct: which together with itself, exceeds the gravity of the water. But the air is subject to two great principles. Compression and expansion, existing however in different proportions, at different degrees of temperature and elevation above the earth. The vast body of air that lies in the superior regions, continually pressing its immense weight upon that below, thereby renders it exceedingly dense, so that it becomes impossible for it to rarefy itself to any considerable extent, and therefore as we ascend the upper stratum of the firmament, the atmosphere becomes less dense by reason of the diminished pressure of the superincumbent air, and in the extreme regions is perfectly elastic and subtle; a light body therefore, instead of rising to the top, will only rise to a height where the air is of the same specific gravity with itself, and in that altitude will remain quiescent, in proportion as the air is more or less agitated: or, it will be carried before the winds and receive different motions, according as it is acted upon by surrounding currents of atmosphere. It is exactly so with the balloon, which

being extended to a considerable bulk, and filled with air, considerably lighter than the common air, naturally ascends.

2. This invention, therefore, has in the course of the last century, become the popular substitute for the old attempts of mankind to construct wings, &c. for flight. It is somewhat curious to observe the pertinacity with which men, in all ages, have prosecuted some kind of bold attempt to 'rule in air.' To say nothing of Icarus, and his fabled wings, or of the automata that have been made ingeniously self-moving, the pretensions of magicians, and the long supposed achievements of witchcraft in this field, angels and daemons have been alike clothed by human credulity with the attribute of flying; and while philosophy has exploded many of the pretensions of the latter, our pictorial illustrations of scripture, and even the finest paintings perpetuate the claims of angels to wings, with almost unquestioned uniformity.

3. Two of the latest attempts of mankind in this way, may be amusing to the reader. During the reign of James IV. of Scotland, a pseudo philosopher of Italy, presented himself at the court of that monarch with loud pretensions to science, and having been made abbot of Fury-land, to allow him learned leisure, offered in presence of the court, to start from the walls of Stirling Castle upon wings, of his own construction, and pass through the air to France. This adventurer must have possessed some kind of sincere confidence of his success, for he actually manufactured an immense pair of wings, which he crowded with plumage of all sorts, and launched from the walls of the castle on the day appointed. Soon, however, he descended to parent earth, and broke his thigh in the fall. His apology to the disappointed spectators was full as bold as his attempt; but it seems to have been received. 'My wings,' said he, 'being composed partly of the feathers of dunghill fowls, they, by a certain sympathy, were attracted to the dunghill: had they been composed of eagle's feathers alone, the same principle of sympathy would have attracted and kept them upwards!'

4. The second attempt of this kind we shall notice, was made at Tübingen, in Württemberg, in 1628. Here a learned rector of the public school, named Keyder, had been for some years insisting upon the possibility of attaining the art of flying, but sagaciously confined *himself* to warmly lecturing on the theory. But a monk of the neighbourhood became a sincere disciple, constructed wings of the approved description, and from a high tower in the neighbourhood, started into air upon them. The wind is said in this case, first to have discomposed his machine, bringing down, also, this adventurer; he fell precipitantly, broke both his legs, and died from the consequences.

5. To lord Bacon, the prophet of art, as Wall pole calls him, has been attributed the first suggestion of the true theory of balloons. But the value of his remarks upon this subject has been overated. The only clear passage in his works speaks of "flying in the air," in the old plan of imitating birds; or, spreading feathers thin and close, and in great breadth, which, he says, 'will bear up

a great weight, being even laid, without tilting upon the sides.' And adds, 'the further extension of his experiment might be thought upon.' In another passage of his Natural History, entitled, *Experiment Solitary, touching the flying of unequal bodies in air*, he says, "Let there be a body of unequal weight, (as of wood and lead, or bone and lead) if you throw it from you with the light end forward, it will turn, and the weightier end will recover to be forwards, unless the body be over long. The cause is, that the more dense body hath a more violent pressure of the parts from the first impulsion, which is the cause (though not heretofore found out, as hath been often said) of all violent motions: And when the hinder part moveth swifter (for that it less endureth pressure of parts) than the forward part can make way for it, it must needs be that the body turn over; for (turned) it can more easily draw forward the lighter part."

We see in this passage no hint at the scientific theory of aeronautics; it is simply an obscure speculation on the quantum of resistance which a body meets with in passing through the air:—here is not a word of the power of rising in it.

6. But in the fourteenth century that theory is recorded in the writing of Albert of Saxony, an Augustin monk, and a commentator on Aristotle. Following the old notion of fire floating above the atmosphere of the earth; he suggests, that if any being could bring down a quantity of that light ethereal air that swims above our atmosphere, and inclose it in a ball or vessel, the vessel might be raised, and kept suspended in common air, at any height. This suggestion rested in perfect dormancy until the beginning of the seventeenth century, when Francis Mendoza, a jesuit of Portugal, maintained that the combustibility of fire was no objection to its being made to ascend in proper vehicles, as its extreme laxity and the exclusion of air would preserve it from inflammation. He died at Lyons A.D. 1626. At about the same period Caspar Schott, also a jesuit, published this theory in Germany.

7. In 1670 all the ancient speculations about artificial wings whereby a man might fly as well as a bird, were refuted by Borelli in his treatise *De Motu Animalium*. In this work, from a comparison between the power of the muscles which move the wings of a bird, and those which move the arms of a man, he demonstrates, that the latter are utterly insufficient to strike the air with such force as to raise him from the ground.

8. In the year 1672, Bishop Wilkins published his Discovery of the New World, in which he certainly seems to have conceived the idea of raising bodies into the atmosphere by filling them with rarified air. This, however, he did not pursue, but rested his hopes upon mechanical motions, to be accomplished by human strength, or by springs, &c. which have been proved incapable of answering any useful purpose.

9. The jesuit, Francis Lana, his contemporary, proposed to exhaust hollow balls of metal, of their air, (See Plate I. AERONAUTICS,) and thus occasion them to ascend. But though the theory was unexceptionable, the means he suggested were insufficient to the end: for a vessel

of copper, made sufficiently thin to float in the atmosphere, would be utterly unable to resist the external pressure; which being demonstrated, no attempt was made on the principle.

10. In 1709, Friar Guzman applied to the king of Portugal for his patronage of a flying machine constructed somewhat in the form of a bird or paper kite, but with tubes through which the wind was to pass to fill wings that were to elevate it: and absurd as this plan obviously was, he met with the royal patronage to such a degree, that he obtained a place in the college of Barcelos, with a professorship in the university of Coimbra, and a pension for life of 6000 reis. But excepting this metaphorical movement upwards to places and honours, we do not hear that the friar ever made any ascent; though it is said, that in 1736, he constructed a large wicker basket covered with paper, seven or eight feet in diameter, which rose 200 feet in the air; and thus came to be reputed a conjurer.

11. It is well remarked by a valuable contemporary, (*Sup. Ency. Brit. Art. AERONAUTICS*), that the persons who had hitherto occupied themselves most with attempts at aerial navigation, were all of them Catholic priests. And he enquires whether such a pursuit may be explained from their habits of seclusion, and ignorance of the affairs of real life, or from their familiar acquaintance with the relations of miracles and legendary tales. There can be no question that it arose from these causes in great part, as well as from the fact of religious men during the dark ages, engrossing almost every pretension to knowledge; thus some of the more artful of the priests, imposed on the vulgar the smatterings of natural philosophy as really miraculous facts: and then again in the dawning of the new day of literature, others of their order largely redeemed its credit by nobly dealing forth of their secluded stores of literature and science, and leading on to a brighter day.

12. In 1766, Mr. Henry Cavendish ascertained that inflammable air was at least seven times lighter than common air, and suggested to Dr. Black, that perhaps a thin bag filled with the former might be buoyed up by the common atmosphere. The same thought occurred afterwards to Mr. Cavallo; and he has the honour of being the first who made experiments on the subject. He first tried bladders; but found them too heavy. He then tried Chinese paper; but that proved permeable to the vapour. His experiments, therefore, in 1782, proceeded no further than blowing up soap bubbles with inflammable air, which ascended rapidly to the ceiling.

13. While the true doctrine of aeronautics seemed thus on the point of being discovered in Britain, it was all at once announced in France, by two brothers, Stephen and John Montgolfier, natives of Annonay, and masters of a considerable paper manufactory there, who had turned their thoughts to this subject, as early as the middle of the year 1782. Their idea was to form an artificial cloud, by enclosing smoke in a bag, and making it carry up the covering along with it. In that year, the experiment was made at Avignon with a fine silk bag; and by apply-

ing burning paper to an aperture at the bottom, the air was rarified, and the bag ascended to the height of 70 feet.—Various experiments were now tried upon a large scale, which greatly excited the public curiosity.

14. An immense bag of linen, lined with paper, and containing upwards of 23,000 cubit feet, was found to have the power of lifting about 500 pounds, including its own weight. Burning chopped straw and wool under the aperture of the machine, immediately occasioned it to swell; and afterwards to ascend into the atmosphere. In ten minutes it had risen 6000 feet; and when its force was exhausted, it fell to the ground at the distance of 7668 feet from the place it had left.

15. Not long after this, one of the brothers, invited by the Academy of Sciences to repeat his experiments at their expense, constructed a large balloon of an elliptical form. In a preliminary experiment, this machine lifted from the ground eight persons who held it, and would have carried them all off, if others had not quickly come to their assistance. Next day the machine was filled by the combustion of fifty pounds of straw, and twelve pounds of wool. The machine soon swelled, and sustained itself in the air, together with the charge of between 4 and 500 pounds weight. It was designed to repeat the experiment before the king at Versailles; but a violent storm of rain and wind happening to damage the machine, it became necessary to prepare a new one; and such expedition was used, that this vast balloon, nearly sixty feet in height and forty-three in diameter, was made, painted within and without, and finely decorated, in ninety-six hours. Along with it was sent a wicker cage, containing a sheep, a cock, and a duck, which were the first animals ever sent on such a voyage. The full success of the experiment was, however, prevented by a violent gust of wind, which tore the machine in two places near the top before it ascended. Still it rose 1440 feet; and after remaining in the air about eight minutes, fell to the ground at the distance of 10,200 feet from the place of its setting out. The animals were not in the least hurt.

16. As the great power of these aërostatic machines, and their very gradual descent, now demonstrated they were capable of transporting people through the air with safety, M. Pilatre de Rozier offered to be the first aerial adventurer in a new machine, constructed in a garden in the Fauxbourg of St. Antoine. It was of an oval shape, forty-eight feet in diameter, and seventy-four in height, elegantly painted with the signs of the zodiac, ciphers of the king's name, and other ornaments; a proper gallery, grate, &c. enabled the person who ascended to supply the fire with fuel, and thus keep up the machine as long as he pleased. The weight of the whole apparatus was upwards of 1600 pounds. On the 15th October, 1783, M. Pilatre placing himself in the gallery, the machine was inflated, and permitted to ascend to the height of eighty-four feet, where he kept it afloat about four minutes and half; after which it descended very gently: and such was its tendency to ascend, that it rebounded to a considerable height after

touching the ground. On repeating the experiment, he ascended to the height of 210 feet. His next ascent was 262 feet; and in the descent a gust of wind having blown the machine over some large trees in an adjoining garden, M. Pilatre suddenly extricated himself by throwing straw and wool on the fire, which raised him at once to a sufficient height. On descending again, he once more raised himself to a proper height by the same means. The balloon was constructed by the Montgoliars, and the spirited young naturalist who thus first ascended, seems to have caught at the moment of its filling, a sort of enthusiasm that prompted him to seat himself in the gallery, and to become the leader of these sublime experiments. Some time after, he ascended with M. Girard de Villette to the height of 330 feet; hovering over Paris at least nine minutes in sight of all the inhabitants, and the machine keeping all the while in a steady position.

17. It was now proved that arostatic machines might be raised or lowered at the pleasure of the persons who ascended. On the 21st of November, 1783, therefore, M. Pilatre and the Marquis d'Arlandes undertook an aerial voyage, which lasted about twenty-five minutes, and during which time, they passed over a space of five miles. From the account given by the Marquis, they met with several different currents of air, the effect of which was, to give a very sensible shock to the machine, and the direction of the motion seemed to be from the upper part downwards. It appears also that they were in some danger of having the balloon burnt altogether; as the Marquis observed several round holes made by the fire in the lower part of it, which alarmed him considerably, and indeed not without reason. However, the progress of the fire was easily stopped by the application of a wet sponge, and all appearance of danger ceased.

18. Speculations were now entertained as to the possibility of a more convenient method of filling balloons, and instead of feeding a fire as it ascended, to inclose inflammable air at once in the machine; a plan which promised many advantages over the other. The first experiment upon it, was made by two brothers, M. Robert, and M. Charles, a professor of experimental philosophy. A bag composed of lutesstring was varnished over with a solution of the elastic gum, called caoutchouc; and was about thirteen English feet in diameter. Many difficulties occurred in filling it with inflammable air; but being at last set at liberty, after having been well filled, it was thirty-five pounds lighter than an equal bulk of common air. It remained in the atmosphere about three quarters of an hour, during which it travelled fifteen miles. Its sudden descent was supposed to have been owing to a rupture, which had taken place when it ascended into the higher regions of the atmosphere.

This experiment, and the successful voyage made by M. Pilatre and the marquis, encouraged the idea of undertaking something of the same kind with a balloon filled with inflammable air. The machine used on this occasion

was formed of gores of silk, covered with a varnish of caoutchouc, of a spherical figure, and measuring twenty-seven feet and a half in diameter. A net was spread over the upper hemisphere, and fastened to a hoop which passed round the middle of the balloon. To this a sort of car was suspended a few feet below the under part of the balloon; and, in order to prevent the bursting of the machine, a valve was placed in it; by opening of which some of the inflammable air might be occasionally let out. The car was of basket work, covered with linen and beautifully ornamented; being eight feet long, four broad, and three and half deep; in weight 130 pounds. Great difficulties again occurred in filling the machine; but these at last being removed, the two adventurers took their seats about two P.M. on the 1st December, 1783. Persons skilled in mathematics were stationed with proper instruments, to calculate the height, velocity, &c. of the balloon. The weight of the whole apparatus, including that of the adventurers, was 604lb, and a half, and the power of ascent when they set out was 20lb, so that the whole difference betwixt the weight of this balloon and an equal bulk of common air, was 624lb. But the weight of the atmosphere displaced by the inflammable gas was calculated to be 771lb, so that there remains 147 for the weight of the latter; and this calculation makes it only five times and a fourth lighter than common air.

19. When the balloon rose, the thermometer stood at 9°. of Fahrenheit, and the barometer at 30.18 inches; and, by means of the power of ascent with which it left the ground, it mounted upwards till the mercury fell to twenty-seven inches, from which they calculated their height to be about 600 yards. Throwing out ballast occasionally as they found the machine descending by the escape of some of the inflammable air, they found it practicable to keep at pretty near the same distance from the earth during the rest of their voyage; the quicksilver fluctuating between 27 and 27.65 inches, and the thermometer between 53°. and 57°. the whole time. They continued in the air an hour and three quarters, and alighted at the distance of twenty-seven miles from Paris; having suffered no inconvenience during their voyage, nor experienced any contrary currents of air, as had been felt by M. Pilatre and the Marquis.

20. As the balloon still retained a great quantity of inflammable gas, M. Charles determined to continue the voyage by himself. M. Robert accordingly left the machine, which was now 130 pounds lighter, and arose with such velocity, that in twenty minutes it was almost 9000 feet from the earth, and entirely out of the sight of terrestrial objects. The globe, which had been rather flaccid, soon began to swell, and the inflammable air escaped in great quantity. He now drew the valve to prevent the balloon from bursting; and the inflammable gas, being considerably warmer than the external air, diffused itself all round, and was felt like a warm atmosphere. In ten minutes, however, the thermometer indicated a great variation of temperature: his fingers were benumbed with cold, and he

felt a violent pain in his right ear and jaw, which he ascribed to the expansion of the air in these organs, as well as to the external cold. But the beauty of the prospect which he enjoyed, made amends for these inconveniences. At his departure the sun was set on the vallies; but the height to which M. Charles was got in the atmosphere, rendered him again visible, though only for a short time. He saw, for a few seconds, vapours rising from the vallies and rivers. The clouds seemed to ascend from the earth, and collect one upon the other, still preserving their usual form; only their colour was grey and uniform for want of sufficient light in the atmosphere. By the light of the moon, he perceived that the machine was turning round with him in the air; and he observed that there were contrary currents which brought him back again. He observed also, with surprise, the effects of the wind, and that the streamers of his banners pointed upwards; which, he says, could not be the effect either of his ascent or descent, as he was moving horizontally at the time. At last, recollecting his promise of returning to his friends in half an hour, he pulled the valve, and accelerated his descent. When within 200 feet of the earth, he threw out two or three pounds of ballast, which rendered the balloon again stationary; but, in a little time afterwards, he gently alighted in a field about three miles distant from the place whence he set out; though, by making allowance for all the turnings and windings of the voyage, he supposes that he had gone through nine miles at least. By the calculations made, it appears that he rose at this time not less than 10,500 feet; a height somewhat greater than that of Mount *Etna*.

21. Many similar aerial voyages were now performed, of which a particular description would be superfluous. But as it had occurred to M. Charles, in his last flight, that there might be a possibility of directing the machine in the atmosphere, this was attempted by M. Jean Pierre Blanchard; who gives an account of the sensations he felt during one of his aerostatic excursions, somewhat different from those of M. Charles; having, in one part of it, found the atmosphere very warm, in another cold; and having once found himself very hungry, and at another time almost overcome by a propensity to sleep. The height to which he arose, as measured by mathematical instruments, was thought to be very little less than 10,000 feet; and he remained in the atmosphere an hour and a quarter.

22. Similar attempts to direct balloons through the atmosphere, were made in 1784, by Messrs. Morveau and Bertrand, at Dijon, who raised themselves with an inflammable air balloon to the height, as was thought, of 13,000 feet; passing through a space of eighteen miles in an hour and twenty-five minutes. M. Morveau had prepared oars for directing the machine through the air; but they were damaged by the wind, so that only two remained serviceable; by working these, however, they were able to produce a sensible effect on the motion of the machine. In a third aerial voyage performed by M. Blanchard, he seemed to produce some effect by the

agitation of his wings, both in ascending, descending, moving sidewise, and even in some measure against the wind: however, this is supposed, with some degree of probability, to have been a mistake, as in no succeeding voyage could the effect of his machinery be perceived.

23. On the 28th of June, 1784, M. Flewant and Madame Thible, (the first female who ever dared adventure upon these exploits,) ascended at Lyons before the king of Sweden, who then travelled under the name of Count Haga. On their entering the car, (which was 75 feet in height,) they ascended with great celerity, and in four minutes the noise of the multitude was no longer audible. Two minutes afterwards, the eye could not distinguish them. Their greatest altitude was 13,500 feet, (the highest yet reached) and the flag, with its staff of fourteen pounds weight, being thrown out, it was seven minutes descending to the ground. The thermometer had dropped to 43° on Fahrenheit's scale; and the sensation of cold that they felt, was attended by a ringing in the ears. - Different currents were found to occupy the strata of the atmosphere, and when passing from one strata to another, the balloon received a sensible undulation. The travellers continued to feed their fire with vine loppings, till, having exhausted their fuel, they descended in a corn field, after remaining in the atmosphere three quarters of an hour. About a fortnight afterwards, a splendid ascent was exhibited from the outer court of Versailles, by command of the French monarch, as a compliment to the king of Sweden. Of this balloon, the naturalists, Rozier and Proust, undertook the management. On their stepping into the car, it rose in the most rapid manner to the height of 12,520 feet, and appeared to float in a vast congregation of towering white clouds. The thermometer stood at 21°, and flakes of snow fell copiously on the voyagers, while it only rained below. Descending from this chaos of clouds, they were cheered and delighted by the aspect of the rich and populous district, spread out before them in the most lively manner, and finally alighted at the forest of Chantilly, thirty-six miles from the place of their ascent, after an excursion of one hour and five minutes.

24. In August, the Abbé Carnus, professor of philosophy, and M. Lauchet, professor of belles lettres, ascended at Rodez, a town of Guienne in France, to a height of 3920 yards above the level of the town. These aeronauts filled one or two bottles with air at their highest elevation, and found that they contained a quarter less air than if filled at the level of the sea, and that the air was much purer.

25. Messrs. Charles and Robert, from their success in their former experiments, were encouraged to enlarge their balloon to the size of an oblong spheroid, 46 feet and a third long, and 27 and a half in diameter, made so as to float with its longest part parallel to the horizon. The wings were of the shape of an umbrella without the handle, to the top of which a stick was fastened parallel to the aperture of the umbrella. See Plate 1. fig. 2. Five of these were disposed round the car, which was near 17 feet in length. The balloon was filled in

three hours, and, with the addition of 450 lbs. of ballast, remained in *équilibrio* with the atmosphere. About noon, on the 19th September 1784, they began to ascend; and having risen to the height of 1400 feet, they perceived some thunder clouds near the horizon, which they took great pains to avoid. From this account, however, it should seem, that they had passed safely through the thunder clouds; as, about forty minutes after three, they heard a loud clap of thunder; and, three minutes after, another much louder; at which time the thermometer sunk from 77 to 59 degrees. The sudden cold, occasioned by the approach of these clouds, condensed the inflammable air, so that the balloon descended very low, and they were obliged to throw out forty pounds of ballast; yet on examining the heat of the air within the balloon, they found it to be 104°, when that of the external atmosphere was only 63. When they had got so high that the mercury in the barometer stood only at 23.94 inches, they found themselves becalmed; so that the machine did not go even at the rate of two feet in a second, though it had before gone at the rate of 24 feet in a second. On this they determined to try the effect of their oars to the utmost; and, by working them for thirty-five minutes, and marking the shadow of the balloon on the ground, they found in that time, that they had described the segment of an ellipsis, whose longest diameter was 6000 feet. After having travelled about 150 miles, they descended, only on account of the approach of night, having still 200 pounds of ballast left.

26. The effect of their wings is described thus:—‘Far from going against the wind, as is said by some persons to be possible in a certain manner, and some aeronauts pretend to have actually done, we only obtained, by means of two oars, a deviation of 22°: it is certain, however, that if we could have used our four oars, we might have deviated about 40° from the direction of the wind; and as our machine would have been capable of carrying seven persons, it would have been easy for five persons to have managed and put in action eight oars, by means of which a deviation of about 80° would have been obtained. We had already observed, (say they) that if we did not deviate more than 22°, it was because the wind carried us at the rate of twenty-four miles an hour; and it is natural to judge, that, if the wind had been twice as strong as it was, we should not have deviated more than one half of what we actually did; and, on the contrary, if the wind had been only half as strong, our deviation would have been proportionably greater.’

27. One of the longest and most remarkable aerial voyages ever performed in France, was undertaken at Paris, in June 1786, by M. Testu, with a balloon twenty-nine feet in diameter, of glazed tiffany, furnished with wings, and inflated with gas. He ascended at four o'clock in the afternoon, the barometer standing at 29.68 inches, and the thermometer at 84°, though the day was cloudy and lowering. The machine had been only filled, but gradually swelled as it became drier and warmer, and acquired its

full distension at the height of 2800 feet; when, to avoid the waste of gas, and the danger of a rupture, M. Testu attempted to lower the balloon by his wings. Not being able to succeed, he thought proper to descend, and alighted in a corn field in the plain of Montmorency, when he was surrounded by the proprietor of the field, and a troop of peasants, who seized him, and insisted on being indemnified for the mischief occasioned by his idle and curious followers. He persuaded them that his wings were broken, and that he and the balloon were entirely at their mercy; when they drew both along, in supposed triumph, by cords fixed to the car, till M. Testu, perceiving that the loss of wings, cloak, &c. had made the balloon much lighter, suddenly cut the string, and left the farmer and his peasants gazing below. He now arose to the region of the clouds, whence he saw small frozen particles floating in the atmosphere, and heard thunder rolling under his feet. As the coolness of the evening advanced, the power of ascension diminished, and he alighted on the ground near the abbey of Royaumont about seven o'clock. He afterwards threw out some ballast, and rose again to a height of 2400 feet, when the thermometer was 66°. He now heard the blast of a horn below, and saw a company of huntsmen in full chase. He immediately opened the valve, and descended between Etouin and Varville; when rejecting his oars, he began to collect some ballast. While he did this, the huntsmen galloped up to him. He then made another ascent, and passed through a dense body of clouds, awful by the frequent thunders, and flashes of lightning following each other in a rapid and vivid stream, illuminating the whole heavens at every explosion. The thermometer fell to 21°; but at the height of 3000 feet, rose as high as 56°. At this altitude, he floated about till half past nine o'clock, when he witnessed the final setting of the sun; a scene so grand, as to mock the richness of description. After this, he was involved in thick masses of thunder clouds, and lightnings flashing round him on all sides. The thermometer sunk to 21°. Snow and sleet fell copiously; loud peals of thunder rolled around, and seemed to shake the very firmament. This tremendous scene continued three hours, during which time our aeronaut remained in the midst of the storm. The balloon was affected by a sort of undulating motion upward and downward, occasioned, as he supposed, by the electric action of the clouds. The lightning was excessively vivid, and the thunder was preceded by a sort of crackling noise. A calm at last succeeding, the stars broke upon his sight as clear as ever, and the sky seemed perfectly serene. He then took some refreshment, and at half-past two o'clock the day began to open upon the world. He staid till he had witnessed the rising of the sun, and afterwards descended to the earth, and alighted near the village of Campremie, sixty-three miles from Paris, having completed a voyage of nearly twelve hours.

28. The first balloon seen in England, was constructed by the ingenious Italian, Count Zambeccari. It was ten feet in diameter, weighed eleven pounds, and consisted of oiled silk, gilt,

by which means it became, not only more beautiful, but less permeable to the gas. It was launched from the Artillery ground, London, on the 25th of November, 1783; and was taken up at Petworth in Sussex, at the distance of forty-eight miles.

29. On the 21st of September, 1784, Vincent Lunardi, an Italian, is said to have made the first aerial ascent in England. His balloon was of oiled silk, striped with blue and red, and thirty-three feet in diameter. There was no valve; the neck, which was in the form of a pear, through which the gas was introduced, being the medium through which it might be emitted. He took with him a dog, a cat, and a pigeon; and after remaining sometime, alighted, about twenty minutes after three, in a meadow in the neighbourhood of Ware, Hertfordshire.

30. Blanchard, who had performed numerous voyages before, on the 16th October ascended with Mr. Sheldon, professor of anatomy to the royal academy, from Chelsea, and after a short voyage of fourteen miles, brought his companion down, and re-asceded to so great an altitude, that he found great difficulty in breathing. The atmosphere at that height was so rare, that a pigeon sent off from the car, found great difficulty in supporting itself, and at length came and settled on the machine, afraid to venture in the boundless ocean which he saw on every side.

31. On the 7th of January, 1785, the same gentleman ascended from Dover, with Dr. Jeffries of America, on the daring exploit of crossing the sea to Calais. The morning was clear and frosty, and a little wind, scarcely perceptible, NNW. The balloon was stationed on the cliff, and at one o'clock, when all things were arranged, M. Blanchard ordered the boat to be pushed off, from the top of that celebrated precipice so finely described by Shakspeare. The balloon being scarcely sufficient to carry two men, (for in fact, Blanchard, though a successful adventurer, had little scientific knowledge as an aeronaut,) they were soon obliged to cast out all their ballast, except three bags of sand, weighing in the whole thirty pounds. After this, they rose a little, but moved very slowly, in consequence of the calmness of the atmosphere. In a short time the barometer which on the cliff stood at $29^{\circ} 7'$. had fallen to $27^{\circ} 3'$. The weather being fine and warm, they had now a most beautiful view of the south of England. At ten minutes before two o'clock, when they were just in the midst of the strait, twelve miles from either shore, they found the balloon descending, and became alarmed at their situation. They threw out half their remaining ballast, but their descent was still more rapid than before; they then threw out the remainder, but this was insufficient; they next cast out a quantity of books. This caused the balloon again to ascend, but at a quarter past two, finding themselves again descending, they threw out the remainder of their books, and ten minutes after had a most delightful view of the coast of France. Still, however, the balloon was falling, and having no more ballast, they cast out their provisions, cut off the wings of their boat, and parted with every thing

VOL. I.

that was moveable, even to their only bottle, which in its descent cast out a steam like smoke, accompanied by a rushing noise, and when it struck the water, the balloon felt the shock. All this not stopping the descent of the balloon, they next threw out their anchors and cords, and at last stripped off their clothes, and fastening themselves to certain slings, intended to cut away the boat as their last resource. The balloon, however, began to rise, and they finally descended in safety in the forest of Guinees, not far from Calais. The magistrates of that town received them with great kindness, and the king presented M. Blanchard with 12,000 livres, and a pension of 1200.

32. It would be tedious to relate all the different aerial voyages that have been performed in this and other countries; but we must not omit the ingenious Mr. Baldwin's excursion from Chester. This gentleman in September, 1785, ascended in Mr. Lunardi's balloon; and after traversing the air in a variety of directions, first alighted in the neighbourhood of Frodsham; then re-asceding, and pursuing his excursion, he finally landed at Rixtonmoss, twenty-five miles from Chester. Mr. Baldwin published the observations he made during this voyage, and gives the following curious particulars of it:—The sensation of ascending, he compares to a strong pressure from the bottom of the car upwards against the soles of his feet. At the distance of what appeared to him seven miles from the earth, though by the barometer, scarcely a mile and a half, he had a grand and most enchanting view of the city of Chester, and its adjacent places, below. The river Dee was of a red colour; the city very diminutive, and entirely blue. The whole seemed a perfect plain, the highest building having no apparent height, but all reduced to the same level, and the whole terrestrial prospect appeared like a coloured map. The perspective appearance of things to him, was very remarkable. The lowest bed of vapour that first appeared as a cloud, was pure white, in detached fleeces, increasing as they rose: they presently coalesced, and formed, as he expresses it, a sea of cotton, tufting here and there by the action of the air in the undisturbed part of the clouds. The whole became an extended white floor of cloud, the upper surface being smooth and even. Above this white floor he observed, at great and unequal distances, a vast assemblage of thunder clouds, each parcel consisting of whole acres in the densest form: he compares their form and appearance to the smoke of pieces of ordnance, which had consolidated as it were into masses of snow, and penetrated through the upper surface or white floor of common clouds, there remaining invisible and at rest. Some clouds had motions in slow and various directions, forming an appearance truly stupendous and majestic.

33. Mr. Baldwin endeavoured to convey some idea of the scene by a sketch, for which, see Plate II. fig. 1. It represents a circular view he had from the car of the balloon, himself being over the centre of the view, looking down on the white floor of clouds and seeing the city of Chester through an opening, which discovered

O

the landscape below, limited by surrounding vapour to less than two miles in diameter. The breadth of the outer margin defines his apparent height in the balloon (*viz.* four miles) above the white floor of clouds. These regions did not feel colder, but rather warmer, than below, and the sun felt hottest when the balloon was stationary. The discharge of a cannon when the balloon was at a considerable height, was distinctly heard; and a second discharge, when at the height of thirty yards, so disturbed him as to oblige him for safety to lay hold firmly of the cords of the balloon. At a considerable height he emptied a pint bottle full of water; and as the air did not oppose a resistance sufficient to break the stream into small drops, it mostly fell down in large ones. The balloon was much affected by the water (a circumstance observed by others,) and at one time was going directly towards the sea. The mouth of the balloon, however, being opened, it descended into an under current blowing from the sea, and Mr. B. at length landed at Bellair Farm, in Rinsley, twelve miles from Chester.

34. The first aerial voyage that was made in Scotland, was performed by Mr. Vincent Lunardi, who, in November and December 1785, ascended twice from Heriot's Hospital-Gardens, Edinburgh. On both these occasions he went entirely out of sight, and the first day of his exhibition being remarkably fine and clear, his balloon, for a long time before it became quite invisible, by the reflection of the sun beams, appeared at first like a full moon, and afterwards like a star of the first magnitude. He alighted safely on that occasion in a field between Cupar and St. Andrews; but in his second voyage he was not so fortunate; for, a strong wind blowing from the west, his balloon was carried in an easterly direction, and when the power of the inflammable air was exhausted, fell into the sea, near the Isle of May, where he was taken up by some fishermen; after having, for a considerable time, experienced the cold bath in his basket: which was prevented from sinking altogether, by the small quantity of inflammable air still remaining in the balloon. After this he repeated his aerial voyages at Glasgow, Kelso, and several other places. Previous to Mr. Lunardi's exhibitions, Mr. James Tytler had greatly excited the public curiosity by undertaking to ascend from Comely Gardens with a rarefied air balloon; but, excepting one morning, that he went up a few hundred yards, in a small basket, without his stove, every other attempt, to make the balloon carry up him and the whole necessary apparatus, proved fruitless. Had he filled his balloon with inflammable, instead of rarefied air, as his skill in chemical operations is undoubted, he would certainly have succeeded, and in that case might have claimed the honour of being the first aeronaut in Britain.

35. **SECT. II.** The attempts to improve the structure of AERONAUTIC machines will now engage our attention; and feeling that we have entered sufficiently into the details of preceding voyages, we shall only occupy our pages in the continuation of this article with such ascents as were made for scientific purposes. A first attempt

of this kind was connected with the desire to lessen the expence of balloons, by discovering some method of ascending without throwing out ballast, and of descending without losing any of the inflammable air. The balloon of the duke de Chartres, afterwards duke d'Orleans, who ascended with this view from Paris in 1784, was constructed upon somewhat new principles. It was of an oblong form, made to ascend with its longer diameter horizontally, and measured fifty-five feet in length, and twenty-four in breadth. It contained within it a smaller balloon filled with common air; by blowing into which with a pair of bellows, and thus throwing in a considerable quantity of common air, it was supposed that the machine would become sufficiently heavy to descend; especially as, by the inflation of the internal bag, the inflammable air in the external one would be condensed into a smaller space, and thus become specifically heavier. The voyage, however, was attended with such circumstances as rendered it impossible to know what would have been the event of the scheme. The power of ascent, with which they set out, seems to have been very great; as in three minutes after parting with the ground, they were lost in the clouds, and involved in such a dense vapour, that they could see neither the sky nor the earth. In this situation they seemed to be attacked by a whirlwind, which, besides turning the balloon three times round from right to left, shook and beat it so about, that they were rendered incapable of using any of the means proposed for directing their course; and the silk stuff, of which the helm had been composed, was torn away. No scene can be conceived more terrible, than that in which they were now involved. An immense ocean of shapeless clouds rolled upon one another below them, and seemed to prevent any return to the earth, which still continued invisible, while the agitation of the balloon became greater every moment. In this extremity they cut the cords which held the interior balloon, and of consequence it fell down upon the aperture of the tube, that came from the large balloon into the boat, and stopped it up. They were then driven upwards by a gust of wind from below, which carried them to the top of that stormy vapour in which they had been involved. They now saw the sun without a cloud; but the heat of his rays, with the diminished density of the atmosphere, had such an effect on the inflammable air, that the balloon seemed every moment ready to burst. To prevent this, they introduced a stick through the tube, in order to push away the inner balloon from its aperture; but the expansion of the inflammable air pushed it so close, that all attempts of this kind proved ineffectual. It was now, however, become absolutely necessary to give vent to a very considerable quantity of the inflammable air; for which purpose the duke de Chartres himself bored two holes in the balloon, which tore open for the length of seven or eight feet. On this they descended with great rapidity, and would have fallen into a lake, had they not hastily thrown out sixty pounds of ballast, which enabled them just to reach the water's edge.

36. This plan for navigating aerostatic machines

by common air, being thus rendered dubious, another method was suggested : which was to put a small *A*ërostatic machine with rarefied air under an inflammable air balloon, but at such a distance that the inflammable air of the latter might be perfectly out of the reach of the fire used for inflating the former; and thus, by increasing or diminishing the fire in the small machine, the absolute weight of the whole would be considerably diminished or augmented. This scheme was unhappily put in execution by the celebrated M. Pilatre de Rozier and M. Romaine. Their inflammable air balloon was about thirty-seven feet in diameter, and the power of the rarefied air one, was equivalent to about sixty pounds. They ascended without any accident; but had not been long in the atmosphere, when the inflammable air balloon was seen to swell very considerably, at the same time that the *A*eronauts were observed, by telescopes, very anxious to get down, and busied in pulling the valve and opening the appendages to the balloon, in order to facilitate the escape of as much inflammable air as possible. Soon after this the machine took fire, at the height of about three quarters of a mile from the ground. No explosion was heard; and the silk of the balloon seemed to resist the atmosphere for about a minute; after which it collapsed, and descended along with the two unfortunate travellers so rapidly, that both of them were killed. Rozier seemed to have been dead before he came to the ground; but M. Romaine was alive when some persons came up to him, though he expired immediately after.

37. But the most striking improvement that has been attempted in the management of balloons is, the detaching a distinct vehicle for the safety or separate descent of the aeronaut. The first invention of this description, now denominated a *parachute*, (Fr. *a guard for falling*,) is attributed to Blanchard, who, in one of his excursions from Lisle, about the end of August, 1785, let down from a great height a dog, by means of a basket fastened to a parachute, and the animal reached the ground unhurt. Since that period, the practice and management of the parachute have been carried much farther by other aerial adventurers, and particularly by M. Garnerin, who has repeatedly descended from the region of the clouds by that very slender machine.

When he visited London in 1802, he made two ascents, in the second of which he threw himself from an amazing elevation in his parachute, consisting of thirty-two gores of canvass, forming a complete hemisphere. When the balloon rose, the parachute hung like a curtain from the hoop, and below it was suspended a cylindrical basket, covered with canvass, four feet high and two and a quarter wide. In this basket the aeronaut placed himself, and rose from North Audley-street, on the evening of the 2d of September. After hovering five or six minutes in the air, he cut the rope, and precipitated himself to the earth. Before the parachute opened he fell with great velocity, but as soon as it was expanded the descent was gradual: the whole apparatus, however, swung with the aeronaut from one direction to another, like the pendulum

of a clock, and made such tremendous oscillations, that the basket was sometimes thrown in almost an horizontal position, and was borne along before the wind over Mary-le-Bone and Somer's-Town, till it alighted in a field of St. Pancras. M. Garnerin received some severe cuts, bled considerably, and trembled, and was greatly agitated on his release from the basket. He said that the accident had been caused by one of the stays of the parachute having given way.

38. This voyage, and subsequent experiments of the same kind, gave rise to calculations on the rate and danger of the descent with a parachute. When it is first abandoned to the air, we see it fall with great celerity till the increasing velocity meets a resistance in the air equal, or nearly so, to the force of gravitation, after which it descends uniformly; but as this equilibrium is not attained at once, the machine in the first instance shoots beyond the bounds of its terminal velocity, then contracts within its just limits, exciting great alarm both in the aeronaut and the spectators; and thus continues for some time, subject to a sort of interior oscillation, alternately accelerating and retarding. If the surface were flat, its motion would be equal to the velocity which a heavy body must acquire in falling through the altitude of a column of air incumbent on that surface, and having the same gravity as the whole apparatus. But a cylinder of air of one foot diameter and height, weighs only $\frac{1}{17}$ of a pound avoirdupoise. Wherefore if the square of the diameter of the parachute be divided by 17, the quotient will give the weight of an atmospheric column of one foot, and the weight of the apparatus being again divided by this quotient, will give the entire altitude of an equiponderant column; the square root of which multiplied by 8, will express the final velocity with which the parachute will strike the surface of the earth: thus, if the diameter of the parachute were 25 feet, then $25 \times 25 = 625$, which, divided by 17 = 36 $\frac{4}{17}$. If, then, the parachute and aeronaut weighed 36 $\frac{4}{17}$, the shock would be equal to a fall of one foot; had the weight been twice as great, the fall would have been twice as heavy, &c. the velocity being at least $8\sqrt{4}$, or 16 feet a second.

39. The resistance of the air, however, is greater than theory supposes. In the higher regions of the air the parachute descends with a rapidity that is not maintained in a dense atmosphere; and when the momentary inconvenience of rushing through this part of the atmosphere is overcome, the mean descent may be calculated at the rate of 12 feet a second, or a mile in 7 $\frac{1}{2}$ minutes; a rate which will not make the shock at the earth considerable.

40. It being now supposed that balloons might be usefully employed in observing the state of the atmosphere, and what circumstances attended the magnetic and electric actions in the upper regions; as also the proportions of the component parts of air in different altitudes, more or less remote from the earth, Messrs. Robertson and Lhoest made an aerial voyage from Hanlburgh about the middle of July, 1803, and rose to so great a height, that the elasticity of the air

alarmingly distended the balloon. They were forced to let out some gas; after which they ascended to an altitude in which it was almost impossible to endure the cold. Their teeth chattered without ceasing. Mr. Robertson's veins swelled, and blood came from his nose. Mr. Lhoest complained that his head swelled so much, that he could not keep on his hat; and they both felt a great degree of numbness, and inclination to sleep. This was at about the height of 2600 toises. Unable to continue any longer they descended, and would have alighted at Badenburg, near Winsen, on the Lube, but the inhabitants fled with the greatest alarm, and took them for spectres. They therefore continued their voyage till they arrived at Wichtenbeck, on the way to Zell. As they first arose the atmosphere was calm, but cloudy; as they ascended, the heat decreased, and they could look at the sun without being dazzled. The barometer fell from 27 to 14 inches, and the thermometer to $4\frac{1}{2}$ below zero. As they still ascended, the barometer fell to $12\frac{1}{2}$ inches.; but here the cold was insupportable, although the thermometer was only one degree below the freezing point, and they respired very rapidly; the pulsations, also, became greatly accelerated. Mr. Robertson made the following experiments, and observations:

i. He let fall a drop of ether on a piece of glass, and it evaporated in four seconds.

ii. He electrified glass and sealing-wax, but they gave no intimation of an accumulation of fluid that could be communicated to other bodies; and the voltaic pile, which, when the balloon was free from the earth, acted with full force, yielded only one-tenth part of its electricity.

iii. The dipping needle lost its magnetic virtue, and could not be brought to that direction which it had at the surface of the earth.

iv. He struck with a hammer oxygenated muriate of potash. The explosion though it made not a very loud noise, was almost insufferable to the ear, and they moreover, observed that though they spoke very loudly, they could with great difficulty hear each other.

v. Water began to boil with a moderate degree of heat, maintained by quick lime.

vi. Mr. Robertson having carried two birds with him, the rarefaction of the air killed one of them, and the other could not fly, but lay extended on its back and fluttered with its wings.

vii. Mr. Robertson could not extract any electricity from the atmospheric electrometer and condenser.

viii. The clouds, Mr. R. observed, never rise above 2000 toises, and it was only in ascending and descending through them that he obtained any positive electricity. The greatest altitude during this voyage was 2600 toises.

41. Mr. Robertson also ascended from Petersburg, on the 30th June, 1804, with the professor Sacharof, to make certain experiments proposed by the academy, and took 12 exhausted flasks, a barometer, thermometer, two electrometers, sealing wax, and sulphur, compass, a magnetic needle, a seconds watch, a bell, a speaking trumpet, a prism of crystal, unslack'd lime, &c. To ascertain the position of the balloon, they

fixed perpendicularly an achromatic telescope, in an aperture in the bottom of the car, which showed terrestrial objects distinctly; two sheets of black paper were also fixed at right angles, suspended from the car with a piece of thread to indicate any variation in the direction of the balloon, which contrivance they called the *way-wiser*. About a quarter past seven in the evening, the barometer being at thirty inches, and the centigrade thermometer at 19° . they ascended, and at thirty-one minutes past seven, the barometer sunk to twenty-nine inches, and the thermometer to 18° . The first cask was now filled with air, and when the barometer had fallen another inch, another cask was filled. The towns and villages being now obscured by a fog, the paper way-wiser was thrown out, and showed the direction of the balloon, for as the balloon fell, the way-wiser being lighter, and meeting more resistance in falling than the balloon, flew up, and when it rose, sunk down to the full length of its thread.

At other times it was seen in a diagonal direction, and pointed out with considerable accuracy the general direction and movements of the machine. At twenty-five minutes past eight, the barometer being at twenty-six inches, another cask was filled with air, and another, when it was twenty-five inches, and so on for every inch descent of the mercury. At half-past nine o'clock, the barometer being at twenty-two inches the thermometer at $4^{\circ}, 30'$, the voyagers saw the sun which was about half obscured by the fogs or the horizon or both. A piece of sealing wax rubbed with cloth, put in motion Bennet's Electrometer. A magnetic needle placed by M. Sacharof on a pin, elevated its north end, and lowered its south end, making an angle of 10, or 12° , but ever after descending, the same needle assumed an horizontal position. The aeronauts experienced no inconvenience except that their ears were benumbed with cold. There were white clouds a great way above the balloon, but the sky was in general clear and bright. They could however see no stars. As they were now floating over some towns and villages, M. Sacharof took his speaking trumpet and directed it toward the earth, and called as loud as he was able; after a lapse of ten seconds his words returned in echo, and sounded distinctly and clearly: calculating by the velocity of sound, he thought himself 5700 feet from the earth! To render the descent as safe as possible, all the instruments, clothing, &c. with an anchor were let down by a rope, but the handle being drawn a considerable distance along the ground, many of the instruments were destroyed, and of the eight casks that had been charged with air at different altitudes, four only were fit for experiment. These last two voyages may be said to be the first ever undertaken with the general view of investigating philosophy and science.

42. Besides the account given by Messrs. Robertson and Sacharof, with respect to the magnet, that there was a change in the dipping power of the needle.

M. Saussure, from experiments made on the Col du Geant, at the height of 3435 metres

above the level of the sea, thought he observed a sensible decrease of the magnetic virtue. Some aeronauts had stated that at a certain height the power of magnetism entirely vanishes.

43. To ascertain the truth or fallacy of these assertions, and also to try the experiment of Saussure in isolated situations remote from the influence of any local attractions; to explore the constitution of the higher atmosphere, its fitness or unfitness for respiration, &c. &c.; and also to make electrical, chemical, and meteorological observations, M. Biot and Gay Lussac, two young philosophers, educated at the Polytechnic school in Paris, proposed taking an aerial voyage. Their plan was patronised by the French government. The balloon which once visited Egypt, was delivered to these gentlemen, for the purpose of the excursion; the artist who constructed it was appointed to repair it under their direction, and every facility was to be afforded them. Besides the usual provision of barometers, thermometers, hygrometers, and electrometers, they had two compasses, a dipping-needle, and another fine needle carefully magnetized, and suspended by a very delicate silk thread for ascertaining, by its vibrations, the force of attraction in the upper strata of the atmosphere. To examine the electricity of the strata they carried up several metallic wires from sixty to 300 feet in length, and a small electrophorus slightly charged. For galvanic experiments, they had procured a few discs of zinc and copper, with some frogs, insects, and birds. It was also proposed to bring back air collected at as great a height as possible, for chemical analysis, for which purpose they had a glass ball closely shut up, previously exhausted of air; so that they had only to open and shut it up carefully, by means of the stopper.

44. They ascended from the *Conservatoire des Arts*, or repository of models, formerly the convent of St. Martin; on 23rd of August, 1804, the barometer being 30, 10' inches; the thermometer 61°, 7'. on Fahrenheit's scale, and Saussure's hygrometer 80°, 8'. near the point of absolute humidity. In a few moments they entered the region of the clouds, which seemed like a thin fog, and communicated a slight sensation of humidity. The balloon becoming quite inflated, they let out part of their gas, and threw out some ballast to give a greater elevation. They now shot through the clouds, and reached an altitude of 6500 English feet. Viewed from above, the clouds had the usual whitish appearance, exhibiting an elegant variety of gentle swells and undulations, resembling a wide plain of snow. At this altitude they commenced their experiments, and first of all employed the magnetic needle. This was attracted by iron; but owing to a slow rotatory motion of the balloon, they found it impossible to determine its rate of oscillation. The rotation showed itself, when any of the ropes were brought in a straight line with the edge of the clouds on any terrestrial objects, the contours of which were sensibly distinguishable the one from the other. Electricity was excited by the contact of insulated metals, as upon the earth. An electric pile, prepared with twenty discs of copper, and as many of zinc, exhibited all the

usual symptoms, the pungent taste, the nervous shock, and the decomposition of water. This might have been expected, says M. Biot, since the action of this pile does not cease, even in a vacuum. They afterwards attained the altitude of 8,940 feet, but afterwards settled at 8,600 feet. At this great elevation the animals seemed to suffer from the rarity of the air. They let off a bee, which flew away making its usual humming noise. The thermometer had fallen to 56°, 4'. by Fahrenheit; yet so far were they from experiencing cold, that they were absolutely scorched by the rays of the sun, and were obliged to lay aside their gloves from the inconvenience occasioned by the heat. Their pulsations were much accelerated, that of Gay Lussac was increased from sixty to eighty in a minute, and his companion's from 79 to 111, attended, however, with no difficulty of breathing; Gay Lussac, whose frame was less robust, experienced the less acceleration. The balloon continued its rotatory motion, which rendered it still difficult to observe, with accuracy, the oscillations of the magnetic needle; but on looking attentively down upon the surface of the conglomerated clouds, they observed that the balloon revolved slowly, first in one direction, next in the contrary one. They therefore, seized the few minutes of quiescence between these opposite motions for their experiments and observations upon the needle; but in these pauses, though they set the needle to vibrate, they were rarely able to count more than from five to ten oscillations. From a number of trials made between the altitudes of 9,500 and 13,000 feet, they calculated seven for the mean length of an oscillation, which at the earth is but $7\frac{1}{2}$, and attributing so nice a distinction to the imperfection of the experiment, they concluded that the force of the magnetic attraction had in no degree diminished, at the greatest elevation they could possibly reach; and the direction of this force, in their opinion, remained the same. M. Biot confesses that he was not able to observe the needle with accuracy, and therefore, cannot positively assert that it experiences no variation; but he thinks it highly probable that it does not, its horizontal force having undergone no change, or if any, it must have been very inconsiderable, because the magnetic bars brought into equilibrium before their departure, retained their horizontality during the whole journey. The weather and the disposition of the apparatus, however, prevented their coming to any nice conclusion.

45. At the altitude of 11,000 feet, they liberated a green linnet, which flew away directly; but soon feeling itself abandoned in the midst of an unknown ocean, returned and settled on the balloon, then collecting itself, took a second flight, and darted downward to the earth, describing a tortuous, yet almost perpendicular track. A pigeon which they sent off, offered a more curious spectacle: He rested a short time on the edge of the car, and looked down as if measuring the breadth of that unexplored sea before him, then launching into the abyss, fluttered irregularly, and after a few strokes, whirling in spiral like birds of prey, precipitated himself toward

the mass of extended clouds, and became invisible. Our aeronauts had now arrived at the altitude of 13,385 feet, and had not yet made electrical experiments. In order to try the apparatus an insulated wire was let down 240 feet in length, and electricity was extracted from its upper extremity, which when applied to the electrometer, appeared to be resinous, or negative, confirming the observations of Saussure and Volta, respecting the increase of electricity, observed in ascending the atmosphere. The experiment was tried, first, by destroying the atmospheric electricity by means of the vitreous electricity, from the electrophorus; and, secondly, by destroying the vitreous electricity, extricated from the electrophorus, by means of the atmospheric electricity. The latter must therefore, have been resinous. The inference drawn from these experiments was, that electricity increases as we ascend farther from the surface of the earth, agreeably to the experiments and observations of Volta and Saussure. The diminution of temperature in the higher regions, was not so great as might have been expected, and less than what is experienced in the same altitude on the tops of mountains, even at the elevation of 12,800 feet. The thermometer was at 51°, by Fahrenheit, while it stood as low as 63 $\frac{1}{2}$, at the Observatory, being a decrement of one degree for every 1000 feet of ascent.

46. The hygrometer, or rather hygroscope of Saussure advanced regularly towards dryness in proportion to the altitude they attained. At the time of the ascent, this instrument indicated 80°, 8', at 16°, 5' of the centigrade thermometer, but at the elevation of 13,000 feet, it changed from 80°, 8', to 30°, from which it would appear that the air is much drier in the upper regions than at the earth, which was the conclusion of M. Biot. The rectitude of it however, has been questioned. It has been observed that the indications of the hygroscope depend on the relative attraction for humidity possessed by the substance employed, and the medium in which it is immersed. But air has its disposition to retain humidity, always augmented by rarefaction, and consequently such attraction must materially affect the hygroscope. Such are the results of this voyage, which has been considered the most scientific of any that have been hitherto made. Having expended all their ballast they descended gradually till at about the altitude of 4000 feet, they entered the stratum of clouds extending horizontally with the surface of the earth, and at last reached the ground. There being no people near the spot to stop the machine, they were dragged in the car to some distance along the fields. M. Biot was so overpowered by the alarm of their descent as to lose entire possession of himself, and the only

way left of avoiding the dangers that threatened them, was, by discharging the remaining gas.

47. M. Biot afterwards presented himself to the Institute as a candidate for a second ascent. He did not however repeat his excursion; but at the request of several Parisian philosophers M. Gay Lussac made another voyage on the 15th of September, from the same place, at about forty-nine minutes past nine in the morning. He reduced his apparatus, and adapted it better to his circumstances. Aware that he could only observe the magnetic needle during the short periods of quiescence, intervening between the rotatory motions of the balloon, he preferred one of not more than six inches long, the oscillations of which were more rapid. The dipping needle was magnetized, and adjusted by M. Coulomb, and the thermometer was inclosed within two concentric cylinders of pasteboard covered with gilt paper, proper to prevent the immediate action of the sun. The hygrometer, on Richer's principle, with four bodies, was sheltered in a similar manner. Two glass vessels were exhausted, with the intention of bringing down air from the higher regions, and the mercurial gauge stood at the twenty-fifth part of an inch. The barometer at the period of ascent, stood at 76,525 centimetres, or 30.66 English inches. The hygrometer at 57.5, and the thermometer at 27.50, of the centigrade, or 82° of Fahrenheit's thermometer. At the elevation of 3000 feet, he saw a light vapour dispersed through the whole atmosphere below him, through which distant objects might be confusedly seen. At the height of 3032 metres, or about 9950 English feet, he commenced his experiments on the magnetic needle, which made twenty oscillations in 83°, the same as it would have made at the earth in 83°, 20'. At the height of 12,680 feet, the needle taking the mean amplitude of the oscillations was 31° as at the observatory. Owing to the wind and other difficulties, he was obliged to renounce any further observations. In his experiments with the dipping needle, he was equally unsuccessful, for the dryness formed by the sun in rarefied air, was so great, that the compass became damaged by the bending of the metallic circle on which the divisions were traced out, by which all his deductions were rendered uncertain: he therefore proceeded to his other experiments.

48. At the altitude of 14,000 feet, a key held in the magnetic direction repelled with one end, and attracted with the other the North Pole of the needle, and even at the increased altitude of 20,150 feet, he found no sensible difference; whence, he concludes magnetism to be the same at the greatest elevation.

The table of observations will, perhaps, give the clearest view of the result of his experiments to the curious reader.

Table of the Observations of M. GAY LUSSAC, in his ascent on the 15th of September, 1804.

Temperature expressed in degrees of the centigrade thermometer.	Mean of the indications of the two hygrometers.	Mean height of the barometer, reduced to that of a barometer at a constant level.	Corresponding heights in metres above Paris.	The same in toises.	Number of magnetic oscillations.	Duration of the oscillations in seconds.	Oscillations reduced to the common number 10.	Corresponding time.

49. From this it appears, that the temperature is very irregular in corresponding heights, which he supposed to arise from the observations being taken, some in ascending and some in descending, the thermometer obeying the variations too slowly. But regarding only the decreasing series of degrees in the thermometer, the law of temperature appears more regular: thus, the temperature at the earth is 27°, 75', and at the height of 3691 metres, is 8°, 5', dividing the difference of the altitudes by that of the temperatures, we shall have 191.7 metres, or 98.3 toises of elevation for each lowering degree of temperature. Towards the surface of the earth, the heat follows a less decreasing law than in the higher parts of the atmosphere. At greater heights it follows arithmetical progression. The lowest temperature observed, was 9°, 25', corresponding to 14°, 9' of Fahrenheit's thermometer; and to an elevation of 23,040 English feet. The gradation evidently is not uniform, as appears from facts already laid down by other observers, but proceeds with augmented rapidity in the upper regions. The hygrometer was very irregular, but tended obviously toward dryness. At the earth, it was 57°, 5', but at the height of 3032 metres, changed to 62°, and then declined till the balloon attained the height of 5267 metres, when it stood at 27°, 5'. From this point it advanced again, with slight aberrations to 35°, 1', at an altitude of 5631 metres, but above this, the varia-

tion was slight. Facts and observations, have, however, convinced us, that the higher strata of the atmosphere, are generally driven through the lower, and are capable of retaining at the same temperature, a larger share of moisture. The two air flasks were opened, one at the height of 21,460 feet, and the other at 21,790 feet, when the air rushed into them with a whistling noise. From that stupendous height, he still saw fleecy clouds at a great height above him, but none below. The atmosphere wanted transparency, and exhibited a dull misty appearance. The different aspect of the sky, was owing, in his opinion, to the different direction of the winds. At this enormous elevation, he began to feel increasingly cold, great numbness, difficulty of breathing, while his throat was so parched from inhaling the dry attenuated air, that he could scarcely swallow a morsel of bread. His ballast being nearly gone, and his balloon completely distended, he began to descend at the rate of about a mile in eight minutes, and after a lapse of thirty-four minutes, alighted, at three-quarters past three o'clock, near the hamlet of St. Gourgon, sixteen miles north west of Rouen. On his arrival at Paris, he hastened to the laboratory of the polytechnic school, with his flasks of air, and proceeded to analyze it. On opening the flasks under the water, the liquid rushed in, and half filled their capacity. It was found on analysis to be exactly the same in point

of proportions, as that at the surface of the earth ; each 1,000 parts containing 215 of oxygen.

50. The next voyage which we must notice by way of warning to future adventurers, was one of the few fatal ones. On the 7th April, 1806, M. Mosment ascended from Lisle, apparently under auspicious circumstances. During his ascent, he dropped a dog with a parachute, which came safely to the ground, and about one o'clock something was seen descending slowly through the air, and proved to be the flag of M. Mosment. Soon after, a murmur was circulated that the body of the aeronaut was found in one of the fosses of the city, lifeless and covered with blood, which proved in the end but too correct. The misfortune has been attributed to the shallowness of the car, by which, he is supposed to have lost his balance in throwing out the dog, and precipitated to the earth.

51. On the 4th of August, M. Garnerin, ascended from Paris at eleven o'clock in the evening, for the purpose of making nocturnal observations, under the Russian flag. His balloon was illuminated by twenty lamps, and formed a very splendid appearance; rockets let off at Tivoli, seemed to him scarcely to rise above the earth, and Paris appeared studded with numerous stars. In forty minutes he rose to an elevation of 13,200 feet : at twelve o'clock, when 3,600 feet from the earth, he heard the barking of dogs ; at two o'clock, he saw several meteors flying around him ; at half past three, he beheld the sun rising in magnificence and grandeur above the ocean of clouds, and the gas expanding, he rose to the height of 15,000 feet, and after a lapse of more than seven hours, descended at Loges, forty-five leagues from Paris.

52. He took a second nocturnal voyage, on the 21st September, in which he was exposed to great danger. He commenced his voyage as before from Tivoli, and was at first carried with unexampled rapidity to an immense height, when he began to prognosticate a storm. The balloon dilated to an alarming degree, and having neglected his apparatus for conducting the gas away from the lamps in its escape, he could not manage the balloon : he therefore with one hand made an opening of two feet diameter, and with the other put out all the lamps he could, and was, without a regulating valve, tossed about from current to current ; his ballast was gone, and in this condition, the balloon rose through thick clouds, then sunk, then struck the earth and rebounded to an amazing altitude : the storm dashed him against the mountains, and after many severe shocks he became for a time insensible. On recovering his senses, he found he had been carried to Tonnere, in a storm of thunder. His anchors shortly hooked in a tree, and he alighted in seven hours and a half from his ascension, 300 miles from Paris, having travelled a distance of forty miles in an hour. This, however, is not more than half the distance he travelled on one occasion in this country, when he went from London to Colchester, a distance of fifty miles, in three-quarters of an hour.

53. Since this period, the names of Saville,

Green, Graham, and other adventurers have been connected with the ascent of balloons, for the purpose of emolument, in England : sometimes exhibiting the triumphs, and sometimes the paucity of scientific attainments in their conductors. But we know of no further efforts than the above, to increase the materials of science itself, by these voyages.

54. The utility of Aeronautic studies and experiments has been very much questioned even by philosophical minds. M. Cavallo, well known in the philosophical world, suggested long ago that small balloons, especially those made of paper, and raised by means of spirit of wine, may serve to explore the direction of the winds in the upper regions of the atmosphere, particularly when there is a calm below ; and we see the French aeronauts adopted this idea, that they might serve also for signals in various circumstances, in which no other means can be used ; and letters or other small things may be easily sent by them ; for instance, from ships that cannot safely land on account of storms ; from besieged places, islands, or the like. The larger aerostatic machines, he adds, may answer all the above mentioned purposes in a better manner ; and they may, besides, be used as a help to a person who wants to ascend a mountain, or a precipice, or to cross a river ; and perhaps one of the machines tied to a boat by a long rope, may be, in some cases, a better sort of sail than any that is used at present. Their conveying people from place to place with great swiftness, and without trouble, may be of essential use, even if the art of guiding them in a direction different from that of the wind should never be discovered. By means of those machines the shape of certain seas and lands may be better ascertained ; men may ascend to the tops of mountains they never visited before ; they may be carried over marshy and dangerous grounds ; they may by that means come out of a besieged place, or an island ; they may, in hot climates, ascend to a cold region of the atmosphere, either to refresh themselves, or to observe the ice which is never seen below ; and, in short, they may be thus taken to several places, to which human art hitherto knew of no conveyance.

55. The philosophical uses, to which these machines may be subservient, are numerous indeed ; and it may be sufficient to say, that hardly anything which passes in the atmosphere is known with precision, and that, principally for want of a method of ascending into it. The formation of rain, of thunder storms, of vapours, hail, snow, and meteors in general, requires to be attentively examined and ascertained. The action of the barometer, the refraction and temperature of the air in various regions, the descent of bodies, the propagation of sound, &c. are subjects which all require a series of observations and experiments, the performance of which could never have been properly expected, before the discovery of aerostatic machines.'

56. Such speculations have been for years on record : the reader will see from our preceding detail that they have but partially been fulfilled.

But we should not omit to state, that the French applied balloons to military purposes during the late war, and ascribe to this in a great measure, the celebrated victory obtained over the Austrians, at Fleurus, 1794. A balloon was sent up under the direction of Mr. Coutel, accompanied by an adjutant and a general, who rose twice the same day to the height of 220 fathoms, and remained each time four hours suspended in the air, observing the movements of the enemy, and corresponding all the time by military signs with general Jourdan, commander of the French army. The enterprise was at last discovered, and a battery opened upon the aeronauts, but they soon gained an elevation beyond the reach of the fire. Afterwards the French commonly prepared balloons to go with their armies, as into Egypt, &c. but we have never heard of any other practical result. We would now direct the reader to

57. SECT. III. OF THE PRINCIPLES OF AERONAUTIC MACHINERY.—The general principles of Aerostation are so little different from those of hydrostatics, that it is almost superfluous to insist on them. It is a fact universally known, that when a body is immersed in any fluid, if its weight be less than an equal bulk of that fluid, it will rise to the surface; but if heavier, it will sink; and if equal, it will remain in the place where it is left. For this reason smoke ascends into the atmosphere, and heated air in that which is colder. Upon this simple principle depends the whole theory of aerostation.

58. A cubic foot of air has been found to weigh about 554 grains, and to be expanded by every degree of heat, about $\frac{1}{70}$ part of the whole. By heating a quantity of air, therefore, to 500 degrees of Fahrenheit, we just double its bulk when the thermometer stands at fifty-four in the open air, and in the same proportion we diminish its weight; and if such a quantity of this hot air be inclosed in a bag, and the excess of the weight of an equal bulk of common air weighs more than the bag with the air contained in it, both the bag and the air will rise into the atmosphere, and continue to do so until they arrive at a place where the external air is naturally so much rarefied, that the weight becomes equal; and here the whole will float.

59. From the frequent exhibition of aerostatic machines, the power of hot air in raising weights, or rather that by which it is itself impelled upwards, has been illustrated by a variety of experiments with which every one is familiar. From these it appears, that in the aerostatic machines on Montgolfier's plan, it must be an advantage to have them as large as possible; because a smaller quantity of fire will then have a greater effect in raising them, and the danger from that element, which in this kind of machines is chiefly to be dreaded, will be in a great measure avoided. On this subject it may be remarked, that as the cubical contents of a globe, or any other figure of which balloons are made, increase much more rapidly than their surfaces, there must ultimately be a degree of magnitude at which the smallest additional heat would raise any weight whatever. Thus, supposing any aerostatic machine capable of containing 500

cubic feet, and the air within it to be only one degree hotter than the external atmosphere; the tendency of this machine to rise, even without the application of artificial heat, would be near an ounce. Let its capacity be increased sixteen times, and the tendency to rise will be equivalent to a pound; and this may be done without making the machine sixteen times heavier than before.

60. It is certain, however, that all aerostatic machines have a tendency to produce or preserve heat within them, as Messrs Charles and Roberts found in their aerial voyage of 150 miles, when the external atmosphere was 63°, and the thermometer within the balloon at 104°. Such a difference of temperature affording a power of ascent equal to forty-one grains on every cubic foot, must, in a machine of 50,000 such feet, have amounted to almost 200 pounds. Hence we may easily account for Mr. Morveau's accident at Dijon, when a balloon filled only with common air made its escape to some distance by the spontaneous rarefaction of the air within. This difference between the external and internal heat, being so very considerable, must have a great influence upon aerostatic machines, and will undoubtedly influence those filled with inflammable air as well as the other kind. The rain, snow, and vapours, which condense upon them in the higher regions, may also occasion an evaporation, and consequently a very violent degree of cold, so as to make them specifically heavier than the atmosphere.

To this, probably, we may ascribe the descent of the balloon which carried M. Blanchard and Dr. Jeffries; and which seemed so extraordinary, that many had recourse to an imaginary attraction in the waters of the ocean, in order to solve the phenomenon. This supposition, however, is rejected by Cavallo; who explains the matter, by remarking, that in two former voyages made with the same machine, it could not long support two men in the atmosphere, so that we had no reason to wonder at its weakness on this occasion. In fact, it does not appear that the air over the sea is at all warmer than that above land; on the contrary, there is every reason to believe that the superior reflective power of the land renders the atmosphere above it warmer: but it is very natural to suppose, that the air above the sea is more moist than that above land; and consequently, by letting fall its moisture upon the balloon, must have occasioned an evaporation, that would deprive the machine of its internal heat; which it would partly recover after it entered the warmer and drier atmosphere over land.

61. Much attention has been directed to the shape most proper for the balloon, an object in aeronautics of considerable importance. The early balloons appear to have been elliptical or oval, but the spherical is now generally preferred because this figure admits the greatest capacity under the least surface. The conical or oblong figure has been proposed as an experiment; in which case the machine is supposed to proceed with its narrow end forward. This suggestion arose from the consideration that a round form, and that which is approximately so, presents a

greater surface to the opposition of air; and is, therefore, an insuperable obstacle to guiding it by the action of the oar, wings, or any other invention which might be contrived to turn it, either in the current of the atmosphere, or even in a perfect calm. Mr. Hoole, copying nature, suggests the shape of a fish, the head of which figure might serve to divide the fluid, and the tail as a rudder, to steer the course of the balloon. The traveller, he suggests, should sit in the centre of gravity of the whole mass; and thus he would not only render it perfectly horizontal, but be able, from his situation, to give an impulse of sufficient force to move the whole body: he should also be provided with instruments analogous to the fins of fishes, says this author, and of sufficient texture to bear the whole force of his muscular strength. The oblong form is, however, attended with the disadvantage already named, as to its capacity being less under the same surface than the sphere; and consequently, its power of buoyancy must be calculated at a proportional diminution, to say nothing of the positive augmentation necessarily incurred by such a change of figure to its ponderosity, or the superadded consideration of the difficulty of balancing and governing such a figure in the open heavens, exposed to the action of violent winds and storms; the first blast of which might roll it sideways, sweep it away upon its bosom, or perhaps turn it over. Other advantages of the spherical form are as follow. The circumferences of spheres are as their diameters; their surfaces as their squares; their solid contents as the cubes of their diameters. The diameter of the circumference being as 7 to 22. If the diameter of a spherical balloon be 35 feet, the circumference will be 110: that diameter multiplied by the circumference, will give the surface of the sphere, and in the case above named 3850 feet. By knowing the weight of a given portion of the materials of which the balloon is formed, as of a square foot or yard, it is easy to calculate the whole; and, in order to find the capacity, take $\frac{1}{4}$ of the cube of the diameter, or multiply $\frac{1}{4}$ of the surface by the entire diameter.

62. Having found the contents and surface of the balloon, we calculate its buoyancy. If the cubic foot of air weighs $1\frac{1}{3}$ of an ounce, we take the number of cubic feet in the solid content of the balloon, and add to them $\frac{1}{3}$ part of themselves, considering the feet as ounces; and hence we have the weight of air displaced by the balloon. If the balloon contain 22,458 cubic feet, each of the weight of $1\frac{1}{3}$ oz. we add to 22,458 ounces $\frac{1}{3}$ of that quantity; and hence have 26,949 $\frac{2}{3}$ ounces the weight of the whole, supposing the dimensions of the same weight as air. This, however, is not the case. From the aggregate, then, of the 26,949 $\frac{2}{3}$ ounces, we deduct the weight of the materials of which the vehicle is made, and the remainder expresses the exact levity of the balloon, on the supposition that it contains common air. But inflammable air weighs from $\frac{1}{2}$ to $\frac{1}{2}$ of the weight of common air only, and, supposed in the above case at $\frac{1}{2}$, will stand thus $\frac{1562\frac{1}{2}}{2}=781$; also $1256-280=976$ ths power of ascension. The same general reasonings may be applied in other cases for calculating the buoyancy of

spherical balloons of all sizes, the levities being nearly as the cubes of the diameters, and consequently the diameters as the cube roots of the levities. But from the application of similar reasonings to the oblong figure, there appears, as we should expect, an augment of weight, and a decrease of capacity, under the same extent of surface.

63. The power of ascension in balloons differs considerably, according to the means of aerostation or rarefaction employed. If a perfect vacuum could be procured, a globe of 10 feet in diameter would rise, with a force of 40 pounds; one of 20 feet, 320 pounds; one of 30 feet, 1080 pounds, in the ratio of the cube of the diameter. We have already stated, the levities are as the cube of the diameters, and consequently diameters as the cube roots of the levities. But air expands by heat at least 450th part of its bulk; and it is impossible to apply caloric in a sufficient degree to obtain its whole ascensional power. That air within a balloon or vehicle, heated 50 degrees, would dilate by elasticity till one-ninth part was driven out; so that even then the tendency of the balloon to rise would be equal only to the ninth part of its whole buoyant force. That being the relation in which 50 stands to 450, and 50 degrees of heat is as much, perhaps, as could be supported. Humidity produces a dilation of air, amounting, in good weather to an eightieth part of the volume of fluid, and in the tropical regions would exceed one-twentieth: hence moist air thrown into a large bag, sufficiently waxed, would cause it to rise. But heat and moisture combined, produce a far greater rarefaction of the air than either of them is capable of producing alone. The smoke used by Montgolfier with so great success, was nothing scarcely but air charged with vapour, produced by burning of vine-twigs, chopped straw, &c. and was computed to be one-third specifically lighter than common air, and therefore must have possessed a degree of rarefaction which it would require 150 degrees of heat to produce operating alone. From these data it is evident that the force estimated at $12\frac{1}{2}$ pounds avoirdupoise in a globe of 10 feet diameter, would amount to $1562\frac{1}{2}$ pounds, if the diameter were 50 feet, and to 12,500, if it were a hundred, being as the cube roots of the levities, from which is to be deducted, the weight of the case, appendages, &c. which, estimated at two-fifths of a pound, for a sphere of one foot in diameter, demonstrates a balloon of 100 feet diameter, capable of exerting an ascending power of not less than 8500 pounds, independent of the cordage, car, ballast, &c. which still must be deducted; and one of $33\frac{1}{3}$ feet diameter would exert a power capable of producing a mere equilibrium between the weight of the canvass and the buoyant force of the rarefied air.

64. Balloons filled with gas remain to be considered. Hydrogen gas obtained from sulphuric acid, acting on iron filings, is six times lighter than common air, but gas evolved by a solution of zinc in that acid, is twelve times lighter. We may, therefore, independently of accidents, &c. consider, that on a general scale the hydrogen gas that fills a balloon, is six times specifically lighter than common air, the balloon must there-

fore exert $\frac{1}{9}$ of the buoyant force corresponding to its capacity, and will have an ascending power equal to $\frac{1}{9}$ of a pound avoirdupois for a globe of one foot diameter, 112 $\frac{1}{2}$ pounds for a balloon of 15 feet diameter, 900 pounds for one of 30 feet, and 7200 pounds for one of 60 feet, the weight of the balloon, &c. to be deducted, which allowing, as has been calculated, $\frac{1}{9}$ part of a pound for a varnished silk globe of one foot diameter, would be in a balloon of 15 feet diameter, 114 pounds, in one of 30 feet 45 pounds, in one of 60 feet 180 pounds, and the consequent power of ascension in such balloons would be 101 $\frac{1}{2}$, 855, and 7020 pounds, whilst a balloon of 1 $\frac{1}{2}$ feet would just float in the atmosphere. There being in that case an exact equilibrium between the weight of the materials and the ascensional power of the gas. The weight of the appendages, it must be considered, has a tendency to compress the gas embodied in the balloon, and thereby to render it more dense, but this effect is not considerable. A load of 6000 pounds in a balloon of 60 feet diameter, has been calculated to produce a compression amounting to $\frac{1}{3}$ of a pound; for a circle of one foot diameter in the horizontal section, the 979th part of the pressure of the atmosphere on a globe of those dimensions, and rating the weight of gas at 1200 pounds, there will be a diminution of buoyancy of 1 $\frac{1}{3}$ pounds. The balloon, according to its power of ascension, would rise with a motion perpetually accelerating, were not this velocity checked by the resistance of the air through which it passes, which according to the theory of dynamics, is to that which a falling body acquires in the same space of time, as the ascensional power is to the weight of the apparatus and fluid. Still, notwithstanding the opposition it meets with from the atmosphere, it will attain its final velocity in about double the time which would be otherwise required for that purpose, after which its ascent will be uniform, the resistance of the air being just equal to the buoyancy of the balloon. The resistance of a circle moving through any given fluid in a direction perpendicular to its plane, is measured by the weight of a column of that fluid of equal base with the circle, and at an altitude from which a heavy body falling will acquire the same celerity; a rule which arises out of the general principle that air presses equally every way. Near the level of the sea, at mean temperature, a column of air 17 feet high, incumbent on a circle of a single foot diameter, weighs a pound; the consequent resistance which such a circle would suffer, propelled at the celerity of 33 feet each second. Newton calculates the resistance of the atmosphere to be just half that of its generating circle, and therefore a velocity of 46 $\frac{2}{3}$ feet in a second, would create a resistance of one pound to a sphere of one foot diameter. In other circumstances the resistance will be proportionate to the squares of the velocities and densities. Consequently if the buoyant force were always the same, the velocity of ascent in a balloon would be inversely as its diameter. A balloon of 30 feet diameter and 100 pounds ascensional power, has the same effect as the ninth part of a pound for a globe of one foot diameter; and would therefore meet a resistance corresponding to the

velocity of 46 $\frac{2}{3}$ divided by 3, the square root of 9 or 15 $\frac{1}{3}$ each second, consequently the balloon would rise a mile in six minutes.

65. To determine the height to which a balloon will rise, the rule is, to compute the contents of the globe in cubic feet, and divide its restraining weight in ounces by the content, and the quotient will be the difference in the density of the atmosphere at the surface of the earth, and at the point to which the balloon will rise. Subtract this quotient from 15, the density at the earth, and the remainder will be the density at that height; after which, the height may be found by comparing the density thus obtained, with philosophical tables for that purpose. The balloon would indeed, at first, rise above this altitude, by reason of the rapid celerity acquired in its ascent, and afterwards sink below it; but this is the point at which it would ultimately settle and continue in the diffuse medium; the density of air, at that degree of elevation, just balancing the ascensional power.

66. Its equipoise cannot be stable so long as it remains in a loose flaccid state; but the circumstances of its ascent are to be determined by means of ballast, and the safety valve appointed for occasionally letting out a portion of the gas; for although the balloon designed for any considerable altitude, is not more than half filled with gas at first, still, by the increased rarefaction of the air as it ascends, and the consequent diminished pressure on the exterior, the expansion sometimes becomes so great as to endanger the bursting of the machine.

67. The rarefied air balloons have been commonly elevated or depressed by increasing or diminishing the fire; the inflammable air balloons by throwing out the ballast, or letting out the gas in suitable portions, through the valve. But these means will in time render the vessel incapable of floating; for in the air they can have no supply of ballast, and with great difficulty can procure gas. They will also rise or fall by the rarefaction of the inclosed air; and it has been proposed to effect these purposes, by means of annexing to the balloon a vessel of common air by condensing and rarefying which, the machine may be lowered or elevated at pleasure. M. Meuvier proposed to inclose one balloon of common air in another of inflammable air; by this means, as the balloon ascends, the gas becomes expanded, and compressing the balloon of common air, diminishes its weight; and to increase the quantity of this air when needful, he suggested the use of bellows. Some propose to annex a small balloon with rarefied air, to one of inflammable air; and by altering the fire of the lower one, to raise or depress the machine.

68. Several inventions have been offered for the purpose of conducting these machines through the air, and giving them a direction to whatever point the aeronaut should wish to travel. Some have proposed to govern them by sails and rudder, in the same manner as ships at sea; but this, as might have been expected, was found impracticable, the course of balloons and ships being so exceedingly different. A vessel upon the water moves with less velocity than the wind, and therefore the wind acts powerfully

upon the sails; but ballous, having the same velocity as the surrounding air, feel no wind, and consequently can derive no benefit from sails. Oars and wings have been applied with as little success. The helm, indeed, was for some time encouraged, from the motion of fishes in the water; but from this no practical benefits have been derived. Professor Dauzel is said to have contrived a machine for the direction of the balloon, an account of which may be seen in the Philosophical Magazine, vol. iv. p. 108; but it seems to have fallen into disuse; and it is probable that these contrivances will never be brought to a state of perfection. The power which the aeronaut has of raising and lowering himself in the atmosphere, will, at present, best enable him to take advantage of the different currents of air, which are blowing at the same time in various directions; and, by committing himself to the breeze he wants, to supersede the necessity of contrivances, which would tend at best to encumber the machine. The parachute however, is a useful appendage, by means of which the voyager can, at any height, leave the balloon, in case of danger, and escape to the earth without incurring the inconvenience of a rapid fall. A machine on the same principle is said to have been long used in the East, by the Vaulters, to enable them to jump from great heights. We have noticed its general principles of descent already.

69. Sec.V. OF MAKING AND FILLING BALLOONS.—With respect to the construction of the balloon or globe, the first thing to be considered, is the formation of the gores of which it is composed. In order to frame these, we must consider that the edges are not segments of circles, and cannot in consequence be described by compasses. To shape them, the following directions are necessary: first draw a right line AB, (see plate I. fig. 1.) equal to half the circumference, which divide by the line CD into two equal parts at the point E, each equal to the one-fourth of the circumference. Describe the line AB in feet and decimals; divide the quarter circumference AE into eighteen equal parts, and to the points of division apply the lines fg, hi, kl, &c: divide the whole circumference into twice the given number of pieces, and make CE and ED each equal to the quotient of this division: so that CD may be equal to the breadth of one of those pieces: multiply the above mentioned quotient by the decimals at the end of the lines fg, hi, kl, &c., and you have the length to which the line ought to be continued. Draw a curve along the extremities of these lines, and you have one quarter of the pattern complete, by which you may shape the rest. The reason of the rule is, that the several breadths of each slip, at the several distances from the point to the centre, are as the sines of those distances, the radius being the size of half the length of the slip. Having computed the circumference of the balloon, it is comparatively easy to form the gores after which nothing remains to complete the machine, but fitting them together, varnishing the exterior, and suspending the car, which is commonly of wicker work, covered with leather, to the balloon, by means

of ropes attached to a net, formed to fit the shape of the balloon. For the greater convenience of aerostation, the ropes from the net are attached to the circumference of a circle about twenty feet below the balloon, whence other ropes go to the edge of the boat.

70. The material universally employed for aerostatic machines of a larger size, to be filled with inflammable air, is varnished silk; and for those of the rarefied air kind, linen painted over with some size colour, or lined with paper; the best varnish for an inflammable air balloon, is that made with birdlime, and recommended by M. Faujas de Saint Fond, in a treatise published on the subject:—‘Take one pound of birdlime, put it into a new proper earthen pot that can resist the fire, and let it boil gently for about one hour, viz., till it ceases to crackle; or, which is the same thing, till it is so far boiled, as that a drop of it being let fall upon the fire, will burn: then pour upon it a pound of spirits of turpentine, stirring it at the same time with a wooden spatula, and keeping the pot at a good distance from the flame, lest the vapour of this essential oil should take fire. After this, let it boil for about six minutes longer; then pour upon the whole, three pounds of boiling oil of nuts, linseed, or poppy, rendered drying by means of litharge; stir it well, let it boil for a quarter of an hour longer, and the varnish is made. After it has rested for twenty-four hours, and the sediment has gone to the bottom, decant it into another pot; and when you want to use it, warm and apply it with a flat brush upon the silk stuff, whilst that is kept well stretched. One coat of it may be sufficient, but if two are necessary, it will be proper to give one on each side of the silk, and to let them dry in the open air, while the silk remains extended.’

On this subject, however, M. Cavallo has made some improvements, as may be seen in his printed publications. Much likewise has been said in France of the elastic gum varnish, and its composition, which was kept a secret; but Mr. Baldwin, after many expensive trials, declares it to be made by melting in an iron ladle, properly heated, pieces of elastic gum, and afterwards stirring in a quantity of drying oil. M. Blanchard’s method of making elastic gum varnish for the silk of a balloon, is the following: ‘Dissolve elastic gum, cut small, in five times its weight of spirit of turpentine, by keeping them some days together; then boil one ounce of this solution in eight ounces of drying linseed oil for a few minutes; lastly strain it. It must be used warm. The pieces of silk, after the varnish is sufficiently dry, may be joined by laying about half an inch of the edge of one piece, over the edge of the other, and sewing them by a double stitch.’

71. Having thus completed the structure of the balloon mechanically, the next consideration is that of filling it. This is commonly done with gas, which may be obtained in different ways, according as inclination and circumstances may direct. The best way is by applying acids to certain metals; by exposing certain animal, vegetable, and mineral substances, to a strong fire, in a close vessel; or by transmitting the

vapour of certain fluids through red hot tubes. Since it is impossible to obtain a sufficient quantity in its natural state, latterly it has been found convenient and cheaper for balloons to be filled from the nearest gas works.

72. The materials that have been generally employed by scientific aeronauts, are iron or zinc, and vitriolic acid diluted with five or six parts of water. The chippings of iron, or the borings of cannon are more suitable to the purpose than iron filings, because the interstices admit the diluted acid more easily, and the heat attending the effervescence is much greater. Iron in this way is capable of producing 1700 times its bulk of gas, four ounces and a half of iron, the same weight of vitriol, and twenty-two and a half ounces and a half of water, will produce one cubic foot of inflammable air; also six ounces of zinc, six of oil of vitriol, and thirty of water, will produce the same quantity, the inflammable air thus obtained, weighing one seventh part of the weight of common air. By passing this air through water in which quick lime has been dissolved, the elastic fluids generated with the air, become absorbed with the water, and the inflammable air is rendered cool and prevented from overheating the balloon. The gas is collected in casks lined with tin. M. Garnerin, in 1802, used thirty-six casks, every twelve of which communicated with a collar, and three tubes from three collars, conveyed the gas into one large tube which joined the balloon. Professor Robertson and Sacharov, had twenty-five vessels into each of which were put 120 pounds of iron filings, 600 pounds of water, and then poured in 120 pounds of sulphuric acid. M. Blanchard filled a balloon from only four casks, each 120 gallons. Lunardi employed only two casks, by which he filled a balloon in the shape of a pea, twenty-three feet in diameter, and thirty feet high, in the short space of half an hour. He employed 2000 pounds of each, and 12,000 pounds of water, a quantity which has been pronounced sufficient for a balloon thirty feet in diameter, having a capacity of 14,137 feet. Zinc is said to be superior to iron, in as much as the gas obtained from iron by the action of vitriolic acid is computed to be six times lighter than atmospheric air; whereas the gas evolved during the solution of zinc in that acid, is not less than twelve times lighter than that fluid.

73. An inferior inflammable air is also obtained by the action of fire upon various substances as pit coal, asphaltum, wood, especially oak, camphor, oil, spirits of wine, &c. but is not so light as that obtained from iron or zinc. It may also be observed that animal substances yield from six to ten times more inflammable air when the fire is suddenly increased than when it is gently raised. The common way of obtaining it is, by enclosing the materials in iron vessels, which are afterwards heated red hot, when the inflammable air immediately proceeds from the aperture of the vessels.

74. M. Lavoisier made inflammable air, by passing the steam of boiling water through a red hot gun barrel. Dr. Priestley, instead of this, took a tube of brass, on which the steam of water has no effect, and having filled it with iron obtained

from the boring of cannon, made the water boil with vehemence, and passing the steam through this red hot tube, the iron yielded one half more air than had ever been obtained from the action of vitriolic acid.

75. Balloons of small dimensions may be filled with gas in the following manner. Let A, (plate I. fig. 3.) be a bottle containing the requisite ingredients, B C a tube in the shape of a siphon, fastened at one end to the neck of the vessel or the bottle. Let E pass through an orifice in the stopper nearly to the bottom of the bottle, or vessel E, almost full of water. In another orifice in the stopper of E, place another tube, to which fix the bladder or balloon. Then the gas coming out of the end of the tube C, and passing through the water, will collect itself in the bottle D, and be conveyed by the additional tube into the balloon.

76. It may also be done in the following manner, (see fig. 4.) let ABC, represent a vessel of clay or iron in the form of a Florence flask, containing the materials. To C, the neck of the vessel, let there be luted a tube of brass, and then a leaden tube, as the materials will swell during the action of the fire. Let the extremity of the tube pass through the water of the vessel II I, and terminate under the inverted vessel EF, to the upper aperture of which the balloon is fixed. The part AB of the vessel is then heated red hot, and the inflammable air proceeding from the tube CD, and passing through the water in the vessel II I, will empty itself into the balloon G. Two things, however, are to be observed, first that the aperture of the vessel EF, be one foot below the surface of the water in the vessel II I, and the fire at a sufficient distance from III, that if any gas escape it may not explode. There should also be a stop cock K, in the vessel EF, through which the common air ought to be drawn out before the operation commences, after which the water will rise as far as the cock.

77. For filling a larger air balloon with gas, See plate II. fig. 2. where AA are two tubs, about three feet in diameter and nearly two feet deep, inverted in larger vessels. At the bottom of each of the inverted vessels there is a hole to which is adapted a tin tube F seven inches in diameter, and seven or eight inches long, to which the silken tubes of the balloon are to be tied; each of the tubs B is surrounded by several casks so regulated as to be no less than half full when the materials are equally distributed. In the top of each cask are two holes, to one of which a tin tube is adapted, so formed as to pass over the edge of the tub B and through the water, terminating under the inverted tub A. The other hole designed to supply the cask with materials, is to be secured with a wooden plug, nearly of the same diameter as the tubes are, about three inches and a half in diameter. The two masts, ropes, &c. are designed to elevate the balloon above the level of the tubs AA and during the process of filling the balloon a net is to be put over it, suspended as in the figure. When the common air is expelled the balloon, the silk tubes are fastened round the tin tubes EE, and by passing into the casks the vitriolic acid upon the other materials, the balloon

will soon be sufficiently inflated to support itself, and the rope G H will be unnecessary. The net is adjusted round the balloon, during its inflation the ropes are tied to the net and fastened to the hoop M N: the boat I K is suspended from the hoop M N, all the necessaries deposited, and as soon as the sphere is three parts full the silk tubes are separated from the tin tubes, their extremities tied and placed in the boat, the aeronauts seated, the lateral ropes slipped off, and the balloon ascends.

78. To fill a balloon with rarefied air the common way is as follows: (see plate II. fig. 3.) A B C D is a scaffold, the breadth of which is two thirds the diameter of the machine elevated six or eight feet from the ground. In the middle is a well E F, made of brick or plastered wood, of less diameter than the balloon, rising two or three feet above the scaffold from the ground, and furnished with doors through which the fire is supplied with fuel. H I and K L are two masts erected one on each side the scaffold, each having a pulley at the top, rendered firm by means of the ropes K G, K P, H P, H N. The balloon is placed on the scaffold with its neck round the aperture of the well; the rope passing over the pulleys of the two masts serves, by pulling its two ends, to lift the machine fifteen feet or more above the scaffold, as represented by dotted lines in the figure M N O. The machine is kept steady and held down by ropes, passing through loops and holes about its equator which are disengaged as soon as the machine can sustain itself. The materials burnt in the well are such as burn quick and clear, rather than those that produce much smoke. Hot air is what should be introduced into the balloon, not smoke; and to obtain which, small wood, straw, spirits of wine, &c. are most eligible. As the

hot air ascends, the machine dilates and lifts itself above the scaffold and gallery, making efforts to ascend. Its aperture is then brought, by ropes annexed to it, towards the side of the well, a little above the scaffold, the fire-place suspended in it, the fire lighted, the passenger's fuel, instruments and other necessaria placed in the gallery, the lateral ropes slipped off, and the machine abandoned to the atmosphere.

79. On reviewing the entire history and progress of this imperfect science, we are naturally led to reflect, both on the restlessness and the astonishing capabilities of the human mind. 'Men would be angels,' says the poet; and to 'ride on the wings of the wind' seems to be used by the highest authority, as an expression of sublime power. Our aeronauts, advancing from the feeble conceptions of those who at first would have imitated the flight of birds, have done this. But they ride the wind as an inexperienced boy first vaults into the saddle, for his steed to be the teacher rather than he the governor of their new connexion.

80. Still that much has been gained for science by these aerial experiments, none can deny. The uniformity of some of the most important natural agencies has been established on a larger scale; the sciences of meteorology, pneumatology, &c. have been illustrated, and the attention of mankind awoke to the exploring new fields of nature. We only lament that of late the subject has been singularly neglected; many years have now elapsed since men of real and accredited pretensions to science have concerned themselves with the management of aeronautic machines. We venture to recal their attention to them, that the past triumphs of philosophy may not degenerate into the rewards of ignorance, cupidity, and empiricism.

paration of metals, minerals, and the like. See ABYSS.

AEROSIS, among the ancient physicians, denotes the act whereby the blood is attenuated and converted into an aura, for the support of the vital spirits, and the maintenance of the flame of life.

AEROSTATIC, *aerij.* belonging to aerostation.

AEROSTATICA, AEROSTATICS, from *aerij,* and *στατικός,* from *στατη,* *statuo,* is used by some authors for AEROMETRY. It is properly the doctrine of the weight, pressure, and balance of the air and atmosphere.

AERSCHOT, or Arschot, a town in the Netherlands, in Austrian Brabant, and capital of the duchy of Aerschot. It is seated on the river Demer, twenty miles S. E. of Antwerp, and seven N. E. of Louvain.

ÆRVA, in botany, a genus of plants of the class monadelphia, order decandria. The characters of which are, that the flowers are polygamous: CAL. five-leaved and patent: STAM. five, and barren: PIST. a globulous ovary, having a filiform style terminated by a bifid stigma; the fruit is a capsule, which is oblong, single-seeded, and encompassed by the calyx. There is one common species, viz. *A. ægyptiaca,* or *tomentosa,* which grows on sandy calcareous soil in Arabia.

AEROPHOBIA, of *aerij,* and *φοβος,* fear; a term that Dr. Franklin, and others, have applied to the dread of fresh air. He speaks of having indulged it for many years himself; but was at last convinced that almost any air is preferable to that of a close chamber which has been frequently respiration; and ridicules those valetudinarians who, enclosing themselves in warm garments, and carefully wrapping about them as much of the noxious air of their close apartments as possible, carry it with them into a close carriage, from which the air is also carefully excluded, and call this taking the air! He speaks of using the air as a tonic bath, by sitting in his chamber without clothes to wash or write, half an hour or an hour every morning, and that he never found any ill consequences from the practice. See *Posthumous and other works of Dr. Franklin,* v. vi. p. 172.

AEROPHYLACEA, in natural history, subterraneous receptacles of air or wind, from *aerij,* *air,* and *φυλακη,* *custodia,* keeping. Kircher speaks much of aerophylacea, huge caverns, replete with air, disposed under ground, from whence, through numerous occult passages, that element is conveyed either to subterraneous receptacles of water, which are raised into springs or rivers, or into the funds of subterraneous fire, which are hereby supposed to be fed for the re-

ÆRUGINOUS, in chemistry, something partaking of, or like the rust of copper. Authors do not seem perfectly agreed about the colour to be expressed by this word, some expressing by it green, others brown.

ÆRUGO, in natural history, the rust of copper, whether natural or artificial. The former is found in copper mines, and the latter, called verdigrise, made by corroding copper-plates with acids. See **VERDIGRISE**. Dr. Grew says, the turquoise stone is a kind of petrified ærugo. Another species of natural ærugo is a greenish marmasite, like the drops of iron, found in copper mines. There is also, on some mountains in Moravia, a sort of grains, like sand, of a grass green colour, when used in painting, which are called the Hungarian, mountain, or sea verdigrise.

ÆRUGO RASILIS, a rust formed on copper, by hanging a plate of it over the strongest vinegar for ten days, without suffering it to touch it.

ÆRUGO SALIS, in natural history, a name given by Pliny, and several other ancient authors, to a reddish slimy matter, separated from the Egyptian salt, called natrum, in purifying it.—We find this matter remain in the filter, on dissolving and filtering the Egyptian nitre, at this time. It seems to be a mixture of a bituminous matter, and a red earth, which mingled among the cakes of the salt, during the time of their concreting from the water.

ÆRUSCATORES, in antiquity, a kind of strolling beggars, like our gypsies, who drew money from the credulous, by fortune-telling, &c. It was also a denomination given to griping collectors of the revenue. The priests of Cybele, were called æruscatores magnæ matris, on account of their begging alms in the streets; to which end they had little bells to draw people's attention to them, like some modern orders of mendicants abroad.

AERY, or **AIRY**, among sportsmen, the nest of hawks, or eagles.

ÆS, among the ancient Romans, had various significations. It properly denoted brass or copper; but as copper was the first metal used in coinage by the Romans, the word was used to signify money in general, as well as the particular coin made of that metal.

ÆS CALDARIUM, or **CAST BRASS**, otherwise called **æs olorium**, or pot brass, is mentioned by Pliny, as not capable of being hammered. This is likewise a term used by the German mineralists, for a substance which sometimes occurs to those who work upon cobalt, and is used for making the fine blue colour called smalt.

ÆS CANDIDUM, among the ancients, was different from that which we call white brass; it was a purer and whiter kind of metal, found, it is said, under the veins of silver, somewhat analogous to Venetian talc. They had probably a method of making copper white, as well as yellow, equal, if not superior, to that now in use. The phrases of orichalcum album in Virgil, and of **λευκὸν κράμα**, among the Greeks, strictly signify white brass.

ÆS CORINTHUM, a precious metallic composition, of a much finer colour than common brass, and in its beauty little inferior to gold. Pliny

says, that it was an accidental mixture of metals at the burning of Corinth, by L. Mummius, when the gold, silver, and brass statues, and all metallic substances, melting and mingling together, formed this mass. But some refiners, who have strictly examined this metal, find no gold in it; a circumstance which, if true, suggests one reason, among others, for concluding, that this account is fabulous. However, the fable has been interpreted by some to signify, that the art of making copper into brass was first discovered by the Corinthians, who found the calamine stone on the plains of Peloponnesus, or at least that they brought this art to perfection.

ÆS CORNARIUM is used by Pliny, to denote brass worked into thin plates.

ÆS FLAVUM, yellow copper. All the Roman authors have mentioned the method of making brass with calamine and copper; but their finest kind which they called orichalcum, or aurichalcum, they distinguished from the inferior sorts which had only the name of **æs flavum**.

ÆS GRAVE, denoted money among the Romans, which was paid by weight, and not by tale. Others understand by **æs grave**, large pieces of copper coined, containing an **as**, or pound of that metal, such as we find current in Sweden. These they assert bore this name, till such time as they were reduced to a smaller standard.

ÆS HEPATICUM was of a silverish colour, and probably what the moderns call bronze; though some confound it with the **æs Corinthium**.

ÆS PAUPERUM, copper ore, divested of its silver.

ÆS PER, ET LIBRAM, was a formula in the Roman law, whereby purchases and sales were ratified. Originally the phrase seems to have been used only in speaking of things sold by weight, or by the scales; but it afterwards was used on other occasions. Hence, even in adoptions, there was a kind of imaginary purchase; the formula whereof expressed, that the person adopted was bought, per **æs et libram**.

ÆS RUDE, money unshaped, or not fashioned for any particular purpose. The money during the first ages of Rome was all of this kind. Others, by **æs rude**, understand metal unstamped; in opposition to **æs signatum**, money stamped or coined.

ÆS USTUM, a chemical preparation, made of thin leaves of copper, sulphur, and nitre, placed stratum super stratum in a crucible, and set in a charcoal fire till all the sulphur is consumed; after which, the copper is taken out of the crucible, and reduced to powder. Some quench the leaves of copper in vinegar, and repeat the calcination. Its principal use is in colouring glass, to which it gives a beautiful tincture. The surgeons use it as a detergent, and some have given it internally; but it is certainly a very dangerous medicine, and should be avoided.

ÆS UXORIUM, in antiquity, a sum of bachelors, as a penalty for living single. tax for not marrying seems to have been imposed in the year of Rome 350, under the censorship of M. Furius Camillus and M. Posthumus. At the census, or review of the people, each person was asked, *Et tu ex anima sententia*

uxorem habes liberum, querendorum causā? He who had no wife, was hereupon fined, after a certain rate.

ÆSACUS, in fabulous history, one of the sons of Priam, king of Troy, who is said to have thrown himself from a rock into the sea, because Hesperia, whom he was in love with, and had followed into the woods, was stung to death by a serpent; or, as others say, changed into a bird.

ÆSALON, in ornithology, a species of hawk, called in English the merlin. It is the smallest of all the hawk kind, and about the size of the blackbird. It feeds on partridges and other birds.

ÆSCHI, in ichthyology, a name which some writers have given the grayling or tumbler, a fish of the trutaceous kind.

ÆSCHINES, in ancient history, the son of Charinus, a disciple and admirer of Socrates; who said of him (alluding to the trade of Æschines's father) that the sausage-maker's son was the only person who knew how to pay a due regard to him. It is said that poverty obliged him to go to Sicily to Dionysius the Tyrant; and that he met with contumelious treatment from Plato, but was extremely well received by Aristippus; to whom he showed some of his dialogues, and obtained from him a handsome reward. He would not venture to profess philosophy at Athens, Plato and Aristippus being in such high esteem; but he set up a school to maintain himself, and wrote orations for the Forum. Phrynicus, in Photius, ranks him among the best orators, and mentions his orations as the standard of the pure Attic style. Hermogenes has also spoken very highly of him. He likewise wrote several dialogues, of which there are only three extant: 1. Concerning virtue, whether it can be taught. 2. Eryxias, or Ærasistratus; concerning riches, whether they are good. 3. Axiochus; concerning death, whether it is to be feared. Mr. Le Clerc has given a Latin translation of them, with notes, Amst. 1711, 8vo.

ÆSCHINES, one of the most celebrated orators of Greece, was the son of Atrometus, a grammarian and schoolmaster, and Glaucothea, who is said by Lucian and others, to have been a timbrel-player. From this circumstance, perhaps, it was that Demosthenes upbraided him with being the son of a courtesan. Plutarch says, he was distinguished neither by his birth nor riches. Being in his youth, of a robust constitution, he devoted himself to the exercises of the gymnasium, and having a clear voice, performed a part in the exhibition of tragedies. Some say that he attended the lectures of Isocrates and Plato: but according to others, he received instruction from Alcidamas, the preceptor of Gorgias. His progress, however, was rapid; and he became so respectable a competitor with Demosthenes, that when the Athenians negotiated a peace with Philip of Macedon, he was sent with him as an ambassador to that prince. Philip is said to have successfully attempted to corrupt our orator on this occasion, and that he in consequence persuaded the Athenians, in opposition to the remonstrances of Demosthenes, to confide in the

promises of the Macedonian prince, and gave him an opportunity to possess himself of Thermopylae. Philip, by further intrigues, engaged the support of Æschines, to prevail with the council of the Amphycions, to elect him for their general, by which means he obtained possession of Elatea, the chief city of Phocis, and established himself in a favourable situation for his farther ambitious designs. Demosthenes at last roused the Athenians, to unite with the Thebans in disconcerting the machinations of Philip; and the two hostile armies encamped near Cheronæa, a city of Boeotia; but his countrymen being discomfited, Athens received a shock, the effects of which she was never able to recover, and Æschines took the lead in criminating his rival. He, accordingly, drew up an accusation against Ctesiphon, or rather against Demosthenes. The conflict between the two orators excited very general attention; and the attack and defence have been considered as the master-pieces of ancient oratory. Æschines lost his cause, and was sentenced to banishment for his rash accusation, ante Christi, 230; when he settled at Rhodes, and opened a school for eloquence. Here he re-delivered the two orations, and when that of Demosthenes was received with redoubled plaudits, Æschines exclaimed, 'Had you heard him thunder out the words himself, what would you have thought of it?' Demosthenes was so sensible of the liberal spirit of his rival, that when Æschines left Athens, in order to embark for Rhodes, he ran after him and obliged him to accept a purse of money; upon which Æschines remarked, 'How will it be possible for me not to regret a country, in which I leave an enemy more generous than I can hope to find friends in any other part of the world!' Æschines finally removed to Samos, where he died at the age of 75 years. He is said to have been the first who delivered extemporaneous orations. Philostratus extols him for luminous perspicuity, decorous gravity, and distinguished energy; and he is denominated by Demosthenes μεγαλοφυνταρος. Photius ascribes nine epistles, (according to the number of the muses), to Æschines; but there are twelve, which were addressed to the Athenians when he was in exile at Rhodes, in Wolfius's edition of Demosthenes and Æschines, p. 205; and Taylor has added them to his edition. The ancients acknowledge only three genuine orations, viz. 1. Adversus Timarchum, Wolf. ed. p. 259. 2. De falsa Legatione, Id. p. 395. 3. Adversus Ctesiphontem, Id. p. 425. Fabricius compares these orations to the Three Graces. Another entitled Δηλιακος νομος, was formerly inscribed with the name of Æschines; but the ancients attribute it to another person of the same name. See Plutarch and Philostratus, ubi supra. Demosthen. et Æchin. Opera, by Wolfius Francof. 1604. Fabricius Bibl. Græc. tom. i. p. 412—928, &c. Several other persons called Æschines have been confounded both with the Socratic philosopher, and the Athenian orator.

ÆSCHINA, in natural history, the name of a species of water fly, of an ash colour, with four wings, a long body, and hairy near the tail.

ÆSCHYLUS, the tragic poet, was born at Athens, about the sixty-fifth or seventieth Olympiad, Stanley says in the sixty-third; he was the son of Euphorion, and brother to Cynegirus and Aminias, who distinguished themselves in the battle of Marathon, and the sea-fight of Salamis, at which engagements Æschylus was likewise present. In this last action, Aminias commanded a squadron of ships, attacked, and sunk the admiral of the Persian fleet, and signalized himself above all the Athenians: so that when Æschylus was charged by the Athenians with blasphemy, and condemned to be stoned to death, Aminias, throwing aside his cloak, showed his arm without a hand, which he had lost at the battle of Salamis. This sight made an impression on the judges, and, touched with his fraternal affection, they pardoned our poet; but he resented the indignity of this prosecution, and resolved to leave a place where his life had been in danger: he accordingly retired to the court of Hiero, king of Syracuse, where he soon after died at the age of sixty-nine. Some affirm, that Æschylus never composed but when he had drank liberally. He wrote a great number of tragedies of which there are but seven remaining, and appears to have been the father of the tragic art. In the time of Thespis, there was no public theatre; the players driving about from place to place in a cart, Æschylus furnished his actors with masks, dressed them suitably to their characters, and introduced the buskin, to make them appear like heroes.—The ancients gave him also the praise of having been the first who removed murders and shocking sights from the eyes of the spectators. He is said likewise to have lessened the number of the chorus. M. Le Fevre remarks, that Æschylus never represented women in love in his tragedies; which, he says, was not suited to his genius; but, in representing a woman transported with fury, he was incomparable. Longinus says, that Æschylus has a noble boldness of expression; and that his imagination is lofty and heroic. His works were held in great esteem by the Athenians, who made a public decree that his tragedies should be played after his death. He was killed by an eagle letting fall a tortoise upon his head as he was walking in the fields: and had the honour of a pompous funeral from the Sicilians, who buried him near the river Gela; where the tragedians of the country performed plays and theatrical exercises at his tomb. One of the best editions of his plays is that of London, 1663, folio, with a Latin translation, and a learned commentary by Thomas Stanley: professor Porson edited them in 2 vols. 8vo. 1805; Bishop Blomfield has also ably edited some of the plays, and Archdeacon Potter in 1777 furnished an able English translation of them.

ÆSCHYNO-MÈNE, BASTARD SENSITIVE-PLANT: A genus of plants, of the decandria order, and diadelphia class; the characters of which are: CAL. a one-leaved campanulated bilabiat perianthium; the lips equal, but the superior one two-cleft, the inferior tridentate: COR. papilionaceous; the banner cordated and subringent; the alæ ovate, obtuse, and shorter than the banner; and the carina, lunated, pointed, and the length of the alæ. The STAM. consist of

ten simple nine-cleft filaments; the antheræ are small: RIST. an oblong villous columnar germen; the stylus subulated and ascending, the stigma simple and somewhat obtuse. The pericarpium is a long, compressed, unilocular jointed pod. The seeds are kidney shaped, and solitary within each joint. There are six species of this genus, all natives of warm countries, viz. the Americana, arborea, aspera, grandiflora, pumila, and sesbana.

ÆSCHIYNOMENOUS PLANTS, a name sometimes given to sensitive plants. See the last article.

ÆSCULANUS, ÆRES, or ÆS, in antiquity, are names given to the divinity who presided over the coinage of copper-money. Æsculanus, it is said, was the father of Argentinus, because copper money was employed before silver; and Argentinus, the father of Aurinus, because gold money succeeded silver. Thus they had three divinities presiding over the coinage of the three principal metals, and some medals of the emperors represent three goddesses, with balances, a cornucopia, and near them a piece of the different metals.

ÆSCULAPII ANGUIS, in zoology, the name of harmless species of serpent, common in Spain and Italy, called also paræa. The coluber æculapii of Linnaeus has white and black bands, bisected by a white ring, and is found in both Indies.

ÆSCULAPIUS, in astronomy, the ancient name for the constellation Ophiuchus.

ÆSCULAPIUS, in the heathen mythology, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron, who taught him physic; by which means Æsculapius cured the most desperate diseases: but Jupiter enraged at his restoring to life Hippolitus, who had been torn in pieces by his own horses, killed him with a thunderbolt. According to Cicero, there were three deities of this name: 1. The son of Apollo, inventor of the probe, and bandages for wounds, worshipped in Arcadia: 2. The brother of Mercury, killed by lightning: 3. The son of Aristipus and Arsinoe, who first taught the art of tooth-drawing and purging. At Epidaurus Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent; he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phaliasins represented him as beardless. The cock, the raven, and the goat, were sacred to this deity; and serpents, more particularly, as symbols of the prudence and forethought necessary in the profession he patronised. His chief temples were at Pergamos, Smyrna, Trica, a city in Ionia, and the isle of Coos; in all which votive tablets were hung up, showing the diseases cured by his assistance. But his famous shrine was at Epidaurus; where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSCULUS, in botany, the HORSE-CHESTNUT: A genus of plants of the monogynia order, and heptandria class; ranking in the natural method,

under the thirty-ninth order, trihilatae. The characters are: CAL. a small, single-leaved, bellied perianthium, divided into five segments: cor. (except in the pavia, where it is four-petaled and close,) five roundish, flat, expanding petals, unequally coloured, and with narrow claws inserted into the calyx: STAM. seven subulated declining filaments, the length of the corolla; the anthers ascending: PIST. a roundish germen, ending in a subulated stylus; the stigma pointed: the pericarpium, a leathery, roundish, trilocular, three-valved capsule. The seeds are two, and subglobose.—In this genus Van Rozen and Miller observe both male and hermaphrodite flowers. There are two species; viz.

1. *AESCLUS HIPPOCASTANUM*, or common horse-chesnut, brought from the northern parts of Asia, about the year 1550, and sent to Vienna about 1588; the nuts of which are reckoned good food for horses.

In Turkey, they are ground, and mixed with the provender of these animals, especially those which are troubled with coughs, or broken winded. Deer are also very fond of the fruit: and at the time of their ripening keep much about the trees, but especially in strong winds, when the nuts are blown down, which they carefully watch, and greedily devour as they fall.

2. *AESCLUS PAVIA*, or scarlet flowering horse-chesnut, a native of Carolina, the Brasils, and the East.

ASHNA, in entomology, a sub-division of the unogata, or fifth class of insects, by Fabricius, comprehending several species of the libellula of Linnaeus, characterized by equal laciniæ, or fringes of the tip.

AESNECY, in law, priority of age, among co-partners.

AESON, in fabulous history, the son of Cretheus, king of Thessaly, and father of Jason, the famous Argonaut; who was said to have been restored to his youth, in his old age, by the enchantments of Medea, Jason's wife.

AESOP, the Phrygian, lived in the time of Solon, about the 50th Olympiad, under the reign of Crœsus, the last king of Lydia. For genius and abilities, he was greatly indebted to nature; but in other respects he was not so fortunate, being born a slave and extremely deformed. St. Jerome, speaking of him, says he was unfortunate in his birth, condition in life, and death; hinting thereby at his deformity, servile state, and tragical end. His great genius, however, enabled him to support his misfortunes; and to alleviate the hardships of servitude, he composed those entertaining and instructive fables which have acquired him so much reputation. He is generally supposed to have been the inventor of that kind of writing; but this is contested by several, particularly Quintilian, who seems to think that Hesiod was the first author of fables; and we are certain that Jotham, the son of Gideon, was the author of a fable or parable, long before either of them. *Aesop*, however, certainly improved this art to a very great degree. The first master, whom *Aesop* served, was Carasius Demarchus, of Athens; and there, in all probability he acquired his purity in the Greek tongue. After him he had several masters; and at length came under a

philosopher, Xanthus, or as Herodotus calls him, Iadmon, from whom he obtained his liberty. Some curious anecdotes are told of his domestication with this philosopher.

Being exposed in an open market place for sale, Xanthus entering the area, was attracted by the appearance of *Aesop*'s companions, and enquired of the merchant his price for them, which he thought exorbitant; and was on the point of quitting the market, when some of the pupils, by whom he was attended, pointed out *Aesop* to his notice. At their solicitation, and jocularly, more than with any serious intention, he put the accustomed question to the despised captive, of What he could do? Nothing at all replied *Aesop*; for I have just overheard my companions answer your question, by affirming they could do every thing; therefore there is nothing left for me to do. He afterwards boldly told Xanthus, that a philosopher like him should appreciate a man according to the vigour of his mind, and not to the appearance of his body; and when the philosopher's wife, (of a most furious and jealous temper,) asked in scorn, of Xanthus, 'whether it were a beast or a man he had brought home?' *Aesop* is said to have exclaimed, 'From the mercies of fire, water, and a wicked woman, great gods deliver us!'

Aesop once accompanying his master to a gardener for the purpose of purchasing some herbs, the agriculturist enquired the reason why those plants which grew of themselves, and without any artificial aid, should come up so fast and thrive so well, whilst others, though never so carefully cultivated, could scarcely be preserved from perishing? Xanthus contented himself with saying, That so providence had ordered it to be. Here *Aesop* interfered; and, after a sarcasm upon the imperfection of the school of philosophy in which Xanthus was bred, requested to be permitted himself to give the solution. 'For what,' said the slave, 'signifies a general answer to a particular question, but an acknowledgment of complete ignorance on the subject proposed?' 'The earth then,' said *Aesop*, 'may be considered as in the nature of a real mother to that which she brings forth out of her own bowels; but she is only a step-dame in the production of those plants which are cultivated and assisted, nay, sometimes even forced under her care, by means of the sheer industry of another. It is natural for her to withdraw her nourishment from the one, and to lavish her powers upon the other kind of plants.'

Aesop is said to have interpreted an obscure inscription which had utterly foiled his master; and, emboldened by his success, to have demanded of him what reward he would offer, if he were to point out to him a considerable hidden treasure? One half of it and your liberty, said Xanthus. Possessed of the property, however, the faithless Samian conveniently forgot the conditions upon which he acquired it, and returned to the defenceless *Aesop* menaces and blows. On another occasion, the wife of Xanthus having eloped from her husband, notwithstanding the acerbity of her disposition, he was desirous of recalling her, and *Aesop* undertook the task of fulfilling his wishes. He prepared a plentiful

feast, and gave it publicly abroad, that his master's first wife having separated from him, this entertainment was prepared for a second marriage. The effect was as he had imagined, the lady immediately ordered her chariot to be prepared, and returned to the house of her husband. At another time, Xanthus in a moment of ineptitude, had made a considerable wager, that he would drink the sea dry; and, on becoming sober, applied to Æsop to extricate him from the difficulty into which he had involved himself. Sir, said the slave, be careful of Bacchus, it is the humour of this god, first to make men cheerful, then to make them drunk, and lastly to make them mad. He exhorted him, however, to take courage, and pursue his advice. Xanthus, accordingly, appeared next day on the sea shore, attended by the man with whom he had made the ridiculous agreement; and now, said he, am I ready to drink the sea dry, but it is you who must first stop all the rivers which run into it.

When he had obtained his liberty, he soon acquired a great reputation amongst the Greeks; and the report of his wisdom having reached Crœsus, he sent and engaged him in his service. He travelled through Greece soon after Pisistratus had usurped the sovereign power, and finding that the Athenians bore the yoke very impatiently, he told them the fable of the frogs who petitioned Jupiter for a king. Æsop was put to death at Delphi. Plutarch tells us that he came there with great quantity of gold and silver, being ordered by Crœsus to offer a sacrifice to Apollo, and to give a considerable sum to each inhabitant: but a quarrel arising betwixt him and the Delphians, he sent back the money to Crœsus; for he thought those for whom the prince designed it, had rendered themselves unworthy of it. The inhabitants of Delphi contrived an accusation of sacrilege against him; and pretending they had convicted him, threw him headlong from a rock. For this cruelty and injustice, we are told they were visited with famine and pestilence; and consulting the oracle, they received for answer, that the god designed this as a punishment for their treatment of Æsop: they endeavoured to make an atonement, by raising a pyramid to his honour.

AESOPUS, (Clodius,) a celebrated actor, who flourished about the 670th year of Rome. He and Roscius were contemporaries, and the best performers who ever appeared upon the Roman stage, the former excelling in tragedy, the latter in comedy. Cicero put himself under their direction to perfect his action. Æsop lived in a most expensive manner, and at one entertainment is said to have had a dish which cost £800. It was filled, we are told, with singing and speaking birds, some of which cost near fifty pounds. The delight which Æsop took in this sort of birds, proceeded, as Mr. Bayle observes, from the expence. He did not make a dish of them because they could speak, according to the refinement of Pliny upon this circumstance, this motive being only by accident; but because of their extraordinary price. Æsop's son was no less luxurious than his father, for he dissolved pearls for his guests to swallow. Horace speaks of one pearl of very great value, which he dissolved in vinegar and drank. Not-

withstanding his expences, Æsop is said to have died worth above £160,000. When he was upon the stage, he entered into his part to such a degree, as sometimes to be seized with a perfect ecstasy. Plutarch mentions it as reported of him, that whilst he was representing Atreus, deliberating how he should revenge himself on Thystes, he was so transported beyond himself in the heat of action, that with his truncheon he smote one of the servants crossing the stage, and laid him dead on the spot.

ÆSPING, in zoology, a species of coluber.

ÆSQUILINUS, a hill in ancient Rome.

ÆSTIPHARA, incineration, or burning of any part of the body.

ÆSTIMATIO CAPITIS, in our ancient law books, a fine in proportion to the degree of the person against whom the offence was committed. King Athelstan, in a great assembly held at Exeter, declared what mulets were to be paid *pro astimatione capitidis*; the estimation of the king's head, to be 30,000 thrymsæ; that of an archbishop or prince, 15,000; a bishop's or senator's, 8000; a priest's or thane's, 2000, &c.

ÆSTIVAL, in astronomy, of, or belonging to, summer; as **ÆSTIVAL POINT**, is that whereby the sun's ascent above the equator is determined.

ÆSTIVAL SIGNS, are those extended from the sun's greatest declination northward, to the intersection of the ecliptic and equinoctial southward, including Cancer, Leo, and Virgo.

ÆSTIVATION, in botany, expresses the state of the bud in summer, and is used by Linnaeus to denote one of those circumstances which constitute the habit of plants.

ÆSTRUS, in entomology, a species of the beetle.

ÆSTUARY, in ancient baths, a secret passage from the hypocaustum, or stove, into the chambers.

ÆSTUARY, **ÆSTUARIUM**, in geography, an arm of the sea, running up a good way into the land, such as Bristol Channel, many of the friths in Scotland.

ÆSTUARY, in medicine, a vapour bath, or any thing that conveys heat to the body.

ÆSYMMETIC MONARCHY, among ancient writers on government, denotes a limited elective monarchy. *Arist. Pol. c. 10.* The word is formed from *αὐτομναω*, regno, I govern.—An æsymnetic state stands opposed to a barbaric, or hereditary one.

ÆSYMMNIUM, in antiquity, a monument erected to the memory of deceased heroes, by Æsymnus.

ÆSYMNUS, a native of Megara, who consulting the oracle in what manner the Megareans might be most happily governed, was answered, if they held consultation with the more numerous; whom he taking for the dead, built a senate-house, with a monument to the dead within it.

ÆTATE PROBANDA, in law, a writ to enquire whether the king's tenant, holding in chief by chivalry, were of full age to receive his lands into his own hands. It was directed to the escheator of the county, but is now disused.

ÆTERNITAS, Eternity, in mythology, was worshipped as a god by the ancients, the Pytha-

goreans, Plato, and Hermes Trismegistus, made time to be the image of it. On medals, eternity was represented in various forms, sometimes under the figure of the sun and moon; sometimes by that of the elephant, for its length of years, as on a medal of Faustina, fig. 1,

Fig. 1.

Fig. 2.

where a chariot is drawn by two elephants; sometimes by a phœnix and a globe, the one for its long life, and the other for its supposed eternity, as on the medal fig. 2, where a female is holding a phœnix and a globe. There was also the common representation of a serpent, winding itself round a globe, or with its tail brought down to its mouth; of a figure veiled, to imply, that eternity is inscrutable; and of a head with two faces, implying that it can see backwards and forwards. The medals of the emperors which have the figure of eternity, implying the perpetuity of the government in their family, are those of Augustus, Vespasian, Titus, Domitian, Severus, Caracalla, Geta, Alexander Severus, Gordianus Philippus, Gallienus, Claudius Gothicus, Quintilian, and Maximian.

ÆTHELI, or **ATH**, a strong well-fortified town in the Netherlands, province of Hainault, situated on the river Dender, about twenty-five miles south-west of Brussels, and eighteen north-west of Mons. It is noted for its linen manufactories, bleaching fields, and iron works. It was once a castellany, having more than 100 villages under its government. Population 7600.

ÆTHALE, in natural history, a name given by some writers to the cadmia fornacum, or tutty, from its being the concreted soot of the lapis calaminaris and copper, melted together, in the making of brass.

ÆTHALIA, or **ILVA**, in ancient geography, now Elba; an island on the coast of Etruria, in compass 100 miles, formerly abounding in iron, as it still does. Stephanus calls it Aethale. The port of Aethalia was called Argous. See **ELBA**.

ÆTHELSTAN. See **ATHELSTAN**.

ÆTHER, in chemistry, the lightest, most volatile, and most inflammable of all liquids, is produced by distillation of acids with rectified spirit of wine. See the INDEXES to CHEMISTRY and PHARMACY.

ÆTHER, in physiology, Gr. from *Aether*, to burn or flame, the ancients supposing it of the nature of fire, a thin subtle matter, much finer and rarer than air; which, commencing from the limits of our atmosphere, is supposed to possess the whole heavenly space. Mythologists speak of it as the origin of all things, an attenuation of fire, which, according to Hippocrates, was immortal; knows all things; sees, hears, and determines whatsoever is, or shall hereafter be. From this fluid, (existing in perfection only in the highest

heavens, and encircling the whole of the material universe,) all grosser elements were said to be first derived, and from them the various productions of nature. Here the gods were enthroned, and the stars rolled along in 'divinest harmony.'

Philosophers cannot conceive that the largest part of the creation should be perfectly void; and therefore, they fill it with a species of matter under the denomination of æther. But they vary extremely as to the nature and character of this æther. Some conceive it as a body *sui generis*, appointed only to fill up the vacancies between the heavenly bodies; and therefore, confined to the regions above our atmosphere. Others suppose it of so subtle and penetrating a nature, as to pervade the air, and other bodies, and possess the pores and intervals thereof. Others deny the existence of any such specific matter; and think the air itself, by that immense tenuity and expansion it is found capable of, may diffuse itself through the interstellar spaces, and be the only matter found therein. In fact, æther, being no object of our senses, but the mere work of imagination, brought only upon the stage for the sake of hypothesis, or to solve some phenomenon, real or imaginary; authors take the liberty to modify it as they please. Some suppose it of an elementary nature, like other bodies; and only distinguished by its tenuity, and the other affections consequent thereon: which is the philosophical æther. Others will have it of another species, and not elementary; but rather a sort of fifth element, of a purer, more refined, and spirituous nature, than the substances about our earth; and void of the common affections thereof, as gravity, &c. Some represent it as 7200 times more rare than air! Others make it more dense than gold itself! Others argue, that the heavenly spaces being the supposed region or residence of a more exalted class of beings, the medium must be more pure and exalted in proportion. Such is the ancient and popular idea of æther, or aethereal matter. The term being thus embarrassed with a variety of ideas, and arbitrarily applied to so many different things, later and severer philosophers set it aside, and in lieu thereof, substitute other more determinate ones. Thus, the Cartesians use the term *materia subtilis*, which is their æther; and Sir Isaac Newton, sometimes a subtile spirit, as in the close of his Principia; and sometimes a subtile, or aethereal medium, as in his Optics. The truth is, there are abundance of considerations, which seem to evince the existence of some matter in the air, much finer than air itself: an unknown something, which remains behind when the air is taken away, as appears from certain effects which we see produced in *vacuo*. Heat, Sir Isaac Newton observes, is communicated through a vacuum, almost as readily as through air; but such communication cannot be without some interjacent body, to act as a medium. And such body may be subtile enough to penetrate the pores of glass; and may be very well concluded to penetrate those of all other bodies, and consequently be diffused through all the parts of space which answers to the full character of an æther. The existence of such an aethereal me-

dium being settled, our philosopher proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elastic and active: in virtue of which, he shows, that a great part of the phenomena of nature may be produced by it. To the weight, e. g. of this medium, he attributes gravitation, or the weight of all other bodies; and to its elasticity, the elastic force of the air and of nervous fibres, and the emission, rarefaction, reflection, and other phenomena of light; as also, sensation, muscular motion, &c. In fine, according to his theory, æther seems to be the primum mobile, the first source or spring of physical action in the modern system. Dr. Hartley constructed upon the theory of a vibrating æther, the celebrated system of vibration, and vibratiuncles of the medullary substance of the nerves and brain; by which, he accounts for all our sensations and ideas. He even thinks it a consequence of this theory, that could matter be endowed with the most simple kinds of sensation, it might arrive at all the intelligence of which the human mind is possessed! The difficulties of Dr. Hartley's system, are thus ably stated by Dr. Reid. Our sensations arise from vibrations, and our ideas from vibratiuncles, or miniature vibrations; and he (Dr. Hartley) comprehends, under these two words of sensations and ideas, all the operations of the mind. But how can we expect any proof of the connection between vibrations and thought, when the existence of such vibrations was never proved. The proof of their connection cannot be stronger than the proof of their existence. For, as the author acknowledges, that we cannot infer the existence of the thoughts from the existence of the vibrations, it is no less evident, that we cannot infer the existence of vibrations from the existence of our thoughts. The existence of both must be known, before we can know their connection. As to the existence of our thoughts, we have the evidence of consciousness; a kind of evidence, that was never called in question. But as to the existence of vibrations, in the medullary substance of the nerves and brain, no proof has yet been brought.

The Cartesian æther is supposed not only to pervade, but adequately to fill all the vacuities of bodies; and thus to make an absolute plenum in the universe. But Sir Isaac Newton overturns this opinion, from divers considerations; by showing, that the celestial spaces are void of all sensible resistance: for the matter contained therein must be immensely rare, as the resistance of bodies is chiefly in proportion to their density; so that, if the heavens were thus adequately filled with a medium or matter, how subtile soever, they would resist the motion of the planets and comets, more than quicksilver or gold. The late discoveries in electricity have thrown great light upon this subject, and rendered it extremely probable, that the æther so often talked of, is no other than the electric fluid, or solar light, which diffuses itself throughout the whole system of nature. See ELECTRICITY, FIRE, HEAT, LIGHT, MAGNETISM, &c.

ÆTHERA, in botany, eringo.

ÆTHEREAL, ÆTHEREUS, something that belongs to, or partakes of, the nature of ÆTHER.

Thus we read of the æthereal space, æthereal regions, &c. Some of the ancients divided the universe, with respect to the matter contained therein, into elementary and æthereal. Under the æthereal world, was included in that space above the uppermost element, viz. fire. This they supposed to be perfectly homogeneous, incorruptible, unchangeable, &c. See CORRUPTION. The Chaldeans placed an æthereal world between the empyreum and the region of the fixed stars. Besides which, they sometimes also speak of a second æthereal world, meaning by it the starry orb: and a third æthereal world, by which was meant the planetary region.

ÆTHEREAL OIL, is a fine, subtle, essential oil, approaching nearly to the nature of a spirit. Thus, the pure liquor rising next after the spirit, in the distillation of turpentine, is called the æthereal oil of turpentine. Some chemists distinguish two principles in urine; the one a volatile urinous salt, resembling spirit of nitre; the other, an æthereal oil, or sulphur, partaking of the nature of spirit of wine.

ÆTHEREAL PHOSPHORUS, is a name generally given, by Bernoulli, to that otherwise called mercurial, or barometrical phosphorus.

ÆTHIONEMA, in botany, from *αὐθω*, to scorch, and *νημα*, a stamen, in allusion to some tawny or sun-burnt tinge in the stamens; a genus of plants.—Class and order, tetradynamite siliculosa. Natural order, siliquose, linn; crucifera, Juss. Its characters are: pouch with boat-like winged valves, (sometimes not bursting.) Longer filaments either combined, or finely toothed towards the top. Insertion of the calyx unequal. There are two species. Brown.

ÆTHIOPIA. See ETHIOPIA.

ÆTHIOPIAN CROWN, in natural history, the name of a shell fish, of the genus of the dolium, or concha globosa. It is of a brown colour; but differs from the common shells of this genus, in having the top, or head, dentated, so as to represent a crown.

ÆTHIOPIS, Ethiopian clary; a decoction of its roots is recommended in pleurisies and rheumatisms.

ÆTHIOPS, in entomology, a species of black Cerambyx, with a spinose thorax, and with two bands of the elytræ; the point of the apex yellow, and middle-sized antennæ, found at the Cape of Good Hope. Also a species of the carabus, wholly black, found at Berlin, and of the cimex, black, with a ridge on the middle of the thorax, and black spinose tibiae, found at Cayenne.

ÆTHIOPS is also a species of papilio, with black wings; the primores marked with three white bands, and cœrulean spots on the upper part; the posterior with two longitudinal pale furrows at the base, and a transverse ridge, with five cœrulean points; found out of Europe. Also a species of apis, or the black bee, with the margin of the segments of the abdomen white; found in America: and of the hairy black musca, with black wings, white at the apex; two points, and a silvery anus; found in Italy.

ÆTHIOPS, in natural history, a species of the turbo, with the shell transversely furrowed and black; the first windings are nearly striated; the succeeding ones are of a silvery brightness,

with the lip and limb brown; the aperture is dilated.

ÆTHIOPS fulica, in ornithology, the wholly black fulica or coot of Sparrman.

ÆTHIOPS Simia, in zoology, the white eye-lid ape of Pennant, and mangabey of Buffon.

ÆTHIOPS ANTIMONIAL, MARTIAL, &c. See INDEX TO PHARMACY.

ÆTHIOLICES, in medicine, from *αἴθω*, to inflame, superficial pustules, or boils in the skin, occasioned by heat.

ÆTHION, in mythology, of *αἴθω*, to burn, one of the four horses of the sun, which caused the fall of Phaeton, according to Ovid. Claudian calls one of the horses of Pluto's chariot by the same name.

ÆTHIRA, a river of Sweden, that rises in the lake Alsugan, and running by Falkenburg, in South Halland, falls into the sea. It is also called Falkenburg.

ÆTHRA, in fabulous history, the daughter of Pittheus, king of Træzene, and mother of Theseus.

ÆTHUSA, in botany, a genus of the pentandria digynia class; and, in the natural method, ranking under the forty-fifth order, umbellatae. The characters are: CAL. an universal umbel expanding, the interior rays shorter by degrees; with a partial umbel, small, and expanding. There is no universal involucrum; the partial one is dimidiated, with three or five leaflets, and pendulous; the proper perianthium scarcely discernible: COR. uniform, with fertile florets; the partial one has five heart-inflected unequal petals: STAM. five simple filaments, with roundish antheræ: PIST. a germen beneath; with two reflected styli; the stigmata obtuse. There is no pericarpium; the fruit is ovate, striated, and tripartite. The seeds are two, roundish and striated. There is but one species, viz. the athusa cynapium, fools-parsley, or lesser hemlock, a native of Britain, which grows in corn fields and gardens. This plant, from its resemblance to common parsley, hath sometimes been mistaken for it; and when eaten, it occasions sickness. If the curled leaved parsley only, were cultivated in our gardens, no such mistakes would happen. Cows, horses, sheep, goats, and swine, eat it. It is noxious to geese.

ÆTHYIA, in ornithology, a name by which old authors have called one of the web-footed fowls, the Utamania of Crete, or the common ank, or razor-bill.

ÆTIANS, in church history, a branch of Arians, who maintained that the Son and Holy Ghost are in all things dissimilar to the Father. See *AETIUS*.

ÆTIOLOGICA, Αἰτιολογική, Gr. that branch of physic which explains the causes and reasons of diseases, and their various symptoms in order to their cure. *Bailey*.

ÆTIOLOGICAL, something that assigns the cause of an effect, or appearance.

ÆTIOLOGY, in medicine, from *Aitia*, cause, and *λόγος*, discourse, a discourse of the cause of a disease. In this sense, we say, the ætiology of the small pox, of the hydrophobia, of the gout, the dropsy, &c.

ÆTOLOGY, in rhetoric, a figure, whereby, in relating an event, we assign also the cause of it. In this sense, ætiology differs from colour, as the former assigns the true cause, the latter only a feigned or specious one. The sceptics were professed opponents of all ætiology, or argumentation from causes.

ÆTION, a celebrated painter, who has left us an excellent picture of Roxana and Alexander, which he exhibited at the Olympic Games: it represents a magnificent chamber, where Roxana is sitting on a bed of a most splendid appearance, rendered still more brilliant by her beauty. She looks downwards, in a kind of confusion, being struck with the appearance of Alexander standing before her. A number of little cupids flutter about, some holding up the curtain, others undressing the lady; some pulling Alexander by the cloak, and presenting him to his mistress, others playing with his arms; while his friend Hæphestion, and the god Hymen, are represented attending with the matrimonial torch. This picture gained Ætion so much reputation, that the president of the games gave him his daughter in marriage.

ÆTITES, is one of those curiosities, in natural history, which merits a more full description than Mr. Johnson has given it. It was formerly in repute for several extraordinary magical as well as medical powers; such as preventing abortion, discovering thieves, and other ridiculous properties. The popular tradition is, that it is found in the eagle's nest, whither it is supposed to be carried while the female sits, to prevent her eggs from being rotten. These stones are found in several parts; near Trevoux in France, one can scarcely dig a few feet deep, without finding considerable strata, of the coarser or ferruginous kind.—They are originally soft, and of the colour of yellow ochre. But the finest and most valued of all the eagle stones, are accidental states of one or other of our common pebbles. These are so far from being a peculiar species of fossil, though usually accounted such, that they are not determinately of any one species of pebble. Those, however, which most usually furnish them, are the brown centered pebbles, with whitish, bluish, and brown crusts. The plain history of this remarkable fossil is this: the central nucleus of many species of pebbles, particularly of this, is coarser than the rest of the stone, that is, it is made up of more earth and less crystal; the natural consequence of which must be, that being of a more loose and rare texture, it is in drying more apt to shrink than such masses as are composed of a harder and purer matter. The central nucleus in this species is also surrounded with a whitish crust of a more loose texture, and more subject to shrink in drying, than even the nucleus itself; and being composed of more earth and less crystal, is also more friable and soft. The outer circles of this stone are of a much harder substance. When the earthy matter in the nucleus, and first crust of this pebble, exceeds its just proportion, the consequence will be, that the stone will become an æties; for the nucleus contracting itself to a small size, on the evaporation of its fluid matter, must separate from

its first crust, and that also shrinking must be drawn backward towards the other crusts; whence the cavity will become larger between that and the nucleus, and consequently, the nucleus will rattle in it when the stone is shaken. The pebble in this state having been afterwards rolled about by the waters, the nucleus has by rolling broken to pieces all the inner crust, and is usually found in the hollow of the stone, buried in a large quantity of a whitish powder. These eagle-stones are not uncommon in our gravel pits. The artites is also known by the names of *cetocium*, *cchites*, *lapis aquila*, *aquileus*, and *lapis pregnans*.

AETIUS, a famous physician, born at Amida, in Mesopotamia, and the author of a work entitled *Tetrabibles*, a collection from the writings of former physicians. He lived about the end of the fifth, and beginning of the sixth century.

AETIUS, governor of Gallia Narbonensis in

the reign of Valentinian III. forced the Franks, who were passing into Gaul, to repass the Rhine. He defeated the Goths; and routed Attila, king of the Huns, who invaded Gaul with an army of 700,000 men. But the emperor, jealous of the merit of this great man, ungratefully murdered him, in 454, with his own hand, under the pretence that he had permitted the invasion of the Huns, after Attila's defeat.

AETIUS, one of the most zealous defenders of Arianism, was born in Syria, and flourished about the year 336. After being a servant to a grammarian, of whom he learned grammar and logic, he was ordained deacon, and at last bishop, by Eudoxus, patriarch of Constantinople. St. Epiphanius has preserved forty-seven of his propositions against the doctrines of the Trinity. His followers were called Aetians.

Æ T N A.

ÆTNA, or **ÆTHANA**, (as Bochart thinks from אַתָּה Hebrew a furnace,) called ~~ætno~~ in modern times Gibello, a burning mountain on the east of the island of Sicily, in the district of Val de Demona, or Demona: a name derived evidently from the superstitious notion of the ancients, that daemons resided here, and held their emporium in the caverns of the mountain. In classic history, we learn that in this place were the forges of the Cyclops, who were engaged in making thunder-bolts for Jupiter, under the superintending care of Vulcan.

Ferrant exercent vasto Cyclopes in antro
Brontesque Steropesque, et nudus membra Pyramon.

On their eternal anvils here he found
The brethren beating and the blows go round.

Homer is altogether silent as to its eruptions, a circumstance which has been thought to imply, that they were in his time not known; or had been for ages suspended. There was a temple of Vulcan erected on the island, in which, according to Ælian, a perpetual fire was maintained: (De Animal. l. xi. c. 3:) and Ætna was the fabled prison in which the giant Enceladus was confined by Jupiter.

The dimensions of the mountain have never yet been ascertained with accuracy; and there are no two travellers whose calculations on this subject exactly correspond. M. Houel, one of the most accurate observers of its phenomena, makes it forty miles in circumference at the base; there are others that make it sixty; others again, make it 100: M. Brydone, who copies the calculations of Signor Recupero, affirms it to be 183 miles round; Mentelle makes the diameter to be even thirty miles; and Buffon gives 300 square leagues as the superficial extent of the entire mountain. As to Brydone, if we compare the account of Mount Ætna's circumference, given by Recupero, with its apparent circumference on the map, prefixed to the 'Tour through Sicily and Malta,' we must at once be

struck with the prodigious disparity. It is plain, that in the map no room is found for any mountain of these dimensions; while by comparing the distances of some of the Sicilian towns from one another, Signor Recupero's calculation will be found enormously exaggerated. The geographer, for instance, has placed Catania, which stands at the foot of Mount Ætna, on one side no more than twenty-eight miles from the most distant point of the river Alcantara, which forms the boundary on the opposite side; so that a circle, whose radius is fourteen or fifteen miles, must encompass as much space as can possibly be occupied by the basis of Mount Ætna. If then, we make the circumference of this famous mountain to be between eighty and ninety miles, we shall not be far perhaps from the truth, though our data are far from satisfying us.

Nor do travellers differ less with respect to its height:

Above the level of the sea.

Kircher makes it	4000 toises
Mentelle	1950
Recupero	2500
Buffon	2000 fath.
Faujas de St. Fond	10,036 feet
Sir G. Shuckburgh	10,954
Saussure	10,963
Brydone	12,000

Some affirm it to be six, some eight, and others even twelve miles high. Pindar, the first writer who mentions an eruption of Ætna, calls it 'the pillared prop of heaven.' *Pyth. Od.* v. 36.

Presenting a picture of all the climates, Ætna epitomizes also the history of the world. Its annals extend through all authentic history. The first eruption taken notice of by ancient and by no means contemporary authors, happened before the Greeks landed on the island, and is supposed to have intimidated the Sicani from continuing in the east part of Sicily. The first recorded eruption was in the time of Py-

thagoras. Plato was invited by the younger Dionysius to examine the state of the mountain, after the sixth. It threw up flames and lava near 100 times between that period and the battle of Pharsalia; and was particularly furious while Sextus Pompeius was adding the horrors of war to its devastations. Charlemagne happened to be at Catania during one of its eruptions; and from his reign the chronicles mention fifteen down to that of the year 1669. Ascending this mountain, therefore, the traveller treads on ground consecrated by the fears and reverence of all ages. Hither Adrian and Plato held their way and combated its difficulties before him; and animated by the same hope, thought themselves sufficiently rewarded by the unparalleled scenery of its brow.

Etna from a distance has the appearance of an obtuse truncated cone, terminating at an immense altitude, in a bifurcated vertex, in which two separate eminences are distinctly visible. Around the great bulk of the mountain, are a number of conical hills, which appear to have bulged out of its sides in different eruptions, each having a crater at the top, and standing to the height of 300 or 400 feet. These hills adorned with verdure, darkened by a thick shade of trees, and scattered with villages and hamlets the abode of 100,000 inhabitants, agreeably diversify the scene; while a profusion of plants and herbs, and a green belt of oaks and pines, which seem planted by the hand of nature, give the whole a romantic and highly picturesque appearance. The mountain affords a specimen of all climates, and is commonly divided into three regions; the fertile, the woody, and the desert or barren region; which some writers have not inaptly termed the torrid, the temperate, and the frigid zones of Etna.

The fertile region is lowest, encircled by the rivers Semerus and Alcantara, except where it is bounded by the sea. Here are found vines, and fruits of the most luxuriant variety; the roots of trees shoot along above the surface of the soil, and the decomposition of the lava has given to the pastures and orchards, a richness and fertility rarely equalled. But Sir William Hamilton observes, they keep their vines low here, contrary to the customs of those who inhabit Mount Vesuvius; and they produce a stronger wine, but not in such abundance. Here also, are the lavas of many terrible eruptions; particularly of that in 1669. At the foot of the mountain raised at that time, is a hole, through which Sir William descended, by means of a rope, into several subterraneous caverns, branching out, and extending much farther than he chose to venture, the cold there being excessive, and a violent wind extinguishing some of the torches. Many other caverns are known in this and the other regions of Etna; particularly one near this place, called La Spelonca della Palomba, from the wild pigeons building their nests there. Here Mr. Brydone was told that some people had lost their senses, from having advanced too far, imagining they saw devils and damned spirits. Some of these caverns are made use of as magazines for snow; which they are well adapted for, on account of their extreme cold.

These are with great probability supposed by Sir William Hamilton, to be the hollows made by the issuing of the lava in eruptions. In this region the river Acis, so much celebrated by the poets in the fable of Acis and Galatea, takes its rise. It bursts out of the earth at once in a large stream, runs with great rapidity, and about a mile from its source throws itself into the sea. Its water is remarkably clear; and so extremely cold, that it is reckoned dangerous to drink it; it is said, however, to have a poisonous quality, from being impregnated with vitriol; in consequence of which cattle have been killed by it. It never freezes, but is said often to contract a greater degree of cold than ice.

After travelling twelve miles from Catania, the traveller usually halts at Nicolosi, 2496 feet above the level of the sea. The heat here is not so fervent as at Catania, because it is higher up the mountain. Mount Rosso, or the Red Mountain, is near this station: so called from its colour, which is not however entirely red, but possesses an agreeable intermixture of other shades: a deep bed of black sand envelopes the bottom; covered with a sort of grey lava, and contains a multitude of openings which have never been explored to any considerable distance in consequence of that excessive cold, of which Sir William Hamilton complained. The year 1669 was the period of its formation, when it rose from the midst of a plain, and discharged torrents of lava. It is one of those mouths through which Etna has in modern times discharged showers of ashes and flakes of flame.

The stream of lava reached, in 1669, from this place to the sea. To the extent of two miles Mount Rosso is surrounded with a black sand, which was thrown out in that eruption, and which then covered a space of fifteen miles, to such a depth as to bury the vines and shrubs that were scattered over the soil. Some of the finer particles of it were wafted by the wind as far as Calabria. The sand is very deep as you approach the mountain; which is forked at the vertex. Sir William Hamilton estimates its height at a mile, and its circuit at three miles; but Borelli makes its circumference at the base not to exceed two miles, and its perpendicular height not more than 150 paces: and with this account Spallanzani agrees. This naturalist bestowed some attention upon the formation of this singular production of nature, the only one out of the many similar eminences that surround the volcano, with whose origin and complete history we are acquainted. The base of the lava of this eminence is horn-stone, of a grey colour, rough to the touch, and of a moderately fine grain. It gives sparks with steel, and sounds when it is struck. It serves as a matrix to a great number of felt-spathose or shoerlaceous crystallizations. The scoriae, of which it is principally composed, have the same kind of base, containing shoerls and felt-spars; but they are more light and friable than the lava, and have a kind of vitreous appearance. These and other differences are produced by the mutual collision and pulverization of the scoriae. The number of detached shoerls found on and near Mount Rosso is very great. It has been thought

that they first entered into the body of lava, and were separated from it by means of the sulphur, which had scorched the lava, but had not produced the same effect on the shoerls, because of the small quantity of iron which they contain; and consequently they remained free and detached. Spallanzani rejects this hypothesis; as upon experiments with the magnetic needle, he found that the martial principle was more abundant in the shoerls than in their base; and he, therefore, accounts for their separation from the lava in another way. The volcanic fire, which melted the lava, was incapable of melting these shoerls, which are not only refractory to the fire, but of a different specific gravity from the lava. When this was melted, elevated to a great height, and separated into small particles in the progress of the eruption, a number of shoerls were detached from it, and fell, isolated, partly within the crater, and partly around it. Accordingly he found, that the shoerls detached from the lava are infusible in the furnace; but those which are incorporated with the lava sustain a proper fusion. These shoerls are also found in many other mountains of Etna. Spallanzani analyzed them, and from 100 docimastic pounds, he obtained the following results: viz.

	Pounds.
Silex - - - -	34.5
Lime - - - -	18.7
Iron - - - -	7.6
Alum - - - -	12.4
Magnesia - - - -	11
Sum	84.2

A crater on the summit of this sub-volcano is of an elliptical form, and was explored by Mr. Houel with torches, but he was soon obliged to return, from the extreme cold he felt within it.

Niccolo del Arena, the next station, is a building which was once in the possession of the Benedictine friars, but they were compelled to forsake it in consequence of the devastations of the lava. It is, however, extremely fruitful; the black sand thrown up in 1669 having been converted into vegetable earth. Contiguous to this place is another volcanic hill of the height of 300 feet, richly overspread with verdure, surrounded by other little eminences on every hand, possessing like itself all the charms of vegetable beauty, and rising like spots of verdure amid a dreary waste of lava. About three miles higher up the mountain is the woody region; here the air is cool and agreeable, the morning-breeze comes breathing over beds of spices surcharged with delicious and reviving odours. Trees shape their foliage and spread their boughs in apparent security, diffusing an air of magnificence and grandeur over the whole landscape. The chestnuts of the woody region are thought prodigies in nature; one, which is particularly celebrated, measures 196 feet at the surface of the earth.

Mr. Hamilton says, he observed a gradual decrease of the vegetation as he advanced up the mountain; the under part being covered with large timber trees, which grew gradually less

as he approached the crater; at last they degenerated into the small plants of the northern climates. He also observed quantities of juniper and tansey; and was informed by his guide, that later in the season (he visited Ætna in June 1769) there are a great many curious plants, and in some places rhubarb and saffron in great plenty. In Carrera's history of Catania, there is a list of all the plants and herbs of Ætna, in alphabetical order. This region is extolled by Mr. Brydone as one of the most delightful spots on earth. He lodged for a night in a large cave near the middle, formed by one of the most ancient lavas. It is called La Spelonca del Capriole, or the goat's cavern; because it is frequented by those animals, which take refuge there in bad weather. Here his rest was disturbed by a mountain thrown up in the eruption of 1766. It discharged great quantities of smoke, and made several explosions like heavy cannon fired at a distance; but they could observe no appearance of fire. This gentleman likewise visited the eastern side of Regione sylvosa, intending to have ascended that way to the summit, and descend again on the south side to Catania; but found it impracticable; though what the insurmountable difficulties were, he does not mention. On this side, part of the woody region was destroyed, in 1755, by an immense torrent of boiling water, which issued from the great crater. Its traces were still very visible, about a mile and a half broad, and in some places more. The soil was then only beginning to recover its vegetative power, which it seems this torrent had destroyed for fourteen years.—Near this place are some beautiful woods of cork, and evergreen oak, growing absolutely out of the lava, the soil having hardly filled the crevices; and not far off, our traveller observed seven little mountains that seemed to have been formed by a late eruption. Each of these had a regular cup, or crater, on the top; and, in some, the middle gulph, or Voragine, as the Sicilians call it, was still open. Into these gulphs Mr. Brydone rolled several stones, and heard the noise for a long time after. All the fields round, to a considerable distance, were covered with large burnt stones discharged from these smaller volcanoes. The woody region, particularly the east side, called Carpinetto abounds with very large chesnut trees; the most remarkable of which has been called, from its size, Castagno de Cento Cavalli, or chesnut tree of a hundred horse. Mr. Brydone was greatly disappointed at the sight of this tree, as it is only a bush of five large ones growing together; but his guides assured him, that all these five were once united into one stem; and Signor Recupero told him, that he himself had been at the expence of carrying up peasants with tools to dig round this bush of trees, and found all the stems united below ground in one root. The circumference, as measured by Messrs. Brydone and Glover who accompanied him, amounted to 204 feet. Another of these, about a mile and a half higher on the mountain, is called Castagna de Galea: it rises from one solid stem to a considerable height, after which it branches out, and is a much finer object than the other; this was measured

two feet above the ground, and found to be seventy-six feet in circumference. A third, called Castagna del Nave, is pretty nearly of the same size; and Massa, one of the most esteemed Sicilian authors, affirms that he has seen solid oaks there upwards of forty feet round. All these grow on a thick rich soil, which seems originally to have been formed of ashes thrown out by the mountain. Here the barometer stood at twenty-six inches five lines and a half, indicating an elevation of near 4000 feet. The snow grotto is 5054 feet above the level of the sea. There are two mountains in the vicinity, whose craters exceed in dimension that of Vesuvius.

The barren region includes all the higher part of the mountain. Here the scene is no longer woody: there is a flat expanse of snow and ice, the traveller shivers under some of the coldest blasts of the frigid zone; sounds are heard in the centre of the mountain, sulphurous exhalations issue from its crevices; at last the summit rears its awful head, pouring out volumes of smoke from its caverns.

The man who treads Mount Ætna seems like a man above the world. He generally is advised to ascend before day-break; the stars now brighten, shining like so many gems of flames; others appear which were invisible below. The milky-way seems like a pure flake of light lying across the firmament, and it is the opinion of some that the satellites of Jupiter might be discovered by the naked eye. But when the sun arises the prospect from the summit of Ætna is beyond comparison the finest in nature. The eye rolls over it with astonishment and is lost. The diversity of objects; the extent of the horizon; the immense height; the country like a map at our feet; the ocean around; the heavens above; all conspire to overwhelm the mind, and affect it with sensations of astonishment and grandeur. We must be allowed to extract Mr. Brydone's description of this scene. There is not, he says, on the surface of the globe, any one point that unites so many awful and sublime objects. The immense elevation from the surface of the earth, drawn as it were to a single point, without any neighbouring mountain for the senses and imagination to rest upon and recover from their astonishment in their way down to the world. This point or pinnacle, raised on the brink of a bottomless gulph, as old as the world, often discharging rivers of fire, and throwing out burning rocks, with a noise that shakes the whole island. Add to this the unbounded extent of the prospect, comprehending the greatest diversity, and the most beautiful scenery in nature, with the rising sun advancing in the east to illuminate the wondrous scene.

The whole atmosphere by degrees kindled up, and shewed dimly and faintly the boundless prospect around. Both sea and land looked dark and confused, as if only emerging from their original chaos, and light and darkness seemed still undivided; till the morning by degrees advancing completed the separation. The stars are extinguished, and the shades disappear. The forests, which but now seemed black and bottomless gulphs, from whence no ray was reflected to shew their form or colours, appear a

new creation rising to sight, catching life and beauty from every increasing beam. The scene still enlarges, and the horizon seems to widen and expand itself on all sides; till the sun, like the great Creator, appears in the east, and with his plastic ray completes the mighty scene. All appears enchantment: and it is with difficulty we can believe we are still on earth. The senses, unaccustomed to the sublimity of such a scene, are bewildered and confounded; and it is not till after some time that they are capable of separating and judging of the objects that compose it. The body of the sun is seen rising from the ocean, immense tracts both of sea and land intervening; the islands of Lipari, Panari, Alicudi, Stromboli, and Volcano, with their smoking summits, appear under your feet; and you look down on the whole of Sicily as on a map; and can trace every river through all its windings, from its source to its mouth. The view is absolutely boundless on every side; nor is there any one object within the circle of vision to interrupt it, so that the sight is every where lost in the immensity; and I am persuaded it is only from the imperfection of our organs, that the coasts of Africa, and even of Greece, are not discovered, as they are certainly above the horizon. The circumference of the visible horizon on the top of Ætna, cannot be less than 2000 miles. At Malta, which is near 200 miles distant, they perceive all the eruptions from the second region: and that island is often discovered from about one half the elevation of the mountain: so that at the whole elevation the horizon must extend to near double that distance, or 400 miles, which makes 800 miles for the diameter of the circle, and 2400 for the circumference: but this is by much too vast for our senses, not intended to grasp so boundless a scene. The most beautiful part of the scene is certainly the mountain itself, the island of Sicily, and the numerous islands lying round it. All these, by a kind of magic in vision, that I am at a loss to account for, seem as if they were brought close round the skirts of Ætna; the distances appearing reduced to nothing. Perhaps this singular effect is produced by the rays of light passing from a rarer medium into a denser, which (from a well-known law in optics) to an observer in the rare medium, appears to lift up objects that are at the bottom of the dense one, as a piece of money placed in a basin appears lifted up as soon as the basin is filled with water.

The Regione Deserta, or the frigid zone of Ætna, is the first object that calls your attention. It is marked out by a circle of snow and ice, which extends on all sides to the distance of about eight miles. In the centre of this circle, the great crater of the mountain rears its burning head, and the regions of intense cold, and of intense heat, seem for ever to be united in the same place. The Regione Deserta is immediately succeeded by the Sylvosa, or the woody region, which forms a circle or girdle of the most beautiful green, which surrounds the mountain on all sides, and is certainly one of the most delightful spots on earth. This presents a remarkable contrast with the desert region. It is not smooth and even,

like the greatest part of the latter; but is finely variegated by an infinite number of those beautiful little mountains that have been formed by the different eruptions of Ætna. All these have now acquired a wonderful degree of fertility, except a very few that are but newly formed, that is within these five or six hundred years; for it certainly requires some thousands to bring them to their greatest degree of perfection. We looked down into the craters of these, and attempted, but in vain, to number them.

' This zone is every where succeeded by the vineyards, orchards, and corn-fields that compose the Regione Culta, or the fertile region. This zone makes a delightful contrast with the other two regions. It is bounded by the sea to the south and south-east, and on all its other sides by the rivers Semetus and Alcantara, which run almost round it. The whole course of these rivers is seen at once, and all their beautiful windings through these fertile vallies, looked upon as the favourite possession of Ceres herself, and the very scene of the rape of her daughter Proserpine. Cast your eyes a little further, and you embrace the whole island; all its cities, rivers, and mountains, delineated in the great chart of nature; all the adjacent islands, and the whole coast of Italy, as far as your eye can reach; for it is nowhere bounded, but every where lost in the space. On the sun's first rising, the shadow of the mountain extends across the whole island, and makes a large track visible even in the sea and in the air. By degrees this is shortened, and in a little time is confined only to the neighbourhood of Ætna.'

Brydone also speaks of observing several of those meteors, generally called by astronomers falling stars; which appeared as much elevated as when viewed from the plain: a proof, says he, that these bodies move in regions much beyond the bounds that some philosophers have assigned to our atmosphere. To have a full and clear prospect from the summit of mount Ætna, it is necessary to be there before sun-rise; as the vapours raised by the sun, in the day time, obscure every object: and all agree, that the beauty of the prospect from thence cannot be expressed. Here Mr. Hamilton also had a view of Calabria in Italy, with the sea beyond it; the Lipari Islands, and Stromboli, (seventy miles distance) appeared just under his feet; the whole island of Sicily, with its rivers, towns, harbours, &c. appeared distinct as if seen on a map. Massa, a Sicilian author, affirms, that the African coast, as well as that of Naples, with many of its islands, have been discovered from the top of Ætna. The visible horizon here is not less than 8 or 900 miles in diameter.

' Seated,' says Spallanzani, ' in the midst of this theatre of the wonders of nature, I felt an inde-
scribable pleasure from the multiplicity and
variety of the objects I surveyed; and a kind of
final satisfaction and exultation of heart.
The sun was advancing to the meridian, unob-
structed by the smallest cloud, and Reaumur's
anerometer stood at the tenth degree above the
leveling point; I was therefore in that tempera-
ture which is most friendly to man, and the re-
freshing air I breathed, as if it had been entirely

vital, communicated a vigour and agility to my limbs, and an activity and life to my ideas, which appeared to be of a celestial nature.'

On the summit, Mr. Hamilton observes, that he was sensible of a difficulty in respiration, from the too great subtilty of the air, independent of what arose from the sulphurous smoke of the mount. Mr. Brydone takes no notice of this; which probably arose from the air being in a more rarefied state at the time of Mr. Hamilton's observation, than of Mr. Brydone's; the barometer, as observed by the former, standing at eighteen inches and ten lines, by the latter at nineteen inches six lines and a half. In these high regions there is generally a very violent wind, which, as all our travellers found it constantly blowing from the south, may possibly be commonly directed from that point. Here Mr. Brydone's thermometer fell.

Near the foot of the great crater, is the Philosopher's tower, called Il Torre del Philosopho, supposed to have been constructed by the philosopher Empedocles while he was studying the phenomena of Ætna; by others these are supposed to be ruins of a temple of Vulcan. They are of brick, and seem to have been ornamented with marble. In this region Mr. D'Orville found a great oblong block of polished marble, eight or ten feet high, and three or four thick; though how it came there was quite unaccountable to him. From Mr. D'Orville's and Mr. Brydone's accounts, we must reckon this part of the mountain steep; but Mr. Hamilton says, the ascent was so gradual as not to be in the least fatiguing; and had it not been for the snows, they might have rode on their mules to the very foot of the crater.

The great crater itself, may be described as a cup, or hollow at the top of a conical hill, rising equally on all sides. The hill is composed chiefly of sand and ashes, thrown up from the mouth at different periods; and at present it is ten miles in circumference, and a quarter of a mile in height. The crater presents the appearance of an inverted cone the inside of which is covered with salts and sulphur of various colours; it is oval in its figure, shelving down from the aperture. Sir W. Hamilton, 1769, calculated the circumference at two miles and a half; Mr. Brydone, 1770, at three miles and a half; Mr. D'Orville, 1727, at three or four miles. In 1788, Spallanzani, who visited this phenomenon, describes the inner sides as terminating in a plain of half a mile in circuit, in the centre of which is a circular aperture of five poles in diameter; contained within the cavity, apparently in a state of ebullition. Several stones that he threw in, fell dead as into a thick paste; but those that did not fall into the matter, made quite a different sound, a circumstance which led him to conclude that the bottom was solid. Riedesel observes, that no sound at all was produced by throwing stones into the gulph; but he heard a roaring like the sea. The crater stood to the east, with one opening, which no longer exists. Mr. D'Orville tells us that he and his companion having fastened themselves by ropes, held by men at the top, went down the shelving sides to the very mouth of the gulph. They beheld a

conic mass of matter in the middle, to the height of about sixty feet, the base as far as they could trace it, nearly 800 feet, from which small lampent flames and smoke issued in every direction. While they were there, the north side of the mountain began to throw out flames and ashes, accompanied by a bellowing noise, on which they retired. Strabo describes the top of the mountain as a level plain, with a smoking hill in the centre. Spallanzani as bifurcated, for he saw another eminence a quarter of a mile distant, with another crater, though not of equal dimension. M. Houel speaks of three eminences, 1782, like an isosceles triangle, only two of which could be perceived from any distance, in the midst of which is the principal crater; in diameter about sixty feet. According to Fazello, there was a hill produced in 1444, which fell into the crater after an eruption, and mingled with the melted mass. Borelli writes that the summit of the mountain rose up like a tower; and during the eruption of 1669, fell into the crater. The whole structure and appearance of the mountain is thus evidently subject to great changes.

The stones ejected from Ætna are granitic, or calcareous, surrounded with columns of Basalt, which M. Dolomieu terms ‘ prismatic lava.’ Spalanzani supposes the shore to be volcanic for twenty-three miles. The same writer observes that there is on Ætna a great scarcity of water, owing, as he imagines, to the rain’s falling on scoria, in which it sinks for want of those various argillaceous strata, which retain it in other mountains. Others affirm that the mountain is well watered; that there are intermitting springs which flow during the day only, and stop in the night, a fact which may arise from the melting of the snow, which ceases as the night comes on; that there are streams always pouring from the side of the mountain, unquestionably originating in some permanent source; that there are poisonous springs, fine salt springs, &c.

An approaching eruption of mount Ætna is indicated various ways. There is at first an increase of the white smoke issuing from the top of the crater, intermingled with volumes of black smoke in the centre. These are attended by slight explosions, and followed by red flashes, or rather streams of fire perpetually increasing in number, and growing in dimension, till the whole becomes one entire black column, highly electrical, illuminated by frequent lightnings, and attended by occasional thunder. These phenomena are followed by showers of red hot stones and ashes. The former projected often to a great distance, and the latter wafted sometimes by the winds, and carried 100 miles, setting fire to buildings, and destroying the face of vegetation. Recupero tells us, that, he had known rocks thrown up to the altitude of 7000 feet. M. Houel saw one of these stones which had been projected from the mouth of Ætna, whose weight was not less than sixteen tons. It is generally three or four months before the lava makes its appearance, boiling over the top, or bursting through the sides of the mountain; a complete liquid mass of melted mineral matter, running like a river, and destroying the face of nature wherever it comes.

The explosions of Ætna have been recorded from a very early period. Diodorus Siculus mentions eruptions of it 500 years before the Trojan war, or 1693 years before the Christian æra. This is that which drove, he says, the Sicani from the eartern part of Sicily, which they then inhabited. Thucydides mentions three eruptions, of which, the second was the most remarkable. It happened the second year of the seventy-fifth Olympiad, when Phædon was archon of Athens, and when the army of Xerxes was defeated by the Athenians, at Plataea. Both the victory and eruption are recorded in an ancient inscription on the Oxford marble. During this eruption, Amphinomus and Anapis, two Sicilian youths, rushed into the midst of the flames, and saved the lives of their aged parents, at the imminent peril of their own; on which account, a temple has been consecrated to their memory.

The third eruption mentioned by Thucydides, occurred in the year before Christ 425, in the eighty-eighth Olympiad, and desolated part of the Catanian territory. He mentions it in the third book on the Peloponnesian war, in these words:—‘ About the spring of the year, a torrent of fire overflowed from mount Ætna, in the same manner as ~~formerly~~, which destroyed part of the lands of the Cataniens, who are situated at the foot of that mountain, which is the largest in all Sicily. It is said that fifty years intervened between this flow and the last which preceded; and that, in the whole, the fire has thus issued thrice since Sicily was inhabited by the Grecians.’

The fifth eruption, of authentic history, occurred in the consulship of Sergius Fulvius Flaccus, and Quintus Calpurnius Piso, nearly 133 years before the Christian æra. It was of some importance; but Julius Obsequius, and Orosius, by whom it is recorded, have not transmitted any details respecting it.

In the consulship of Lucius Æmilius Lepidus, and Lucius Aurelius Orestes, about 125 years before Christ, Ætna poured forth such a torrent of fire, that the adjoining sea is represented as absolutely hot, and immense numbers of fishes were destroyed. One historian declares, that the inhabitants of the isles of Lipari ate so many of those fishes as to occasion a distemper, which proved generally fatal.

Orosius states, that four years after the preceding eruption, the city of Catania was desolated by another equally tremendous; the roofs of the houses were demolished by the burning ashes, and so dreadful was the desolation, that the Romans exempted the inhabitants from all taxes for the space of ten years, to afford them an opportunity for repairing the damages they had sustained.

Livy mentions an eruption of Ætna, just previous to the death of Cæsar, in the forty-third year before Christ. It was not very considerable in itself, but acquired importance from being afterwards considered as an omen of Cæsar’s death.

In the life of Caligula is mentioned, by Suetonius, an eruption that happened in the year forty, of the Christian æra; on the same night in which the emperor fled from Messina, where he was at the time.

According to Carrera, there was an eruption of mount Ætna, in the year of our Lord 253. The same author records another in the year 420; and Geoffrey of Viterbo, in his Chronicle, mentions an eruption in 812, in the reign of Charlemagne.

We cannot attempt to go into all the authentic details of those occurrences: but that of 1169, was the most tremendous eruption of ancient times; it happened on the 4th of February. At day-break there was an earthquake in Sicily, felt across the Strait, as far as Reggio, Catania sunk in ruins, and 15,000 inhabitants perished in its fall. The roof of St. Agatha's church fell in, and killed the bishop; new rivers burst forth, and several of the ancient rivers disappeared. The clear spring of Arethusa, so celebrated in antiquity, became muddy and brackish. The fountain of Ajo ceased two hours, and then poured out more copiously than before, but its waters became of a blood colour. At Messina, the sea retired; and then returning, it whelmed the city walls, rolled through the town, and swept multitudes away, men, women, and children. The trees and vegetables were burnt up by the showers of hot ashes and stones that fell upon them.

In 1329, another awful visitation occurred, of which a few particulars are furnished by Nicholas Specioli. It happened about vespers, on the 23rd of June. The mountain began to send forth dreadful sounds, and alarmed all the island, a volume of smoke encompassing a blaze of fire, arose from the mountain. Snow spread over Moyona. The flames in the evening touched the clouds; many buildings were reduced to ruins; many rocks on the shore dashed into the sea; springs and streams of water were dried away. The sun was eclipsed from morning to evening, with clouds of smoke and ashes; on the south side of the St. John's church, fire issued out from an opening made in the ground. Our historian drew near to see the wonders of nature: the earth tottered under his feet, and four volumes or showers of red hot stones issued in a very short space. The writer of this history affirms, that neither Babylon nor Sodom suffered so tremendous a visitation, and that many of the inhabitants died for fear; many birds died in the heavens, and the fish in the surrounding seas.

In 1536, another terrible eruption took place, and one which is memorable, on account of the death of Francis Negro de Piazza, a celebrated physician of Lentini, who, from a desire to examine the phenomenon, approached too near the crater, and was killed by a volley of ignited stones.

In 1537, the mountain was again disturbed. It was rent in several places, and the lava poured out with great violence, and destroyed Mont Pellieri and Fallica, together with the gardens, vineyards, and monastery of St. Nicholas D'Areana, and nearly all the inhabitants. The wind tore up the trees, the river Simeto left its banks, and swept away both people and cattle. The summit of the mountain fell in with a noise so dreadful, that the people of the island believed it to be the last day, and prepared accordingly; many of the people were struck deaf by the

noise, and the castle of Corleone, though nearly eighty miles from the volcano, was demolished.

No eruptions of Ætna have been more terrible or destructive than that of 1669. Eighteen days before the commotion the sky was black and cloudy, agitated by frequent thunder and lightning. In the island of Stromboli, two volcanoes, to the westward of Sicily, raged more than usual. Several houses were overturned by earthquakes in the village of Nicolosi, and the crater seemed to exhibit signs of great commotion. On the 8th of March, the sky darkened over La Pedara, and on the 11th, a chasm of some miles in length was opened in the mountain, twenty miles from the crater towards the city of Catania. On the following night, many new chasms opened in different places of the mountain, and from them all burst columns of smoke, tremendous thunders, accompanied by alarming earthquakes. From the principal crater a stream of lava flowed towards the lake of La Hardia. On the following day, it proceeded to the territory of Mal Passo, and wasted it in twenty hours. It then turned on Mont Pellieri, and in some places the dreadful stream was two miles broad. A new and immense chasm appeared on the 23d, and produced a hill of stones, sand, and ashes two miles in circumference, covering the surrounding country for a distance of fifteen miles. On the morning of the 25th of March, the whole mountain was agitated by an earthquake, and the highest crater fell down into the focus with a tremendous noise. A wide gulph of a mile in extent, yawned in the place where it stood, pouring out large masses of ashes and stones, and among others the celebrated block of lava, now on mount Frumento. The lava turned its course towards Catania with a great noise accompanied by alarming earthquakes: it overflowed the walls and desolated the gardens of the Benedictine Convent, and ran down into the sea. The stream of lava in forty days destroyed the habitations of 27,000 persons, and of the 20,000 inhabitants of Catania, only 3000 survived. As the lava ran down the mountain, red hot stones of a pale red might be seen swimming along in it of the size of an ordinary table; all the country was covered with it, smoking like a furnace of melted iron. Sometimes large masses fell into the sea with a dreadful noise. But when the lava rolled into the sea, the sound was more dreadful than the most tremendous thunder, and was heard to an immense distance. The water retired, the sun was darkened, the fish were destroyed, and the colour of the sea itself was changed. A continued noise issued from the mouth of the cleft, which could be heard sixty, and sometimes 100 miles, and to this distance the ashes were carried. The mouth whence this terrible inundation proceeded was only ten feet in diameter. Burning rocks, sixty palms in length, were thrown out of it to the distance of a mile. The sun did not appear for many weeks, and four months elapsed before the scene was altered. A vineyard in the possession of a convent, standing on ancient lava, was borne up by the melting of the lava beneath it; and instead of being destroyed, the people with great astonishment saw the whole field begin to move

off. Some of this vineyard remains to this day.

A description of the scene in the neighbourhood of Ætna at the time, was sent to the court of England by Lord Winchelsea, who happened then to be at Catania in his way home from an embassy at Constantinople. The account is not now to be procured; but Sir W. Hamilton found a copy of it in Sicily, and gives an extract, part of which follows: ‘When it was night, I went upon two towers in divers places, and I could plainly see, (at ten miles’ distance, as we judged,) the fire begin to run from the mountain in a direct line, the flame to ascend as high and as big as one of the greatest steeples in your majesty’s kingdoms, and to throw up great stones in the air; I could discern the river of fire to descend the mountain, of a terrible fiery red colour, and stones of a paler red to swim thereon, and some to be as big as an ordinary table. We could see this fire move in several other places, and all the country covered with fire, ascending with great flames in many places, smoking like a violent furnace of iron melted, making a noise with the great pieces that fell, especially those that fell into the sea. A cavalier of Malta, who lives there, and attended me, told me, that the river was as liquid, where it issues out of the mountain, as water, and came out like a torrent with great violence, and is five or six fathom deep, and as broad, and that no stones sink therein.’ The account given in the Philosophical Transactions is to the same purpose.

Since 1669, there have been several eruptions, but none of them comparable to it. In that which happened in 1766, the lava sprung up into the air to a considerable height, twelve miles below the summit; but formed a stream only six miles in length, and one mile in breadth. Another eruption happened in 1787. From the 1st to the 10th of July, there were signs of its approach. On the 11th, after a little calm, there was a subterraneous noise, like the sound of a drum in a close place, and it was followed by a copious burst of black smoke. It was then calm till the 15th, when the same prognostics recurred. On the 17th, the subterraneous noise was heard again; the smoke was more abundant, slight shocks of an earthquake followed, and the lava flowed from behind one of the two little mountains which form the double head of Ætna. On the 18th, while the spectators were in anxious expectation of a more severe eruption, all was quiet, and continued so more than twelve hours: soon after they perceived some new shocks, accompanied with much noise; and the mountain threw out a thick smoke, which, as the wind was westerly, soon darkened the eastern horizon: two hours afterwards a shower of fine black brilliant sand descended; on the east side it was a storm of stones; and, at the foot of the mountain, a deluge of flashes of fire, of scoriae and lava. These appearances continued the whole day; at the setting of the sun, the scene changed. A number of conical flames rose from the volcano; one on the north, and another on the south, were very conspicuous, and rose and fell alternately. At three in the morning, the mountain appeared cleft, and the summit seemed a burning

mass. The cones of light which arose from the crater were of an immense extent, particularly the two just mentioned. The two heads seemed to be cut away: and at their separation was a cone of flame, seemingly composed of many lesser cones. The flame seemed of the height of the mountain placed on the mountain: so that it was probably two miles high, on a base of a mile and a half in diameter. This cone was still covered with a very thick smoke, in which there appeared very brilliant flashes of lightning, a phenomenon which Ætna had not before afforded. At times, sounds, like those from the explosion of a large cannon were heard seemingly at a less distance than the mountain. From the cone, as from a fountain, a jet of many flaming volcanic matters were thrown, which were carried to the distance of six or seven miles: from the base of the cone a thick smoke arose, which, for a moment, obscured some parts of the flame, at the time when the rivers of lava broke out. This beautiful appearance continued three quarters of an hour. It began the next night with more force; but continued only half an hour. In the intervals, however, Ætna continued to throw out flames, smoke, stones ignited, and showers of sand.—From the 20th to the 22d, the appearances gradually ceased. The stream of lava was carried towards Bronte and the plain of Lago. After the eruption, the top of the mountain on the western side was found covered with hardened lava, scoriae, and stones. The travellers were annoyed by smoke, by showers of sand, mephitic vapours, and excessive heat. They saw that the lava which came from the western point divided into two branches, one of which was directed towards Ilibeccio; the other, as we have already said, towards the plain of Lago. The lava on the western head of the mountain, had from its various shapes been evidently in a state of fusion: from one of the spiracula, the odour was strongly that of liver of sulphur. The thermometer, in descending, was at 40 degrees of Fahrenheit’s scale; while near the lava, in the plain of Lago, it was 140 degrees. The lava extended two miles; its width was from 13 feet and 3-4ths to 21, and its depth 13 feet and 3-4ths.

The last eruption took place on the 27th of March, 1809, which formed a row of craters within the space of about two miles. From the dark bosom of a wood of tall firs and huge oaks, says a British officer present, spread over steep craggy hills and close valleys, conceive twelve craters or mouths, two unceasingly, and the rest at intervals, with a noise like a tremendous chorus of several thousand cannons, muskets, and sky rockets, discharging flame, and showers of burning rocks of various forms and all magnitudes, from several yards in diameter down to the smallest pebble, which, according to their weight and bulk, ascend from 200 to 1000 feet. The two fore-mentioned craters, (or rather double crater,) the lowest of the row down the mountain, formed the principal object of this awful and magnificent scene—they were the only craters which did not seem to labour. Their joint emissions had encompassed them with a black oblong hill of ashes and lava stones; thirty yards above the top of which, their mingling flames

furiously ascended, in one immense blaze, which seemed 100 yards in breadth. Amidst this blaze, vast showers of rocks, rising and falling, were continually passing each other. About the middle of the whole line of craters was situated one, which laboured the most, and made the loudest, the heaviest, the highest, and the most dangerous discharges; from the rocks of which our party twice narrowly escaped one or two of very considerable size, falling within a pace of us:—I think the lava flowed only from a few of the chief craters, particularly the double one. During the emissions of rock and flame, the boiling matter was seen in slow undulating waves issuing through the sides, close to the bottom of the black hills of ashes. The double crater appeared completely isolated by the lava of the others. Just below it, all the lavas uniting, formed one grand stream of various breadth, from half a mile to fifty yards.

During the eruption, the images of the saints were brought from Castiglione, and placed a few yards in front of the fire. Mass was repeated; and the miserable ragged natives of both sexes crying, sobbing, beating their breasts, tearing their hair, &c. The priests told the people it was in consequence of their sins, and exhorted them to entreat all the saints to pray for them; and when the eruption stopped, they attributed it to the interference of saints.

Captain Smyth, our latest British traveller in these regions, estimates the whole altitude of Ætna at 10,874 feet, giving about 150 miles for the radius of vision. The crater, as it at present appears, and which other writers, we see, have represented at from two miles and a half to even four miles in circumference, he describes as ‘an oval, stretching from E. and by N. to W. and by S., with a conjugate diameter of 493 yards; the transverse lie was prevented from ascertaining by a dense cloud that arose before his operations were completed.’ From the edge of the crater, the interior, he adds, ‘through successive strata of volcanic substances, is incrusted with various coloured efflorescences of ammonia, sulphur, and martial vitriolic salts, to the depth of about a hundred yards on the east, but considerably less on the west side. The efflorescences of a beautiful orange yellow are the most predominant. The bottom of the crater is plain, and tolerably hard; though, from being composed of loose cinders, the feet sink in some places; near the centre, are two mounds of scoriae and ashes, each with a large aperture at the summit, and several fissures around, from whence, at intervals, issue volumes of thick smoke, with a rumbling noise and hissing sound. There is, also, a light thin vapour, occasionally oozing from the bottom and sides of the huge amphitheatre in every direction. I endeavoured to look into the principal chasm, but the rapid ejection of the cinders, and the strong sulphureous vapours that exuded, prevented me from attaining my object; and, indeed, I could not but feel apprehensive that a nearer approach, where the footing was so frail, might prove too hazardous; besides which, the heat and smoke had increased to such a degree, that it was high time to regain the summit’

Our traveller accordingly ascended, ‘When on a sudden the ground trembled under our feet, a harsh rumbling with sonorous thunder was heard, and volumes of heavy smoke rolled over the side of the crater, while a lighter one ascended vertically with the electric fluid escaping from it in frequent flashes in every direction. The shortness of the time that had elapsed since I was in the crater, rendered me thankful for so providential an escape; but even from the spot on which we stood it was necessary to remove with the utmost expedition, and before we could effect our retreat, we were overtaken by a disagreeable, cold, humid cloud that annoyed and retarded our progress.’—p. 152.

This gentleman’s estimate and observations are the more entitled to regard, as he was an officer (R. N.) who has been for many years stationed in the Mediterranean by Government, to survey various parts of the coasts and islands of that sea.

An able writer, in the Quarterly Review, ventures to correct Captain S. however, upon one point. ‘He errs,’ says this writer, ‘in common with almost every traveller in Sicily, and indeed with the Sicilians themselves, in supposing that the ascent of Ætna is not practicable in winter. In defiance of the difficulties started by the people of Catania,’ continues our critic, ‘and repeated by the Nicolosi guide, we gained the summit of Ætna on the 27th of January, 1819. That it is a work of severe labour at such a season, cannot be denied, the snow extending ten or twelve miles down the mountain, and mules being consequently so far useless. But the labour is not such as need deter a stout pedestrian from undertaking it; and splendid indeed is the reward which awaits him when he seems to descry at once from that proud pinnacle, ‘all the kingdoms of the world and the glory of them.’

We have stated this fact for the benefit of future travellers in Sicily, whose wanderings may fall out in the winter months. If they wish in earnest to ascend Ætna, we charge them not to be discomposed by the ‘è impossible, Signori,’ of every Sicilian they may meet; and we further advise them to signify to their guide that they shall graduate his pay by the altitude to which he leads them. With these provisos, we venture to predict, that they will reach the summit. It is singular enough, that it was on the 28th of January that Swinburne relinquished all thoughts of gaining the summit, in compliance with the idle counsel of his conductor. Possibly when the spring is further advanced, and the snow is beginning to melt, the ascent may not be feasible; (at least early in the morning) and will support the foot.’ Captain SMYTH’s *Memoir on the Hydrography of Sicily, &c.* 4 p. 1824—and *Quarterly Review*, Aug. 1824.

Many ingenious hypotheses have been framed relative to the causes of volcanic eruption. Some have attributed it to electricity; some to the fermentation of sulphur and iron, which, mixed with water to a paste, and buried in the earth, will take fire, and produce, on a small scale, similar phenomena. Immense beds of pyrites have been thought to be deposited at the central

base of the mountain, which occasionally explode. Others imagine a central fire, to which Vesuvius, Ætna, and other volcanic mountains, are so many flues or chimneys, connecting themselves with the atmosphere. Some important questions in mineralogy, geognosy, and geology, connected with this topic, are asked by Humboldt, and as yet unanswered.—‘ Is the conical mountain of a volcano entirely formed of liquified matter, heaped together by successive eruptions; or does it contain in its centre a nucleus of primitive rocks covered with lavas, which are the same rocks altered by fire? What are the affinities which unite the productions of modern volcanoes with the basaltes, the phonolites, and those porphyries with basis of felspar, which are without quartz, and which cover the Cordilleras of Peru, and Mexico, &c.? Has the nucleus of volcanoes been heated in its primitive position, and raised up in a softened state by means of elastic vapours, before these fluids communicated by means of a crater with the external air? What is the substance which for thousands of years keeps up this combustion, which at some times is so active, and at others so slow? Does this cause act at an immense depth, or does it take place in secondary rocks lying on granite?’

Buffon regards Ætna as one of the primitive mountains, which subsisted as a volcano from the creation of the world. He considers that the eruptions ceased for a long period after the deluge, for want of sufficient fluid to occasion effervescence with the minerals it contained, and were not renewed till the bursting open of the straits of Gibraltar and the Bosphorus, when the ocean, mixing with the Mediterranean, inundated the territory between Italy and Sicily, and the base of Ætna itself, producing an eruption of the mountain, which, from a continuation of the cause, has been successively repeated to the present time. M. Dolomieu thinks that Ætna existed as a mountain previous to its becoming a volcano, shells having been found two thousand feet above the level of the sea, and calcareous strata beneath the lava, the deposition of which must have preceded the eruption of the lava. A more obvious conjecture respecting Ætna is, that it has been formed by successive eruptions, each adding to its elevation and extent. New mountains and hills are seen springing up at every great eruption, and of these hills the mountain seems formed. It is therefore to be regarded as a compilation of volcanoes, the growth of many ages, and formed, by their own convulsions, into that vast mass of mountains that has assumed so magnificent an appearance. Recently an opinion has been current, that Ætna sensibly diminishes, and it ‘cannot be discerned to so great a distance as formerly. M. Houel considers the lower part of the mountain to consist entirely of marine substances, deposited in different ages; and the higher part, of matter that has been thrown up from the crater and has dropped upon the surface. He proposes in his Voyage Picturesque, a theory of the volcanic fire, which merits a particular detail. We can form no idea of fire subsisting alone, he observes, without any pabulum, and unconnected with any other principle. It is only seen in conjunc-

tion with some other body which nourishes it.—The matter in fusion, which issues from the focus, is but the incombustible part of that which nourishes the fire, into the bosom of which it penetrates in search of pabulum. But the bottom of the volcano is the only part on which it acts, because the fire can only operate in proportion to the facility with which it can dissolve and evaporate; and its action extends no further than to keep the substances it has melted in a state of ebullition. The fusible matter which is ejected from the mouth of the volcano, hardens by degrees as it cools in the external air, and produces that species of stone which is commonly denominated lava. Even in a state of fluidity, and when in the burning focus, lava, on account of its gravity and density, must possess some considerable degree of solidity; in consequence of which it resists and irritates the fire into a state of ebullition. A quantity of matter, in such circumstances, must resemble generally any other thick substance or concreted mass in a boiling state, and small explosions are liable to be produced, from time to time, upon every part of the surface of this heated matter, by which means small particles or pieces are scattered around in every direction. A similar process is carried on, this writer contends, though on a much larger scale, in the focus of a volcano, and the explosions there, though precisely of the same nature, produce proportionably greater effects, repelling with the utmost violence, whatever lies in the way, or offers any resistance.

An attempt has been made by some geologists to impeach the Mosaic testimony respecting the creation of the world, from some circumstances connected with this. Recupero discovered a stratum of lava, which, he says, was discharged from the mountain during the second Punic war, and yet in his time was not covered with depth of soil sufficient to produce vegetation. From this isolated part, which in itself is extremely questionable, he ascends into the general principle, that it requires two thousand years to cover a stratum of lava. He found, in digging into a pit, seven distinct strata, or layers of lava overspread with rich mould, and hence he attempts to infer that 14,000 years must have elapsed since the deposition of the lowest strata. Count Borch following the same defective mode of reasoning, concludes Ætna to be eight thousand years old. In 1776 he examined several beds of lava; that produced in 1157 had twelve inches of earth; that in 1329 had eight inches; that of 1669 had one inch; that of 1766 being totally bare. But the abbé Spallanzani observes, that the lava of 1329 had eight inches of earth; in 447 years after its deposition. Yet the lava of Arso in Ischia, emitted in 1302, was perfectly hard and sterile in 1788; and lava, near Catania, which has been used for the purpose of building upwards of two thousand years, is unconquerably barren, although cultivation has been attempted. Gioeni again in the year 1787, found lava covered with mould which had been produced little more than twenty years; and others entirely barren, though of a much earlier date. The ruins of Herculaneum are enveloped in seven

beds of strata, each covered with rich mould, so that the very process has taken place at Herculaneum which in Recupero's opinion would require fourteen thousand years! It is clear that lavas of different degrees of density placed in various situations of altitude, and exposure to the action of the elements, require different periods of time to make them fertile, and that no general rule can be established from any one or even all of them. Ætna being at the top perpetually covered with snow, the whole island is supplied from thence with that article, so necessary in a hot climate, and without which, the natives say, Sicily could not be inhabited. So great is the demand for this commodity, that

the bishop's revenues, which are considerable, arise from the sale of mount Ætna's snow; and he is said to draw £1000 a year from one small portion lying on the north side of the mountain. Great quantities of snow and ice are likewise exported to Malta and Italy, making a considerable branch of commerce. On the north side of this snowy region, Mr. Brydone was assured, that there are several small lakes which never thaw; and that the snow mixed with the ashes and salt of the mountain are accumulated to a vast depth. The quantity of salts contained in this mountain, with great probability, he conjectures to be one reason of the preservation of its snow.

ÆTNÆ SAL, a name given by some authors to the sal ammoniac, which is found on the surface and sides of the openings of Ætna, and other burning mountains, after their eruptions; and sometimes on the surface of the ferruginous matter which they throw out.

ÆTOLARCHA, in Grecian antiquity, the principal magistrate, or governor of the Ætolians.

ÆTOLIA, in ancient geography, (receiving its name from Ætolus, the son of Eurytion), was a province of Middle Greece, bounded on the east by Locris, on the west by Acarnania, from which the river Achelous divided it, on the north, by the country of the Perrhebi, and Athamanes, and part of Epirus, and on the south, by the gulf of Corinth. Its extent from north to south was about forty-eight miles; and from east to west, above twenty miles. Strabo says, (l. x. tom. ii. p. 691,) it was customary to divide Ætolia into two districts, the one called the ancient Ætolia, a level and fruitful country, which lay between the rivers Achelous and Calydon, on the Evenus; and the other, *επικτηρος*, or the acquired, which was craggy and barren, contiguous to the Locrians, towards Naupactus and Eupalius; and extended northwards towards the mountain Oeta. The principal cities were Thermus, Calydon, and Pleuron, said to be named after sons of Ætolus. Their only sea-port was Oeuias, on the Corinthian bay. Livy and other historians, describe the Ætolians as warlike, proud, and arrogant; and they are said to have fought with one shoe, whence the epithet *μονοκυνηγης*, has been given to them. Turbulent, and accused by Polybius of faithlessness and treachery, so that the other states of Greece were obliged to consider and deal with them occasionally, as a horde of robbers, the people of this minor state, were tenacious of liberty, and exercised in their struggles for it, considerable influence over the general affairs of Greece. To oppose the projects of Philip of Macedon, they entered into a treaty of alliance with the Romans, before Christ 211, (confirmed, before Christ 213,) which was ordered by the Roman senate to be deposited in the capitol, as a monument of their first Greek alliance. The forces of Philip being employed in Macedon, the Ætolians entered Acarnania; but, though assured of assistance from Lævinius, the Roman general, they were intimidated by the resolution of the Acarnanians, returned home,

and directed their arms against Anticyra, a city of the Locris, which, aided by the Romans, they compelled to surrender. They now marched into Achaea, to oppose the forces of Philip; but were twice defeated, near Lamia, a city of Phthiotis. After this, an embassy from Ptolemy Philopater prevailed upon Philip to grant the Ætolians a truce of thirty days, and they were finally under a necessity of concluding a very unfavourable peace with him; before Christ 204. An extraordinary diet being now held at Nau-pactus, in which the friendship of the Ætolians was solicited, not only by Philip, but also by the two powerful republics of Athens and Rome; the Romans prevailed, and Ætolia was again involved in war with the Macedonian prince. This new ally was nobly assisted by them in the battle of Cynocephala, in which, Philip was totally defeated. Peace, however, was afterwards concluded with Philip, before Christ 196, without their concurrence, and they turned their arms against Rome. Antiochus then became the leader of a formidable confederacy of the Greeks; but, becoming enamoured at Chalcis, with the daughter of one of the citizens, he spent an idle winter in feasting and rejoicing; of which the Romans availed themselves, and sent a powerful army into Greece, which drove him from the country. The Ætolian strength was concentrated at Heraclea, where they sustained a memorable siege of forty days, against one of the best disciplined armies of Rome. The town fell at length by stratagem; Lamia soon followed; and Amtracia, before Christ 189. Here the Ætolians invented a singular kind of machine, in order to drive the enemy out of a mine, which accidentally opened into one of theirs. It was a hollow vessel, with an iron bottom, bored with holes, and armed with spikes, for preventing the approach of the enemy. They filled this vessel with feathers, and having brought it to the place where the two mines met, set the feathers on fire; and, by driving with bellows the smoke on the besiegers, obliged them to quit the mine: by this stratagem, they gained time for repairing the foundations of the walls. After this event, the Ætolians sent ambassadors to Rome, and procured peace, on the humiliating condition of delivering to the magistrates of Corcyra all prisoners and deserters, both of the Romans and their allies, except those who had been taken twice, or during her alliance with Rome; paying

to the Roman general in Aetolia 200 Euboic talents, of the same value with that of the Athenian talents, and engaging to pay fifty talents more within six years; to secure which, they were to deliver to the consul forty hostages of his choice, none of whom should be under twelve, or above forty years of age; the prator, general of the horse, and those who had been already hostages at Rome, excepted. After the conquest of Macedon by Paulus Emilius, the Aetolian republic was further reduced. Five hundred and fifty of the chief persons of the nation were assassinated by the partisans of Rome, under a suspicion of wishing well to Perses: while those who had openly espoused his cause, and others who had secretly favoured him, were sent to Rome, and never allowed to return to their native country. On the destruction of Corinth, and the dissolution of the Achæan league, Aetolia, with the other free states of Greece, was reduced to a Roman province, commonly called the province of Achaia. See ACHAIAS.

The government of Aetolia was republican, controlled by the Pantæolium, a general council held as occasion required. The prator, the general of horse, the public secretary, and the ephori, were the principal public functionaries. Livy states their cavalry was at one period esteemed superior to that of any other of the Grecian states.

AETOS, in architecture, of *aerōs*, an eagle, a name given by the Greeks, to the pediment or tympanum of an edifice. Winckelman suggests that the ancients originally placed a representation of the bird of Jove in this situation, as being the summit of their buildings, and therefore in the earliest periods dedicated to Jupiter. Several ancient medals have been seen with this bird on the roof, particularly the coins of Tarsus and Pergamum. Besides these authorities, in favour of the opinion that this custom gave this specific name to the pediment, may be added the authority of Shaw, who discovered the figure of an eagle on the pediment of a temple near Tunis, built in the time of the Antonines. Various basso reliefos, which decorated the Aetos of temples, are described and delineated in the eighty-eighth plate of the fourth volume of the Museo Pio Clementino. The Corinthians seem first to have regularly formed this ornamented pediment, which some have imagined them to borrow from the Egyptians, who placed an extended hawk, in a similar position over their temples. See Elmes' Dictionary of the Fine Arts.

AFAR'. Adv : *Afepnan*, to lengthen. Fanan, to go fare, to go. Gone hence, moved to a distance.

And the puppican stood *afer*: and wolde not reise his yghen to heuene, but smoot his breste and seyde : God be iuersyf to me synner.

Wyclif. Luk. xviii.
We are carelesse of that which is neer us, and follow that which is *afare* off.

Burton's Anatomy of Melancholy.

So shaken, as we are, so wan with care;
Find we a time for righted peace to pant,
And breathe short-winded accents of new broils,
To be commenc'd in stronds *afar* remote?

Shaksp. Henry IV.

We hear better, when we hold our breath than contrary; insomuch as, in listening to attain a sound *afar* off, men hold their breath.

Bacon's Nat. Hist. No. 284.

Hector hastened to relieve his body.
Dismiss'd his burnish'd helm that shone *afar*,
The pride of warriours, and the pomp of war.

Dryden.

The rough Vulturnus, furious in its course,
With rapid streams divides the fruitful grounds,
And from *afar* in hollow murmur sounds.

Addison on Italy.

Much suspecting his secret ends, he entertained a treaty of peace with France; but secretly and *afar off*; and to be governed as occasion should vary.

Sir John Hayward.

Ah, who can tell how hard it is to climb
The steep where fame's proud temple shines *afar*!
Ah, who can tell how many a soul sublime
Has felt the influence of malignant star,
And wag'd with fortune an eternal war!

Beattie's Minstrel.

AFDELLES, in ichthyology, a name given by the Cretans to the fish called at Rome, donzellinga and zigurilla. It is the julis of others; and according to the Artedian system, is a species of the labrus. Artedi distinguishes it from the others, by the name of palmar labrus, with variegated sides, and two large teeth in the upper jaw.

AFER, (Domitius,) a famous orator, was born at Nismes, and flourished under Tiberius, Caligula, Claudius, and Nero. He disgraced his talents, by turning informer against some of the most distinguished personages in Rome. Having upon a statue he had erected in honour of Caligula, declared that this prince was a second time consul at the age of twenty-seven, Caligula regarded it as a sarcasm upon his youth, and raised a process against him. Afer, instead of making a defence, repeated part of the emperor's speech with the highest marks of admiration; after which, he fell upon his knees, and begging pardon, declared, that he dreaded more the eloquence of Caligula than his imperial power. This mean flattery succeeded so well, that the emperor not only pardoned, but raised him to the consulship. He died in the reign of Nero, in the year of our Lord, 59.

AFFA, a weight used on the Gold Coast of Guinea. It is equal to an ounce, and the half of it is called eggeba. Most of the Africans on the Gold Coast give these names to those weights.

AFFABLE, adj. } Ad : *sari*, to speak to.

AFFABIL'ITY, } Whence *affabilis*, easy to

AFFABLY. } Be spoken to, granting a facility of access, courteous ; spoken of superiors,

He was prudent, comely, princely, *affable*, ientle, and amiable, he loued justice, and punished the malefactors.

The Exposition of Daniel, by George Joye, fo. 181.

He was *affable*, and both well and fair spoken; and would use strange sweetness and blandishment of words, where he desired to affect or persuade any thing that he took to heart.

Bacon.
Shaksp. Tam. Shrew.

Hearing of her beauty and her wit,
Her affability and bashful modesty,
Her wond'rous qualities, and mild behaviour.

Shaksp.

He was of a most flowing courtesy and *affability* to all men ; and so desirous to oblige them, that he did not enough consider the value of the obligation, or the merit of the person. *Clarendon.*

All instances of charity, sweetness of conversation, *affability*, admonition, all significations of tenderness, care, and watchfulness, must be expressed towards children. *Taylor.*

Gentle to me and *affable* hath been
Thy condescension, and shall be honour'd ever
With grateful memory. *Milton's Par. Lost.* b. viii.

A cheerful mind is not only disposed to be *affable* and obliging ; but raises the same good humour in those who come within its influence. *Spectator.*

Distinguished as he [Euphrates, the philosopher] is by the sanctity of his manners, he is no less so by his polite and *affable* address. *Melmoth's Pliny*, letter x.

AFFAIR, *n.* Fr. *affaire*, from *à faire*, to do; deduced, says Menage, from *ad facere*. Whatever is, has been, or may be, the object of attention or pursuit ; business. Some of the Chroniclers have written *effiris*, *effers*.

Among monkes myght ich be. ac mený tyme ich sparre
For þr þeþ mený folle frækus. myne *afferes* to aspye.
Vision of Piers Ploughman, p. 95.

No man that warreth, entangleth hym self with the *affaires* of this life, because he wolde please him that hathe chosen hym to be a souldier. *Geneva Bible*, 2 Tim. ii. 4.

O douchty men, quod he, worthy in weris,
The gretest part of our werkis and *affiris*
Bene endit now, sa that in tyme cumming
All fere and drede ard passit of ony thing.
Douglas, b. xi. p. 359.

Bot than percease, gif they behald or se
Sum man, of grte auctorite and *affers*,
Thay ceise, and all still standand, giffis him eris.
Idem, b. i. p. 17.

CÆS. I have eyes upon him, and his *affaires* come to me on the wind : where is he now ? *Shaksp. Ant. & Cleop.*

I was not born for courts or great *affairs* ;
I pay my debts, believe, and say my prayers. *Pope.*

A good acquaintance with method will greatly assist every one, in ranging, disposing, and managing all human *affairs*. *Watts's Logick.*

What St. John's skill in state *affairs*,
What Ormond's valour, Oxford's cares,
To aid their sinking country lent ;
Was all destroy'd by one event. *Swift.*

The *affairs* of kingdoms, and the concerns of individuals are variegated alike with the checker work of joy and sorrow. *Cowper's Letters.*

AFFAIT' *v.* Used by the Chroniclers for *Defeat*.

þo þe kyng hem adde *afaited* so, þat hy ne kepte
nanmore hym mete.

gut he þogte asaytþ þe Scottes, ar he hem letc.
R. Gloucester, p. 177.

My father ye shall well beleue,
The yonge whelpe, which is *affaited*,
Hath not his maister better awaited,
To couche. *Gower. Con. A. b. i.*

AFFAM'ISH, *v.* See *FAMISH*. To starve
AFFAM'ISHMENT, *s* with hunger.

But the only image of that heavenly ray,
Whereof some glance doth in mine eye remayne,
Of which beholding the idea playne,
Through contemplation of my purest part,

With light thereof I doe myselfe sustayne,
And thereon feed my love-*affamish* hart.

Spenser. Sonnet lxxxvi.
What can be more unjust, than for a man to endeavour to raise himself by the *affamishing* of others' *Hall's Cuses of Conscience.*

AFFEAR' *v.* See *To FEAR*. Hence the participle *affear'd*, now considered a vulgarism, but used by Shakspere and Ben Jonson, in the same sense as afraid ; it is not however from the same root.

To Joppyn whan he cam, þe Soudan was not þere,
þe ston þe Soudan nam, Richard forto *affere*.

R. Brune, p. 187.

With scalled browes blake, and pilled berd :
Of his visage children were sore *aferd*.

Chaucer. The Prologue. The Somounour.
This wif was nor *aferde* ne *afrade*,
But boldely she saide, and that anon ;
Mary, I defie that false monk Dan John,
I kepe not of his tokenes never a del.

Idem. The Shipmanne's Tale.

A foole, where was thyne herte tho,
Whan thou thy wortliche ladie sie ?
Were thou *aferd* of hir eie ?

For of hir honde there is no dreade.

Gower. Con. A. b. iv.

Thauh ge come by fore kynges. and clerkes of þe lawe,
Beeþ nat a *ferd* of þat folke. for ich shal geve þow
tonge

Connynge and clericie. to conclude hem alle.

Vision of Piers Ploughman, p. 198.

Each trembling lease, and whistling wind they heare,
As ghastly bug, does greatly hem *affare*.

Sp. F. Q. 2, 3, 20.

Chin as woolly as the peach,
And his lip should kissing teach,
Till he cherish'd too much beard,
And made love or me *afear'd*.

Ben Jonson. Her Man Described.

Bleed, bleed, poor country !

Great tyranny, lay thou thy basis sure !

For goodness dares not check thee :

His title is *afear'd*. *Shakespeare's Macbeth.*

Be not *afear'd*, the isle is full of noises.

Shakespeare's Temp. 3rd. 2nd.

AFFECT, *v. & n.* Ad : *Facio, factum, to make to or towards.* In a strict and philosophical sense, to produce a pleasing or painful impression, which, in mental operations, is more or less indulged by the object acted upon, so as to occasion a re-action or moving towards another object, generally with kindness, tenderness and love ; to influence ; also to pretend to ; to assume ; to arrogate ; to manifest self-conceit, formality, preciseness, and hypocrisy. Affection was formerly synonymous with affection, in the sense of love and benevolence. Affectionate, in the sense of love and benevolence, as we now use both effectual and affectionate.

To pat sollempnité com lordes of renoun,
pat weddyng for to se, for gret affection.

R. Brune, p. 162.

Men schulen be louynghe hemself, couetouse, high
of berynge, proude, blasfemeris ; not obedient to
fadir and modir, unkynde, cursed, withouten *affec-*
cion. (*Aesopos.*) *Wicilif*, 2 Tymo. c. iii.

Be mery with them that are mery. Wepe also with them y^e. wepe. **Be of lyke affeccyon** one towradres another. *Bible.* 1539. Rom. xii.

Then gan the palmer thus: most wretched man, That to *affections* does the bridle lend; In their beginning they arc weak and wan, But soon through sufferance grow to fearful end.

Faerie Queene.

The duke of Brabande, named Antony, a man of great polcy and wysedome, forecasting y^e great sheding of Cristen manny's blode, with many other inconuenyencys lykely to haue ensyd of this variunce atwene theyse ii dukis, made such *affectionous* labour, yt with great dyfycute he pacfyed them agayn for that tyme. *Fabyan.* p. 561.

In things of their own nature indifferent, if either counsels or particular men have at any time, with sound judgment, misliked conformity between the church of God and infidels; the cause thereof hath been somewhat else, than only *affection* of dissimilitude. *Hooker.* b. iv. § 7.

These antick, lisping, *affected* phantasies, these new tuners of accents. *Shaksp. Romeo and Juliet.*

The passions that are enemies to the graces are, impudence, *affectionation*, strong and harsh degrees of pride, malice, and austerity. *Usher.*

Certainly there be that delight in giddiness, and count it a bondage to fix a belief, *affecting* free-will in thinking as well as in acting. *Lord Bacon's Essays.*

It seemeth that, as the feet have a sympathy with the head, so the wrists have a sympathy with the heart; we see the *affects* and passions of the heart and spirits are notably disclosed by the pulse. *Bacon's Nut. Hist.* No. 97.

It is not possible a man should have any long conference with God, and be no whit *affected*. *Hall's Contemplations.*

The sun

Had first his precept, so to move, so shino;
As might affect the earth with cold and heat,
Scarce tolerable. *Milton's Par. Lost.* b. x.

Didst thou pray with the same *affection* and labour as thou didst purchase thy estate?

Bishop Taylor's Sermons.

Some indeed have been so *affectedly* vain, as to counterfeit immortality; and have stolen their death, in hopes to be esteemed immortal.

Brown's Vulgar Errors, b. vii. c. 10. Perhaps they are *affectedly* ignorant: they are so willing it should be true, that they have not attempted to examine it.

Government of the Tongue, § 5.

By talking so familiarly of one hundred and ten thousand pounds, by a tax upon a few commodities, it is plain, you are either naturally or *affectedly* ignorant of our condition. *Swift.*

As a thinking man cannot but be very much *affected* with the idea of his appearing in the presence of that Being, whom none can see and live: he must be much more *affected*, when he considers, that this Being, whom he appears before, will examine the actions of his life, and reward or punish him accordingly. *Addison, Spectator.* No. 513.

Say, would'st thou conquer, have thy conquest crown'd
By hands of seraphs; triumphed with the sound
Of heav'n's loud trumpet; warbled by the shrill
Celestial choir; recorded with a quill
Plucked from the pinion of an angel's wing;
Confirmed with joy by heaven's eternal king
Conquer thyself, thy rebel thoughts repel,
And chase those false *affections* that rebel. *Quarles.*

Among the numerous stratagem^s by which pride endeavours to recommend folly to regard, there is scarcely one that meets with less regard than *affec-*

tation, or a perpetual disguise of the real character by fictitious appearances. *Rambl'r.*

We are forbidden to murmur, but we are not forbidden to regret; and whom we loved tenderly while living, we may still pursue with an *affectionate* remembrance, without having any occasion to charge ourselves with rebellion against the sovereignty that appointed a separation. *Couper's Letters.*

AFFECTIO BOVINA, in agricultural affairs, a disease incident to black cattle, occasioned by a little worm bred between the flesh and the skin; which works its way over all parts of the body. This seems to be the same disease described by Mr. Loudon, in his excellent Encyclopedia of Agriculture, recently published (1825,) as the *wornals* or *puckeridge*; or humours on the backs of cattle, occasioned by a dipterous insect which punctures their skin, and deposits its eggs in each puncture; but which is erroneously attributed to the fearn owl, or goat-sucker, (*caprimulgus Europeus*, L.) When the eggs are hatched, and the larvæ or maggots are arrived at their full size, they make their way out, he observes, and leave a large hole in the back, to prevent which, the destruction of the egg should be attempted, by nipping the humour, or thrusting in a hot wire.

AFFECTIO, in a philosophical sense, implies an attribute inseparable from its subject. Thus, magnitude, figure, weight, &c. are affections of all bodies; and love, fear, and hatred, are affections of the mind. Affection seems to express a settled bent of mind toward a particular being or thing, and occupies a middle space between disposition on the one hand, and passion on the other. According to some writers, it is distinguishable from disposition, which being originally seated in one's nature, must exist before there can be an opportunity to exert it upon any particular object, whereas affection can never be original, because, having a special relation to a particular object; it cannot exist till the object has once at least been presented. It is also distinguishable from passion, which, depending on the real or ideal presence of its object, vanishes with it; whereas affection is a lasting connexion, and subsists even when we do not think of the person. A disposition to gratitude, has thus been said to exist in a virtuous mind, which through want of an object, may happen not to be exerted; but the disposition, meeting with a kindly office, makes a man grateful to his benefactor. An intimate connexion is now formed between them, termed affection: which has a permanent existence, though not always in view. The affection for the most part lies dormant, till an opportunity offers for exerting it: in that circumstance it is converted into a passion of gratitude; and the opportunity is eagerly seized of testifying it in the warmest manner.

Dr. Cogan distinguishes between affection and passion; and discriminates between both these terms, and that feeling which is usually denominated emotion. The term affection, he says, has a different signification from either of the other two, and represents a less violent, and generally a more durable influence, which things have upon the mind. It is applicable to the manner in which we are affected by them

for a continuance; and supposes a more deliberate predilection and aversion, in consequence of the permanent influence of some prevailing quality. This distinguishes it from the transient impulse of passion; nor is it so intimately connected with any external *signs*, which distinguish it from emotion. The affections sometimes succeed to passions and emotions, because these may have been excited by something that becomes permanently interesting; or they may be gradually inspired, by a deliberate attention to the good or bad qualities of their objects. In this philosophic sense of the word, affection is applicable to an unpleasant as well as pleasant state of the mind, when impressed by any object or quality: it may be produced by any thing that torments or corrodes the heart, as well as by that which charms and delights it. Custom, however, chiefly appropriates the term to the kindly and benevolent affections. See *Philosophical Treatise on the Passions*.

Dr. Reid (*Essays*, p. 143, 167.) has applied in the same manner, the general name of affections to those various principles of action in man, which have persons for their immediate object, and which imply, in their very nature, our being well or ill-affected to some person, or at least, to some animated being; *Qd* whether they dispose us to do good or hurt to others. He observes, however, that the word affection seems, by custom, to be limited to good affections. Accordingly, when we speak of having affection for any person, it is always understood to be a benevolent affection. In the extensive sense above stated, our affections are very naturally divided into benevolent and malevolent, as they respectively imply our being well or ill affected towards their object. The characters of love and hatred, resulting from the infinitely various situations and circumstances upon which their developement and operations depend, entitle them to the denomination of primary or cardinal affections.

Our benevolent affections, whilst they differ in the feeling, or sensation, which is a common ingredient in all of them, and in the objects to which they are directed, agree in these two respects, *viz.*, that the feeling which accompanies them is agreeable, and that they imply a desire of happiness to their object. The first of these affections is that of parents and children, and other near relations, commonly called natural affections: the second, is gratitude to benefactors: the third, is pity and compassion towards the distressed; a fourth is esteem of the wise and good: the fifth is friendship: the sixth, is love between the sexes: and the last, is patriotism or public spirit; that is, an affection to any community to which we belong. The malevolent affections, (commonly called passions) in the arrangement of Dr. Reid, are emulation and resentment.

AFFECTION, *affectus*, in medicine, denotes any disorder under which the whole body or any part of it suffers; and it is generally defined by some epithet, as—*Affectio colica*, the colic affection, or simply the *colic*.—*Affectio melancholica*, melancholy.—*Affectus implicatus*, a complicated affection or disorder, or that in which many parts are

affected with different disorders. *Hippocrat. de Epidem. Gal. Comm. 2. &c.*

AFFER'ERS, } Affier; a kind of arbiters, or
AFFER'ORS, } referees appointed in courts leet, &c.

Affers are such as are appointed in courts leet, &c. upon oath, to mulct those who have committed faults arbitrarily punishable, and have no express penalty set down by statute. *Cowel.*

AFFERERS, in law, *afferatores*; those who in courts-leet, settle and moderate the fines, upon oath. *Hawkins Pleas. C. l. ii. c. 112.*

To **AFFERE**, in law, signifies either ‘as to affere an amercement,’ to mitigate the rigour of a fine; or ‘to affere an account,’ i. e. to confirm it upon oath in the Exchequer.

AFFERI, in archiol, are cattle fit for husbandry, according to our old law writers.

AFFETTUOSO, *affetto*, Ital. in music, in an affecting tender style; a term employed in music-books at the beginning of a movement; it denotes a movement, says Mr. Damely, between the adagio and the andante.

AFFIDATUS, or **AFFIDATUS**, a tenant by fealty. *Affidati*, are not properly vassals, but *quasi* vassals, or persons who vow fealty to, and put themselves under the protection of another. They are otherwise called *commendati* and *recommendati*.

AFFIDA'VIT, Law: Lat. *ad fidare*, *affidavi*, to pledge faith; a form of oath in writing, which can be administered only by persons qualified.

You said, if I return'd next size in Lent

I should be in remitter of your grace;
In th' interim, my letters should take place
Of *affidavits*. *Domw.*

Count Rechteren should have made *affidavit*, that his servants had been affronted; and then Monsieur Mesnager would have done him justice. *Spectator*, No. 481.

AFFIDAVIT OFFICE, in law, is an office in the court of Chancery, for taking an affidavit, or oath in writing, sworn before a master in Chancery; and made use of, and read in court, upon motions; though not allowed upon trials.

AFFIDIARE, in law, to be enrolled for a soldier upon an oath of fidelity.

AFFIE', *v* or *Affy'*, *Affier*, *Affidare*; to give or pledge faith; to trust, credit,

AFFI'ANCE, *Affiance*; to confide in; to plight troth, to bind one's self to the performance of a promise, or particularly the marriage contract; to be troth.

Richard answered per tille, and said, “it is foly,
To schewe counseil and skille, pat not is to *affie*,
And phit per own writte *per deede* dos certifie,
R. Brunne, p. 155.

She is Fortune verely
In whom no man should *affy*,
Nor in her yefts haue *flaunces*
She is so full of variaunce.

Chaycer. R. of Rose, fol. 141, col. 4.

At last such grace I found, and meanes I wrought,
That I that lady to my spouse had wonne;
Accord of friends, consent of parents sought,
Affiance made, my happinesse begoune.
Faerie Queene, b. ii.

The duke is virtuous, mild; and too well given,
To dream on evil, or to work my downfall.—

—Ah! what's more dangerous than this fond *affiance*?
Seems he a dove? his feathers are but borrowed.

Shaksp. Henry VI.

Wedded be thou to the hags of hell,
For daring to *affy* a mighty lord
Unto the daughter of a worthless king.

Idem.

Marcus Andronicus, so I do *affy*
In thy uprightness and integrity,
That I will here dismiss my loving friends.

Shaksp. Titus Andr.

Religion receives man, into a covenant of grace; where there is pardon reached out to all truly penitent sinners, and assistance promised, and engaged, and bestowed, upon very easy conditions; viz. humility, prayer, and *affiance* in him.

Hammond's Fundamentals.

There can be no surer way to success, than by disclaiming all confidence in ourselves, and referring the events of things to God with an implicit *affiance*.

Atterbury's Sermons.

AFFILE', v. or } See FILE. To rub or
AFILE'. } smooth by filing.—Obsolete.
For wel he wiste, whan that song was songe,
He must preche, and wel *afyle* his tonge,
To winne silver, as he right wel coude:
Therefore he sang the merier and loude.

Chaucer. Prologue. The Pardonere, v. i. p. 29.
For when he hath his tonge *afiled*,
With sote speche, and with lesyngc,
Forthwith his false pitous lokynge,
He wolde make a woman weene
To gone vpon the feire greene,
Whan that she fauleth in the myre.

Gower. Con. A. b. i.

AFFILIATION, AFFILIATIO, in writers of the middle age, is the same with ADOPTION. See AFFILIATION. Among the ancient Gauls, it was a sort of adoption practised only among the great, and performed with military ceremonies. The father presented a battle-axe to the person he was to adopt for his son, as an intimation that he was to preserve the effects he thus called him to succeed to, by arms.

AN ORDER OF AFFILIATION, in modern usage, is that which a magistrate issues on the oath of a woman to compel the father of an illegitimate child, to provide for its maintenance.

AFFINEITY, part. } Ad : *finis*, end. *Affinis*
AFFIN'ITY. } is primarily a relative by marriage; a relative of our relations; one who touches the boundary (*finis*) of another's relationship;—distinct from consanguinity. Applied to things, it signifies a relation arising from neighbourhood, association, real or supposed similarity, or resemblance.

For I am sure that Fryth and al his felowes, with al the friendes that were of theyr *affiniti*, shal neither be able to quenche and put out that faith.

Sir This. More's Works, p. 903. c. 2.

Osway assemblyd his kuyghtes, and made towardre hym: and for *affynite* of maryage that was atwene theyr children, Oswy offeryd to hym many great offirs to thentent to have had peace with hym.

Fabyan, p. 118.

If partially *affin'd*, or leagu'd in office,
Thou dost deliver more or less than truth,
Thou art no soldier.

Shaksp. Othello.

The British tongue or Welsh was in use, only in this island; having great *affinity* with the old Gallick.

Camden.

All things, that have *affinity* with the heavens, move upon the centre of another, which they benefit.

Bacon. Essay xiv.

They had left none alive; by the blindness of rage killing many guiltless persons, either for *affinity* to the tyrant, or enmity to the tyrant-killers.

Sidney. b. ii.

And Solomon made *affinity* with Pharaoh king of Egypt, and took Pharaoh's daughter.

1 Kings iii. 1.

The art of painting hath wonderful *affinity* with that of poetry.

Dryd. Dufresnoy, Pref.

Man is more distinguished by devotion than by reason; as several brute creatures discover something like reason; though they betray not any thing that bears the least *affinity* to devotion.

Addison, Spect. No. 201.

A breach was made with France itself, notwithstanding so strait an *affinity*, so lately accomplished; as if indeed, (according to that pleasant maxim of state,) kingdoms were never married.

Wotton.

AFFINITY, in law, preserving the sense of its etymology, *ad* to, and *finis*, a boundary, or limit, denotes the approach of two families by marriage to each other's boundaries: ‘Quod dum cognationes per nuptias copulantur, et altera ad alterius cognationes finem accedit.’

The Jewish law prohibits marriages with regard to affinity, which seem not prohibited by the law of nature. On its basis generally, our own civil law, and that of most European countries, has been established, ‘No person,’ says the ninety-ninth canon (1603), ‘shall marry within the degrees prohibited by the laws of God, and comprised in a table set forth by authority, in the year 1563; and all marriages so made and contracted shall be adjudged incestuous and unlawful.’ A table of these degrees is therefore commanded by the ecclesiastical law, to be hung up in all the churches of England. The statutes that contain them are 18 Henry VIII. c. 7, and 25 Hen. VIII. c. 12.

The Mosaic law positively enjoined, in some cases, one particular marriage, the lawfulness of which has often been discussed in modern times, i. e. that between a man and his brother's widow. See *Deut. xxv. 5.*

Bishop Hall well remarks on this topic, ‘I know no reason why you may not conclude it is not unlawful. The question of the expedience would require another debate. Doubtless, in all cases of this nature, it must needs be yielded that it were more meet and safe, since the world yields so large a latitude of choice, to look further off. A wise and good man will not willingly transgress against the rules of just expedience, and be as careful to consider what is fit to be done, as what is lawful.’ *Works. vol. 8. p. 493.*

A question of affinity, real or pretended, it is remarkable, became the exciting cause, in England, of our final deliverance from the domination of the see of Rome.

The canon law distinguishes three species of affinity: The first, contracted between the husband and the relations by blood of his wife; and between the wife and the relations by blood of her husband. The second, between the husband and those related to his wife by marriage, and the wife, and those so related to her husband.

The third, between the husband and the relations of his wife's relations; and the wife, and the relations of her husband's relations. By the fourth council of Lateran, held in 1213, it was decreed, that none but the first kind was any real affinity: the two last being mere refinements, which ought to be set aside. The degrees are reckoned after the same manner in affinity as in consanguinity; and therefore differently in the canon law, from what they are in the civil law. Thus, whatever line or degree of consanguinity the kindred of one of the parties married, are in, they are in the same line and degree of affinity to the other. And again, in whatever line or degree of affinity persons are, in the first kind, they are in the same in the second and third kinds of affinity. Hence arise what we may call a direct and collateral, an ascending and descending line of affinity. Affinity does not found any real kinship; it is a kind of fiction, introduced on account of the close relation between husband and wife. It is even said, in law, to cease when the cause of it ceases. Hence a woman who is not capable of being a witness for her husband's brother, during his life, is allowed to be a witness, when a widow, because the affinity is dissolved. Yet with regard to the contracting marriage, affinity is not dissolved by death, though it be in every thing else; for a man is not allowed to marry the widow of his father, brother, or son; such connection being considered as incestuous, nearly as much as if they were formed with the blood relations of the same degree.

The degrees and denominations of affinity are chiefly, First, father-in-law, i. e. husband's or wife's father, in Latin, *socer*; Second, step-father, i. e. mother's husband, *viticus*; Third, mother-in-law, i. e. husband's or wife's mother, *socrus*; Fourth, step-mother, i. e. father's wife, *noverca*; Fifth, son-in-law, i. e. daughter's husband, *genitor*; Sixth, daughter-in-law, son's wife, *nurus*; Seventh, step-son, i. e. husband's or wife's son by a former marriage, *privignus*; Eighth, step-daughter, i. e. husband's or wife's daughter by a former marriage, *privigna*; which two last, considered in relation to each other, are called *comprivigni*. These four last degrees are often confounded, and mistaken for each other; the step-son being called son-in-law, and the step-daughter, daughter-in-law, et vice versa, although no degrees of relationship are more distinct. Ninth, brother-in-law, i. e. husband's brother, sister's husband, *levir*, or wife's brother, *uxoris frater*; Tenth, sister-in-law, i. e. husband's or wife's sister, *glos*, or brother's wife, *fratria*. All these degrees are prohibited from intermarrying: to which may be added, Eleventh, the uncle-in-law, i. e. the aunt's husband; Twelfth, the aunt-in-law, i. e. the uncle's wife; Thirteenth, the nephew-in-law, i. e. the niece's husband; and Fourteenth, the niece-in-law, i. e. the nephew's wife, on either side.

AFFINITY, in chemistry, is a term which corresponds to attraction in mechanical philosophy, and denotes the tendency which the constituent parts of bodies have to unite, and the power by which they adhere when united. It has also frequently been called elective attraction. See CHEMISTRY, and ATTRACTION.

Other writers speak of compound affinity, the union of different bodies in one homogeneous mass. Intermediate affinity, an union by the help of a medium; as azote, with fixed alkalies, by the help of nitric acid.—Quiescent and divalent affinity; the former of these terms, expresses, according to Kirwan, the force exerted to preserve the old combination; and the latter, that which tends to destroy it.—Reciprocal affinity, when a separation is caused between two substances by a third, with which one of them is united, but afterward separated again by the influence of the separating principle.—Compound elective affinity, or double elective attraction, when there are more than four substances; as, if nitric acid be added to the sulphate of ammonia, decomposition takes place; but if nitrate of potash be added, then two new bodies are formed, that is, the potash attracts the sulphuric acid, and the nitric acid the ammonia.

AFFINITY, in civil law, is divided into civil, between free persons; and servile, between slaves.

AFFINITY, LEGITIMATE, is contracted by a proper and legal matrimony; or between slaves, by *contubernium*.

AFFINITY, QUASI, that subsisting either after the dissolution of a marriage, as between a husband and his wife's daughter, after divorce; or before the marriage is solemnized, as that between a father and a daughter-in-law, not married but only betrothed to his son.

AFFINITY, SPIRITUAL, in the church of Rome, is contracted by the sacraments of baptism and confirmation; according to which, a god-father may not marry with his god-daughter, without a dispensation.

AFFINITY, KEYS OF, or relative keys, in music, regular pieces being composed in keys properly fixed and determined, with which they begin and end, and which are occasionally resumed, they are called primitive or principal keys, major or minor; and these are, properly speaking, surrounded by five others, to which they bear a strong affinity, or relationship; for example:—

- C major, primitive key.
- D minor, first relative key;
- E minor, second relative key;
- F major, third relative key;
- G major, fourth relative key;
- A minor, fifth relative key.

- A minor, primitive key;
- C major, first relative key;
- D minor, second relative key;
- E minor, third relative key;
- F major, fourth relative key;
- G major, fifth relative key.

'These six primitive keys offer, in their combination,' says Mr. Dannely, '720 changes, and were those formerly used by the most celebrated composers, from the time of Palestrina to Sebastian Bach; but unfortunately for the cause of music, scarcely any mention is made of them in the present day. See ENCHAINING OF HARMONIES.'

AFFION, in chemistry, a name given by the Arabians to opium; and also to an electuary, in which opium is an ingredient.

AFFIRM, v.
AFFIRM'ABLE,
AFFIRM'ANCE,
AFFIRMA'TION,
AFFIRM'ATIVE, adj.
AFFIRM'ATIVELY,
AFFIRM'ER. Ad : *firme*, to support; opposed to the word deny; to certify, declare positively, avouch the truth, assure, ratify; to affirm is a solitary, to *confirm* is an assisted asseveration.

pe pape set pat terme, for his hopyng was,
 pe pes pei suld afferme for drede of hardere kas.

R. Brunne, p. 316.

And take this for a generall reule, that every conseil that is *affirmed* so strongly, that it may not be chaunged for no condition that may betide, I say that thilke conscil is wicked.

Chaucer. *Tale of Melibeuſ*, vol. ii. p. 93.

Dame Pertelote I say you trewely,

Macrobius that writh the avision

In Afrike of the worthy Scipion,

Affirmeth dremes; and sayth that they ben

Warning of thinges that men after seen.

Chaucer. *Nonneſ Preſte's Tale*.

To appease the multytude, the kyng tokē the childe in his armys, and so bare hym into the place of th assemble of the people, and there shewed vnto theyn, wt *affirmanſe* of great othes, that his entent was onely for the wele of the childe, and for defence of his countre.

Fabyan, p. 187.

Yet it is not cuen ſo, ſo fible as his owne, where he argueth in the negative, as I lay the ſample for th *affirmatiue*. Sir T. More's Works, p. 1131. c. 1.

For the *affirmative*, we are now to answer such proofs of theirs, as have been before alleged.

Hooker.

The common opinion of the Oestridge, struthiocamelus, or sparrow camel, conceives that it digests iron, and this is confirmed by the *affirmations* of many.

Brown's *Vulgar Errours*.

It is as gross a paradox to hold there are no antipodes, and that the negative is now as absurd as the affirmative seemed at first.

Howel's Letters.

Whether there are ſuch beings or not, 'tis ſufficient for my purpose, that many have believed the affirmative.

Dryden.

One may *affirm*, with all respect to the inspired writings, that the divine Spirit made use of no other words but what were intelligible and common to men at that time, and in that part of the world; and as Homer is the author nearest to those, his ſtyle muſt of course bear a greater reſemblance to the ſacred books, than that of any other writer.

Pope.

AFFIRMATION, in law, ſignifies the ratifying or confirming a former law, or judgment: Thus we ſay, the house of lords, on an appeal, affirmed a decree of the lord Chancellor, or of the court of Session. Affirmation is also a ſolemn form of attesting the truth, allowed to be used by the Friends or Quakers, instead of an oath, which they hold absolutely unlawful to take.

The Friends have, from the earliest appearance of the ſociety, been very steady in their objections, and have submitted to all kinds of civil disadvantages and open persecution, on account of their repugnance to oaths. It is our plan to bring forward the opinions of all respectable parties, with their own way of ſtating them. The last, and one of their most respectable writers, Mr. Jos. John Gurney, ſays, that 'Such a line of conduct they deem to be both justified and required, first, by certain plain moral principles; and ſecondly, by divine commands of the

most impressive and comprehensive character. For the moral principles concerned, he quotes James i. 12; Matt. v. 37; and adds, 'Since the law of truth in the verbal communications between man and man, a law strenuously supported even by heathen moralists, and obviously essential to the well being of all human ſocieties, is very frequently enjoined in the records of God's revealed will; since it is plainly of universal obligation on the followers of Jesus; and since, on the other hand, there is nothing more decisively condemned than the false tongue: it follows, that with true Christians a deliberate and serious, yet ſimple affirmation, or negation, possesses a force ſo perfect in its kind as to be incapable of any real augmentation. Hence there arises a plain moral, obligation in conformity with the precept of the apostle James, that our yea ſhould be yea, and our nay nay—that is to ſay, that our affirmations and our negations ſhould be naked and ſimple, and wholly unaccompanied by any form of oath. For if, on any particular occaſion, a man ſwear in addition to his yea and nay, in order to render them more obligatory and convincing, their force becomes comparatively weak at other times, when they receive no ſuch confirmation. If ſuch an one be a believer in the Lord Jesus Christ, and especially if he be a ſerious professor of religion, it is plain, that by his conduct he gives countenance to the false and dangerous notion that the oath of a Christian is more binding upon his conscience, and therefore more credible than his deliberate word, and thus he invariably lowers the standard of the law of truth.'—Gurney on the Religious Peculiarities of the Friends, 8vo. 1824.

AFFIRMATION, in logic, a positive proposition alleging the truth or reality of something. In algebra, also, affirmative or positive quantities, terms introduced by Vieta, i. e. those which have their appropriate characters.

AFFIRMATIVE, in grammar. Authors distinguish affirmative particles, ſuch as *yes*, from *negatives*, ſuch as *no*. The term affirmative is also used substantively, because we ſay, the affirmative is the more probable ſide of the question; there were ſo many votes, or voices, for the affirmative, &c.

AFFIRMATIVE, in the Romish inquisition, is applied to ſuch heretics as own the errors and opinions with which they are charged; and maintain them in their examination with firmness and resolution.

AFFIX' v. & n. Ad : *figo, fixum*; to fasten

AFFIX'ON. n. to; to unite to the end; ſubjoin; attach; closely connect with.

Before that tyrantis zet of men, that dede is,

Affixit, studi mony dolorus hedis,

With viſage blaiknyt, blude berun, and bla,

The laithlie odoure of filth ſtill and therfra.

Douglas, b. 8. p. 247

Her modest eyes, abashed to behold

So many gazers as on her do stare,

Upon the lowly ground *affred* are.

Spenser.

Six ſeveral times do we find that Christ ſhed his blood; in his circumciſion, in his agony, in his crowning, in his scourging, in his *affixion*, in his transfixion.

Bp. Hall.

He, that has ſettled in his mind determined ideas,

with names *affixed* to them, will be able to discern their differences one from another. *Locke.*

If men constantly *affixed* applause and disgrace, where they ought; the principle of shame would have a very good influence on publick conduct; though, on secret villanies, it lays no restraint.

Roger's Sermons.

The doctrine of irresistibility of grace, in working whatsoever it works; if it be acknowledged, there is nothing to be *affixt* to gratitude.

Hammond's Fundamentals.

AFFIX, in grammar, a particle added at the close of a word, either to diversify its form, or alter its signification; in which sense affix is the same with *suffix*; though affix is sometimes, but less properly, applied more generally, so as to include prefix particles. We meet with affixes in the Saxon, the German, and other northern languages; but more especially in the Hebrew, and other oriental tongues. The Hebrew affixes are single syllables, frequently single letters, subjoined to nouns and verbs; and contribute not a little to the brevity of that language. The oriental languages are much the same as to the radicals; and differ chiefly from each other as to affixes and prefixes.

A-FLAT, in music, is the ninth diatonic-chromatic note of the scale of C.

A-FLAT MAJOR, one of the twenty-four keys in modern music, requiring a signature of four flats.

A-FLAT MINOR, one of the twenty-four keys in modern music, requiring a signature of seven flats.

AFFLATUS. Ad: *flo*, to breathe upon; a divine influence communicating to the receiver supernatural powers, particularly the gift of prophecy.

The prophets and teachers, in those times, are reckoned as men who exercised those offices by a spiritual *afflatus*, and were enabled to perform them by the miraculous gifts of the Holy Spirit then vouchsafed to them.

Whitby on the New Testament, Gen. Pref.

The poet, writing against his genius, will be like a prophet without his *afflatus*.

Spence on the Odyssey.

AFFLATUS. Naturalists sometimes speak of the *afflatus* of serpents. Tully uses the word figuratively, for a divine inspiration. In which sense, he ascribes all great and eminent accomplishments to a divine *afflatus*. The Pythian priestess being placed on a tripod or perforated stool, over the sacred cave, received the divine *afflatus*, and fell into phrenetic agitation; during which, she pronounced, in hollow groans and broken sentences, the will of the deity. The *afflatus* is supposed by some, to have been a subterraneous gas, or exhalation, wherewith the priestess was literally inspired; and that, it had the effects of a real physical disease; the paroxysm of which was so vehement, that Plutarch observes, it sometimes proved mortal. But Van Dale, with more probability, supposes the pretended enthusiasm of the Pythia to have arisen from the fumes of aromatics, or perhaps of intoxicating liquors.

AFFLICT, v. Ad: *fligo*, to throw to

AFFLIC'TION, } the ground; to cast down;

AFFLIC'TIVE, } deject; throw into a state

AFFLIC'TIVELY, } of consternation, grief, sor-

row, calamity; to undo; trouble, disquiet, distress, torment.

Abbay and priorie, and oþer religions,
For vs salle pray and crie in þer afflictions.

R. Brunne, p. 202.
Sir T. More's Works, p. 1080. c. 2.

For as Salomon sayth: the hope that is deferred and delayed, paineth and afflicteth the soule.

Sir T. More's Works, p. 1080. c. 2.

For as the afflictions of Christ are plenteous in vs, even so is oure consalacion plenteous by Christ.

Bible, 1539, 2 Cor. i.

To the flesh (as the apostle himself granteth) all affliction is naturally grievous; therefore nature, which causeth fear, teacheth to pray against all adversity.

Hooker, b. v. § 48.

We'll bring you to one that you have cozened of money; I think, to repay that money, will be a biting affliction.

Shakespeare.

If a man be gracious and courteous to strangers, it shews he is a citizen of the world; and that his heart is no island cut off from other lands, but a continent that joins to them. If he be compassionate towards the afflictions of others, it shews that his heart is like the noble tree, that is wounded itself, when it gives the balm.

Lord Bacon's Essays.

Nothing does so powerfully call home the conscience, as affliction.

Hall's Contemplations.

Yet in the middes of this afflictio, and to make an end of the same, God of his ineffable goodness, looking on this countrey, with his eyes of pitie and aspect of mercie hath sent me in the truth to restore again this decayed kyngdō to his auncient fame and olde renoume.

Hall, p. 247.

What! when we fled amain, pursued and struck

With heaven's afflictiong thunder, and besought

The deep to shelter us? This hell then seem'd

A refuge from those wounds.

Milton's Paradise Lost, b. ii.

And because affliction is of such a nature as to try the temper, disposition, and intentions of men, therefore temptation often is used for affliction.

Barrou.

God deals with his children as a merciful father; he does not, as he himself tells us, afflict willingly the sons of men.

Couper's Letters.

AFFLUENCE, n. Ad: *fluo*, to flow to;

AFFLUENT, } a metaphor derived from

AFFLUX, } the flowing of water,

AFFLUX'ION, } which announces speedy

abundance: hence, affluence is the forerunner of prosperity, and denotes wealth, plenty, exuberance.

As they lived in great affluence and ease, we may presume that they enjoyed such pleasures as that condition afforded, free and uninterrupted.

Sydney's Criticism on Pastoral Writing.

External or worldly prosperity, consists in an accomodate condition of man in this world, as health of body, comfort of friends and relations, affluence or at least competency of wealth, power, honour, applause, good report, and the like.

Hale's Contemplations.

An inflammation, either simple, consisting of a hot and sanguineous affluxion; or else denominable from other humours, according unto the predominancy of melancholy, phlegm, or choler.

Brown's Vulgar Errors.

Though an unwieldy affluence may afford some empty pleasure to the imagination; yet, that small displeasure is far from being able to countervail the im-bittering cares that attend an over-grown fortune.

Boyle's Occasional Reflections, § 4. dis. 11.

The cause hereof cannot be a supply by procreations; ergo, it must be, by new affluences to London out of the country.

Graves.

The infant grows bigger out of the womb, by agglutinating one *afflux* of blood to another.

Harvey on Consumptions.

An animal that must lie still, receives the *afflux* of colder or warmer, clean or foul water, as it happens to come to it.

Locke.

AFFLUX, in electricity, is opposed to efflux; it was a term in general use previously to the discovery of positive and negative electricity. It was apprehended that in all electrical operations, there was both an afflux of electrical matter to the globe and the conductor, and an efflux of the same matter from them. Dr. Watson soon corrected this opinion; but the Abbé Nollet was more tenacious; and was confirmed in his attachment to this theory, by observing, that bodies not insulated, plunged in electric atmospheres, showed signs of electricity; not perceiving, that the electricity of such bodies was in its nature and effects different from, and directly opposite to, that of the electrified body, in the atmosphere of which they were involved.

See ELECTRICITY.

AFFORAGE, in the French customs, before the revolution, was a duty paid to the lord of a district, for permission to sell wine, or other liquors, within his seignory.

AFFORARE, in old law, to set a value on any thing.

AFFOREMENT, or AFFOIAMENT, in ancient charters, a fortress, or work of fortification and defence.

AFFOIAMENTUM CURIA, in law, the calling a court on any extraordinary occasion.

AFFORCIARE, in law, to add, increase, or strengthen; as in the case of a jury, cum in veritate dicenda sunt sibi contrariorum; i. e. when they are not agreed on their verdict.

AFFORD', v. - The etymologies given of this word are unsatisfactory. It signifies to yield, produce, grant, give; also, to furnish for a certain price.

So soon, as Maurmon there arriv'd, the door
To him did open, and afforded way.

Faerie Queene.

MOWB. The purest treasure mortal times afford,
Is spotless reputation; that away,
Men are but gilded loam or painted clay.

Shakspeare's Richard II.

This is the consolation of all good men, unto whom his ubiquity affordeth continual comfort and security; and this is the affliction of hell, to whom it affordeth despair and remediless calamity.

Brown's Vulgar Errors.

KING. Why speakest thou not?

HIER. What lesser liberty can kings afford,
Than harmless science? Then afford it me.

Spanish Tragedy, 2nd edit, act v.

They fill their magazines, in times of the greatest plenty; that so they may afford cheaper, and increase the public revenue, at a small expence of its members.

Addison on Italy.

AFFORESTING, part. turning ground into forest. William the Conqueror, and his successors, continued afforesting the lands of the subject for many reigns; till the grievance became so notorious, that the people of all degrees and denominations were brought to sue for relief; which was at length obtained, and commissions were granted to survey and perambulate the

forest, and separate all the afforested lands, and re-convert them to the uses of their proprietors, under the name and quality of purlieu or pouralle land.

AFFRAP' v. Ital. *affrapare*; Fr. *affrapper*, to strike; to make a blow at; encounter; strike down.—Obsolete.

He gan to encounter him in equal race,
They beene ymet, both ready to *affrap*,
When suddenlynay that warriour gan abase,
His threatened speare, as if some new mishap
Had him betide, or hidden danger did entrap.

Faerie Queene, b. ii. c. 1.

I have beene trained up in warlike stowre,
To tossen speare and shield, and to *affrap*
The warlike rider to his most mishap.

Idem. b. iii. c. 2.

AFFRAY', v. & n. } *Effrayer*, Fr. to frighten.
AFFRAID'. } *Affraide*.

The verb is obsolete; the noun signifies a tumultuous assault upon one or more persons in public.

pe stones were of Rynes, pe noyse dedefulle & grete
It *affraied* pe Sarazins, as louen pe fire out schete.
pe noyse was vnride, it lasted alle day,
Fro morn till even tide, per of had many *affray*.

R. Brunne, p. 174.

Me me thus in my bed al naked,
And lised forthe, for I was waked
With small foules a great hepe,
That had *affraied* me out of my slepe,
Through noise, and swetnesse of ther songe.

The Dreame of Chaucer, fol. 241, c. 1.

I was out of my swowne *affraide*,
Wherof I sigh my wittes straide,
And gan to clepe hem home ageyne.

Gower. Con. A. b. viii.

Thys wourthy knyght the commen wele Ronane,
In grete *affray* perturbit to rest agane
And quiet sall restore.

Douglas. b. vi. p. 196.

God so *affrayed* me wt so terrible a dreame, that all things beganne to be to me suspecte, ferefull, unsanory and redye to fall fro me.

The Exposition of Daniel, by George Joye, f. 50. c. 2.

Be not your herte *affrayed*, ne dredre it: ye bilcuren in God, and beleeue ye in me. In the hous of my fadir, ben manye dwellingis.

Wyclif. Jon. c. xiv.

And lightly started vp as one *affrayd*,
Or as if one him suddenly did call,
So, oftentimes he out of sleep abrayd,
And then lay muzing long, on that him ill apay'd.

Spenser's Faerie Queene, b. iv. cant. 5.

To be *afraid* to die, or wish for death,
Are words and passions of despairing breath;
Who doth the first, the day doth faintly yield,
And who the second basely flies the field.

Quaries

A goddess arm'd,
Out of thy head I sprung. Amazement seiz'd
All the host of heaven; back they recoil'd *afraid*
At first, and call'd me Sin, and for a sign
Portentous held me.

Milton's Par. Lost. b. ii.

Be not of us *afraid*,
Poor kindred man! thy fellow-creatures we,
From the same parent-power our beings drew,
The same our Lord, and laws, and great pursuit.

Thomson.

AFFRAY, in English law, from the French, *affrayer*, to affright, formerly was defined, to be,

'a public offence to the terror of the king's subjects,' as where persons appeared with armour or weapons, not usually worn, to the terror of others. *Stat. 2 Edw. III.* cap. 3. Its legal description is still best contained in the words of that statute: 'That no man of what condition soever, except the king's servants in his presence, and his ministers in executing their office, and such as be in their company assisting them; and also upon a cry made for arms to keep the peace, shall come before the king's justices, or other of the king's ministers doing their office, with force and arms, nor bring any force in *affray of peace*, nor go nor ride armed, by night or day, in fairs or markets, or in the presence of the king's justices, or other ministers elsewhere; upon pain to forfeit their armour to the king, and their bodies to prison at the king's pleasure. And the king's justices in their presence, sheriffs, and other ministers in their bailiwicks, lords of franchises and their bailiffs in the same, and mayors and bailiffs of cities and boroughs within the same, and borough-holders, constables, and wardens of the peace within their wards, shall have power to execute this act. And the judges of assize may punish such officers as have not done their duty therein.' But it now also implies a skirmish or fighting between two or more, in some public place, to the terror of his majesty's subjects; and there must, it is said, be a stroke given or offered, or a weapon drawn, otherwise it is not an affray; for if the fighting be in private it is no affray, but an assault. *3 Inst. 158.* It is inquisitable in the courts-leet, and punishable by justices of peace in their sessions, by fine and imprisonment.

An affray differs from an assault, in that it is a wrong to the public; whereas assault is of a private nature. *Lamb. lib. ii.* Affrays may be suppressed by any private person present, who is justifiable in endeavouring to part the combatants, whatever consequences may ensue. But a constable, or other similar officer, may break open doors to suppress an affray, or apprehend the affrayers; and he may either take them before a justice, or imprison them by his own authority for a convenient time, till the heat is over; and may then, perhaps, also make them find sureties for the peace. *3 Inst. 158.* *1 Haykins P. C. 134, 136, 138.*

Affrays admit of several degrees of aggravation, as when two persons deliberately engage in a duel, though no mischief has actually ensued; or when the officers of justice are disturbed by an affray, in the due execution of their office, or where it occurs in the king's court and such places. All affrays again in a church or church-yard are deemed heinous offences; and therefore it is enacted, by Stat. 5 and 6. Edw VI. c. 4. that if any person shall, by words only, quarrel, chide, or brawl, in a church or church-yard, the ordinary shall suspend him, if a layman, *ab ingressu ecclesie*; and, if a clerk in orders, from the ministration of his office, during pleasure. And, if any person in such church or church-yard proceed to smite or lay violent hands upon another, he shall be excommunicated, *ipso facto*; or if he strike him with a weapon,

or draw any weapon with intent to strike, he shall, besides excommunication (being convicted by a jury,) have one of his ears cut off; or, having no ears, be branded with the letter F. in his cheek. *Blackst. vol. iv. p. 146.*

AFFREIGHTMENT, AFFRETAMENTUM, from the French *fret*, in law, signifies the freight of a ship.

AFFRET, v. See **FRET**.

A trumpet blew; they both together met
With dreadfull force and furious intent,
Careless of peril! in their fierce *affret*.

Spencer's Faerie Queene, b. iv. c. 3.

AFFRIEND, v. See **FRIEND**.

Where when she saw that cruel war so ended,
And deadly foes so faithfully *affrended*,
In lonely wise she gan that lady greet,
Which had so great dismay so well amended.

Spencer's Faerie Queene, b. iv. c. 3.

AFFRIGHT, v. & n. A. S. *Afýnhtan*, or
AFFRIGHT'ER, *Afýpan*, to frighten;
AFFRIGHT'EDLY, to affect with sudden
AFFRIGHT'FUL, fear; to terrify.
AFFRIGHT'MENT.

William was oglýft, his helm was fulle of myre,
William was not paied, pat falle mad him *afright*
He stode alle dismaide

R. Brunne, p. 70.

By God me mette I was in swiche misches
Right now, that yet min herte is sore *afright*.
Chaucer. The Nonnes Preestes Tale, v. ii. p. 178.

When now the genius of this woeful place,
Being the guide to his *affrightful* ghost,
With hair dishevell'd, and a ghastly face,
Shall haunt the prison where his life was lost.

Droyton. Baron's Wars.

As one *afright*
With hellish fiends, or furies mad uproar,
He then uprose. *Faerie Queene*, b. ii. caut. 5.

As the moon, cloathed with cloudy night,
Does shew to him, that walks in fear and sad *affright*.
Item.

K. JOHN. Nay, but make haste, the better foot
before,

O let me have no subjects enemies,
When adverse foreigners *affright* my towns
With dreadful pomp of stout invasion.

Shakespeare's K. John.

Thy name *affrights* me, in whose sound is death.
Shakespeare's Henry VI.

Ev'n those who dwell beneath its very zone,
Or never feel the rage, or never own,
What happier natures shrink at with *affright*,
The hard inhabitant contends is right.

Pope. Essay on Man.

AFFRONT, v. & n. Ad: *frontem*, stare: *ad frontem contumeliam allidere*, to insult a man to his face; to present a hostile front to a person like opposing armies; to meet face to face; to face; to encounter; to offer an insult; to offend designedly; to treat contemptuously or rudely.

For ich ne wiste wher to ete. ne in what place
And neyheude ny pe noon. and with neode ich mette
That *afrontede* me foule. and faitor me calde.
Vision of Pier's Ploughman, p. 392.

In this meane whyle king Philip and the French
king with two more puissant armies, *afronted* eche
other peere vnto the water of Some, eyther *of* them
being obstinately bent to drive the other out of the
fielde, for which cause they entrenched their campes.

Grafton, v. ii. p. 565.

He highly leapt out of his place of rest,
And rushing forth into the empty field,
Against Cambello, fiercely him addrest;
Who him *affronting*, soone to fight was ready prest.
Faerie Queene, b. iv. c. 3.

Skilfull capitaines in arrauning of their battailes,
place first in the vanguard, thicke and strong
squadrions to *affront* the enemie, then light armed
souldiors, afterwards the archers and darters, and last
of all in the rereward, the companies of succours.

Holland's Trans. of Ammianus Marcel.

He would often maintain Plantianus, in doing
affronts to his son *Bacon's Essays.*
I neer attempted aught against thy life,
Nor made least line of love to thy loose wife,
Or in remembrance of thy *affront* and scorn,
With clowns and tradesmen kept thee clos'd in horn.

Ben Jonson. Exeration of Vulcan.

Did not this fatal war *affront* thy coast?
Yet sattest thou an idle looker on *Fairfax*, i. 51.
But harm precedes not sin; only our foe,
Tempting, *affronts* us, with his foul esteem
Of our integrity. *Par. Lost*, b. ix.

Ah! spare your swords, where beauty is to blame;
Love gave th' *affront*, and must repair the same. *Waller.*

I would learn the cause, why Torrismond
(Within my palace walls, within my hearing,
Almost within my sight,) *affronts* a prince,
Who shortly shall command him. *Dry. Span. Friar.*

This brings to mind Faustina's fondness for the gladiator, and is interpreted as satire: but how can one imagine, that the fathers would have dared to *affront* the wife of Aurelius?

Addison.

—Yea, often plac'd

• Within his sanctuary itself, their shrines,
Abominations; and with cursed things
His holy rites, and solemn feasts profan'd,
And with their darkness durst *affront* his light.

Milton.

AFFRONTEE, from *ad*, to, and *frons*, the forehead, in heraldry, an appellation given to animals facing one another on an escutcheon; a kind of bearing which is otherwise called *confrontee*, and stands opposed to *adossee*.

AFFUIAGE, **AFFUIAGUM**, from *affoer*, q. d. *affocare*, to make a fire, of *ad* and *focus*, in ancient customs, a right of cutting fuel in a forest, for domestic fire.

AFFUSE', { Ad: *fundo, fusum*; to pour
AFFUS'ION. { one thing on another.

I poured acid liquors, to try if they contained any volatile salt or spirit; which would probably have discovered itself, by making an ebullition with the *affused* liquor.

Upon the *affusion* of a tincture of galls, it immediately became as black as ink. *Grew's Museum*

When the Jews baptized their children in order to circumcis^o, it seems to have been indifferent to them whether it was done by immersion or *affusion*.

Wheatley on the Com. Prayer, p. 362.

A F G H A U N I S T A U N .

AFGHAUNISTAUN or **AFGHANISTAN**, a kingdom of Asia, situated between Persia and Hindostan, and forming a considerable portion of Caubul, bounded on the E. by the river Niblab or Indus, on the N. by Hindoo Coosh and the Paropamisan range of lofty mountains, separating it from Bulkh and Budukhshan, on the W. by Persia, on the S. by Baloochistan. It lies between 29 and 36 degrees of N. Lat. and 61 and 71 E. Long. including the ancient kingdoms of Zabuliston, (Ghizne and Kandahar) and Kabuliston. All that lies west of the parallel of Mooklor, 68°, 30', is comprehended in the extensive province of Khorassaun. The mountains are considerable. The peaks of Hindoo Coosh are said to be higher than the Andes. Lieutenant Macartney estimated one of the summits of this range of mountains at 20,493 feet. The elevation must be very great, since the Honourable Mountstuart Elphinstone could perceive no diminution of snow on any part of this lofty range in the midst of June, although in the plain of Peshawer, the thermometer was 113°. The course of these mountains is W. from the Indus to L. 71°, beyond which their direction is not accurately known.

The lower ranges are clothed with woods, and adorned with flowers. The range of Solimaun commencing from Suffaid Coh, or White Mountain, runs S. S. E. through Janjee, and then striking off afresh in a southerly direction, forms the country of the Jadrauns, extending as far as 31° N. Lat. It is accompanied by two minor

ranges of beautiful hills in a parallel direction along its eastern side, reaching as far as latitude 32° 20', every where diversified with valleys, and intersected with rivers, beside several minor hills, which running E. and W. divide and beautify the landscape on both sides of the great chain. The first and loftiest range is chiefly composed of black stone; the two less chains consist, one of red stone, and the other of a friable grey sand stone. The Suffaid Coh is always covered with snow. The Paropamisan chain runs 350 miles E. and W., and extends 200, N. and S. the whole forming one rude mass of barren mountains, the interior of which has never been explored by Europeans.

Of the rivers, the Indus is the most important, which, although it has been traced 1350 miles, its entire course is not known. The desolate condition of the country has prevented its springs from being correctly ascertained. It receives many rivers in its source, and fifty miles from Mullau, flows along an open country, and spreading upon the plain near the fort of Attock, forms a multitude of islands, receives the river Caubul, and then suddenly contracting, rushes through a narrow opening into the branches of the Solimaun. At the distance of fifteen miles from Neelaub, it is said to be only a stone's throw across, but very deep and rapid. It afterwards winds among the hills, passes through the Salt range in a clear quiescent stream, and then widening to its full extent, it flows along in grand and beautiful magnificence, till receiving the

river Punjund, it takes a south-west curve across the country of Sind, where it forms an island, dividing itself into two streams, the principal of which again divides, till at last the whole river disembogues itself by many mouths into the Arabian gulph.

The Helmund or Etymander, rises on the eastern side of the Parapamisan range, a few miles west of Caubul, after a course of 200 miles among mountains, enters the plain of Dooraunes, then enters a desert, and terminates in the lake of Seestaun, the whole length being about 400 miles. There are many other rivers, but of comparatively little importance.

The climate of Afghaunistaun is very various, in consequence of the different degrees of elevation, direction of the winds, &c. The higher parts are hot, the middle temperate, and the lower cold. The average heat is inferior to that of India. The cold in the winter is not great, and when Mr. Elphinstone was at the plain Peshawer, snow had been seen but once in the memory of the oldest inhabitants. Some Indian plants are in leaf all the year, and early in April the barley was in ear, which was cut the first week in May. The heat was often intense, but attained its height by the 23d of June; and in the middle of July, a cool wind set in from the east, which was succeeded by cool cloudy weather. The greatest height of the thermometer, during the year, was 120°, its greatest depression 25°.

The summer in Hindostan is intensely hot, so much so, that the inhabitants wet their clothes before they go to sleep, but south of the valley of Turnuk, the cold is as great as in any part of the country. Western winds are common, and generally bring rain. The easterly winds are hot and dry. In the warmest parts of the kingdom, the pestilential simoon is common. Although the climate is on the whole favourable to longevity, fevers and agues are common, and the small pox is extremely prevalent, notwithstanding the almost universal practice of inoculation. Ophthalmia is also frequent, and the diseases of Afghaunistaun have been generally observed to be much more fatal than those of India.

The monsoon is attended with less violence than in the latter kingdom, and is exhausted near the sea. In the N. E. however, it is more violent; and what is most remarkable is, that it comes from the east. What the Indians call the S. W. monsoon, commences on the Malabar coast in May; but is later in Mysore, and in the north commences in June. The rains diminish toward the west, while the winter rains extend as far as the Hellespont. The spring rains are, generally speaking, short; in some places not more than a fortnight.

The animals of Afghaunistaun are not numerous. There are, nevertheless, tygers, lions, wolves, and bears, in the woods. The antelope is found in the plains. Buffaloes, dromedaries, and sheep, are in great abundance. The dogs are similar to those of England, and the cats are so valuable as to be exported. Herant and some other districts have been long celebrated for beautiful horses, and deer with long, curiously twisted, branching horns.

The birds are, generally, similar to our own.

There are however three kinds of eagles. The shauheen is taught to attend the falconer, and to strike the quarry in its attempt to escape. The chirk strikes on the antelope, and holds it till the greyhounds arrive.

Scorpions are found; but their bite is seldom fatal. Bees and mosquitoes abound in every part of the empire. The locusts, which are the most terrible, come up over the face of the whole country, bringing famine and desolation. The chief fish are turtles and tortoise.

The trees greatly resemble those of Europe; they are, however, much finer, and more numerous: our finest fruits grow wild. Oaks, cedars, and cypresses, are common; also the mulberry, tamarisk, willow, plane, and poplar. One species of pine flourishes here, called jelgoozeh; the cones of which are larger than artichokes, and contain seeds resembling pistachio nuts.

Gold is found in the rivers, especially those which flow from Hindoo Coosh. Silver is found in the country of Caufirs. In the country of Afreedes and Hazaurehs, and other places, are lead and antimony. Iron and copper are found in the country of Vizeeres; alum in the clay of Callabaugh; orpiment in the country of Hazaurehs and Bulkh; salt-petre is made from the soil all over the kingdom; and sulphur is found in Bulkh and Seeweestaun.

The Afghauns trace their descent from Afghaun and Usbec, grandsons of Saul, king of Israel, whom they represent as the forty-fifth in descent from Abnah, raised from a shepherd to a king, because his stature was exactly the length of a reed which the angel Gabriel gave Samuel, by which to try the man who should be king of Israel. Afghaun is also described as an extraordinary character.

Sir W. Jones, in his Asiatic Researches, thinks the chronology of the Afghauns highly probable. He argues that the Afghauns are, by the best Persian writers, said to be descended from the Jews. 'We learn,' says he, 'from Esdras, that ten of the Jewish tribes came to Arzareth, where they settled. The Pushtoo language has a resemblance to the Chaldaic; and a district under their dominion is called Hazareh, or Hazard, which is perhaps the very word intended by Esdras.'

This theory is overturned by the fact, that the Hazarehs have but recently occupied a part of Afghaunistaun. The Persian historians, it is true, grounded their histories upon the traditions extant; but nothing is more uncertain than the mere rumours of an uncivilized people, respecting their origin and chronology. The most ancient names bear no resemblance to the Jews, and the probability is, that they derived their name from the Arabs, in common with all other Mahomedan tribes. Some historians, nevertheless, contend that they were descended from the Egyptians; whilst others, refer them to the Hun or Scythian tribes. They are divided into numerous toomaus or clans, whose names are probably derived from the chief of the family at the time of their settlement. The principal in history are, Khulijy, Soory, Lody, Roh or Rohilla—Ghilja or Gilyaunce, Bunguish, Abdaly, and Hazareh, although the latter are said to be

of Persian origin. Their national name is Alkai; but by the Persians they are called Afghauns, and by the Hindoos Pataus. Kyse Abdoreshed, whom they acknowledge as their founder, is said to be the thirty-seventh from Saul.

The government consists of an assemblage of commonwealths, or tribes, each being a subordinate government, formed into one state through the supreme authority of one common sovereign. Their principal distinctions are said to spring from the four sons of Kyse Abdoreshed. A tribe is called *ooloos*, and is placed under the jurisdiction of a chief, called a *khaun*, chosen from the oldest family, by an election of the people. The attachment is, however, rather to the community than to the chief. The fighting men receive no pay; but if a horse is killed, the owner receives the value of him from government.

The general law of the kingdom is that of Mahomet; and, in most of the oolooses, is adopted in civil cases; but the criminal code is the Pooshtoonwulle, or usage of the Afghauns; and in some oolooses, the parties are compelled to submit to arbitration, or to quit the ooloos. Trifling offences are also settled occasionally by the *jeerga* of the sub-division. When the *jeerga* meet, they take their seats on the ground, and utter a short prayer before they proceed to business. A penalty is annexed to every offence among the Afghauns, with the exception of the Berdooraunes. It always includes a public submission and acknowledgment; and frequently a number of young women are consigned over in marriage to the injured party and his relations. After the prisoner has been delivered up to the accuser, the parties are directed to salute each other with the usual address of *Salaum alaikum*: 'Peace be unto thee.'

If division quits its ooloos it is readily received into another, and the king is the head of the tribe *Dooraune*. One or two tribes are entirely independent.

The Afghaun language is called the Pushtoo, the alphabet is Persian and the Nushk character is generally employed in writing. The chief words relative to science, religion, &c. are derived from the Arabic through the Persian. They have several authors in poetry, law, and theology; and some of the kings have not only written poems themselves, but have given great encouragement to letters generally.

Ahmed Shaah held an assembly of the learned once a week, which practice is still continued. They study the sciences and read their books in methodical order, so that if one person asks another what books he has read, he answers 'up to so and so,' and the other perfectly understands him. Rehmaun is the most popular poet. Khooshhaul is, however, the best; having spent his life in struggles against the Great Mogul, his intellectual associations have given a martial air and spirit to his compositions.

In childhood the Afghauns commit the education of their children to a moollah or priest, by whom they are taught passages from the Koran, &c. Every village and town has its own schoolmaster, who is supported by certain lands and contributions. At Peshawer and

other places are establishments for finishing the education of youth for the higher professions, &c.

They grow barley, corn, turnips, melons, cucumbers, pumpkins, gourds, rice, Indian corn, arzem, nukhod, peas, beans, &c. The assafetida plant runs wild in the western hills, and the palma christi, or castor oil-plant, commonly called budaugeer, is every where found. The lands are usually watered by irrigation through the means of embankments, channels, &c. and, except in the colder districts, they have two harvests in the year. They have five classes of cultivators; proprietors who cultivate their own lands; tenants who rent lands; buzgurs, or farmers, like the metayers of France; hired labourers; and villains, who cultivate their lord's land without wages.

The Afghauns keep no shop, and follow no handicraft or trade. There are bankers, merchants, artisans and labourers. The Hindoos are the chief bankers, owing to the prohibition in the Koran, which forbids Mussulmen taking interest. There are some considerable merchants who are divided into thirty-two trades, each having its *cudkhoda* to manage all transactions with government; for though not taxed, they are nevertheless liable to exactions, when the king, for instance, marches to any considerable city, he sends to the *cudkhodas* to find a shop of each trade to attend him to the next considerable city, town, &c., sending presents to the merchants, instead of regular payments by which means they sustain considerable loss.

They trade chiefly with India, Persia, and Toorkistaun, and from Tibet they obtain a cloth called *ussul too*, manufactured of shawl wool. Their exports are horses, furs, shawls, Mooltaun chintz, madder, assafetida, fruits, &c. Their imports are cloths, muslins, indigo, ivory, sandal wood, wax, spices, silk, cottons, gold and silver. Their internal trade is considerable.

The people are generally divided into the inhabitants of houses, and the inhabitants of tents. Their furniture commonly consists of a coarse woollen carpet, and pieces of felt to sit upon, which they usually do cross-legged; and in case of ceremony the person kneels and then sinks back on his heels. They converse freely, and are fond of taking snuff. When a visitor is introduced, he salutes the party, by saying, 'Assalaum, Alaikoom,' peace be to thee. The company answer, 'O Alaik Assalaum,' and unto thee be peace. The master of the house then takes the stranger's hands and says, 'Shu Rauglee, &c.' you are welcome, may you often come; to which the reply is, 'Shupucheiree,' may you prosper. After dinner they sing songs and play music.

They are fond of the chase. Races are frequent, and at a wedding the bridegroom commonly gives a camel to be run for. The higher ranks also tilt with lances, practise firing at a mark, with guns, bows and arrows, &c. They have a great passion for the sail, or the enjoyment of fine prospects; dancing, and a game called khossye or cubuddee, in which two men advance, each holds his left foot with his right hand, and hops forward to upset his adversary.

They commonly bathe twice a week, and always on the Friday. The shops on that day are shut. The Afghaun goes to the bath, has his skin scrubbed till it is quite clean, his beard dyed, and superfluous hair burnt from off his body for an hundred dinars, or threepence-halfpenny; after which, on leaving the bath, he joins a party for the day to some favourite hill or garden, defraying the expences by subscription; and for a trifling sum at the entrance, each person takes what fruit he pleases.

Their dress is not unlike the Persian, especially in the upper classes of society, and consists of loose cotton trowsers, a low cap of black silk or satin, crowned with gold brocade, half boots reaching to the calf, a large frock shirt, with sleeves reaching below the knee, to which is superadded a large cloak reaching to the ankles, either of sheepskin tanned with the wool inside, or soft grey felt. The dress of women is not much unlike that of the men. Their shirts, however, are larger and of finer materials. They have a cap of silk interwoven with gold thread, to which is annexed a large sheet thrown over their heads, with which, in the presence of strangers, they cover their faces. They wear pendants in the nose, rings in their ears and on their fingers. They also wear tight trowsers commonly white; and those that are unmarried have their hair loose.

The people are less debauched than the Asiatics are in general, although their virtues are said to be on the decline. They have the same tendency to imitate the manners of the Persians, as European nations have to imitate the French. They are, however, at present laborious, generous, brave, and temperate, their chief vices being envy, revenge, and obstinacy.

Amongst the common people it is customary to rise before twilight, and go before breakfast to pray at the mosque. They lunch upon vegetables, curds, and flesh, but the shaumee, or great meal, is after the last prayers.

Sun-rise is the time when the great commonly rise, and after having read the Koran for an hour, and been at court, where there are apartments for their use and in which they receive communications, and transact business; they lunch and sleep; and in the evening receive company and amuse themselves till a late hour.

Wives are purchased, and may be divorced at pleasure. The brother of a deceased person marries his widow, except she have children, in which case she commonly remains single. Those who cannot purchase a wife remain in a state of celibacy. The rich marry early, seldom exceeding twenty years of age in the man, and sixteen in the woman. Before marriage, the arrangement of all preliminary circumstances is managed by the relations on both sides, for after a lover has intimated his wishes, a deputation from his parents wait on the parents of the girl, and make the necessary provisions, sometime before the ceremony. Polygamy is allowed, but seldom practised, owing to the common poverty of the people: and the middle class consider two wives and two concubines a large establishment. The women in general are not very cultivated, since it is thought immodest to write, as by that means

a woman might correspond with her gallants and admirers.

The Afghauns are hospitable, and the greatest affront you can offer a man is to carry off his guest. If a man become noted for want of hospitality, he is reproached with having no *poosh toonwulle*, 'Nothing of the customs of the Afghauns.'

They have a custom called *nannawautee*, in English, 'I have come in.' When a man has to ask a favour he goes into the house of his friend, and refuses to take any refreshment or even to sit on his carpet till the request is granted, nor is it honourable to refuse it. A man in danger often goes *nannawautee* to another's house, who must then take up his quarrel, especially if a woman sends her veil and implores assistance, the claim in that case, is thought irresistible. The Afghauns, notwithstanding their hospitality often rob the stranger after his departure, the rites of hospitality being considered as over. So that the only way to pass the country with safety is to agree with the chiefs, and procure an escort for the journey.

In religion they are confirmed Mahomedans of the Soone sect, who hold the first three caliphs as the legitimate successors of Mahomed and believe their traditions. They consider that no infidels can be saved, but nevertheless they cherish no feelings of asperity toward them. They never speak of any thing they expect without adding *Inshaulla*, 'please God,' and often say 'please God I am so many years old.' They often count their beads in conversation; and before they enter on any undertaking repeat the Fauteheh, or the commencement of the Koran. Their prayers are repeated five times a day, and every Mussulman prays with his face turned toward Mecca, to which every person performs a pilgrimage at least once in the course of his life. The hour of prayer is announced from the tops of the minarets by the shout of *Allaho Akbar*, 'God is most great.' The man who hears it, though in the midst of business, instantly withdraws. The first part of the prayer is said standing, the rest sitting on the heels, often bending forward and touching the ground with his forehead. Their oaths are very solemn, as 'I swear by God and his prophet:' 'may I go an infidel out of this world if it is not true.' but the most solemn is the name of God, Allah, three times repeated in different forms 'Wullah, Billah, Tillah.'

There is an officer called Mooshtesib, who superintends the public morals, sometimes they inflict forty blows with a leather thong, and often send the culprit round the town on an ass, with his face toward the tail. The Moolahs, who have the title of Ulima, or learned, are greatly venerated; they profess great austerity, and have the care of youth, the practice of the law, and the administration of justice. When two colosses are about to meet in battle, they often rush between them holding out the Koran, and attempt a reconciliation, in which from their great sanctity, they commonly succeed. A Moolah cannot be injured with impunity; they are in general capable of taking sufficient revenge by excommunicating, suspending worship, refusing to bury, &c.; but when this does not succeed,

they take the green standard of the prophet, and parade the country with drums, uttering the war cry and inciting the people to take up arms in their cause. They are always known by a large loose white or black gown, and a peculiar sort of large turban. Their wives have nothing remarkable in their dress to distinguish them from other women.

Besides regular clergy, they have other orders, as Sijuds, the supposed descendants of Mahomet, Fuheers, Dervises, &c. One particular sect is exceedingly venerated, even the places where they are buried are sacred, and in war time the women are placed there during the absence of the tribe as a place of security. The people generally believe in ghosts, alchemy, magic, &c., reverence burial grounds, called 'cities of the silent'; consider every mountain and cavern inhabited by a daemon called the goul, or spirit of the waste. They believe the power of talismans, &c.

With respect to their history, the most early accounts we have, represent the Afghauns as inhabiting the mountains of Ghore, in or about the ninth century, when they were established in all the north-east territories, although a considerable part of the nation was subject to the Arabians. The people who still dwelt in Ghore had their own kings. Their prince Mahomet was taken by Mahmood king of Ghazni, by

whom the people also were greatly oppressed. They rebelled in the twelfth century, dethroned the king, burnt the capital, and reduced alike Bulkh, India, Budukhshain, part of Kharasau, and the kingdom of Caubul. They held India for the most part during the three following centuries, and even the provinces that were wrested from them, were retaken from the king of Khwarizm, by Jengheez Khaun, during whose government, and also that of his son Tamerlane, they maintained their independence. After his death Bauber, the father of the great Mogul, subdued Caubul, and made it his capital, in which one of his sons succeeded him. Sheer Shauh founded an Afghaun dynasty in India, and succeeded in driving the other son of Bauber entirely from the peninsula. The house of Timour, the father of Bauber, was at length established, and all Afghaunistan, excepting the mountains, divided between Persia and Hindostan.

About 1720 the two tribes of Ghiljies shook off the Persian yoke, and extended their empire as far west as the confines of Russia and Turkey. The Afghauns considered their authority an usurpation, and in 1737, Nadir Shauh conquered them, and annexed the greater part of the kingdom to the Persian dominions. The present Afghaunistan monarchy was founded after his death.

AFIELD'. In or into the field.

The was peers ful proude, and putte hem al to werke,
In daubing and in delvynge, in doneg a feld berynge.
Vision of Piers Ploughman, p. 138.

We drove *afield*; and both together heard,
What time the grey fly winds her sultry horn;
Batt'ning our flocks, with the fresh dews of night.
Milton.

Afield I went, amid the morning dew,
To milk my kine, for so should housewives do.
Gay.

Oft did their harvest to his sickle yield,
His furrow oft the stubborn glebe hath broke;
How jocund did he drive the team *afield*!
How bowed the woods beneath his sturdy stroke!
Gray's Elegy.

AFINE. On fine. See FINE.

For no man at the first stroke
Ne may not fell douno an oke
Nor of the reisins haue the wine,
Till grapes be ripe and well *afine*
Before empressoed, I you ensure
And drawn out of the pressure.
Chaucer. R. of R. fol. 133, col. 3.

AFIRE'. On fire.

While there is oylye for to fire
The lampe is lightly set *afire*.
Gower. Con. A. b. viii.
Of Deiphobus the palace large and great
Fell to the ground, all ouerspred with flash.
His next neighbour Ucalegon *afire*:
The Sygean seas did glister all with flame.
Surrey. Aeneis, b. ii.

Powder is ready, and enough to work it,
The match is left *afire*.
Fletcher's Island Princess, ii. 1.

AFLAT'. On the flat.

When you would have many new roots of fruit
trees, take a low tree; and bow it, and lay all his
VOL. I.

branches *aflat* upon the ground, and cast earth upon them, and every twig will take root.

Bacon's Natural History.

AFLIGHT'. A word in use till the time of Elizabeth; applied to the want of courage, &c. at the approach of danger. See FLIGHT.

Upon this worde hir herte *aflight*,
Thynkende what was best to doone.

Gower. Con. A. b. ii.

And yet were they all in case safelye to escape; whereas Judas on the other syde which nothing feared at all, but tooke a specchiall pleasure to see them so *afligghted*, lost lys lyfe for euer, and that in fewe howres after. *Sir T. More's Works*, p. 1389, col. 2.

AFLOAT'. On float.

Now er alle *on flote*, God gif pam grace to spedre,
With douthy fo to note, whan þei com to dede.

R. Brunne, p. 169.

There is a tide, in the affairs of men;
Which, taken at the flood, leads on to fortune;
Omitted, all the voyage of their life
Is bound in shallows and in miseries:
On such a full sea, are we now *afloat*;
And we must take the current when it serves,
Or lose our ventures. *Shaksp. Julius Caesar.*

His legions, angel forms, who lay intranced
Thick as autumnal leaves that strow the brooks
In Vallombrosa, where the Etrurian shades,
High over-arch'd imbower; or scatter'd sedge
Afloat, when, with fierce winds, Orion arm'd

Hath vex'd the Red-sea coast. *Par. Lost*, b. i.

Take any passion of the soul of man, while it is predominant and *afloat*; and, just in the critical height of it, nick it with some lucky or unlucky word; and you may as certainly over-rule it to your own purpose, as a spark of fire falling upon gunpowder, will infallibly blow it up. *South.*

There are generally several hundred loads of timber *afloat*; for they cut, above twenty-five leagues up the river, and other rivers bring in their contributions,

Addison's Italy.

Whatever is *afloat* in the stream of time, may, when it is very near us, be driven away by any accidental blast which shall happen to cross the general course of the current.

Rambler.

AFOBA, in botany, a name given, by the natives of Guinea, to a kind of plant, of the *phaseolus* genus, or kidney-bean. They use it pounded and mixed with oil, to cure cutaneous disorders. It is more hairy than the common kinds, and its leaves are very small.

AFOOT'. On foot; implying action.

And thei sayen hem go awey and manye knewen and thei wenten a *foote* fro al citees and runnen thidir and camen bifore hem.

Wyclif. Mark vi.

I see you stand like greyhounds in the slips,
Straiuingupon the start. The game's *a foot*:
Follow your spirit; and upon this charge,
Cry, God for Harry, England, and St. George.

Shakspeare's Hen. V. act ii.

The king [Harolde] himselfe stode *afoote* by the standarde, and his brethren Girthe and Leofwine with him, to the ende that in such common peril and iopeardy no man should once thinkne to fie or run away.

Snow's Chronicle.

AFORE', *ad. & prep.* On the fore part; much used in composition. It has respect to time and place.

I meane this, that trespace hight
But reason conceiueth of a sight
Shame of that I speake *afore*.

Chaucer. R. of R. fol. 130. col. 3.

He, back returning by the yuorie dore,
Remounted up as light as cheerfull larke,
And on his little wings the dreame he bore
In haste unto his lord, where he him left *afore*.

Spenser's Faerie Queene, b. i. c. 1.

Approaching nigh, he reared high *afore*
His body monstrous, horrible, and vast.

Faerie Q.

Whosoever should make light of any thing *afore* spoken or written, out of his own house a tree shall be taken, and he thereon be hanged.

Esdras, vi. 22.

If he never drank wine *afore*, it will go near to remove his fit.

Shakspeare. Tempest.

Emilia, run you to the citadel;
And tell my lord and lady what hath hap'd?
Will you go on *afore*? *Shakespeare. Othello.*

AFORE, in maritime affairs, *avant*, Fr. *fore* *Sax.* all that part of a ship which lies forward, or near the stem; it likewise implies *further forward*, or nearer the prow; as, the manager stands afore the foremast, i. e. further forward, or nearer the stem. In both these *senses* *afore* is used in contradistinction to *abafit*. See *ABAFT*.

AFRA, in natural history. See *PINTADO*.

AFRANIUS, a Roman comic poet, who lived about the 170th Olympiad, and wrote comedies in imitation of Menander. He is commended by Tully and Quintilian.

AFRESH'. On fresh.

But when yo remnāt of the wicked shal attempt *afresh* to raise vp again such abhominatiōs, the Lord shal sodainly without warning fal vpō them with his most fearfull tirrible last judgment.

Bale's Image, second part, R. 5.

Never was there any thing more pitiful than to hear my master blame the dog for loving his master's murtherer, renewing *afresh* his complaints with the dumb counsellor.

Sidney's Arcadia.

The faction still defying Edward's might,
Edmond of Woodstock, with the men of Kent,
Charging *afresh*, renew the doubtful fight
Upon the barons, languishing and spent.

Drayton. Barons' Wars.

The Germans, serving upon great horses, and charged with heavy armour, received great hurt by light skirmishes; the Turks, with their light horses, easily shunning their charge, and again (at their pleasure,) charging them *afresh*, when they saw the heavy horses almost weary.

Knolles's History of the Turks.

When once we have attained these ideas, they may be excited *afresh* by the use of words.

Watts's Logick.

Bleat out *afresh* ye hills; ye massy rocks,
Retain the sound: the broad responsive low,
Ye valleys raise; for the great Shepherd reigns,
And his unsuffering kingdom yet will come.

Thomson.

A F R I C A.

AFRICA, one of the great divisions, commonly called, 'the four quarters,' of the earth, the third in magnitude and population, is rising in importance, though probably less known to Europeans than any other. It forms an imperfect triangular peninsula, of which the north is the base, and is separated from Europe by the Mediterranean Sea, the eastern side from Asia, by the Isthmus of Suez, the Arabian gulph, and the Indian Ocean, whilst the Atlantic and Pacific wash the west and south. The length of Africa, calculated from Cape Serra to Cape Aguilhas, is about 4320 geographical miles, and its greatest breadth 4140, including an area lying between the 37th degree of north, and the 35th of south latitude, and the 18th degree of west, and 51st of east longitude.

NAME.—The present name of this continent, among the ancients, was exclusively applied to *Africa Propria*, a small province in the northern part. Its origin has been traced by the

learned to different sources. Bochart deduces it from the Punic word *seric*, an ear of corn; and supposes it employed to express the great fertility of those parts that were known to the ancients. Others derive it from the Phœnician word *Ha-varca* or *Areca*, anciently applied to the country of Barca. Servius derives it from the Greek privative *α* and *φρεν*, cold, considering it to express the great heat of the climate. It has been also, with great probability, traced to the Hebrew 'phreka,' broken off, or separated, describing its geographical figure, as detached from the continent of Asia.

DIVISIONS.—Africa, under the name of Lybia, was divided by the ancients into Africa Propria, and Africa Interior. AFRICA PROPRIA, commonly called the territory of Carthage, had various limits assigned to it. Mela and Ptolemy comprehended in this division, all the kingdoms situated between the river Ampsaga, and the borders of Cyrenaica, inhabited, according to

Pliny, by twenty-six different nations, Numidia and Regio Syrtica inclusive. Its true limits, however, were* the river Tusca, or boundary of Numidia on the west; the Mediterranean or African Sea, on the north; the frontiers of Garamantes and the deserts of Libya interior, on the south, with the Lesser Syrtis and the Mediterranean, on the east. This portion of Africa was divided into two great provinces, Regio Zeugitana and Byzacium, with which the summer and winter circuits of the kingdom of Tunis, as exhibited in the travels of Dr. Shaw, nearly correspond. It was remarkable for the ancient lakes Hipponitis, Palus Sisara, Palus Tritonis, Palus Pallas, and Palus Libya; for the famous river Bagrada, and for the contiguous islands of Cossyra, Tarichiae, Lopadusa, Aegusa, Dracontia, Galatia, Aeginurus, and Larunesiae. AFRICA INTERIOR, comprehended those more remote southern countries, little known to the Greeks and Romans, otherwise than by report. 'Libya Interior,' the western point of this division was inhabited by the Hesperian Ethiopians, Nigritæ, Gætulæ, and Garamantes; whilst the eastern part was denominated by Ptolemy, 'Ethiopia sub Aegypto,' including several countries, too well known to need any specification. Restricted as the Romans were, both in their conquests and commerce by the tropic of cancer, they acquired scarcely the names of the more retired and southerly kingdoms; whilst with Numidia, Gætulia, and Mauritania, they were more immediately connected.

The modern DIVISIONS of Africa, are,

1. *Northern Africa*, a term which best expresses perhaps, the Barbary states and their dependencies, (exclusive of Egypt, which is principally an eastern country of this continent,) includes all that portion of the globe, extending from the great 'Desert of Sahara' to the Mediterranean, and from Egypt to the Atlantic. It is inhabited by different nations, hostile to each other, but being overrun by the Mahomedans during the first æra of their power, has ever since retained the religion, government, and manners, then impressed upon it. The configuration of the deserts S. and E. of this division, have led some historians to imagine that they were formerly covered with sea; and that Barbary, thus rendered insular by the rolling of the wide ocean wave over the deserts east and west of the Atlas, constituted the island of Atlantis, so often mentioned by the ancients. The states of this territory are those of Morocco, Algiers, Barca, Tunis, and Tripoli.

2. *Western Africa*, including a spacious territory and many countries, imperfectly known to Europeans, which may be arranged under three divisions. 1. Those lying between the southern limits of Sahara and the mountains of Khong, refreshed by the magnificent streams of the Senegal and Gambia. 2. The coast of Guinea, widening from the heights of Kong to the Equinoctial line. 3. The wide region stretched on both sides of the Zaire or Congo, with the included kingdoms of Congo; Loango, Angola, Metamba, Benguela, &c. extending from the equator to 15° of S. latitude, from which, down

as far as the southern promontory, the internal geography is unknown.

3. *Southern Africa*, or Caffraria, is a term given to that division of the African continent which immediately surrounds the Cape of Good Hope, projecting more than 30° south of the equator. On the south-east coast are the kingdoms of Inhambane, Sabia, Manica, Sofala, and Monomotapa, or Mocaranga; but the inhabitants, especially those in the immediate vicinity of the Cape, are very low in point of civilization.

4. *Eastern Africa*, in its approach to the vertex of the peninsula, is much less known than the western coast, being colonized only by the Portuguese. It includes Zanguebar, Ajan, and Adel, with their tributary kingdoms. In the higher regions, the kingdoms of Egypt, Ethiopia, and Abyssinia, are well known.

5. *Central Africa*, stretching on both sides the Niger, almost across the Continent, is an immense tract of country, including the interior of the peninsula; of which, vast regions remain undiscovered. The nations commonly included in this division are Timbuctoo, Houssa, Bornou, Durruf, Bergoo, Kordofan, Dabarku, and Ranga.

6. A sixth division may include the numerous islands with which Africa is in a manner encircled, lying both in the Atlantic and Pacific oceans. These are commonly arranged in groups, as the Cape de Verd isles, the Canary isles, Porto Santo, and Madeiras. Madagascar is 840 geographical miles in length, and one-fourth that distance in breadth. St. Helena is famous as the late residence of Buonaparte. The St. Matthew, Ascension, and St. Thomas's islands, together with Zanzibar, Pemba, Mauritius, Bourbon, Monifa, and others, are included in this division.

GULFS AND STRAITS.—The gulfs belonging to Africa, are those of Guinea, Sofala, Sidra, Goletta, France, &c. The straits are those of Gibraltar, Babelmandel, and the Mozambique channel.

CAPES.—The capes are those of Good Hope, Bona, Spartel, Gibraltar, Geer, Bojador, Blanco, Verd, Guardafui, and others.

MOUNTAINS.—The mountains of Africa run in chains, and are scarcely inferior to any others in the known world. The Atlas mountains, fabled by the ancients to be the pillars of heaven, have in some places an elevation of more than 13,000 feet from the level of the sea, and stretch over more than half the Continent. This, which is the only African range fully explained, has been described by M. Desfontaines as running forward in two grand divisions; of which, the one toward the Desert is called the great Atlas, and the other toward the Mediterranean, the less. Their course is parallel from east to west, and the intervening space broken by hills and mountains, forms a number of deep and beautiful vallies, watered by numerous rivers and streams. The whole range is of primitive granite, and attains its loftiest height towards the western extremity, where it towers above the sultry plain of Morocco; but even there, notwithstanding the heat of the climate, it is covered with perpetual snow. The Mountains of the Moon supposed to ex-

tend across the entire Continent, between the seventh and eleventh degrees of north latitude, must be of still more formidable magnitude, if we may judge of them by their fame throughout the Peninsula, and those mighty rivers, of which they contain the source.

The highest and most celebrated portions, are those immediately south of Abyssinia, and the country of Nigritia. On the opposite side of the Continent, and nearly in the same parallel, are the mountains of Kong, running in a course from west to east, and stretching from near the point of Cape Verd, as far as the meridian of Tombuctoo, where they are supposed to connect themselves with the Mountains of the Moon, and so to form one entire range, reaching across the whole breadth of the African Continent. Abyssinia is almost entirely a country of mountains, intersected by deep and extensive vallies. The southern shores of Africa are also overlooked by lofty mountains. Those of Lupata surround the kingdom of Mocarana. The Crystal mountains, the kingdoms of Congo, Angola, and Benguela. The numerous and large rivers that water Mozambique on the one side, and Congo on the other, indicate some extensive ranges intervening between these two regions, and accordingly, such have been reputed to exist; but, they have never been laid down with geographical accuracy, their directions and magnitude appear to be unknown.

RIVERS.—The rivers of Africa are numerous and interesting, more remarkable perhaps, than even its mountains, and their course wrapt in deeper mystery. The innumerable and vast streams poured down from the Atlas, and other lofty ranges, are many of them lost in the sands of the desert; others, circumvolving through the unknown interior, at last empty themselves into the ocean.

The Nile is the largest river at present entirely discovered; the source of this celebrated stream, after much speculation, is now satisfactorily ascertained to be the mountains of the Moon, some hundred miles south of Darfur. The immense mass of waters poured down from those celebrated heights, swelled by large tributary accessions from Abyssinia, forces its way across the sands of Nubia, divides the vale of Egypt, and at last empties into the Mediterranean. It is at first called Bahr el Abiad or White River, and in the sixteenth degree of latitude forms an union with the Bahr el Azrek or Blue River, the latter of which, although mistaken by the Portuguese and other geographers, for the Nile, was well known to the ancients as a mere auxiliary. The whole course of this river is estimated at 2000 miles, abounding with magnificent cataracts, and exercising an unparalleled influence on the fertility of the surrounding country.

The Niger has, however, excited a much deeper feeling of interest among the learned, and seems to be involved in deeper mystery. Its source, as also those of the Senegal and Gambia, is now fixed in the mountains of Kong on the western side of the Continent. The last run in a southerly direction to the ocean, but the Niger directs its course towards the east,

and, after spreading itself upon the plains of Bambarra, it either rolls down into the depth of interior Africa or shapes its course to the Bight of Benin; but its subsequent path and ultimate issue form the grand problem of modern geography, which neither theory nor experiment has been able to solve. The Zaire, or Congo, is the next in interest and importance to those already named, and pours into the ocean so extraordinary a mass of waters, and with such unparalleled impetuosity, that it has been thought by some the long sought termination of the Niger, in consequence of which an expedition, lately sent out into Interior Africa, was directed to ascend the Congo, in the hope of meeting another that was sent in descending the Niger; this however failed. Of the rivers that flow into the Indian Ocean, may be mentioned the Zambeze, the Quillimane, and the Magdacho, whose source and early flow are involved in equal obscurity. The last two are supposed to arise from the same source as the Nile. With respect to the first, although it has been ascended some hundreds of miles in search of gold, nothing satisfactory has been ascertained.

DESERTS.—One of the most striking features of Africa, is the immensity of its deserts. The great desert of Sahara alone reaching from the shores of the Atlantic, to the confines of Egypt; and covering a superficial area of more than 2500 miles in length, by 700 its average breadth. Over this immense world of desolation are scattered numerous oases, of which Fezzan is the most remarkable. These beautiful islands of verdure, rendered doubly delightful from their pointing up from such wide oceans of sand, furnished some of the most happy pictures of the ancients; and formed their Hesperian gardens, the Fortunate islands, and the islands of the Blest. Besides the great desert above mentioned, there are several smaller ones still of very considerable magnitude and geographical importance. Some of these lie near the European settlements; and modern travellers have supposed another wide wilderness lying between the eastern and western ranges of mountains.

To cross these immense deserts is an undertaking attended with great danger and difficulty; hence travellers commonly go in caravans, each consisting of a number of persons seldom fewer than 2000, for the purpose of mutual safety. They travel by means of camels, which are eminently fitted to journey in those dreary regions; and in their route stop at regular stations for refreshment, these are commonly about fifty miles apart, but sometimes much farther. They have no track to direct them; and as the shifting sands soon obliterate any impression, they are

at ^{one}

they miss their calculation, with respect to one of these stations, they frequently perish for want of water. So late as 1805, a whole caravan, consisting of 2000 persons, was lost in consequence of the drying up of a well, on which they depended for a supply. Water is carried

from station to station in skins, by means of camels, the same as other goods. A certain portion of their beasts of burden being set apart for that purpose; the load of a camel is about three or four hundred weight, and the expense of carriage a farthing a mile for every hundred weight.

The heat of the climate arises from its being almost equally intersected by the equator; and is so intense that Mr. Park lying in his hut of reeds in the dry season, could not endure to hold his hand against the hot wind that blew through the crevices, and even the negroes, when the wind blew from E. or N. E., could not bear to touch the ground with their feet; nevertheless, owing to a different elevation and other circumstances, the climate is in some parts agreeable. The southern side of the equator is milder than the north, though at an equal distance; but near the Mediterranean, even the north is not disagreeable to Europeans refreshed as it is by its sea-breezes, and rendered cool by its vicinity to the mountains.

QUADRUPEDS.—The beasts of Africa are numerous, and are considered amongst the most extraordinary in the world, for strength, size, and ferocity. They reign undisturbed in the vast deserts of this amazing peninsula, fostered by the sultry heat of the climate, which seems more suitable to them than to any other of its productions. The majestic lion roams at large, and there are but few tracts where the traveller is safe from his dreadful incursions. The tiger is never seen; but the panther, the leopard, and the hyaena, are almost peculiar to this division of the globe; as is also one species of the rhinoceros, distinguished by two horns on the nose; and one of the elephant, remarkable for a round head, convex forehead, large ears, and only three toes on the hind feet. Baboons, apes, and monkeys, leap in myriads through the woods, and many of them grow to an astonishing stature.

The simia troglodytes chimpanæ, or ourang-outang, in appearance greatly resembling the human species, commonly running to the height of from five to six feet, is a native of Africa. Crocodiles and hippopotami abound in the rivers; the black bear is a native of Barbary; horses and asses run wild. The zebra and quagga are seen commonly by travellers: and there are no fewer than thirty kinds of antelopes, celebrated for their fleetness and beauty. The great Cafrian buffalo is very ferocious, and is said to be a species peculiar to Africa. The dromedary is emphatically called ‘the ship of the desert,’ and is the most useful animal in that part of the world. His large flat hoof, the power of carrying water for himself and his master, together with his great strength to support burdens, render him almost the only animal capable of travelling in the burning sands, and without him, many of these deserts would be totally impassable. The camel dromedary is more lightly formed than the camel, and is used when extraordinary swiftness is required. He will walk fifty miles a day, with ease, and when made to gallop will travel 200 miles for many days in succession, and frequently, in cases of extreme exigence, has been known to travel 300 miles in twenty hours. Drom-

edaries are trained by the Moors for the purposes of war and plunder. South of the Niger, the ass is commonly employed for travelling; the ground being so irregular and mountainous, that the camel would not be of any service. But elephants are perhaps the most numerous of all the larger animals of Africa: they roam in vast herds, through the forests of the interior, and have been thought a species quite distinct from those of Asia. The inhabitants, when they see an elephant, hunt him down, feast upon his flesh, make sandals of his hide, and sell his teeth to Europeans. Their mode of attacking them is by fire-arms; as soon as they have discharged their pieces at one of them, they fall flat on the ground to avoid the first effects of his resentment; but no sooner is he become faint with the loss of blood, than they rise and make a second discharge, which commonly terminates his life. In some parts of Africa, elephants are caught in pits, in a manner similar to that practised in the island of Ceylon.

BIRDS.—There have been calculated 642 species of birds, of which nearly 500 are peculiar to Africa; and of eighty-seven genera, six or eight are peculiar. Parrots are generally scarce in Africa; but insectivorous and frugivorous birds are very numerous. The guinea fowl, of which there are three species, is a native. The ostrich commonly rising to the height of six or eight feet, abounds in the sandy deserts, and is remarkable for swiftness. They flock together in large troops, at a distance resembling an army of soldiers, and in swiftness exceed the fleetest horse. The eggs of the ostrich frequently exceed three pounds in weight; and these the bird deposits in the sand to be hatched by the heat of the sun. The didus or dodo, formerly known in some parts of the continent, is supposed to be now entirely extinct, none of the species having been seen for a great length of time.

INSECTS.—Africa swarms with the most beautiful insects. The migratory locust is the most formidable, marching forth in myriads, and spreading its ravages over the most fertile provinces; they have been known to cover an area of 2000 square miles; and hitherto no means have been able to prevent their progress. The ant is also numerous, building nests, each from ten to twenty feet in height; not only destroying every thing in the houses, but even cutting through the trunks of trees in a few weeks. The tsaltsalya is a dreadful scourge, particularly in Abyssinia. The scorpion is a native: of spiders there are two kinds, the tarantula, which abounds in Barbary; and the tendaraman, a native of Morocco, whose bite is fatal. The great centipede is found in every part of the interior regions.

The conchologist meets innumerable varieties of the most beautiful shells, on the borders of all the coasts and rivers; where are also found many species of zoophytes, in some places constructing reefs and islands of immense magnitude and extent. The guinea worm is frequently met with; and the famous nautilus of the ancients, is found in the African seas.

REPTILES.—Africa is full of reptiles and serpents of every description; of these the larger ones belong to the Python tribe. Crocodiles

abound in the large rivers; but, happily for the people, one species of tortoise, called *tyrse*, devours the young crocodiles in great numbers, the moment they are hatched. The ouaran of the Nile also, a species of lizard from three to six feet long, greatly venerated by the ancient Egyptians, devours the crocodile's eggs. The boa constrictor is one of the most terrible snakes in Africa, both from its prodigious size, and habits. The *haje*, which the ancients called *aspis*, is taught by the Egyptian jugglers to dance; this animal, from the practice of erecting itself on being approached, was adopted by the ancients as the emblem of protection, and sculptured as such on the portals of their temples. The *ameleon* is a native of many parts of Africa.

PLANTS, &c.—The vegetable kingdom opens to the botanist a field untraversed, at present, by the foot of science; containing a beautiful variety of all those plants that charm the eye, and adorn the fair face of nature. The *baobah*, or calabash tree, exhibits the most extraordinary dimensions. Its height, though commonly reaching sixty or seventy feet, bears no proportion to the trunk. Adanson is said to have found one in the island of Senegal, which measured seventy-four feet in circumference; the branches of which, spreading in all directions, were as large as common trees; thus constituting, of itself, a species of forest. The *mangrove*, which grows on the banks of rivers, strikes root in its bed, forming a platform above the water, and a little arcade below the stream. The *shea*, or vegetable butter-tree, is curious and important to the natives; whilst, on the borders of the desert, is found the celebrated *lotus* tree, the fruit of which, (a farinaceous berry,) when prepared, becomes very nutritious, and equal in taste to the sweetest gingerbread. The flora of Africa is not yet half explored: although it has already added to botany many new and interesting species, a great harvest yet remains in the interior.

MINERALS.—Various metals have been found in Africa, but none of them characteristic, excepting gold. This metal is found on every part of the central mountains, occurs frequently in an alluvial soil, and is also found in the rivers. That which is brought to Egypt, Fez, Algiers, Morocco, &c. is commonly brought from Bambouk, north-west of the Kong mountains. Pure gold is said to be found in veins in the district opposite Madagascar. Africa produces besides the jasper, agate, emerald, topaz, numerous other precious stones. Copper is found in the Western Atlas; also in the adjacent region about Fertit, Abyssinia, Mozambique, Congo, and the mountains beyond the Orange river. Mines of silver are found in the territory of Tunis: iron abounds in Morocco and other places.

INHABITANTS.—Africa is considered to have been first peopled by Ham and his immediate descendants. Mizraim peopled Egypt, (Gen. x. 6, 13.) The Pathrusim, Naphthaliim, Caftuhim, and Ludim, took possession of other parts, but their relative situations are not accurately known. The Lehabim have been supposed to have settled in Libya; Phut, between Numidia and

Libya, along the Mediterranean; and that many of the Canaanites retired into Africa when driven, from their own country by Joshua. The Auses, whose chief city was Auza, the Maxyes, and Machlyes, (Libyan nations) the Zäueces, and Zygantes, are supposed all to have been a mixture of the old Libyans and Phoenicians. The Garamantes, Gaetuli, Hesperiani, Æthiopians, &c. inhabited the western regions. The Astacuri, Dolopes, Blemmyes, Cadupi, Ichthyopagi, Lotophagi, Elephantophagi, &c. are feigned to have inhabited the southern regions. The present inhabitants of this peninsula are commonly divided into Moors and Negroes. The former supposed to be the descendants of the ancient Arabs, blended with numerous other nations, who have settled in Africa. These have, for the most part, occupied the habitable parts, and driven the negroes into the southern regions, or beyond the great rivers. The Moors are piratical, treacherous, unsettled, roaming like their ancestors, from place to place; and being superstitious Mahomedans, are generally very hostile to Europeans. The term is, however, vaguely applied, since, during the middle ages, all the Mahomedans were called Turks and Moors; and all who were not of the former, were considered of the latter. At present the name is chiefly restricted to the inhabitants of the cities of Barbary. Their general character is rudeness and austere superstition. Their towns are gloomy, having narrow streets. Their houses have walls of earth, and are destitute of windows; and even their internal splendour is barbarous. Compared with the Turks, the Moors are generally an inferior race. Jews exist in great numbers in Barbary, where, as they exhibit their peculiarities and political distinctions, they are the objects of derision and contempt. The inhabitants of Egypt are chiefly foreigners. The Copts are of a yellow dusky complexion; the females elegant and interesting. They are said to be the only race descended from the original natives. The proper Arabians chiefly occupy the country districts, residing in tents woven of camels hair and the fibres of the palm; forming a sort of moveable towns and villages. The government is under a sheik and emir, or patriarchal chiefs, tributary to the sovereign of the Moors. The mountains are occupied by independent tribes. The negroes are gentle, hospitable, and affectionate; but, withal, improvident, thievish, and superstitious. They are divided into two classes, Foulahs and Mandingoos. The former hold Mahomedanism, divested of some of its gloomy features, and are esteemed one of the most respectable tribes in Africa. Their original country is situated east of Bambouk, and is denominated Fooladoo; but their principal kingdom is that behind Sierra Leone, of which Temboo is the capital. Amidst all the different tribes and kingdoms occupying this great peninsula, the forms of government are almost infinitely diversified.

AGRICULTURE.—Agriculture and the arts are in a very imperfect state amongst all the native tribes of this continent. In none, with the exception of Whydah, is landed property at all recognized, nor have they the means of applying

the advantages which have resulted from European skill, or even European implements to the cultivation of the earth. The hoe is the only instrument with which the ground is tilled; and Park mentions it as a surprizing instance, nowhere else seen in Africa, that for a mile round Kirwanny the country was entirely cleared of wood. The labour of cultivating the earth is common to a whole village during two short seasons, seed time, and harvest, when all the inhabitants go out headed by their chief, while their musicians attend and cheer the toil by the conjoined harmony of their different voices and instruments.

MANUFACTURES AND COMMERCE.—Manufactures are in a still less advanced state, the most extensive department of which is cotton cloths, and this is mostly carried on by each family for its own use. Dressing of leather alone, of all African manufactures, forms an article of export to Europe.

Meantime, commerce, except on the coasts of the Mediterranean and Red Sea, has never been in flourishing state; the west of Africa having nothing but an immeasurable waste of ocean before it, wanted an opposite coast with which to trade. Inland commerce has, however, been more extensive, and has overcome the mightiest obstacles ever presented to mutual communication. Deserts full of shifting sands, where wide desolation seemed fatal to every thing endued with life, are traversed by large and numerous caravans. In these the camel, called 'the ship of the land', is almost exclusively employed; and by his means the commercial Arabs have penetrated even to the depths of Interior Africa.

CARAVAN ROUTES.—The number of camels composing a caravan is various, but generally from 500 to 2000. They travel at the rate of three miles an hour, and for six or seven hours in the day, from station to station till they have completed the entire route. The party are supported by the milk of the camel, barley meal, Indian corn, dates, &c.; and on arriving at the different stations commonly remain a few days to recruit their stock of provisions, and refresh themselves and cattle. Without professing to enumerate all the caravan tracts which stretch across the vast deserts of Africa, we shall specify the principal points from which they set out, and some of the places where they stop for refreshment, occasionally making a short stay of two or three days. The points whence they generally set out are three, Morocco, Fezzan, and Egypt. The caravans from Morocco are very large, and proceed to Soudan, or Tombuctoo, chiefly the latter. The principal stations being the rendezvous Akka or Tatta, Tegazza, Taudeny and Arawdu or Arodu. The whole journey occupies 129 days, sixty-five of which are spent in rest. Another route to the same point is by Wedinoon, Cape Bojador, and Gualata, although many travellers prefer directing their course to Bambarra, and the banks of the Senegal. Of late, a negro state has been established on the borders of Morocco, forming a species of entrepot for the commodities of Soudan, which prevents many Moorish mer-

chants crossing the deserts. M'curzouk, the capital of Fezzan, is a sort of central point for the trade of Interior Africa, and has several caravan routes of considerable importance; one to Cairo which requires about forty days. The halting places being Seivah, Augila, and Temissa; another leads to Bornou, through the deserts of Bilma and Tibesti, a journey of fifteen days. The principal halts of which are Temissa, Dourboo and Kavem. A third leads to Timbuctoo by Gadamis. Its longest, and perhaps most important route, is to Cashna, a journey of sixty days, although the caravan frequently crosses the Niger, and turning westward proceeds over the mountains of Kong to Ashantee. Egypt sends out three caravans for the general rendezvous at Cairo, one to Sennaar, another to Darfur, and a third to Fezzan; the latter is annual, the two former once in two or three years. The caravan with which Mr. Browne travelled consisted of 500 camels but the number often amounts to as many as 2000.

INTERNAL COMMERCE.—Salt, the chief article of commerce from North Africa, is an article of luxury in the interior regions, where the inhabitants suck it as children do sweetmeats. It is sold in its rocky state, in slabs of twenty-four feet long, each worth £2 or £2 10s. and is exchanged by the caravans for the gold of Nigritia.

Dr. Shaw assures us that the western Moors carry on a trade with the barbarous nations bordering upon the Niger, without ever seeing the persons they trade with. 'They make this journey,' says he, 'in a numerous caravan, carrying along with them coral and glass beads, bracelets of horn, knives, scissars, and such like trinkets. When they arrive at the place appointed, which is on such a day of the moon, they find in the evening several different heaps of gold dust, lying at a small distance from each other, against which the Moors place so many of their trinkets as they judge will be taken in exchange for them. If the Nigritians the next morning approve of the bargain, they take up the trinkets and leave the gold dust, or else make some deductions from the latter. In this manner they transact their business without seeing one another, or without the least instance of dishonesty or perfidiousness.' The antiquity of this custom is at least as high as Herodotus, as appears from the following passage. 'It is their custom,' speaking of the Carthaginians, 'to unload their vessels, and dispose their goods along the shore. This done, they again embark, and make a great smoke from on board. The natives seeing this, come down to the shore, and placing a quantity of gold, by way of exchange for the merchandize, retire. The Carthaginians then land a second time; and if they think the gold equivalent take it and depart, if not they go aboard their vessels again. The inhabitants return and add more till the crews are satisfied. The whole is conducted with the strictest integrity, for neither will the one touch the gold till they have left the value in merchandize, nor the other remove the goods till the Carthaginians have taken the gold.' *Herod. Melp. 196.*

The articles furnished for the internal commerce of Africa, are chiefly sashes, silk handkerchiefs, carpets, woollen caps, and leather furnished by the Mediterranean states, gold, ivory, gums, hides, oil, skins, woods, &c. are derived from all parts of the peninsula, together with arms, agricultural implements, and ornaments for the chiefs and the women.

EARLY GEOGRAPHY.—Little of the geography of this vast section of the earth was known to the ancients, and of what information they had acquired respecting it we are but imperfectly informed. Many voyages made in the early ages were never written; and others have perished in the lapse of time. Geography rose like the morning sun, first breaking through the clouds of the east, and brightening most of all, that division of the hemisphere; but, as it arose, it widened its influence, and seemed to pour its broad sun-beams upon every portion of the world. Early attempts were made to explore the region of Africa, as is evident from facts and evidences recorded in history. Eratosthenes notices the first division of the old world into continents. This began in the islands of the Cyclades, and was, no doubt, intended originally to distinguish between the opposite shores of Greece and Caria. The latter of these, including a small district denominated Asia, has since given its name to that division of the globe. The coast of Lybia was called Africa, or Southland, from its position with respect to Greece. The north coast was known early to the European nations of the north, whose several districts are frequently mentioned in their writings; and along the western coast, discovery proceeded with a more advanced step than on that directly opposite; but all expeditions to effect its circumnavigation are considered to have failed.

Herodotus says, that Necho, king of Egypt, having desisted from his attempt to cut a canal from the Nile to the Arabian Gulph, fitted out an expedition under the direction of Phoenician navigators, to sail round this Continent. Their directions were, to take their course down the Red Sea, to sail down the Southern Ocean, to double the Columns of Hercules, and return by way of the Mediterranean. The navigators are said to have succeeded; but Herodotus himself avows a degree of scepticism, because they said, that having sailed round Lybia, they had the sun on their right hand. Such, however, must have been their actual observation during their voyage down the regions south of the equinoctial line, according to the subsequent demonstrations of astronomy. The great and numerous obstacles they must have encountered in that rude period of navigation, have always rendered the long voyages of the ancients suspicious, especially those which relate to the circumnavigation of Africa. The Portuguese experienced innumerable difficulties in doubling the Cape Bojador, and effected it at last only by means of the compass, which enabled them to stand out to sea: destitute of that instrument, M. Gosselin thinks they never could have succeeded. Huet, (*Commerce et Navigation des Anciens*, 34, 275,) the Abbé Paris, (*Academie des Sciences*, vii. 79,) Montesquieu, (*Eprit des Lois*, b. xxi. c. 10,) con-

tend that it was really performed, while Vossius, (in his *Notes to Pomponius Mela*,) D'Anville, and others, are very unbelieving. A discussion of the question has taken place between Major Rennell on the one side, and Dr. Vincent and M. Gosselin on the other. In the opinion of the last two gentlemen named, Gibbon, in an essay written upon that subject, appears to coincide; viz. that such an expedition exceeds all the means and resources of ancient navigation. Whatever disputants may advance with respect to this voyage, one fact is certain, viz. that if Africa was circumnavigated by the Phoenicians, all their discoveries have entirely perished. Subsequent to the attempt of Necho, Sataspes made an attempt to sail round Africa. He was a Persian nobleman, whom Xerxes had condemned to be crucified; but afterwards altered the sentence to that of making a voyage round Africa. He commenced his undertaking, and passed the straits; but sailing for months together down the western coast, and having no prospect before him but immense deserts on the one hand, and a trackless ocean on the other, his courage failed him, and he returned. Eudoxus, a native of Cyzicus, who made the next attempt, procured from surrounding states a pretty large expedition, with a view to the same object, but his intimidated crew, compelling him to keep near the shore, the ship ran aground. He then constructed a new vessel out of the old materials, and set out afresh, but was obliged to return, the vessel being too small to effect any useful purpose. Bocchus, king of Mauritania, afterwards engaged to send him out afresh; but doubting the sincerity of his patron, he retired to Iberia, where he fitted out an expedition superior to the former; but the narrative, which was written by Strabo, closed about the time the expedition sailed, and we have nothing further of its success.

Other voyages were undertaken with nearly the same success. Sixty vessels were sent out by the Carthaginians, containing 30,000 persons, under the conduct of Hanno, for the purposes of the better discovery and colonization of Africa; they doubled the promontory of Lybia, erected the celebrated temple of Neptune, and crossing the bay, came to the great river Lixus, and landed on the island of Cerne, where they planted a colony. They afterwards proceeded along the coast, and saw numerous islands; but discouraged perhaps at the greatness of the undertaking, returned to Cerne. How far they went is not distinctly known. M. Gosselin considers they proceeded along the coast of Morocco, to the river Nun; but Major Rennell thinks they went beyond Sierra Leone, whose mountains are the identical ones which they denominated the Chariot of the gods. Their descriptions correspond with the present features of the coast about the Gambia and Senegal. The Periplus of Hanno, containing the journal of this voyage, has given rise to much learned and elaborate discussion, and was opposed by numerous objections by Dodwell, in the Oxford edition of the Minor Greek Geographers. The authenticity of this celebrated document, is now, nevertheless, acknowledged; and the work itself thought one of the most curious and valuable memoirs of antiquity. As

to the portion of coast sailed over, different opinions are entertained; and upon the detail of the voyage, three different systems have been advanced by Bougainville, Gosselin, and Rennell. The earliest voyages to the east, are those mentioned in Bible history, viz. to Tarshish and Ophir. These evidently extended a considerable distance along the coast of the Indian Ocean. With regard to the interior, remote antiquity is almost silent upon well attested facts of geographical exploration. Herodotus mentions an adventurous journey of five young Nasamonians, who penetrated the great sandy Desert, and were taken by some little dark-coloured men, and carried to a city inhabited by people like themselves. This city is supposed by Rennell to be a city of Central Africa, and a river mentioned by the same author, to have been the river Niger. To the countries watered by the Niger, the knowledge of the ancients was in a great measure confined. A distinction stated by Herodotus between Ethiopians and Africans, appears to correspond with the modern division of Moors and Negroes. He appears to have adopted the error still popular in Africa, viz. that of confounding the Niger with the Nile. He supposed the river just mentioned to have been the western part of the Nile. But by his tracing the Nile four months sail from the lower extremity of Egypt, and considering it as flowing from the south-west, that he was acquainted with the true source of that river, to say the least, is probable. The expedition of two divisions of the army of Cambyses, (to the south and west of Egypt,) the latter of which is supposed to have perished in the desert, constituted the next effort to explore the interior of Africa. Alexander, when at Memphis, visited the temple of Jupiter Ammon, but lost a great part of his troops in the attempt. War and commerce, however, gradually opened a way into these regions. Under the Ptolemies we may suppose many efforts were made, and by the Romans, expeditions were sent under Septimius Flaccus and Julius Maternus, as intimated by Ptolemy, b. i. c. 8. The best ancient description of interior Africa is to be found in Ptolemy. Though unacquainted with the extent of Sahara, and the geographical scite of Nigritia, he has shown himself acquainted with the whole course of the Niger, and the general geography of the African rivers. His description of the Niger is, that it 'joins together Mount Thala and Mount Mandrus,' lib. iv. c. 6. His predecessor, Eratosthenes, who is said to have formed the first regular geographical system, evinced considerable knowledge of the African rivers. His theory respecting the Nile is curious. Placing, in common with Strabo, Mela, and other writers, the southern extremity of Africa, on this side the equator, they supposed beyond the equator a great antichthonos or balancing continent, and convinced that the true source of the Nile must be beyond what they then imagined the limit of the southern extremity of Africa, they placed the source of the Nile in the southern continent, and supposed its early course to be under the ocean till it emerged on the southern shore of Africa. The Arabians have given

some little information, which is correct and valuable, with much that is poetic and fabulous. The most copious of their writers is Edrisi. Nubia was little known to him. The Nubians and Egyptians being of different religions, even the merchants of each country, instead of travelling into the territories of the other, brought their commodities to the opposite side of the great cataract; where, as soon as they had landed and made the exchange, they immediately re-embarked. In the absence of this medium, the Arabians opened for themselves another. They had penetrated at a remote period, across the great Desert, to the eastern shores of the Niger; and through the fertility of its banks and the richness of its golden sands, they formed settlements. Emigration and revolution swelled the tide, till, in the course of two centuries, several great Mahomedan kingdoms were established on the Niger. Of these new establishments Ghana or Gana, stood pre-eminent, bordering upon the Wangara, where the overflowings of the Niger impregnated the soil with gold. A regular system of commerce was established with other Mussulman states; and caravans were seen in all directions, traversing the vast expansive deserts. The position of Ulil, described by Edrisi as an island situated in the sea at one day's sail from the mouth of the 'Nile of the negroes,' or Niger, is not positively determined. It is highly probable that this sea must have been an inland lake, which, supposition has extended much to the west of Tombuctoo. East of Gana lay Wangara, the celebrated 'country of gold,' represented by the Arabs as nearly surrounded with the branches of the Nile, by which it is inundated during the rainy season; and as containing two lakes near the cities of Semigonda and Reghehil. The Tocrur, and several other kingdoms being founded, the Arabs extended themselves westward through Barbary. Flourishing settlements were also formed on the coast, colonized by Arabians. These were mostly at Melinda, Monbaza, and Sofala, called commonly the Golden Sofala, Vakvak, or Ouac; Ouac forms here the indistinct limit of knowledge. The Arabians had no idea of the existence of Good Hope Cape. It appears by the curious map of Edrisi, on the contrary, that, like Ptolemy, he extended it to the east till it became conterminous with India and China: hence his placing the island Vakvak in the sea of China, which so perplexes Hartmann.

Subsequent to the flourishing era of Arabian science, extending from the tenth to the fourteenth century, geographical discovery has been the exclusive boast of Europeans. In the fifteenth century Africa was circumnavigated, its figure was ascertained, its country colonized. The Portuguese one of the most insignificant states of Europe, influenced by curiosity, avarice, and a desire to detect, in the person of a rumoured Christian sovereign on the eastern coast, that real Prester John, whose abode they were most anxious to ascertain, penetrated at the two opposite points of Abyssinia and Congo; but, instead of making fresh discoveries, only darkened and perplexed what had been known before. The Nile for instance, was said to rise in Abyssinia. Abyssinia itself was immensely extended,

even beyond the southern frontier of Congo and Monomotapa. Lake Zambre was placed 2000 miles south of its real position, and made the common source of the Nile, Congo, and Zambezi. The Niger was thought to be a mighty river, emptying itself into the ocean by two mouths, the Gambia and Senegal. It is true they were divided in their opinions; some fixed its source in the lake Dembea; others, in a lake south of Bornou; others thought it one of the branches of Gion, which took its sweep in this direction immediately after it issued from Paradise; but the conjectures were no satisfaction to geographers.

John I. equipped a powerful armament to attack the Moors on the coast of Barbary; and several vessels appointed to precede it, in exploring the western coast, advanced as far as Bojador Cape, but were deterred from attempting to double it, by the tremendous aspect of the sea at that point.

In the year 1415, Don Henry fitted out a vessel, under the command of Gonzalez Zarco, and Tristan Vaz, for the purpose of extending the line of maritime discovery. In this, the expedition failed; but, being driven back by the squalls from their intended course, they fell in with the island since called Porto Santo. In the following year, a fresh expedition under the command of the same persons, deputed to take possession of the island, fell in with Madeira, so called from its being covered with wood; and in 1432, Gilianez, one of the prince's commanders, venturing on a bolder navigation, pushed beyond Bojador in the open sea, and saw the Continent stretching down to the south. From this period the Portuguese continued advancing from place to place, till they had explored the whole line between Cape Blanc, and Cape Verd. At one inlet of the sea, finding a few Moors with a small quantity of gold, they named the place 'Rio d'Oro,' the golden river. The island of Arguin, Cape Verd, Senegal, and Gambia, were shortly after colonized; a settlement was formed at Elmina, on the Gold Coast, the present capital of the Portuguese dominions in Africa; the castle of Mina became the central point of fresh discoveries; and the king assuming the title of 'lord of Guiana,' directed his commanders in future to erect pillars of stone, dignified with the arms and escutcheons of Portugal, accompanied by appropriate inscriptions, to mark the limit of their discoveries.

From Mina was sent Diego Cam, who soon after his departure fell in with a powerful current from the land, which led to the discovery of a river which, from the country through which it flowed, was called the Congo, by the Portuguese, and by the natives the Zaire. Sailing up the river he saw multitudes of black natives, and after having enticed some of them on board, he set sail for Portugal. In a few months he returned, and proceeded along the coast as far as 200 leagues. John II. successor of Alphonso, sent out a large fleet, which after discovering the kingdoms of Benin and Congo, sailed 1500 miles beyond the equinoctial line: in the course of which voyage, negotiations were entered into, colonies planted, and forts erected. Covillan

and Payna being sent on an embassy to the court of Abyssinia, received orders to explore the Redsea, and the coasts of the Indian Ocean. Bartholomew Diaz was directed to proceed to the southern extremity of the peninsula, and to explore his projected passage to India; and after having discovered a thousand miles of new country, he at length saw the lofty southern promontory he called Cabo Tormentosa, or Storm Cape, which the king from the conviction that it was the prelude to more noble and interesting discoveries, afterwards changed to the Cape of Good Hope. Covillan visited Hindostan, sailed to Sofala, and proceeded northward along the eastern coast of Africa, and the favourable accounts he transmitted from Abyssinia, induced the king once more to fit out a powerful squadron under the command of Vasquez de Gama. To this and the preceding voyage, is ascribed the discovery of the real form of the African continent.

INTERIOR AFRICA.—During all these important discoveries, the interior was little known, the peninsula being chiefly visited for the purpose of procuring slaves; but in the eighteenth century, the French penetrated into the interior. Claude Jannequin in 1637, represented himself as having ascended the Senegal seventy leagues. Queen Elizabeth granted a patent to certain merchants of Exeter, enabling them to carry on trade with the Senegal and Gambia. The latter created at the time a little jealousy with the Portuguese.

In the seventeenth century a report of the extreme riches of Africa, induced a number of English gentlemen to form themselves into a company, for the purposes of exploration and commerce. Several voyages were accordingly undertaken, in one of which, made by Jobson in 1620, an African king made a cession of Tenda and its vicinity for some bottles of brandy. Captain Stubbs went out by request of the Royal African Company, to ascend the Gambia, and ascertain the truth of the reports respecting the great quantity of gold found there. Other expeditions followed; but little information was brought to England till the deputation of Mungo Park of whom we shall speak hereafter.

AFRICAN INSTITUTION.—In 1788, was formed the African Institution, and Ledyard was deputed to that great continent, to ascertain if possible the geography of Interior Africa. He was of an enterprising spirit, had sailed round the world with Captain Cook, had formed the design of crossing the continent of America from the Atlantic to the Pacific; and having laid down a plan for travelling by land to Kamtschatka, had proceeded by Denmark and the Sound to Stockholm, and attempted to cross the Gulph of Bothnia, the middle of which being unfrozen he was prevented. His expedition to Africa produced much valuable knowledge respecting Egypt, and would no doubt have been equally successful in the central regions, but the delay of caravans, together with other difficulties and disappointments, operated so on his mind as to produce a bilious fever, of which he died.

Mr. Lucas, who was afterwards deputed by the same society, resided three years in Môrocco, but made very little progress in the object of his mission; and Major Houghton, the next geographical missionary, was alike unfortunate.

About this time the society turned their attention to the celebrated Mungo Park, a native of Scotland. He had been educated for the medical profession, and was all that the society could have desired. He sailed from Portsmouth, on the 22d of May, 1795, and reached Jillifree, on the Gambia, on the 21st of June, where he devoted himself to the study of the Mandingo language, in the house of Dr. Laidley, of Pisania; and at the commencement of the dry season, 2d of December, 1795, proceeded towards the interior. He advanced into the kingdom of Walli, and on the 5th, reached Medina, the capital. The chief earnestly prayed him not to attempt so dangerous an expedition; but, nevertheless, offered him a guide if he resolved to proceed. On the 11th, he reached the frontier town of Woollî, and hired three elephant hunters as companions through the wilderness. On the 18th, he reached Tallika, the frontier town of Bondou, and found an open fertile country, reaching to Koorkarany, in latitude $13^{\circ}, 53'$, north. On the 21st, he reached Fatteconda, the capital of Bondou, where he conversed with the very king who ordered the plunder of Major Houghton, and presented to him the blue coat which he wore, for which he received in return, five drachms of gold. The ladies of the seraglio derided the whiteness of his skin and the prominence of his nose; and he complimented them on the glossy jet of their skins, and the lovely depression of their noses. On the 24th he reached Joag, the frontier town of Kajaaga. The house of the judge in which he slept, was, shortly after his arrival, surrounded by horsemen, who demanded duties for the king, which they said he ought to have paid on entering the kingdom, and having helped themselves to about half his property, departed. Shortly afterwards, he arrived at Teessee, where he was plundered of half his remaining property by his friend Demba. At Kooniary, the capital, N. lat. $14^{\circ}, 34'$, and fifty-nine and a half geographical miles east of Joag, he was favourably received by the king, and afterwards proceeded through Ludamar, and on the 27th of February, arrived at Deena. From this place he proceeded to Sampaka, and thence to Dalli and Goomba, where he was seized by a party of Moors, whom Ali ordered to convey him to Benown, that his wife Fatima might see a white man. At the latter place, he was treated with great brutality; the people shut him up with a wild hog, and amused themselves with worrying and teasing him. They examined very curiously, his person and his clothes: some of them proposed putting him to death. The king's brother proposed putting out his eyes, which he said resembled those of a cat: the queen alone compassionated his distress, and sent him provisions; at length however he effected his escape, and the next day arrived at Foulah, and on the 5th of July, at Wawra beyond Ludamâr, and the kingdom of Ali. From this place he went to Dingyee, then to Moorja, and on the 21st, reached Sego,

where he saw the long sought Niger, as broad as the Thames at Westminster, rolling its magnificent stream from west to east; its banks crowned with the four townships which compose the city, including a population of 30,000 people. The king would not allow his entrance into the city; but a poor woman took him to her hut and treated him with great kindness; she and her daughters sung an extempore song on the occasion: 'The winds roared and the rains fell, the poor white man faint and weary sat under our tree; he has no mother to bring him milk, no wife to grind him corn.'—Chorus, 'let us pity the poor white man: no mother has he.' The next day, Park was presented with 5000 cowries, 250 of which are worth one shilling, and ordered to quit the vicinity.

Africa has supplied many striking proofs of female kindness and hospitality. Ledyard's 'Praise of Women,' is well known to have been derived from facts that occurred in his African journeys. Mr. Park's testimony was equally decided on this subject. The above simple expressions of kindness to a stranger have been formed into verse by the late duchess of Devonshire, and set to music by Ferrari; the song is as follows:

I.

The loud wind roar'd, the rain fell fast;
The white man yielded to the blast;
He sat him down, beneath our tree;
For weary, sad, and faint was he:
And ah! no wife or mother's care,
For him, the milk or corn prepare:

*The white man shall our pity share :
Alas ! no wife no mother's care,
For him the milk or corn prepare.*

II.

The storm is o'er; the tempest past:
And mercy's voice has hush'd the blast;
The wind is heard in whispers low,
The white man far away must go:—
But ever in his heart will bear
Remembrance of the negro's care.

*Go, white man, go ;—but with thee bear
The negro's wish, the negro's pray'r :
Remembrance of the negro's care.*

Leaving Sego, he then advanced to Sansanding, containing 10,000 inhabitants; thence to Sibili, Negara, Nyaneeko, Modiboo, Kea, and thence in a canoe to Moorzan; after which, he crossed the Niger to Silla, nearly 1100 miles east of Cape Verd. Here, being exposed to violent tropical rains, and finding his advance would be attended with imminent peril, he returned by the same route, and after innumerable difficulties and privations, arrived at Pisania. In one part of his journey, he was robbed and stripped of his clothes, and left alone in the wilderness, in

the heavy rainy season, almost 500 miles distant from the nearest European settlement. The king of Bambarra had also sent a canoe in pursuit of him, to bring him back to Sego. He nevertheless cheered up his spirits, and proceeded through swamps, bogs, and marshes; sometimes swimming over creeks with his horse's bridle between his teeth, and his papers in his hat, and frequently subsisting on nothing else but the corn intended for his horse. This was, however, an important journey, during which, he fixed the boundaries of the Negroes and Moors; traced the resources of the Senegal, Gambia, and Niger; confirmed the ancient accounts relative to the course of the last river, illustrated the history of the ancient Lotophagi, the mode of propagating the Mahomedan religion by proselytism, and established a number of geographical positions in a direct line of 1100 miles from Cape Verd.

About this time Mr. Browne entered Darfur, with a view of crossing the entire continent from east to west; but he could not proceed, and all his effects were seized for the use of the sultan. He nevertheless learned while at Darfur, that the sources of the White river, Bahr el Abiad, or Western Nile, are forty hills called Kumbri, or the Mountains of the Moon, that the stream flows north-west, exactly coinciding with the Gis of Ptolemy, and Nile of the Negroes; that Azran west of Bornou, abounds with silver, the inhabitants having literally such an abundance of that metal, as to apply it to the most common purposes.

Dr. Blumenbach, in 1795, recommended to the African society, a person well qualified to undertake another expedition into Africa. He was the son of a clergyman, and had studied divinity at the university of Gottingen. Such was the recommendation, that Sir Joseph Banks in making a reply, said, if Mr. Horneman is the person you describe, he is the identical person we are in pursuit of. In one night he laid out the plan of his entire journey, and after studying the oriental languages, in 1796 he went to London in the February of the following year, and immediately embarking, arrived on the 10th of September, in the bay of Caroubé; and taking with him from Alexandria, an aged monk who spoke Arabic, went to Cairo, where he studied the language of the Western Arabs. Buonaparte, who had just landed in Egypt, offering him every assistance, he set off with a caravan, on the 5th of September, and arrived shortly after at the borders of the Libyan desert, passed Ummesogir, and came to Siwah, where he saw the ruined temple of Jupiter Ammon. He proceeded from this station to the territory of Fezzan, 300 miles in length, and 200 in breadth; here he visited Tripoli; and in a letter addressed to the society, intimated that he was about to proceed in a caravan for Bornou; but unhappily this was the last intelligence they ever heard respecting him.

Next to him the society sent out Mr. Nicholls, whose career terminated fatally; and a young German deputed as his successor, shared the same fate.

Burckhardt, a Swiss, came to London at about this time, on a similar recommendation

from Gottingen, and proceeded on the 2nd of March, 1809, to Aleppo. In Syria, he devoted himself to the attainment of an intimate acquaintance with the Arabic language and manners, visited Palmyra, and Baalbec, and returned to Cairo through Arabia Petraea, and across the great desert of El Ty. He afterwards made excursions to Mecca and Medina, obtaining a full account of the powerful Mahomedan sect of Wahabees; and to Mount Sinai, and the deserts passed by the Israelites in their journey from Egypt. Here studies and travels occupied him until the summer of 1817; and his papers, which have not yet been published, are spoken of highly by Mr. Salt, who gives an interesting account of his death, at Cairo, of a dysentery, in October of that year.

Mungo Park was shortly after sent out by government with an expedition; and accordingly departed from Pisania, the 4th of the following May, and reached Medina on the 11th, from which point he shortly after entered the woods of Simbani. Having crossed the woods, they approached the Gambia, 100 yards in breadth; entered the Tenda wilderness, and crossed Falemé, where they were overtaken by a tornado. The ground was shortly covered with water three inches deep, and half the men were sick. They ascended the neighbouring hill with great difficulty, the natives following and plundering them all the time; but when they reached the top, they found a serene atmosphere, and a sweep of prospect highly grand and romantic. Departing from this place they reached Keminnoon, or Maniakarro, the best fortified town on the continent; on the 19th, crossing the Ba Woollina, they came to Bangassi, four or five times the extent of Maniakorro; and shortly having ascended a ridge of mountains, they beheld the Niger rolling its vast stream along the plain nearly two miles in breadth.

Two days afterwards, he obtained a canoe for present convenience, and embarked with Mr. Anderson on the way to Sego through Bambarra. He received permission to build his boat anywhere in the country, and assurances of protection. While he remained at Sansanding, collecting intelligence, and building a vessel, his friend and relative Mr. Anderson, died; and his whole party consisted, at that time, of only four Europeans. Still, in writing to Lord Camden, his spirits seemed as ardent as ever; 'I shall set sail,' says he, 'for the east, with the fixed resolution to discover the termination of the Niger, or perish in the attempt;' and perish he did. In consequence, however, of the uncertain rumours that agitated the public mind respecting him, lieutenant colonel Maxwell, then governor of Senegal, obtained permission from government to engage a proper person to institute an enquiry into the probability of Mr. Park's death. By this means he learnt that from Sansanding, our traveller went to Silla, and thence proceeded with his party, nine in number, towards Ginne: but as they passed Sibbie, or Dibbie, they were attacked by three canoes full of armed men, to which they repulsed. Afterwards they had to oppose sixty canoes, after defeating which, they passed Kaffau and Gourman, where they sup-

plied themselves with provisions, and entered the kingdom of Haoussa ; but the king having learnt that the white men left without giving presents, sent an army to oppose them at a village called Boussa, situated on a rock, in which there was a large opening that admitted the water to pass in a strong current ; in this place, therefore, Mr. Park, on his attempting to pass, was attacked with arrows and lances ; and after fighting for some time, overpowered with numbers, and unable to keep up the canoe against the current, Mr. Park, and a Mr. Martyn, leaped into the water, to escape by crossing the stream, but were drowned in the attempt. This journey was full of adventures, and the unhappy manner in which it terminated will be long remembered.

Tombuctoo had long excited the attention of modern travellers, none of whom had been able to give any accurate description of it. Some interesting intelligence of it was about this time obtained by means of an American sailor. The American ship, Charles, on a voyage to the south of Africa, was wrecked near El Gazie, south of Cape Blanco, and the crew swam safe to land, but were shortly surrounded by Moors, stripped naked, and carried to the east, forty day's journey, as far as the village of Soudenny, north of Bambarra ; whence they were afterwards sent as slaves to Tombuctoo. A sailor of the name of Adams was taken as a curiosity to the palace, where he was well treated, and had every opportunity of enquiry. He thought the city about the size of Lisbon, although the houses were more scattered. The palace stands in a square of half an acre, encompassed by a mud wall. The houses of the higher classes are built with wood ; those of the lower orders with branches of trees overlaid with the palmetto, and covered with earth.' It seemed altogether a negro city, from which Moors seemed to be excluded. The government is despotic but mildly administered, the chief punishment being slavery. The people can neither read nor write, but keep their accounts by notching sticks, &c. Marriage is performed in a very simple manner ; concubines are kept, and illicit intercourse prevalent among all classes. They hunt slaves once a month ; and exchange slaves, gold-dust, and ivory, with the Moors for tobacco, tar, nankeens, and other articles. About 200 yards S. E. of the town, flows a river called La mar Zarah, three quarters of a mile wide. Such are the general statements of this American sailor.

Mr. Jackson also gives a description of Timbuctoo, as he derived it from native Africans ; but he has evidently committed a perfect anachronism in stating, that, in 1800 it was subject to Woolo king of Bambarra ; since it appears from Park, that in 1796, and also in 1805 the king of Bambarra was Mansong, and Tombuctoo was independent. Isaden's journal, noticed by the editor, it is true, mentions that Woolo, predecessor to Mansong, was a celebrated warrior ; so that it is not unlikely that at a certain period he might have possessed the sovereignty ; still this could not have been in 1800. The same gentleman also mentions an excellent police, managed by a divan of twelve Alemma, subject to an election every three years. He mentions the countries of Lamlam, and Melli,

in the geographical scite assigned them by the Arabs, and not in the position fixed by Leo. These countries are said to be inhabited by one of the lost tribes of Israel, who fled from the arms of the Saracens.

With respect to the Niger, Mr. Jackson seems of opinion that it loses itself in an inland lake, or sea, in the interior of Africa. He states that fifteen day's journey east of Tombuctoo, there is an immense lake, called the Bahar, or sea of Soudan, inhabited by a race of people who navigate it with large decked vessels, containing from 100 to 150 men. Mr. Park received no intelligence of any lake beyond the Dibbie during his first journey ; but in his second journey obtained the following intelligence at Sansanding : 'One month's journey S. of Baedoo, through the kingdom of Gotto, will bring the traveller to the country of the Christians, who have their houses on the banks of the Ba Sea Feena, which is incomparably larger than the Dibbie, and flows sometimes one way, and sometimes another.' Now from Sansanding to Silla two days, thence to Tombuctoo fourteen, thence to the sea of Sandan fifteen, makes up Park's month, being in all thirty-one days. Amidst all the opinions at present given respecting the termination of the river, none appear satisfactory. Some have supposed it to enter the Nile, others the sea of Sandan. The Congo, the Atlantic, Sands, Absorption, have been alike assigned, as the solution of the mysterious problem. Sidi Hamet, in Riley's Narrative of his Captivity, gives some interesting observations respecting the eastern part of this river. The above gentleman visited Timbuctoo ; and while he remained there, the shegan, or king of the state sent a caravan to the city of Wassanah, and compelled him to accompany it. The journey was fifty-seven days to the south east ; sometimes on the banks, and at others in sight of the river in question, which about 1140 miles opposite Wassanah is called Zadi, and is so broad that a man can scarcely be seen on the opposite bank. 'The king's brother told one of my Mooselmin companions,' says he, that, 'he was going to set out in a few days, with sixty boats to carry 500 slaves down the river, first to the southward, and then to the westward, where they should come to the great water, and sell them to pale people, who came there in great boats, and brought muskets, and powder, and tobacco, and blue cloth, and knives, &c. He said it was a great way, and would take him three moons to get there, and he should be gone twenty moons before he could get back by land, but should be rich.' 'We saw,' he continues, 'a great many of these people who had been down the river, to see the great water, with slaves, teeth, &c. They said the pale people lived in great boats, and had guns as big as their bodies, that made a noise like thunder, and would kill all the people in a hundred negro boats, if they went too near them.'

Since the spirit of African exploration has been excited, and so effectively patronised by government, many valuable accessions have been made annually to our knowledge of this continent. The adventures of Riley, who, after encountering

a series of hardships, penetrated to Tombuctoo, confirmed the previous intimations of Adams respecting that place and its inhabitants; but he was, from his total illiterateness, necessarily defective in all scientific information.

In 1816, Captain Tuckey sailed on an expedition to the Congo, but unhappily perished with most of his party, after ascending that river considerably beyond the first rapids. The general information which the survivors brought home, may be thus stated.—This river commences about Point Padran, and runs to Inga, about forty miles distant; its breadth at that place not exceeding 400 yards. It afterwards leaves the mountains, and expands to the breadth of from two to four miles, around which the kingdom of Congo extends itself indefinitely; and is divided into chenooships, or petty states, held under some personage, real or fabulous, supposed to be in the interior. The population increases as the traveller advances towards the central regions: vegetables and fruits are both numerous and excellent, the winter being as mild here as the spring in Italy. The inhabitants are said to be the lowest of the Negro class; distinguished, on the male side by indolence, on the female, by degradation. The component parts of a tribe are, first, the che~~ko~~, or chief; second, the branches of his family; third, mafooks, or collectors of taxes; fourth, foomos, who are the yeomanry, having houses and land of their own; fifth, fishermen, and the labouring classes. The saleable slaves are those taken in war, or kidnapped in the interior. Every man has a charm or *fetiche*, which he carries with him, as a horn, a hoof, a shell, &c. as a protection from lions, alligators, thunder, &c. The chief crimes are poisoning and adultery.

Major Peddie commanded a military expedition, which started from Senegal in October, 1816; but this gentleman died at Kacundy, on the river Nunez, and Lieutenant Campbell succeeded to the command, who proceeded up the country, by the head of the Rio Nunez, to a place called Pangettoc, on the road to Labay and Teembo, a hundred and fifty miles beyond Kacundy. Here he was detained for three months, in consequence of a war between the foulahs, (whose chiefs would not allow him to proceed,) and a neighbouring tribe. His horses, camels, and the greatest part of his asses, being lost at this place, our traveller felt disheartened at the prospect of proceeding; and returning to Kacundy, is said to have died there of a broken heart.

In April, 1817, the African Company despatched a party, consisting of Mr. James Bowditch, Mr. Hutchinson, and Mr. Tedlie, with other persons, amounting in the whole to 130, to Coomassie, the capital of Ashantee. Their route was through Annamaboe, Abrah, and the Fante territory. Mr. James was recalled, and, Mr. Bowditch becoming chief of the embassy, a formal treaty of perpetual 'peace and harmony' was made between Sai Totoo Quamina, king of Ashantee, Boitinnee Quama, king of Dwabin and its dependencies (his intimate ally), and the British government; a resident was left at Coomassie; and both the kings agreed to send their

sons to Cape Coast castle for education. The conductor of this mission, T. E. Bowditch, Esq. has given the world an ample account of 'Ashantee, with Geographical notices of other parts of the interior of Africa,' in one vol. 4to. price 3*l.* 3*s.* which is now before us.

Ashantee, according to the information thus obtained, extends beyond the kingdoms of Fante, Akim, Assin, and Wassaw, from about $0^{\circ}, 45'$. to $3^{\circ}, 0'$ W. long.; and from about $7^{\circ}, 20'$. to $6^{\circ}, 8'$ N. lat.; commanding a population of one million, and including an area of about 14,000 square miles. The line of Ashantee authority on the Gold Coast, is marked from the Assinee to the Volta, including the once powerful state of Aquamboo. The capital, Coomassie, stands in N. lat. $6^{\circ}, 30'$., and W. long. $2^{\circ}, 6'$., and contains about 50,000 regular inhabitants. It has daily markets, which are well supplied with provisions; and regular streets, named after the European manner, from fifty to a hundred yards wide, and from half to three quarters of a mile long. See ASHANTEE.

In the latter end of the year 1818, Mr. Ritchie, accompanied by Captain G. F. Lyon, arrived at Tripoli, for the purpose of proceeding from that place into the interior of Northern Africa, under the protection of the Bey of Fezzan. The party took a preparatory journey, (until the Bey was prepared to proceed to Benioleed,) over the Gharian mountains. Captain Lyon, on this occasion, assumed the dress, and endeavoured in every way to qualify himself for passing as a good Mussulman. He even ventured into the streets of Tripoli in his new character, and on occasion of a solemn Mahomedan procession, when no person of another religion can with safety show himself. In March 1819, Mukni Bey, with a caravan of about 200 men, and camels, were ready to depart for the interior; and again arriving at Benioleed, Captain Lyon had the honour of an introduction to the wife of Sheik Barood, a chief manager of the Bey's affairs. She had the reputation of being the most beautiful woman in this part of Africa. Captain Lyon found her so fat that she could scarcely walk, and gives the following account of her appearance.

'On my entrance, she so veiled herself as to exhibit to advantage her arm, with all its gay ornaments; and on my requesting to be favoured with a view of her face, she, with very little reluctance, gratified me. Her chin, the tip of her nose, and the space between her eyebrows, were marked with black lines; she was much rouged; her neck, arms, and legs, were covered with tattooed flowers, open hands, circles, the names of God, and of her numerous male friends. She had a multitude of gold ear-rings and ornaments, set with very bad and counterfeit jewels, and weighing altogether, I should think, two or three pounds. Her shirt was of striped silk; and she had a rich purple silk baracan, or mantle, gracefully thrown round her, and fastened at the breast by a gold pin, with ornaments of the same metal suspended from it: all the other articles of finery which she possessed were displayed round the tent, whilst a multitude of poor thin wretches, resembling witches, sat round her in

astonishment, never having in their lives seen such a paragon of perfection. Like all other Arabs, they touched whatever pleased them most; one admiring this object, another something near it, so that our poor belle was sometimes poked by a dozen fingers at once; all, however, agreeing on one point, that she was beautifully and excessively fat; and, I must say, I never before beheld such a monstrous mass of human flesh. One of her legs, of enormous size, was uncovered as high as the calf, and every one pressed it, admiring its solidity, and praising God for blessing them with such a sight. I was received most graciously, and invited to sit close to her, when one of the first questions she asked me was, if in my country the ladies were as fat and handsome as herself. For the plumpness of my country-women, I owned, with shame, that I never had seen one possessed of half such an admirable rotundity, which she took as a great compliment; but I did not attempt to carry the comparison farther, though she was really very handsome in face and features. She amused herself, while speaking, with playing on a kind of drum made of clay, called derbooka, by beating with one hand, and playing with the fingers of the other; and perceiving that I was amused by it, she ordered an old man to get up and dance. The females sang and clapped their hands in good time, and the dancer went through a variety of figures, all equally indelicate. A woman then succeeded him, and in this respect quite threw him into the shade; but as I knew it to be the general mode of dancing in this part of Barbary, I of course applauded it. Lilla Fatma herself then thought proper to honour us with a few graceful attitudes in the same style; but Mr. Ritchie's entrance into the tent soon put a stop to the exhibition, and the ceremony of veiling took place in the same manner as before.'—p. 62.

Their advance was now into a dreary country, and on the frontier of Fezzan they experienced one of those dreadful eastern storms called the sirocco, of which our traveller observes, that in addition to their excessive heat and dryness, they are so impregnated with sand, that the air is darkened by it, the sky appears of a dusky yellow, and the sun is barely perceptible. The eyes become red, swelled, and inflamed; the lips and skin, parched and chopped; whilst severe pains in the chest are very generally felt, in consequence of the quantities of sand unavoidably inhaled.

The country of Fezzan is, for the greater part a vast desert, extending from about 30° , $30'$. to 24° , north latitude; and from 13° to 20° , east longitude; being about 450 miles in length, by 370 broad, and containing a population of about 75,000 souls; of which Mourzouk, the capital, contains 2500. It stands in latitude, $25^{\circ} 54'$ north; longitude, $15^{\circ} 52'$ east; and, is surrounded by walls of mud, about 15 feet in height, having round buttresses, with loop-holes for musketry, rudely constructed. There are seven gates, four of which are built up in order to prevent the people from escaping when required to pay their taxes; and the other three are guarded. The houses are mostly of one story; and those of the poorer classes, have no other light than

they receive from the doors, which are so low as to require stooping nearly double to enter them. The streets are narrow; but there are many open spaces. The castle, compared with the other buildings, may be called immense, rising to the height of eighty or ninety feet, with battlements on the walls, which at the foundation are fifty or sixty feet in thickness. The rooms are small and mean; the best of them are occupied by the women, of whom the number may be from fifty to sixty, half a dozen of which are considered superior to the rest. They are watched by five eunuchs, who have the privilege of beating them, if necessary, to support their authority.

The burying-places are without their walls; but many of the graves are so little below the surface, that in a strong wind the sand is dispersed, and the bodies exposed; such, however, is the dryness of the air, that no bad smell or putridity ensues. Within the town are sixteen mosques; some of them, however, are very small. The Cadi is the head of the whole, but each has its own imam; captain Lyon thus describes the dress of the Fezzan ladies.

'The dress of the women here differs materially from that of the Moorish females, and their appearance and smell are far from being agreeable: they plait their hair in thick bobbins, which hang over their foreheads, nearly as low down as the eyebrows, and are there joined at the bottom, as far round to each side as the temples. The hair is so profusely oiled, that it drops down over the face and clothes; this is dried up by sprinkling it with plenty of a preparation made of a plant resembling wild lavender, cloves, and one or two more spices, pounded into powder, and called Atria; it forms a brown, dirty looking paste, and, combined with perspiration and the flying sand, becomes in a few days far from savoury in appearance or odour. The back hair is less disgusting, as it is plaited into a long tress on each side, and is brought to hang over the shoulders; from these tresses, ornaments of silver or coral are suspended. Black wool is frequently worked in with these back locks, to make them appear longer. In the centre of the forehead, an ornament of coral or beads is placed, hanging down to the depth of an inch or two. A woollen handkerchief is fastened on the back of the head; it falls over behind, and is tied by a leather strap under the chin. Each ear is perforated for as many rings as the woman possesses, some wear even six on one side; the largest, which is about five inches in diameter, hanging lowest, supported by a string from the head. Round the neck, a tight flat collar of beads, arranged in fancy patterns, is worn with coral necklaces, and sometimes a broad gold plate immediately in front. A large blue shirt is generally worn, the collar and breast ornamented with needle-work: the women also wear white shirts, and striped silk ones, called shāmi, which are brought from Egypt;—a jereed and red slippers complete their dress.'—p. 170, 171.

On the 20th of November, Mr. Ritchie died at Mourzouk, after a protracted illness; and captain Lyon, and his only companion Belford, were in an extremely weak state. 'And now for the

first time,' says captain Lyon, 'in all our distresses, my hopes did indeed fail me. At day-light I went out and informed our kind friends, Yussuf, and Hadje Mahmoud, of our misfortunes; at which, they were much affected, and offered us all the assistance in their power. Belford, as well as he was able, hastened to form a rough coffin out of our chests; and, a sad and painful task it was. The washers of the dead came to us to perform their melancholy office, and Mr. Ritchie's body was washed, perfumed, and rubbed with camphor; and I procured some fine linen, with which the grave-clothes were made. During our preparations for the burial, the women, who are always hired to cry at the death of persons whose friends are able to pay them, proposed to perform that disgusting office in our house; but I would not allow it, and very unceremoniously shut the door against them. While I was out of sight, either our servant, or some of our officious visitors, stole several of our effects, and I clearly saw that we were now considered as lawful plunder. The coffin being completed, I hired men to carry it with ropes, but one of them having suddenly gone away, poor Belford was obliged to take his place; when, attended by our small party of Mamelukes, we proceeded at a ~~pick~~ pace to the grave, at about ten o'clock. The clay below the sand was white, which was considered as a good omen; and, Belford and myself threw the first earth into the grave. During the night we had, unknown to the people, read our protestant burial-service over the body: and now publicly recited the first chapter of the Koran, which the most serious Christian would consider as a beautiful, and applicable prayer, on such an occasion.'

When recovered a little from the effects of this dispiriting scene and his own illness, Captain L. proceeded under protection of the sultan's tassera or order, on his journey southward; and passed through Traghan and Zuela to the eastward. The springs at the former place, Captain Lyon says, are the pride of Fezzan. They consisted of four ponds of brackish water, each thirty or forty feet in diameter, covered with a green crust, and swarming with frogs. Near Zuela, Captain Lyon observed a blacksmith burning the side of a patient with a red hot iron for the cure of the liver. Our travellers reached Gatrone or Kattron, on the 30th of December; and on the 2d of January, arrived at Tegerry, which has a ruined mud castle, surrounded by several pools of stagnant water. It stands in latitude $24^{\circ} 4' N.$ being situated on the borders of the great Desert, is a sort of resting-place for all the caravans from Soudan, Bornou, and Waday; and was once, in consequence, a flourishing place. The inhabitants here were found to speak the language of Bornou: and here terminated Captain Lyon's travels southward. He was himself much exhausted by the climate, and Belford had fallen from his camel from excessive weakness.

At Mourzouk, Captain Lyon availed himself of the constant arrival of caravans from other parts of northern Africa, to obtain many notices respecting the countries to the southward and

eastward, which singularly agree with the information collected by Horneman, Burckhardt, &c. There was almost an unanimity among the natives respecting the identity of the Niger and the Egyptian Nile. He thus sums up the information he obtained on this subject:

'The Nil, Goulbi, Joliba or Kattagum, runs from Tombuctoo, through Melli, in the country of the Fellata; thence to Kebbi, which is three days north of Nooty: past this place or country, it runs to Yaowri, which is seven days east; from thence to Fendah, a Fellata country, S.W. of Kashna, which latter kingdom it passes at thirteen days south of the capital. It again makes its appearance at Kattagum, four days W. S. W. of the capital of Bornou, where it runs into a lake, called the Tsaad. Beyond this lake, a large river runs through Baghermee, and is called the Gambarro and Kamadakoo; the word Nil being also used for the same stream. Thus far are we able to trace the Nil, and all other accounts are merely conjectural. All agree, however, that, by one route or other, these waters join the great Nile of Egypt, to the southward of Dongola.'—p. 148.

Coffles or caravans, conducting slaves from the interior, are frequently seen at Mourzouk. One of them conducting 1400 slaves, the greater part females, entered the place during Captain L.'s stay. They are said to remain here for some time to be fattened, when they are said to be sent off for Tripoli, Benghazi, and Egypt: thus marching about for 1800 or 2000 miles before they can be settled, and frequently passing through the hands of eight or ten masters, most of whom refuse to consider them as human beings. Yet, says Captain Lyon,

'In justice to the poor unenlightened creatures whom they make their prey, I must say that I never witnessed such innocence, tenderness, and mildness as most of them evince when brought to Mourzouk, particularly at the death of any of their companions in adversity. On these occasions, they do not, like their persecutors, scream and make an insincere wailing; but sit silent and in tears, and often refuse to take their little allowance of food. Should one of the females fall sick, the others nurse, feed, comfort, and very often give up the whole of their scanty meal to the sufferer. I speak merely of the women, for the men are not blessed with very kind hearts; and it would be considered by them as disgraceful to betray any soft and tender feeling. Should a woman have an infant belonging to her, each of her companions in turn will carry and endeavour to amuse it. The women very seldom become sullen, and are lively without being at all boisterous or noisy; they are clean in their persons, very fond of ornaments, tractable, and easily taught; but in acquiring knowledge they unfortunately lose much of their native simplicity.'—p. 140.

Our traveller describes the young Tibbo girls as of light and elegant forms, with expressive eyes, aquiline noses, fine teeth, and lips like those of Europeans; the colour of their skin is of the brightest black; their gait graceful and elegant; their feet and ankles are delicately formed, and ornamented generally with copper or silver

anklets and neat red slippers. Their hair is plaited in a peculiar manner, and decorated with gold, silver, coral, agates, cowries, &c. according to the taste and ability of the wearer. They are fond of dancing, and sing and keep time remarkably well; some of their dances are not unlike those of the ancient Greeks. The men have intelligent countenances; are very active, but too slight in their make to be much esteemed as slaves, being unable to perform hard labour. These people are distributed over Bornou, Waday, Borgoo, and Bhagarmie, and many of them live in a free state in the southern parts of Fez-zan: numerous camels, horned cattle, asses, sheep, and goats, are found amongst those to the eastward.

Major Laing, who in the former part of the year 1822, penetrated into Africa, from Sierra Leone, as far as Soolinana, has published an interesting volume of travels. This gentleman describes the Timannee country, into which he first entered, particularly that part of it which is under the jurisdiction of Ba Simera, as populous and fertile, intersected by numerous rivers, and navigable creeks; and possessing a soil, which with little attention would raise its inhabitants to opulence. It is bounded on the east by Kooranko, on the west by Sierra Leone, part of Bullom and the ocean, on the north by the countries of Mandingo and Limba, and on the south by Bullom and Kooranko. Its length from east to west may be computed at ninety miles, and its breadth from north to south about fifty. At Toma, which is only sixty miles from Sierra Leone, no white man had ever before been seen; and a woman who first descried the party, stood fixed like a statue in admiration of them, until they had passed;—then ‘she gave a loud halloo of astonishment, and covered her mouth with both her hands.’ The natives generally have very little clothing, and many of them none at all: but the dress of the females, near the water side is peculiar; the young women wear ‘a narrow piece of cloth, called a tutunge, or a covering of beads called a patie,’ fastened to a few strings, or a narrow strip of cloth wrapped round their loins; whilst the married women adopt the more decent attire of two yards of blue baft, wrapped round the body like a petticoat. Amongst other superstitions, those connected with the burial of their dead, are the most remarkable: when a death takes place, various methods are adopted to appease the wrath of the evil spirits, supposed to have been the agents in the decease, and much pagan ceremony is exhibited. Whilst our traveller was at Bung, a girl died suddenly; immediately upon the decease, a loud yell was uttered from about a hundred people assembled upon the occasion; after which, several hundred women, some of them beating small drums, sallied through the town, confiscating every moveable article that they could find out of doors. The elders and Gregee men assembled a few hours afterwards, in the palaver hall, to ascertain, if possible, the cause of her death. They enquired whether any one had threatened her life; afterwards they queried whether she had been killed by witchcraft; and at last, after a consultation of three

days, concluded, that she died by the agency of the devil. The first two nights, during the time of this consultation, large parties of the inhabitants paraded the town, clapping their hands, yelling and shouting, to avert the wrath of the greegrees; and on the third, the night of interment, presents of rice, palm wine, cassada, and cloth, were deposited at the greegree houses, to satisfy the evil spirits that they might not kill any more people. Five or six men, strangely dressed, appeared about midnight, intimated that the evil spirits were satisfied, took away the presents, telling the people that no other death should happen in the town for some time. The joy which this assurance diffused among the people, was celebrated by dancing and revelry, till after day break. The Timannees in common with numerous other tribes of Africa, before eating or drinking, consign a portion to the dead, by throwing it upon the ground; ‘Charnel houses’ says our traveller, ‘in which the remains of the kings or head men are deposited, are never opened; but small apertures are left in the walls, through which cooked provisions and palm wine, are at times introduced.’ These the Timannees imagine, are needful for the dead; ‘of whose spiritual existence they seem to be satisfied.’ Small houses containing skulls, images, &c. are to be found generally near the entrance of the towns; the supposed residences of the greegrees, and ‘almost every house has its protecting spirits, who are often invoked in a manner that is calculated to excite the commiseration of the European spectator.’

The Purrah, so much dreaded in this country, is an institution, or rather a confederation, whose power supersedes that of the head man of the districts, and whose deeds of darkness are as little enquired into in Africa, as were those of the inquisition in Europe. Its origin our traveller was not able to ascertain; the head quarters of the Purrah are in enclosures, situated in the woods, and any man approaching them is apprehended, and seldom heard of after; single travellers, and even whole parties are frequently carried off in the same way, and there is reason to believe that a great number of the slaves sold at the Gallinas are supplied by this association. On some occasions they make incursions into towns by night, and carry off every thing valuable, dead or alive. ‘One night’ says our traveller, ‘the town in which we slept, was visited by the purrah, and my sentinel remained firm at his post; when the purrah came up an attack was made upon him, but the application of the bayonet, kept them at a distance, until I made my appearance, when the purrah uncertain of their power over a white man, scampered off; they were mostly naked and unarmed, but a few had knives. The outward distinguishing marks of the purrah, are two parallel tattooed lines round the middle of the body, inclining upwards in front towards the breast, and meeting in the pit of the stomach.’ As a proof, however, that the slave trade is not entirely carried on by the rapacity of the purrah, major Laing was twice offered children for sale by the mothers themselves, and might have bought them for ten bars, or about thirty shillings sterling.

The country of Kooranko from its mountains and picturesque appearance, as beheld from Ma Boom, excited in our traveller considerable interest. At Ma Biss, about two hours walk from the town of Ma Boom, to the north-west he found the river Rokelle flowing in a W. by S. direction, at the rate of nearly three miles an hour. The banks of the river were composed of argillaceous schist, or clay slate, interspersed with stupendous blocks of granite, lifting their rugged heads on either side to the height of thirty or forty feet. The channel of the river appeared about three hundred feet across, and was deep in the centre. Down this river he was informed the inhabitants floated their canoes to Rokou, during the rains, in the space of four days; but respecting the source of it, could obtain no intelligence.

The Mandingo scattered over this district, are described by our author as a shrewd and well made people, superior to any who inhabit the western parts of Africa. Their costume is plain and neat; the width of the trowsers is a considerable mark of distinction, so much so, that 'Korté Abooniato,' i. e. *large trousers*, a common expression amongst them, is synonymous with 'great man.'

At Kooloofa, on the frontiers of Kooranko, our traveller was again hailed by the natives as the first white man who had ever set foot in these parts; and making enquiries respecting the Kabauka Pampana, he learned that it was not more than three miles to the southward; after walking which distance he 'fell in with it, meandering along a deep channel about 200 feet in breadth in a mean direction from N. E. to S. W.' He describes the banks as lofty and picturesque, beautified with trees of luxuriant and various foliage in which he particularizes the camwood. On leaving Kooloofa the day following, he traversed a delightful country opening fine views of the picturesque hills of Kooranko, streaked down their sides with the courses of numerous rivulets tributary to the Kabauka Pampana. The soil here is extremely fertile where properly cultivated, resembling in many parts the soil of Ma Boom and the circumjacent region, being a rich black loam, mixed with a little clay and fine sand, the debris of granite washed from the Kooranko hills. 'In many places,' says our traveller, 'we met with extensive beds of granite intersected with veins of quartz, and in others the rock was found in a rapid state of decomposition.' The civility which Major Laing received at Nyiniah reminds us of some features of the classic page, and at the same time shews that the embers of humanity are not quite extinguished in the native African. The head man of Nyiniah forced him by civility to remain at his town one day longer than he intended, and visited him early in the morning attended by his chief and principal griot, the latter of whom entertained him for some time, by vociferating (or as he considered it singing) the praises of his master. Then he sung 'of the white man who came out of the water to live among the Kooranko people; the white man ate nothing but fish when he lived in the water, and that

was the cause of his being so thin. If he came among black men he would get fat, for they would give him cows, goats, and sheep to eat; and his thirst should be quenched with draughts of milk.' The song being concluded, our traveller was presented with a fine young bull, which being thrown down, was encircled by a crowd of people. 'Those nearest the animal placed their hands upon him, and joined in a short prayer which a Mahomedan repeated aloud; the purport of which,' said our traveller, 'was, that I might get safe to my journey's end and home again among the white men, and that God might long preserve my life.' The Moslem immediately took the knife and repeating aloud, 'Bissim Alla Hi,' i. e. 'May God enable you to bear what is going to happen to you,' severed with one cut the wind pipe of the victim. Every knife being now drawn and employed, so much execution was displayed that in the course of ten minutes the animal was cut up and portioned off. On these occasions the maraboo, who kills the animal, is entitled to the head, neck, and feet; the guarauge expects the hide, liver, and other parts of the inside; the head man of the town receives the right hind leg for his portion, and the blacks with fimo, and jelle, all come in for their share by right of ancient usage, so that the breast is all that is reserved for the person to whom the present is made. On leaving Nyiniah our author was charmed with the country, which he describes with a luxuriance and beauty characteristic of his volume; he passed two rapid streams traversing the plain nearly in a N. E. direction, and at a short distance fell in with the source of another, the spring of which forms a basin of ten yards diameter, embanked in masses of granite, and becomes one of the tributary accessions to the Kamaranka. The contiguous mountains appeared to consist of micaeous granite and mica slate, the strata running from E. to W. In the valleys were found pebbles of red and white quartz, and flat stones of various dimensions, so strongly impregnated with iron as to draw and repel the needle at the distance of several inches. A few miles N. by E. from Neta Koota flows the river Ba Jafana, about fifteen yards in breadth. This river springs about three miles distant from this spot in the Belakonko mountain; and after running about eighteen miles to the N. W. unites with the Rokelle. Between Foodayia and Kaniagama is a noisy rapid stream, about thirty yards broad, tributary to the same river. After passing the source of the Tongolelle, and overcoming considerable danger from the treachery of his carriers, our traveller arrived at Kania. He was not very much pleased here with the conduct of the women. Before he left the town their husbands returned from the war in which they had engaged, and the evening previous to his departure, dancing commenced, which was accompanied by the songs of the females. 'They sung of the white man who had come to their town; of the houseful of money which he had, such cloth, such beads, such fine things as had never been seen in Kooranko before.' It

their husbands were men and wished to see their wives well dressed, they ought to take some of the money from the white man!' It was with difficulty and artifice that this was avoided. Tamba, one of his attendants, mixed with the singers, and 'sung of Sierra Leone, of houses a mile in length filled with money, that the white man who was here had nothing compared to those in Sierra Leone; if therefore they wished to see some of the rich men from that country come into Kooranko they must not trouble this one; whoever wanted to see a snake's tail must not strike it on the head.' The Koorankos, generally, greatly resemble the Mandingoes both in language and costume. The women adorn each other's head with great skill, file their teeth to a point, and are ornamented on the breast and back with various devices burnt into the skin. The principal vegetables produced in the country of Kooranko are rice, plantains, yams, white spinach, ground nuts, cassada, delicious pines, and bananas.

Komato is the frontier town of the Kooranko country towards Soolimana; and here, on the 4th of June, our traveller was met by a party from Falaba, with horses sent by the king of Soolimana, to conduct him to Falaba, his capital. Leaving the town, he crossed a river not far to the east, the Rokelle, upon what was called a Nyankata, a species of suspension bridge, which he thus describes. 'From the branches of two stupendous trees, which growing in an inclined direction, nearly embraced one another across the river, were suspended to numberless stays, composed of vine and twisted bark of trees, three strong ropes of well twisted figs, one to support the feet, and the other two (attached to the third by cords of bark) to enable the passenger to balance himself by holding on with both hands, who in this manner by cautious steps is enabled to gain the opposite side; the twigs are not drawn tight, but are permitted to hang in a sort of curve, so that the effect is like that of walking on a slack rope, a ladder of cross branches is affixed to the trees at the extremities, so that the traveller mounts about forty feet before he steps upon the Nyankata, but when he reaches the centre of the river, he is not more than ten feet above its level. This Nyankata, for I must call it by its native name, having none of my own, was the first indication I had met with since I had left Sierra Leone of co-operation in works of public utility, and I hailed it with pleasure as a symptom of progressive improvement.' p. 214.

Major Laing thus describes his entrance into Falaba. 'About ten o'clock we came in sight of this long-looked for town, which covered a large extent of ground in a beautiful valley, hemmed in on all sides by gentle acclivities. We descended upon it by the south, but were conducted along to the northern gate, through which we were ushered into the capital of the Soolima nation. We passed along a street, or defile, of about half a mile in length, to a spacious piece of open ground, which stands nearly in the centre of the town, in one corner of which we found seated upwards of 2000 men, armed with muskets, bows, and spears; on my entrance

I was saluted by a heavy and irregular discharge of musketry, which, unfortunately, put my horse on his mettle, and as I had neither whip nor spur to teach him good manners, I was obliged to resort to jerking him with the curb, of the severity of which I was as yet ignorant; in consequence he backed among the armed assemblage, who were, by this retrograde movement, thrown into some confusion, and certainly not impressed with much opinion of my horsemanship. Being recovered from the awkwardness of my first appearance, I ordered the salute to be returned with three rounds from my party, and then alighting, shook hands with his majesty, who put into my hand two massive rings of gold, and made a motion for me to sit down beside him. I found him a good-looking man, about sixty years of age; his countenance mild, agreeable, and inoffensive in its expression; he is rather taller than the generality of Soosoos, being about five feet eleven inches in height; and his plain loose garment of black country cloth became him well. I was scarcely seated when my old friend, Yarradee, (habited in rather a more costly manner than when I first beheld him at the camp in the Mandingo country,) mounted on a fiery charger, crossed the parade at a full gallop, followed by about thirty warriors on horseback and 2000 on foot, the latter making a precipitous rush, and firing in all directions. After a lapse of a few minutes, the party on horseback returned, and performed various movements and evolutions for about half an hour, much to the amusement and admiration of my party, several of whom had been with the late unfortunate Major Peddie, and subsequently with Major Gray in Boondon; and who declared it to be a show passing any thing they had ever witnessed. Yarradee now alighted from his horse, and seizing his bow, pulled the string to the full extent, affecting to shoot an arrow at some distant object; he appeared to watch it on tiptoe with eager expectation till it reached its destination, when he gave a leap and a smile of satisfaction; then striking his breast with his right hand, and distorting his naturally ugly visage into a most hideous grin, he beckoned his war-men to follow, which they did, with a shout that rent the skies: after advancing a few paces they stopt short, and watching Yarradee, who, with the eye of a hawk, was intent on the motions of the supposed enemy, waited his direction to discharge their arrows; and having done so, each individual appeared to trace the flight of his own arrow, and betrayed signs of satisfaction or disappointment at its supposed execution or failure; a discharge of musketry followed the flight of arrows, after which the spears and cutlasses were put in requisition to hack and cut in pieces the discomfited foe; while those warlike movements were going forward, another set of people were by no means idle; there were above one hundred musicians who playing upon divers instruments, drums, flutes, ballafoos, harps of rude workmanship, with many other kinds, which it would be tedious to enumerate, kept up a din sufficient almost to crack the tympanum of ordinary ears and which compelled me to fortify mine with a

little cotton; two fellows, in particular, with crooked sticks, kept hammering with provoking perseverance, and with the violence of blacksmiths at the anvil, upon two large drums which stood about four feet high, in shape similar to a chess-castle turned upside down; their only desire appeared to be that of making a noise, and in that I suppose the chief art consisted, for the harder they beat, the more applause they obtained. A nod from the king at length put a stop to this clang of steel and din of drums, and I was flattering myself with the hope of being permitted to retire to the apartment allotted to me, but my motion was interrupted by the king who said I must hear something more. Being again seated, a jelle, or singing man, elegantly attired in the Mandingo costume; his wrists and elbows ornamented with bells, and beating on a sweet-toned ballafoo, the notes of which he ran over with taste and velocity, stepped out, and after playing a sort of symphony, or prelude, commenced a dialogue in song with some persons who were to be invisible at first, but who afterwards joined him'—p. 228—233.

During the residence of major Laing at the capital of Soolima, he frequently mentioned his solicitude to visit the source of the Niger, which he felt convinced was at no great distance. The king shook his head and said, 'White man, it is impossible, I am at war with the people of Kissi, the country from which the river comes; and if they were to know you came from me they would that moment kill you.' Numerous obstacles were at different times thrown in his way, but he expresses the fullest confidence that had his time been at his own disposal, a longer stay would have enabled him to accomplish the desirable object. He held some conversation with a caravan of merchants who came to Falaba from Kowia, a town on the banks of Falico, a branch of the Niger, who gave him much information respecting the source of that celebrated river, assuring him that it might be reached from Falaba in three days. He ascended a sugar-loaf hill, called Konkodogore, he states, four miles south of Falaba, from which he saw the hill Loma, whence the Niger springs; also the source of the river Mungo, originating in three hills which stretch to the westward. The source of the Rokelle he visited, tracing its diminished stream to the foot of a hill where 'springing from under a rock, and shaded by a thick foliage of date trees, it bubbles up and scatters itself over a wide surface of red clay, in appearance like a stream formed by the bursting of a water pipe in the streets. About a hundred yards or more below the source, the water collects into a channel of about a foot in breadth, and runs off rapidly to the S.S.E.' Afterwards it makes a circuitous sweep, shaping its course in a south-westerly direction, between Setacolia and Tigmatamba, where receiving considerable accessions, it widens and deepens, till it assumes the magnificence of a noble river.

Our author lays down the source of the Niger from the best information he could obtain, as being in lat. $9^{\circ} 25'$ N. and long. $9^{\circ}, 45'$ W. It is at its source, he says, called Tembie, and that it runs due north to Kang Kang, a dis-

tance of many miles, its course being marked by a ridge of hills breaking off at right angles from the chain, running easterly from Sierra Leone. Of this northerly branch, Loma forms a part; and the continuance, in the opinion of our author, of the mountains of Kong, the position of which has long been a subject of much speculation. On reaching Kang Kang, the river assumes an easterly direction, and exchanges the name Tembei, for Ba Ba, and Joli Ba, synonymous with each other, and signifying, 'Large River,' which it carries to Sego, Jinne, and Tombuctoo, after which the name Joliba is lost amid a multiplicity of designations.

Numerous traditions are found amongst the negroes, respecting it, one particularly is remarkable; 'that although not more than half a yard in diameter at its source, if any one was to attempt to leap over it, he would fall into the spring, and be instantly swallowed up; but that a person may step over it quietly without any apprehension of danger.' Another of these fictions relates, 'that it is forbidden to take water from the spring; and that any one who attempts it, will have the calabash wrested from his hands by an invisible power, and perhaps lose his arm.'

The limited success of preceding African expeditions, did not deter his majesty's government from again (1821) endeavouring to extend the knowledge of the British name and character in this direction. We follow a species of demis-official account of the last expedition, dispatched into the interior of Africa, from a respectable periodical journal.

'The bashaw of Tripoli had signified to the British consul his readiness to escort us far as Bornou, with the sultan of which he was in strict alliance, any British travellers who might be accredited by their government. Of so good an opportunity Lord Bathurst readily availed himself; and three gentlemen, volunteers, were appointed for this service—Doctor Oudney, a well informed North Briton, and a navy surgeon; Mr. Clapperton, a lieutenant in the navy, and lieutenant (now major) Denham, who was educated at the Royal Military College, and served in the Peninsular war. To these was added a carpenter from the dock-yard at Malta, by name John Hilman. From the private correspondence of these gentlemen with their friends, we are able to glean some little account of their proceedings. They were kindly received by the bashaw; and, after the usual delay in preparing for the journey, set out with an escort for Mourzouk. They had been advised by the bashaw to clothe themselves, as all former travellers had done, in Moorish or Arab dresses; but this disguise is so easily seen through, that they determined to wear their own dress, and openly to avow themselves Englishmen and Christians wherever they might go; and the result has been, that they have never experienced the slightest insult or inconvenience among any of the numerous tribes with whom they have had intercourse. Another tedious delay of a whole year at Mourzouk had at least one good effect, that of inuring them to a still warmer climate; while their frequent journeys

to various parts of Fezzan brought them acquainted with the manners, the language, and the disposition of the natives. During their long residence here, they experienced no ill effects either from climate, want of provisions, or badness of water. The doctor's fame spread rapidly into every part of Fezzan and beyond it; and patients poured in from every side to enjoy the benefit of his advice and his physic.

At length the time of their departure arrived; and Boo Khaloom, a particular friend of the bashaw of Tripoli, was appointed to command the escort, consisting of 300 Arab horsemen—far more than were necessary, but ordered out of the abundant care of the bashaw for the subjects of his cousin of England. In the month of November, 1822, they left Mourzouk, following the route laid down by Captain Lyon, as far as Tegherry. From this place they crossed a dreary desert, occasionally somewhat enlivened by little hollows or valleys, in which wells were found for themselves and their cattle, consisting of a multitude of camels in addition to the horses. In the course of four or five hundred miles, they passed a few villages and several towns inhabited by the Tibbos, whose territories cover a large extent of this wild region, and who consider themselves entitled to a certain tribute for keeping the wells in repair. These people, the most harmless perhaps of the numerous tribes whom a life of precarious subsistence has thrown upon this miserable country, treated our travellers with great kindness, and in their whole conduct fully justified the character given of them by Captain Lyon. Yet they are not safe or unmolested even in their deserts, being subject to the depredations of the Tuaricks, a fiercer race, who plunder the unprotected villages situated in the valleys, or little oases, but seldom venture to attack the larger towns, erected on the tops of detached and naked brown hills, which here and there rise out of the gray surface, like rocks out of the sea. Of these towns our travellers passed four, whose names are Kishbee, Asianumua, Dirkee, and Bilma.—Bilma is the great mart of salt for a considerable part of Soudan, 30,000 camel loads of which are said to be carried away yearly by the trading party of the Tuaricks. This is not dug out of the earth in masses, as has been represented; but manufactured by a very simple process: shallow pits, banked round with sand and mud, are dug, after the rains, which soon fill by water oozing in from below. The heat of summer evaporates the water, and leaves behind an incrustation of good culinary salt. From Bilma to Agades one desert of sand succeeded another, with here and there ridges of dark sandstone peeping out of the dreary surface, exhibiting neither plant nor living creature, nor any other object to rest or relieve the wearied eye. One single wadey, or valley, near Bilma, about half way between Mourzouk and Bornou, produced grass and shrubs, and a few date trees. There was no want, indeed, of frequent wells, the water of which was tolerably good; and near these generally were found a few tufts of grass; great numbers of their camels, however, perished for want of food.

On the 4th of February, twenty days after their departure from Bilma, they reached Lari, the frontier town of Bornou. Here the country suddenly changed for the better. Large herds of antelopes were bounding over the plains; guinea fowls and turtle-doves were most abundant, and grass and acacia trees clothed in some degree the surface. Several villages also made their appearance, the houses of which, like those of Lari, consisted of bell-shaped huts, formed of the straw of dhurra. Lari is situated in about 14°. 40'. north latitude, and nearly on the same meridian with Mourzouk. Here our travellers suddenly got sight of the great lake of Bornou, called the Tsaa'd, which, extending easterly, receives the little streams of those northerly valleys in which most of the Kanem villages are situated. Hence they continued their route in a southerly direction for seven days, without leaving the Tsaa'd at any great distance, the road mostly lying within sight of its waters or banks; the former presenting numerous bays and inlets, and islands covered with thickets and tall reeds; the latter were low, though a sandy embankment, of forty or fifty feet in height, ran parallel to the margin of the lake, at the distance of one and sometimes two miles from it, having apparently formed, at one time, the bank of the lake, and still, perhaps, forming it in the rainy season; as the ground between this and the lake was in many places observed to be overflowed, even from the effect, as it appeared, of the north-east wind. Several elephants were seen among the acacia woods, and two or three were observed browsing among the reedy islands. The whole neighbourhood was well stocked with villages, among which was one of a larger kind, named Burwa, with mud walls, whose houses and huts were observed to be neat and clean, and all its inhabitants decently clothed.—Leaving Lari, and at the distance from it of about sixty miles beyond the commencement of the lake, they crossed the river Yaou, (the Zad of Horneman, and the Tsaa'd of Burckhardt,) flowing from the westward into the lake, being now a stream of about one hundred feet wide, and running at the rate of a mile an hour, between high sandy banks from two to three hundred feet apart. It is this river which is said to overflow in the rainy season, and into which Burckhardt says a female slave is thrown on the occasion by order of the king. At the ford where our traveller crossed, two rude ill-shapen boats were lying on the bank. Their gratification in meeting with such a river, after a thousand miles nearly of desert, will readily be imagined. In all their letters they speak warmly of its beauties, the calmness and *sweetness* of its waters, the comfort it seemed to add to the numerous little villages scattered along its banks, and the possibility of its being the far-famed Niger,—which it unquestionably is. A walled town of the same name, Yaou, stood on its banks. From this place to Kouka, the residence of the sheik, is a fine beaten track, covered with kofillas of bullocks transporting merchandize, and with foot passengers mostly armed with spears, and cheerfully trooping along. Approaching within one day's journey of the residence of the sheik, our travellers received a message from him, in

answer to one announcing their arrival, that he would receive them at Kouka the next day. The accounts of this personage had been so contradictory, that they approached his capital in an interesting state of uncertainty, whether they should find him at the head of thousands, or whether he would receive them under a tree, surrounded by a few negroes.

They were soon, however, relieved from their suspense; for, on arriving within a few miles of Kouka, they were astonished with the appearance of about four thousand cavalry drawn up to receive them, well armed with spears, and a body of negroes, called the sheik's guard; these latter were clothed in coats of iron chain-work, closed at the neck, and drawn over the head like a Guernsey frock, which, dividing both before and behind, fell on each side of the horse, and protected the thighs also. On their heads they wore skull-caps of iron or brass, fastened on with turbans, yellow, red, and white, and tied under the chin; the horses' heads were also defended by plates of the same metal: their saddles were small and light; their stirrups of brass, in which four toes of the foot only are placed; a sandal of leather covers the foot, ornamented with the skin of a crocodile, and to this the spur is fixed. 'They really,' says Major Denham, in one of his letters, 'rode beautifully, and charged rapidly to within a few feet of our horses' heads, without checking their speed, when they brought up, shaking the reversed spear at Boo Khaloom, with a cry of Barca, Barca! welcome, welcome!' After this, he says, they closed their flanks and completely surrounded the travellers and their little party of Arabs; 'they had nearly put an end to us,' he adds, 'by the dust alone which they raised; and their spears rattled over our heads in rather discordant notes of welcome—all this, however, was managed with a skill and address that was any thing but savage.' Surrounded by this tumultuous escort they approached the town; and after about an hour's delay, were ordered to move on through several dark avenues of the sacred palace of the sheik of Spears, lined with his guards, in plain blue Soudan shirts, and armed each with a spear and dagger. In the same garb the sheik received them, seated in an inner room, on a small carpet, but having on his head a Cashmere turban. Two slaves, with loaded pistols, were lying at his feet. Having read the letter of the bashaw of Tripoli, he merely said they were welcome, and ordered a negro to shew them to the huts that had been prepared for them. They were pleased with the cast of his countenance, and his affable and engaging manner: his age appeared to be about forty-five. The sultan's court at Birnie is described as one of fans, silks, and feathers, while the sheik's is one of spears. Dr. Oudney paid a visit to this mock sovereign, to whom he was conducted by a troop of horsemen of most grotesque appearance, dressed in ~~black~~ round-topped turbans and short thick stuff cotton jackets, looking 'so thick and buncy,' says the Doctor, 'that they sat on their horses as steady and unmoveable as if they had been so many well stuffed sacks of corn. The great horse of state, with a huge man upon him, headed the proces-

sion; (we are glad to find such respectable authority for the Lord Mayor's man in armour;) but so swelled out was the horse with the covering of a thick stuffed carpet, and so loaded was the man with clothing and charms, that both of them appeared incapable of moving. The sultan was perched in a kind of cage in the wall, from which he did not descend; but sent his ambassador to bid the strangers welcome; and in the mean time the drums beat, and the long wooden trumpet sounded, whilst a sort of herald under a tree, with a mace in his hand, was vociferating, with all his might, the genealogy, the titles, and the praises of the sultan.

Our travellers having satisfied their curiosity at Kouka, and the neighbouring towns, were desirous of prosecuting their discoveries beyond the dominions of Bornou; Dr. Oudney and Lieutenant Clapperton wishing to proceed to Soudan, and Major Denham to the eastward; but the sheik gave them to understand that his cousin, the bashaw of Tripoli, having strictly charged him with the care and protection of their persons, he considered himself responsible for their safety, and could not, therefore, allow them to depart on any service of danger. Nothing, indeed, could exceed his kindness to the strangers: and Major Denham entertained a sanguine hope that he might be allowed to accompany him on a projected expedition against Bagherme, after the rainy season. 'He is never tired,' says the Major, 'of asking questions about sieges; and gun-powder is his delight. Thirty or forty English muskets, and two camel-loads of good powder would be to him a more acceptable present than any other that could be given him. My rockets are here invaluable; he has seen two, which have delighted and frightened the whole nation. I have given him a dozen, all that were left; and they are preserved with the utmost care;' and he adds, 'by means of these alone I shall get to Bagherme, as they are to accompany an expedition to that country, which is in agitation, and they cannot as yet set them off; one of them bursting over the town, he assures me, will cause its immediate surrender by its inhabitants.' In the mean time, however, an occasion offered for this enterprising officer to proceed beyond the boundaries of Bornou. Boo Khaloom, who had attended our travellers from Tripoli, thought it no bad opportunity, before his return, to avail himself of the advanced situation in the interior, to proceed on a Grazzie, a sort of marauding expedition which the native tribes of Africa are in the habit of making upon each other. At the earnest solicitation of Major Denham to accompany this expedition, the sheik reluctantly consented, but insisted on sending an old negro servant to take care of him. The number composing the Grazzie consisted of about 3000 men, partly Arabs of Boo Khaloom, partly natives of Bornou, under the command of Barca Gana, his chief Mameluke and general, and some of the troops of the Sheik. They travelled south; and after a march of six days reached Mora, the capital and residence of the Sultan of Mandara, situated in a valley at the foot of a noble chain of hills, at the distance of 170 miles from Kouka. These hills or mountains (said to ex-

tend to the distance of thirty or forty days to the south-west) are composed of granite, and their sides clothed with trees. In the valleys are many towns inhabited by Mussulmans; but those who dwell in the mountains are Kindies, or savages, who receive protection from the sultan of Mandara, in consideration of furnishing him with a certain number of slaves. Boo Khaloom had expected that a portion of these would have been given to him at Mara; but this was positively refused: he therefore proceeded still southerly against the Fellatas, a very powerful nation, on the offer of the sultan to add to his forces. The Major's account of this enterprize, written to a friend of his at Malta, is so curious and full of interest, that we shall give it in his own words.

' On the 25th of April, the sheik's troops, the Arabs, and about 2000 horse of the sultan of Mandara, with himself, set forth for Musfeia, the capital of the Fellatas. Our road lay through extensive valleys, thickly planted with trees, and bounded by those beautiful hills, the sides of which presented here and there clusters of huts, and the height of which, sometimes exceeded 1500 feet. On the 28th, soon after daylight, we approached the Fellatas' towns, having marched nearly the whole night. Two of them were quickly burnt, and passing on we came upon a third, situated between two low hills, with a dry wadey in front. Here the Fellatas had mustered their forces, had carried a strong fence of pointed stakes from one hill to the other, were themselves on a rising ground behind, and covered by the huts. The position was extremely strong and well chosen. The Arabs moved on with great gallantry, Boo Khaloom at their head; and, notwithstanding the showers of arrows (some poisoned and some not) that poured on them from behind the palisades, they carried them in less than half an hour, and pushing on, drove the Fellatas up the sides of the hills. A few of the Bornou spearmen now supported the Arabs, and pierced through and through about fifty unfortunates whom the fire of the Arabs had obliged the Fellatas to leave wounded near the stakes. Had even a small part of either the Mandara troops, or those of the sheik, now moved up boldly, they must have carried the town, for the Fellatas did not exceed 1000 or 1200 men at the utmost; but they still kept on the other side of the wadey, out of reach of the arrows. The Arabs advanced to the very houses, and got possession of some of them, Barca Gana, myself, and about forty of his own people alone accompanying them. Seeing the backwardness of their enemies, they now made an attack in their turn; the arrows were so thick, that there was no standing against them, and the Arabs quickly fell back. Barca Gana had two horses hit under him, that died almost immediately, the arrows being poisoned; and, here poor Boo Khaloom received his death wound by an arrow of the same description, which struck him in the foot. My horse was badly wounded in the shoulder, and in his near hind leg; an arrow had struck me in the face as it passed, merely bringing the blood, and two others stuck in my *bornouse*; most of the Arabs had two, and some three

wounds, and one dropped near me with five sticking in his head alone.

' No sooner did the Mandara and Bornou troops see the retreat of the Arabs, than they one and all took to flight in the most dastardly and confused manner possible; and I now, for the first time, as I saw Barca Gana on a fresh horse, lamented my own folly in thus exposing myself, being badly provided against accidents. If either of my horse's wounds were from poisoned arrows, I felt that nothing could save me; however, there was not much time for reflection. We instantly became a confused flying mass, and plunged, in the greatest disorder, into that wood which we had but a few hours before moved through with order and very different feelings.

' I had got a little to the west of Barca Gana's track, and was following one of the sultan of Mandara's eunuchs, mounted on a white horse, when the cries behind of the Fellata's horse pursued, made both him and me quicken our pace. The spur however had the effect of incapacitating my animal altogether. The arrow I found afterwards had reached the shoulder bone, and in passing over some rough ground he stumbled and fell. Almost as soon as I was on my legs, the Fellatas were on me. I had however, kept hold of the bridle, and seizing a pistol from the holster presented it at two, who were pressing me with their spears. They instantly went off; but another, who came on me more boldly just as I was trying to remount, received the contents somewhere in his left shoulder, and again I was enabled to raise my foot to the stirrup. Once more mounted, I again pushed my retreat. I had not however, proceeded many hundred yards, when my horse again came down with more violence than before, threw me to a considerable distance against a tree, and, alarmed at the horses behind him, he quickly started up, escaped, and left me on foot and unarmed. My life was now preserved by one of those wonderful interpositions of Divine Providence, which ought to fill the mind of man with gratitude and devotion.

' I was almost instantly surrounded, and, incapable of making the least resistance, as speedily stripped. In an attempt first to save my shirt, and then my trowsers, one villain made two thrusts at me with a spear that badly wounded my hands in two places, and slightly my body, just under my ribs on the right side. Indeed I saw nothing before me but the death I had seen inflicted on those who had fallen into the hands of the enemies of the people, in whose power I now was—but it was otherwise ordained.

' Scarcely were my clothes torn off me, when my plunderers began to quarrel for the spoil. Without a moment's reflection, I crept under the belly of the horse nearest to me, and started, as fast as my legs would carry me, for the thickest part of the wood. Two of them followed me, and I ran off towards the east, knowing that our stragglers would be in that direction, but still almost as much afraid of friends as foes. A deep mountain-stream obstructed my passage, which, by swimming a few strokes, I quickly got over,

and then felt myself quite safe from my pursuers. My feelings at this moment, (what could I do in the helpless state of nakedness in which I was,) cannot be described. I now saw horsemen through the trees still farther to the east, and I determined on reaching them if possible, whether friends or enemies—and my feelings will readily be imagined, when I discovered Boo Khaloom, with about six Arabs, and Barca Gana pressed by a party of Fellatas, whom they had halted to drive back, being the only people who carried guns.

' My voice however, would never have reached their ears had not Maranny, the sheik's negro, who accompanied me from Kouka, seen and known me at a distance, and to this man am I indebted for my life. He rode up to me, assisted me to mount up behind him, while the arrows whistled over our heads, and he then galloped off to the rear as fast as his wounded horse could carry him. Boo Khaloom now rode up to me, and desired one of the Arabs to cover me with a *bornouse*; these were the last words I heard him speak, and we had scarcely proceeded ten miles, when Maranny exclaimed, ' Look ! look ! Boo Khaloom is dead ! ' I turned my head round, almost as great an exertion as I was capable of making, and saw him fall into the arms of an Arab.' The major then proceeds to state, that, after riding forty-five miles, he reached the territories of Mandara in a most deplorable condition, and with some difficulty succeeded in borrowing a shirt, which had been worn eight or ten days. The Arabs had lost every thing; forty-five of them were killed, and nearly all of them wounded. The sheik, on his return, received him with the greatest kindness; and, his wounds were speedily healed.

The distance from Kouka to the Fellata villages in the mountains, the Major informs us, is about 230 miles nearly south, or $3^{\circ} . 20'$. difference of latitude, which would make the latitude of these villages about $9^{\circ} . 30'$. Assuming the longitude to be the same as that of Mourzouk, $14^{\circ} . 10'$. it will be seen, by inspecting the charts, that he was not more than about 300 miles from old Calabar; so that Captain Adams was unwittingly right in saying that the best, at least the nearest, way to the Niger, or its waters, would be across the country from that quarter. While the Major was absent, another important step in African geography was made by Dr. Oudney and Lieutenant Clapperton. With the consent of the sheik they set out on an excursion to examine the river Shary, which, by proceeding southerly, they found at the distance of ninety miles from Kouka. It is a noble stream, nearly a mile broad, flowing gently at the rate of about a mile an hour, and containing a great number of flat islands. It flows from the southward, and is supposed to have its origin in the chain of granite mountains mentioned by Major Denham. They traced its stream to the northward, till it entered itself by five or sixth mouths into the lake Tsaad; directly in the face of the report which they had gleaned from all quarters, that this river flowed out of the lake. Our travellers had never had the lake fairly open to them before; for it is so

stu'dded near its banks with islands, and the country is so perfectly flat, that there is no seeing beyond them; but here it presented a noble sheet of water, extending north, north-east, and east, farther than the eye could reach. Some of the islands in the Tsaad are inhabited by a people called Budooma, who carry off, on rafts, not only cattle which they find grazing near the shore, but frequently women and children; yet the sheik has no canoes, nor any means of punishing these marauders. John Hillman, the carpenter, had made himself very useful in fabricating sofas and palanquins for the sheik, and had become of course a favourite; the greatest service he could perform for the natives, however, would be that of instructing them in the art of boat-building and of navigating the lake. There is no want of wood for this purpose, and their cotton would supply them with ropes and sails. We trust it will have occurred to our travellers, that the best and surest way of examining its eastern shores is by means of a boat. Our travellers first saw this lake at Lari, which is 130 miles to the northward of Kouka, and as Kouka is said to be ninety miles to the northward of the mouth of the Shary, the lake must be at least 200 miles in that direction; and may be more, provided these two points should happen not to be its northern and southern extremities. A portion of it would appear to occupy the position assigned by major Rennell to the swamps of Wangara; but our travellers had no better success in hearing any thing of this name than Burckhardt, Ritchie, Lyon and others; and so little did it resemble a swamp, that in the month of April, at the end of the dry season, when not a drop of rain had in all probability fallen for six or seven months, it had all the appearance of being full and perfectly transparent. It is not stated, however, in any of the letters which we have seen, whether the water be fresh or salt, though the very omission may almost be assumed as a proof of its being fresh; a still stronger proof is that of its abounding with hippopotami and crocodiles—two animals that exist only in fresh water. Burckhardt, indeed, had positive information that the lake of Borno was fresh. The probability is, that it is *fresh* and *has* an outlet; and if any reliance can be placed on Arab authority, the Gambaroo, which flows by Bagherme and Fittri to the eastward, is that outlet. ' Some report,' Doctor Oudney says, ' that the Shary gives off a large branch which falls to the southward of Bagherme two days, and runs to Fittri, and thence to the Nile ; ' and Major Denham learned from an Arab sheik of Waday, that a branch of the Shary, called the Bahr el Dago, goes into the Nile; that it receives additional supplies from Lake Fittri, twelve days journey from those mouths of the Shary which flow into the Tsaad; and that it then takes a course to the south-eastward, till, as before, it reaches the Nile. He was further informed, by the Sheik, of some Mourzouk merchants having spread a report that it was their (the travellers') intention to come up that river (El Dago) from Misr (Egypt) with ships as large as elephants, loaded with guns and gunpowder. There must

be something, we think, in this universal belief that the waters, which we have now traced into the Tsaad, find their way to the Nile of Egypt. There is nothing whatever against their reaching the Bahr el Abiad, except the low level of the Tsaad, which is evidently the *sink* of North Africa; yet the comparative difference of levels between it and the former river is not at all known; nor do we find, in the letters of the travellers, any estimate of its level above that of the sea.

'But where,' asks Dr. Oudney, naturally enough, 'where is the celebrated Niger? The Yaou is the only probable river coming from Soudan, and it is almost too small.' Yet the wonder is, that in the dry season it was not smaller. Most rivers that have no feeders, and more especially African rivers, that lose so much by absorption and evaporation, diminish as they proceed in their course; and if the Niger (for so will we not scruple to call it) had not been confined within very narrow banks, but had spread out a more considerable surface, the probability is, that the whole of its waters at this season, and at this distance from its source, would have been evaporated. Major Denham, who went directly south, beyond the 10th degree of latitude, crossed no river between Kouka and the termination of his journey, and there is none between that city and the Yaou; so that if this stream be not the Joliba, which has been pretty well ascertained to run into the lake Nyflic, about 300 miles to the westward of the Tsaad, and nearly on the same parallel, there certainly is no other in Bornou that can be considered as the Niger. If, indeed, the account of all travellers, and the Arab writers, can be depended on, and particularly the result of Horneman's enquiries, no doubt whatever can remain that the Yaou is the Niger, which Major Rennell has traced satisfactorily into the swamps of Wangara, or (for they must be the same) the lake of Bornou; what becomes of it afterwards, and whether it terminates in the lake, is a point which we trust our travellers will be able to determine.

'From the multitude of villages, observed by our travellers along the western shores of the lake, and the several large towns not very distant from it, there can be no doubt that this part of Africa is well stocked with inhabitants. The town of Kouka, which may be called the sheik's head-quarters or military dépôt, has only about 8000 inhabitants. It is situated at the distance of fifteen miles from the western borders of the Tsaad, in lat. 12°. 51'. N. and long. 13°. 14'. E. being nearly twenty miles to the westward of the meridian of Mourzouk; and the travelling distance is about 1000 miles from the same place, which occupied the expedition ninety-two days. Bernie, the residence of the sultan, is eighteen miles S. S. E. of Kouka, and is said to contain 30,000 inhabitants; and Engornou, sixteen miles S. E. by S. of Kouka, not less than 50,000. At this place there is a weekly market held on Wednesdays, to which all the surrounding countries, the people of Kanem and of Soudan resort; so that the numbers who occasionally attend are said to amount to eighty and sometimes a hundred thousand souls! Major Denham made a visit to this place, and was much pleased with

it. The currency appeared to consist of amber, coral, and glass beads; but dollars were well known and most in demand. A large diamond-cut drop of a glass chandelier, the Pitt diamond of central Africa, was, however, an object of contest among the ladies of the court. How such a population is supported, it is not easy to imagine: the whole kingdom, on the western side at least, is one dead flat of sand and clay, without a single stone of any description. In the season of heat and drought, every vestige of verdure takes its departure, except from the various kinds of acacia trees and the tamarind: yet herds of elephants, giraffes, buffaloes, and antelopes of various kinds, are everywhere seen, and especially along the borders of the lake. Major Denham says he counted forty-seven large elephants in one group. Where and on what they feed at this season does not appear. Tame bullocks are met with in droves of a thousand or fifteen hundred, and flesh meat is very cheap: a fine ox might be bought for three dollars; and fowls at the rate of forty for a dollar. Of vegetables, our travellers saw little but onions and a few yams; and no fruit except the tamarind. In the sheik's garden is a single lime-tree. The quadrupeds above mentioned, and many smaller species, supplied our travellers with abundance of game, which were procured chiefly by Clapperton, who is an excellent shot. The lake too, abounds with a great variety of water fowl, some of which are said to be of extraordinary beauty; and the ducks and geese were so tame, that he killed eight or ten at one shot. Snipes rise in thousands, like so many clouds.

The temperature in March and April was uniformly high, seldom lower than 100°. and sometimes 104°, at two or three o'clock; yet the constant refreshing breeze prevented it from feeling oppressive. The barometer was steady at twenty-nine inches. So little did the heat appear to affect Clapperton, that he used to go out for several days together, along the margin of the Tsaad, to kill game, and suffered nothing from the exertion: the people were uniformly civil and obliging. A numerous tribe of Arabs had settled in the sheik's dominions. They came from the banks of the Shary, and are described as different from those of the north; their complexions are of a light copper colour, with handsome aquiline noses, and large expressive eyes; they are savage in their manners, and of undaunted courage. Major Denham says they resemble very much some of the best looking of our gipsy race, particularly the women, and their Arabic is nearly pure Egyptian.—*Quarterly Review, No. LVIII.*

We have detained the reader amongst these interesting details, with the greater pleasure, as they have certainly contributed to enhance our knowledge of this portion of Africa materially.—Major Denham, we are happy to learn from the public papers, returned in safety, and we look forward for the publication of his journal and papers to enrich various future articles of our work.

Mr. Laing, to whom we have already alluded, started afresh from Tripoli, and joined a caravan to Timbuctoo. He survived a very dangerous

attack from the Fellatahs, in which he received twenty-eight sabre cuts, and reached Timbuctoo in safety. He resided there some months, but the Fallatah chiefs not only insisted on his leaving Africa, but assassinated him while sleeping a short distance from that capital. He was accompanied by several of his countrymen who were most anxious for his success. Had he succeeded according to his expectations, his next object would have been to fall down one of the streams, as far as the Tsaad of Bornou, where he expected to meet with our countrymen, who have been for some time domiciled at Kouka.

Two of those countrymen, Dr. Oudney and lieutenant Toole, we are concerned to state, have paid the debt of nature; the latter fell a victim to exertions which, in an African climate, were too severe for his youth, immediately after performing a fatiguing journey across the desert from Mourzouk; the other, to a complaint which he carried out with him, but to which he firmly persuaded himself an African climate would prove friendly—a disease of the lungs. We have still to regret the absence of their journals, itineraries, geographical observations, and other documents, which however, are believed to be safe; but various letters to the consul at Tripoli and to their friends in England supply, in some degree, the deficiency of these details by the general outline they give of their proceedings.

On the 21st of May 1823, Dr. Oudney, lieutenant Clapperton, and a confidential slave of the sheik's as a guide, set out on a journey into Soudan. They reached in four days, (travelling in a north by west direction,) Old Birnie, once the capital of Bornou, and formerly a city of great consequence: its walls were of brick, mixed with clay, thirty feet high, ten or twelve feet thick, and eight or nine miles in circumference; but they were now in ruins, as was a magnificent palace of the sultan's of Bornou, which covered a vast extent of ground, the latitude of this place $13^{\circ}. 4'$. north long. about $1^{\circ}. 15'$. west of Kouka. Here they were joined by the sheik, who invited them to accompany him on an expedition against the Munga tribes, in which they passed successively the towns of Kubshara, Biskour, Surgum, and Balley, the latter being about a hundred and twenty miles from Kano, the capital of Houssa, and a celebrated resort of merchants, in this part of Africa. From this place they returned to Kouka; but recommenced their journey on the 14th of December, and in twelve days passed the western frontier of Bornou, and entered the Beder territory, the sudden change to severe cold, which they here experienced, proved fatal to Dr. Oudney.

'On the morning of the 12th,' says Lieutenant Clapperton, 'when the camels were loaded, Doctor Oudney came out of his tent. I then saw but too plainly that the hand of death was upon him, and that he had not an hour to live. I prevailed on him to return to his tent, and I sat down beside him: he expired about an hour afterwards. The only request he made was, that I would forward his papers to Lord Bathurst, and to say, that he wished Mr. Barrow might have the arrangement of them, if agreeable to his lordship. I sent immediately to the governor

of the town to acquaint him with what had happened, and to request that he would point out a spot where I might be allowed to bury the remains of my friend, to hire some of his people to wash the body, and to dig a grave; all of which was immediately complied with; and, as we travelled in the character and habits of Englishmen, I considered it an indispensable duty to read the funeral service over the body in the tent and at the grave side, according to the rites of the church of England; and, so far from meeting with the least interruption, the natives, on the contrary, took pains to show me every possible respect for having so done. Having killed two sheep, to be distributed among the poor, I caused a wall of clay to be built round the grave; and the next morning, being extremely unwell from exposure to the sun, and grief for the loss of my friend and companion, to whose good and amiable qualities no language of mine can do justice, I left Murmur with a heavy heart, and on the 20th at noon arrived at the city of Kano, where I was received with great ceremony.'

It may be proper to add that lieutenant Clapperton delivered the sheik's letter, and a present, to the sultan of Kano, who received him with great kindness, and promised to forward him in safety to his master Bello, the sultan of the Fellatas. The letter alluded to, is an extraordinary instance, both of the benevolence and cultivation of this chieftain's mind. After the usual formal salutations, he says, Some distinguished persons, Englishmen and Christians, between whom and Mussulmen an ancient friendship and brotherhood has existed, as is no secret but known to all the world, are about to visit your country. The love between these people and the followers of the true faith has continued for ages, and ascends from one generation to another, even as the wealth of a father descends to his children; and by this friendship, frequent amicable intercourse is kept up between them and Mussulmen. But this love is most observable in the ease with which Mussulmen now visit their countries, which are rich and extensive, going and returning without danger or molestation. And now these Christians have visited us, through the medium and love of our master Yussuff, Bashaw of Tripoli, at their own desire, to see the country, which is by God's mercy ours, and what is wonderful in the land, its rivers, lakes, and people, all of which may differ from those of their own country. We have enabled them to see all the country of Bornou, even in the way they wished, with freedom; and they ask of us a passage to yours, in order that the wonders which are not here, may be seen by them there. We have granted their request, and have furnished them with letters of kindness and greeting, which letters will tell you how we esteem them:—

We remind you, but it is needless, for your great knowledge will inform you, that it is written, that even our prophet himself, our interposer and advocate, (praise be to God and his angels!) ordered, that these should not be molested nor injured when they came in peace, and did no harm. We throw them upon your care and protection. You know that there are believers who strike down and trample upon the weak and un-

protected. You know, also, that justice is not always done to the good by the wicked. We trust therefore to you, and beg that you will support and protect these Englishmen and Christians; that you will not permit them to be buffeted or abused, nor allow them to be pained either by privations or blows, or even regarded with disdain, until such time as it shall please God that they shall return to their native land.

'They are people of a pure heart and true tongue; such we have found them; be you their supporter, and cause them to rejoice in our recommendation; so may God reward you, and grant you what you hope for and desire! and by his blessing may we together proceed on the road to heavenly bliss! May all health, and happiness, and virtue, and faith, be to you and to those near you, and all that belong to you, and not to yourself alone! Dated the evening, &c.

(Signed) SLAMEEN BEN KANERRY,
Sheikh of the Koran.'

'On the 23d of January, Major Denham, accompanied by Lieutenant Toole, left Kaonka, and arrived at the river Shary on the 30th, which they found, in lat. $12^{\circ} 47'$. above six hundred yards in breadth, and running N. E. at the rate of about five miles an hour. Here they embarked for the lake Tsaad, before mentioned, with eight canoes, furnished them by the Kaid of Showey, a small town in this neighbourhood, and found the whole course of the river highly interesting. On its banks, thickly clothed with trees and beautiful shrubbery, they saw numbers of crocodiles.

'The Shary was found to empty itself into the great lake by two branches formed by the island. Descending the western branch the following morning, for about two hours, our travellers found themselves on that sea of *fresh water* which, says major Denham, we called the Lake of Waterloo. They had not proceeded however, beyond two miles on the open lake, when the heavy swell from the north-east, caused the canoes to ship so much water, and the paddling became so laborious to the men, that they were obliged to return. They understood that the nearest of the Beddoomy islands was a voyage of three days from the mouth of the Shary (about ninety miles) in the direction of north-east, during two of which they lose sight of land. These people carry on a piratical war with the borderers of the lake. It is said that they frequently muster from sixty to one hundred canoes. They make no slaves, but demand ransom for their prisoners, who, if it be refused, become islanders, take wives, and remain among them. The whole of the islands are said to be able to muster a thousand canoes, with fifteen to twenty men in each. In every other respect, but that of plundering, they are said to be a mild and inoffensive people, not given to cruelty, and never known to murder their prisoners. They say of themselves that 'they have a strong arm and a cunning head, a small country and poor cattle, and that they must take from those who are richer than themselves.'

'Returning up this stream, they saw a variety of water fowl, and other birds, abundance of fish, and numbers of large hippopotami. Attempting

to cross the country from Showey to the Loggun territory, Mr. Toole seems to have received a cold that terminated his earthly career. The journey was through a succession of swamps and stagnated waters, 'where,' says major Denham, 'flies, bees, mosquitoes and immense black toads, vie with each other in displaying their peace-destroying powers.' The inhabitants, are so molested by them that they construct within their houses nests of cells one within another, to the number of five or six, to secure a retreat from them. At Kissery, in the midst of these swamps Mr. Toole's sufferings became so great that he could no longer mount and dismount from his horse. They attempted to halt, and their situation may be conceived from the circumstance of their being obliged to light fires at the entrance of their tents, and constantly to supply them with weeds and wet straw, in order to procure a temporary relief from the millions of insects that hovered round them. Their horses refused all food, and naturally averse to flame and smoke, rushed to the fire, and suffered their heads to be actually scorched, in order to obtain a little respite from the stings of their persecutors.

'Painful as their condition was, the Shua Arabs, who guarded the frontier of the Loggun territory, refused to let them pass, until they had received permission from the sultan. On the 16th February this permission came, but poor Mr. Toole was now quite insensible, and was obliged to be lashed upon a camel. In this state they entered the town, and took possession of a decent hut which had been assigned to them. The next morning major Denham was summoned before the sultan, who, like him of Bornou, was caged up in a box, the front of which was lattice work of cane. This being removed, the major says, something alive was discovered on a carpet, wrapped up in silken robes with the head enveloped in shawls, nothing but the eyes being visible; the whole court prostrated themselves, and threw sand on their heads, while eight trumfrums and as many horns blew a loud and most tremendous blast. On receiving a small present, he *whispered* welcome! for speaking out, it seems, is considered extremely ill-bred in a Loggun gentleman. This old gentleman in the box, on being asked for his permission to proceed up the Shary, enquired particularly if the major wished to purchase any *siriahs*, or handsome female slaves, 'for if you do, he gently whispered, you need go no farther; I have some hundreds, and will let you have them cheap.' Finding however, that he was not likely to gain a customer, the shade was drawn and the audience finished.

'The name of this capital of Loggun is Kur-nuck, and it is situated on the banks of the Shary in Lat. $11^{\circ} 7'$. and contains about fifteen thousand inhabitants, who speak a language half Arabic and half Baghermie. They have a considerable trade with the Shua Arabs, from whom they receive bullocks, milk, and fat, in exchange for blue striped cottons, which they manufacture well, and dye of a very clear and beautiful colour. The people are described as much handsomer than those of Bornou, and more intelligent; the women particularly so, possessing a superio-

carriage and manner to those of any black nation that major Denham had ever seen. He was visited by the ladies of some of the principal persons of the country, who examined every thing about his person, begged every thing, and stole every thing they could secrete, and when discovered, only laughed heartily, clapped their hands together, and exclaimed, 'why, how sharp he is! only think, he has caught us!' They have no pretensions, it would seem, to modesty. Major Denham gives them the credit of being the cleverest and the most immoral race he had ever met with, though they call themselves Moslem.

There was no difficulty in getting permission to proceed up the river, which was here about 400 yards wide; and as the major's colleague seemed a little better, he embarked for the purpose of exploring it higher up. The canoes were here better than those lower down, measuring about fifty feet in length, and capable of carrying from twenty to twenty-five persons, built of a fine-grained red wood which grows plentifully on the banks of the Shary; the planks were from two to three feet wide. He had only proceeded a few miles when a boat was seen rowing after them as quickly as possible, and on its coming up, the whole seven that were with him, made to the shore at once in the utmost confusion. He soon discovered that the Baghermie were advancing towards Loggun, and the sultan had sent word that the sheik of Bornou's people should instantly quit the city. It was in vain for the major to plead the sickness of his friend and of his servant;—'go,' said he, 'go while you can, I can give you no protection.' Finding there was no alternative, poor Mr. Toole, unable to assist himself, was again lashed on a camel, and they quitted the walls of Kurnuk, when the three gates were shut upon them one after the other, with great satisfaction, by an immense crowd of people. It was the fourth day before they reached Angala, in Bornou, having enjoyed very little rest, and scarcely any food; the poor sick traveller being delirious the greater part of the time, lashed on a camel, and exposed to the scorching rays of the sun. On being told that they had reached Angala, he said, 'thank God, then I shall not die!' Every hope, however, vanished two days afterwards; a cold shivering seized him, and his extremities were like ice; in this state he continued a few hours, and expired without a struggle or a groan, being completely worn out and exhausted. 'The same afternoon,' says Major Denham, 'I followed his remains to their last lodging place, where six of the sultan of Angala's slaves lowered them into a deep grave they had dug, overhung by a clump of mimosas in full blossom,—and a silent prayer breathed over them was the best funeral service which circumstances allowed me to perform.' Mr. Toole had not completed his twenty-second year, and was in every sense a most amiable and promising young officer. His manners are said to have been extremely pleasing, and his disposition kind, gentle, and obliging. He was perfectly resigned to his fate; and when major Denham, the day before his death, spoke of their return to Kouka, he smiled, shook his head, and said, 'No, no, it is all over,' and shortly after

begged, as his last request, that lord Bathurst would recommend his next brother to succeed to his ensigncy in the 80th regiment.

Major Denham now accompanied the sheik's army, on an expedition towards Fitre, round the northern end of the lake. The major was more anxious to proceed to Kanem on the northern side, and thence along the eastern shore of the lake. The sheik, from anxiety for his safety, gave almost a positive refusal, but at length consented that he should go to the southward, cross the Shary below Showey, and take with him twenty horsemen, with some of his best Arabs, all armed with guns, while he (the major) was only to have a couple of the fastest going maharies, the fleetest animal that is known: his rout to be quite close to the banks of the Tsad, while the armed force was to take a more inland direction, and nearly parallel with him. He stipulated with the sheik that he should encompass the lake and return by Laree, on the northern extremity, to Kouka. Major Denham could not realize his hopes of encompassing the Tsad, on account of the wars carrying on between Bornou and the nations on its northern and southern banks. Both travellers reached England in safety, after accomplishing a greater extent of travel than any of their predecessors. Captain Clapperton left Europe a few months after, on a second expedition. He started from the Bight of Benin, and passing through many interesting countries, and meeting with comparatively few obstacles, he again established himself with sultan Bello, intending to proceed to Bornou with presents to the sheik of that place. These presents, however, excited the cupidity of Bello, and our traveller was not permitted to advance. The treachery of this monarch, and the disappointment of his hopes, preyed so heavily upon him, that he died at Soccato. Lieutenant colonel Denham went to the new English settlement of Fernando Po, as inspector general of the liberated Africans, and afterwards became governor in chief of our settlements on the western coast; he however fell a victim to the climate of Sierra Leone in a very few months.

We have thus exhibited, at considerable length, the spirited modern efforts of Englishmen, in exploring these hitherto impervious deserts. It is not, however, to be forgotten that other parts of Africa have attracted the attention, and been illustrated by the researches of our enterprising countrymen. Legh and Burckhardt are names (the last especially) indissolubly connected with the history of its north-eastern shores; while Jackson, Keating, and others have explored its more northern wilds: nor must we forget our obligations to Sparman, Kolben, Vaillant, and Barrow, in southern Africa; or the labors of Hamilton, lord Valentia, Mr. Salt, and Belzoni, in the east of this continent. We shall avail ourselves of the information they have respectively afforded, as these districts are brought successively under our review.

AFRICA, or Mehedita, an opulent seaport town on the coast of Barbary, ninety miles S. S. E. from Tunis. It was taken by the emperor Charles V., who demolished its fortifications.

AFRICAN SLAVE TRADE. See **SLAVE TRADE**.

The AFRICAN INSTITUTION is a society instituted for purposes of benevolence, or rather

of reparation toward Africa; its views cannot be better stated than in the resolutions which were adopted at the constituent meeting on the 14th of April, 1807, and which were circulated with the first report, as the basis of the society.

‘1. That this meeting is deeply impressed with a sense of the enormous wrongs which the natives of Africa have suffered in their intercourse with Europe; and from a desire to repair those wrongs, as well as from feelings of benevolence, is anxious to adopt such measures as are best calculated to promote their civilization and happiness.

‘2. That the approaching cessation of the slave trade, hitherto carried on by Great Britain, America, and Denmark, will, in a considerable degree, remove the barrier which has so long obstructed the natural course of social improvement in Africa; and that the way will be thereby opened for introducing the comforts and arts of a more civilized state of society.

‘3. That the happiest effects may be reasonably anticipated from diffusing useful knowledge and exciting industry amongst the inhabitants of Africa; and of obtaining and circulating throughout this country, more ample and authentic information concerning the agricultural and commercial faculties of that vast continent; and that, through the judicious prosecution of these benevolent endeavours, we may ultimately look forward to the establishment, in the room of that traffic by which Africa has been so long degraded, of a legitimate and far more extended commerce, beneficial alike to the natives of Africa and to the manufacturers of Great Britain and Ireland.

‘4. That the present period is eminently fitted for prosecuting these benevolent designs; since the suspension, during the war, of that large share of the slave trade, which has commonly been carried on by France, Spain, and Holland, will, when combined with the effect of the abolition laws of Great Britain, America, and Denmark, produce nearly the entire cessation of that traffic along a line of coast extending between two and three thousand miles in length; and thereby afford a peculiarly favourable opportunity for giving a new direction to the industry and commerce of Africa.

‘That for these purposes a society be immediately formed, to be called ‘The African Institution.’ Disclaiming all colonial and mercantile speculations, and all direct aim at the propagation of religion, which they deemed the sole and legitimate purpose of the christian missionary, they further resolved to pursue their object by such means as the following. To collect and diffuse information respecting the natural productions of Africa, and respecting its agricultural and commercial capacities, its intellectual, moral, and political condition—to cultivate a friendly connexion with the natives, and promote their instruction in the art of reading, and in useful knowledge in general—to enlighten them with regard to their true interests, and the means by which they may improve the present opportunity of substituting a beneficial commerce for the slave trade—to introduce amongst them the improvements and most useful arts of Europe—to promote the cultivation of the African soil,

by furnishing the natives with seeds, and plants, implements of husbandry, and agricultural instruction—to acquaint them with medical discoveries—to obtain a knowledge of the African languages, and reduce them to a written form, and to employ agents for establishing correspondences, &c. From its commencement the society has maintained a most jealous circumspection with regard to the execution of the abolition laws, communicating information to government, and aiding its measures with the wisdom of practical experience. We wish we could add, in respect to foreign nations, with a success proportionate to its zeal. In consequence of the scantiness of the society’s funds, the latter purpose has hitherto been that to which its principal attention has been directed, as the primary step to improvement. The annual Reports of this society very ably detail its proceedings, which are under the management of a patron and president, twenty vice-presidents, a treasurer, and a committee of management, consisting of thirty-six persons, annually chosen. The president is the duke of Gloucester.

AFRICAN COMPANY, a society of merchants, established by Charles II. for trading to Africa. An association of merchants of the city of Exeter gave rise to this company, and first received a patent in 1588, from queen Elizabeth, which conferred on them the exclusive privilege of trading to the rivers Senegal and Gambia for ten years. A similar charter was granted by her successor James I. to certain merchants forming a joint stock company in 1618, but it was soon dissolved: a third company created in 1631, by Charles I. shared a similar fate. A demand for negroes for our West India islands began however to be pretty constant about this time, and the duke of York, with some other persons of distinction, in 1662, obtained a charter from Charles II. which secured to the English a monopoly of all commerce with Africa, from Cape Blanc to the Cape of Good Hope. Of this company also the directors in a few years resigned their charter; when in 1672 the last incorporation of this description was formed by letters patent, and conducted for some time a flourishing trade. They raised a joint capital of £111,000, and erected various forts on the coast, until the existence of these monopolies by grants from the crown, being considered at the Revolution inconsistent with the declaration of rights, the trade to Africa was thrown open. All private traders, however, were obliged, by stat. 9 and 10 William and Mary, to pay 10 per cent. towards maintaining the forts and factories already erected; and in 1730, £10,000 was granted by parliament in aid of this expence.

In 1750, the original company being completely bankrupt, its forts and various establishments on the African coast were vested, by 23 Geo. II. cap. xxxi., in a new company of merchants trading to Africa. This company could not trade as a corporate body, nor possess transferrable stock; its duties were to maintain all the forts and garrisons in good repair that lie between Cape Rouge and the Cape of Good Hope; any British subject might be admitted

into it on the payment of 40s.; and the management of its affairs are vested in nine commissioners, chosen annually, for London, Liverpool, and Bristol, in equal numbers. The commissioners appointed to enquire into the state of the African Settlements, in 1812, gave the following as the annual expence of each of these forts :

Appollonia	- - - - -	£ 879	7	10 <i>½</i>
Dixcove	- - - - -	926	2	5
Succondee	- - - - -	429	3	5 <i>½</i>
Commenda	- - - - -	842	2	3
Cape Coast Castle	- - - - -	4768	9	1 <i>½</i>
Annamaboe	- - - - -	1885	12	3 <i>½</i>
Tantumquery	- - - - -	771	17	6 <i>½</i>
Winnebah	- - - - -	776	8	11
Accra	- - - - -	1328	1	0
Whydah	- - - - -	587	16	6 <i>½</i>

£13195 2 5

The whole annual expenses of the company in Africa, for forts, salaries of officers, &c., was stated to be £25,327 1s. 5*½*d. It further appeared from this Report that the trade of the coast was chiefly in the hands of the governors of the forts, to each of whom it afforded a perquisite of from £800 to £1000 a year.

The company's annual expenditure at home consisted of £100 to each of the nine members of the committee; and £300 to the secretary; in all £1200. The number of persons in their employ, at Christmas 1813, consisted of forty-seven governors and subordinate officers, and 450 soldiers and menials. The company was dissolved in 1820.

The AFRICAN ASSOCIATION, distinguished for its early patronage of travellers in Africa, originated with gentlemen of various parties, who in 1788, united themselves, to the number of about ninety-five, to promote the discovery of the interior of this great continent. Their affairs were conducted by a committee of five distinguished individuals. Lord Rawdon (the present marquis of Hastings), the late Dr. Watson, Bishop of Landaff, Sir Joseph Banks, H. Beaufoy, Esq. and Mr. Stuart; who had the honour to dispatch the intrepid Ledyard on his first journey to Africa, in the year of their institution; and it was to Henry Beaufoy, Esq. that Ledyard made the memorable answer, on being asked, upon the first interview, when he would set out?—‘To-morrow morning.’ The committee assigned him, in conformity with his own desire, the course from east to west, in the supposed latitude of the Niger. In August he arrived at Cairo; but died before entering upon the route proposed. Mr. Lucas was their next traveller, but with little more success. Embarking for Tripoli in October, (1788), he was instructed to penetrate the desert of Zaara to Fezzan, and to return by way of Gambia.

But at Mesurata, he found those difficulties which deterred him from proceeding further. In 1790 Major Houghton was engaged by the committee to ascend the Gambia eastward, and to continue on the same line of route over the continent. He reached the coast in November, and went up the river 900 miles, to Bambouk, and from thence to the adjoining province of Kasson, where he died in September, 1791. The association now had the honour of engaging the celebrated Mungo Park, who in 1795 entered upon the same route as his predecessor; explored the source of the Niger to Silla, and after almost incredible exertions returned in about two years. He was afterwards, it is but too well known, sent out by government, in 1805, to renew these labours, and never more returned.

To the individuals who first directed and encouraged the enterprises of our countrymen in this direction, it is due thus to re-state the names and objects of their travellers, of whom Messrs. Horneman and Burckhardt were the last. Both these gentlemen perished in their ardent thirst for the diffusion of knowledge. The former embarked from London in 1797, and was heard of at Tripoli in April 1800, but since that period no intelligence whatever has been obtained respecting him. The latter, who particularly distinguished himself, after passing through Nubia, died at Grand Cairo. Latterly government has directed and equipped various expeditions to the interior of Africa, and nobly superseded those exertions of private societies.

AFRICA is represented on medals by the different symbols of the elephant, Pegasus, scorpion, lion, &c., as on a medal of Adrian, bearing on the obverse the head of the chypho HADRIANUS AUG. CONSUL III. Pater Patriæ, on the reverse the figure of a female crowned with the proboscis, &c. of an elephant, and holding a scorpion in her hand; from the abundance of those animals in that country, inscription AFRICA. The female has also a cornucopia in her arms, and a basket with ears of corn at her feet, emblematical of its fertility. A medal of Severus bears on the obverse the head of Severus crowned with laurel, inscription SEVERUS PIUS AUG.; on the reverse a figure of Africa standing, having ears of corn in her right hand, and a lion at her feet; inscription Pontifex Maximus TRIBUNUS POPULI CONSUL III. P. P.

AFRICANUS FLOS. Gerard mentions four species of this flower; Miller enumerates and describes thirteen; but they are of no repute in medicine.

AFRICANUS, (Julius,) an historian of the third century, the author of a chronicle which was

greatly esteemed, and in which he reckons 5500 years from the creation of the world to Julius Caesar. This work, of which we have now no more than what is to be found in Eusebius, ended at the 221st year of the vulgar era. Africanus also wrote a letter to Origen on the

history of Susanna, which he regarded as suppositious; and we have a letter of his to Aris-tides, in which he reconciles the seeming contradictions in the two genealogies of Christ, recorded by St. Matthew and St. Luke. The emperor Heliogabalus at his request rebuilt the abbey of Nicopolis on the site of the ancient Emmaus. The remains of this author were printed among the *Mathematici Veteres*, Paris, folio, 1693, and were translated into French by M. Guischardt in his *Mémoires Militaires des Grecs et des Romains*, Paris, 1774. The early part of his Chronology is supposed to be an abridgment of the work of Manetho, who lived 300 years B.C. The exact time of his death is doubtful.—Lardner says ‘We may glory in Africanus as a Christian.’

AFRICANUS, (Scipio.) See SCIPIO.

AFRICTA, a kind of wafers, which the ancients used in their sacrifices.

AFRIQUE, St. a town of France in the department of the Aveyron, on the Sorgues, eleven leagues and a half S. S. E. from Rodez. Population 3580.

AFRICUS, a name sometimes given to the wind S.W. and by W. so called from its blowing from Africa. Horace calls it protervus.

AFRONT'. In front.

AFSLAGERS, in commerce, persons appointed by the burgomasters of Amsterdam to preside over the public sales made in that city. They must always have a clerk of the secretary's office with them, to take an account of the sale. They correspond to our brokers, or auctioneers.

AFT', Gothic, *aftaro*, A. S.

AFT', prep. & adv. { *Aften*: according to

AFT'FREYE,

AFT'WARDS.

Tooke, the comparative of the noun aft; it is synonymous with hind, and baek, and is a frequent prefix in compound words, but affects their signification no otherwise than its general acceptation imports; i. e. succession in order of time and place.

In be yvf hondred ger of Grace Scynt Austyn hyder com.

And four score ger and tuo, to prechy Cristendom.
And about an hundred ger yt was and fyfty al so,
After pat Saxons and Englysse verst come pys lond to.

R. Gloucester, p. 230.

Help pi kynne Crist bit. for per by gynnek charite,
And *afterwarde* awhaite, hoo hap moost neede
And per help yf pou hast.

Vision of Piers Ploughman, p. 288.

Therefore kepe ye and do ye alle thingis, what-ever thingis thei seyen to you: but nyle ye do *after* her werkis; for thei scienc and do not.

Wicliif, Matt. xxiii.

O ye sonnes of men, how long wylle ye blaspheme myne honour? Ad haue soch pleasure in vanyte, and seke *after* lesyng?

Bible, Ps. iv.

And saw the fox toward the wode is gon
And bare upon his back the cok away.

They crierden, out! harow and wala wa!

Aha the fox! and *after* him they ran

And eke with staves many another man.

Chaucer. *Nonnes Freestes Tale*, v. ii. p. 196.

Uses, not thought upon before, may *afterward* spring up; and be reasonable causes of retaining that, which former considerations did formerly procure to be instituted

Hooker.

Let go thy hold, when a great wheel runs down a hill; let it break thy neck, with following it: but the great one, that goes upward, let him draw thee after.

Shakspere's King Lear.

Thou shouldst have made him,

As little as a crow, or less; ere left

To *after-eye* him. *Shaksp. Cymbeline*.

Good *after* ill, and *after* pain delight;

Alternate, like the scenes of day and night.

Dryden's Fables.

Those, (who from the pit of hell,

Roaming to seek their prey on earth) durst fix

Their seats long *after*, next the scat of God.

Paradise Lost.

Far be it from me, to justify the cruelties which were at first used towards them, which had their reward soon *after*.

When o'er the ship in undulation vast,

A giant surge down rashes from on high,

And fore and *after* the severed ruins lie.

Falconer's Shipwreck.

AFT, in maritime affairs, abaft or behind, near the stern of the ship, as, ‘To run out the guns afore and aft,’ i. e. from one end to the other.—‘Right aft,’ i. e. in a direct line with the stern when applied to any distant object.—‘To haul aft the fore sheet or main sheet,’ i. e. to pull the sails more towards the stern.

AFTER, in maritime affairs, the hinder part of the ship, as the after-hatchway, the after-capstan, after-sails, &c.

AFTER-GUARD, the seamen who are stationed on the poop and quarter-deck of vessels, to attend and work the after-sails, &c.

AFTER-BIRTH, in midwifery. See PLACENTA

AFTER-MATH, in agriculture, or after-grass, the second crop, or grass which springs up after mowing: or grass-math, that is cut after some kinds of corn. In cutting rowen or second crops of grass, says Mr. Loudon, more attention will be requisite than in the first, as the crops are mostly much lighter and more difficult to cut, the scythe being apt to rise and slip through the grass without cutting it fairly, except when in the hands of an expert workman. Crops of this sort should always be cut as much as possible when the dew is upon them; and as soon as ever there is a tolerable growth, as by waiting, the season is constantly getting more unfavourable for making them into hay; and when not well made this hay is of little or no value. When the grass has been decided to be in the proper condition for being cut down, a set of mowers proportioned to the extent of the crop should be immediately provided. In some districts, it is the custom to pay these labourers by the day; but a better and more general practice is, to let the work at a certain price by the acre. The extent or proportion of ground that can be mown in any given space of time, must obviously vary much according to the nature of the ground, the fulness of the crop, and the goodness of the workman, but in general an acre is supposed a full day's work for an expert mower.

AFTER-KINDRED, a term used by some writers for remote kindred.

AFTER-NOON. The Romans professed to dedicate their mornings to business, and their afternoons to diversions, as at their game called *pila*, and other exercises of the body, especially walk-

ing or riding. These lasted till the eighth or ninth hour, answering to our three o'clock, which was the time for the baths. After bathing, they anointed and perfumed themselves; and about the tenth hour, went to *cœna*, supper, about three hours before sun-set; which done, the day was ended at the public spectacles, theatrical or amphitheatrical sports; with music, singing, and the like.

AFTER-SAILS, in maritime affairs, comprehend all those which are extended on the mizen mast, and on the stays, between the mizen and main-masts: they are opposed to the head sails.

AFTER-THROES, or pains, *enixus posteri*, *dolores post partum*, in midwifery, are pains resembling labour pains, though ordinarily less violent, and which occur after the expulsion of the placenta; being occasioned by the contraction of the uterus to expel foreign bodies from its cavity, as well as to reduce the capacity of the blood-vessels, which, during pregnancy acquire a considerable magnitude. They are more or less severe in different women, but are found very rarely to occur after first labours. They are more frequent after the birth of large, than of small or middling-sized children; or after labours that have terminated in an unusually quick and rapid manner, particularly if the placenta has been extracted almost immediately after the birth of the child. After-pains, even when most severe, are seldom attended with danger; and are best relieved by the application of warm cloths, with gentle friction; by giving internally twenty-five or thirty drops of the tincture of opium, or by assiduously rubbing upon the region of the uterus, a mixture composed of four parts volatile linament, and one of the tincture of opium; by administering frequent draughts of warm gruel, or giving castor oil, or some other gentle purge on the following day. See LABOUR.

AFTER-SWARM, are secondary or posterior swarms of bees, frequently found to quit the hives within a fortnight after the first. Some writers distinguish the after swarms from the prime, in that the latter are directed by the vulgar, or crowd of bees, whose only rule is the fulness of the hive; whereas the former are appointed by the ruling bees, and indicated by a noise or call, which these make for the space of two or three days, as it were, to give warning to the common herd to prepare for a march. Within eight or ten days after the prime swarm is gone, if the princess next in order find a competent number fledged and ready, she begins to tune her treble voice, in a mournful and begging note, as if she prayed the queen-mother to let them go; to which voice, if she vouchsafe a reply, by tuning her base to the other's treble, it marks her consent; in consequence of which, within a day or two after, if the weather allow, the new swarm appears. If the prime swarm be broken, the after will both call and swarm the sooner, perhaps the next day; in which case a third, sometimes a fourth, succeeds in the same season; but all usually within a fortnight after the prime swarm. See SWARM.

AFTO, in botany, a name given by the natives of Guinea, to a plant of the *erisimum* kind, which they grind to powder, and take as snuff, to cure the head-ach. Petiver has called this plant the

woody and woolly *erisimum*, or hedge-mustard, of the coasts of Guinea.

AFUERA, an isle of Juan Fernandez, in the Pacific, on the coast of Chili. Its coasts abound with sea-fowl and wolves. W. long. 80°. 41'. S. lat. 33°. 47'.

AFWESTAD, a town of Sweden, in Dalecarlia, seated on the Dala; which has a copper work, a church, a post-office, and a mint for coining. In the middle of the last century, a portion of the copper coinage of the country was here conducted, but this is now discontinued.

AFWIOWARA, a village and district of Kantoineko, in Lapland, situated on the mountains under Norway. It has a bailiwick and a court of law.

AFZELIA, in botany, a genus of the didynamia angiospermia class and order; the characters of which are, CAL. quinque-partite, COR. campanulated, and the capsule rotundated, acuminated, double-celled, gaping at the apex and polyspermous; with hemispheric receptacles. There is one species, the *Afzelia Cassiodoides*, the *Afzelia* of Gmelin. Also a new species of the decandria monogynia class and order, near the *Hymenæa*, and of the natural order of leguminosæ: the essential characters of which are, CAL. tubulose with a limb quadrifid, deciduous; Pét. four, unguiculated, with a very large head: the filaments two, superior, sterile; the legumen many-celled; the seeds arillated at the base. It is found in Africa, near the equinoctial. Linnæan Trans. vol. iv. p. 221.

AGA, in the Turkish language, signifies a great lord or commander. Hence the general of horse is denominated *spahilar agassi*; and the aga of the Janissaries is the commander in chief of that corps. He is an officer of great importance; and is the only person who is allowed to appear before the Grand Signior, without his arms across his breast, in the posture of a slave. Eunuchs at Constantinople are in possession of most of the principal posts of the seraglio, and the title aga is given to them all, whether in employment or out. It is also given to all such as are without employ, and especially to wealthy landholders.—We find also agas in other countries. The chief officers under the Khan of Tartary are called by this name. And among the Algerines, we read of agas chosen from among the boluk bashis (the first rank of military officers), and sent to govern in the chief towns and garrisons of that state. The aga of Algiers is the president of the divan, or senate. For some years, the aga was the supreme officer, and governed the state in place of bashaw, whose power dwindled to a shadow. But the soldiers rising against the boluk bashis, or agas, massacred most of them, and transferred the sovereign power to the califf, with the title of Dey or king.

AGA, or ADJA, in geography, a village about half a mile from Anamaboa, on the gold coast of Africa, where the Dutch formerly had a fort. The landing is difficult and dangerous; but the adjacent country produces several valuable commodities, and among others a very fine cotton.

AGAAZI, or AGAGI, in geography, the Abyssinian denomination of a class of shepherds, who are said to have been employed by the descend-

nts of Cush, the first inhabitants of the country, and by dispersing the produce of Arabia and the eastern coast of Africa over the continent, to have acquired wealth and influence. Agag, says Mr. Bruce, denoted the nobles and chiefs of the armed shepherds, whence came their title king of kings; and the plural of this is agagi, or, as it is written in the Ethiopic, agaazi. The king of Amalek, mentioned 1 Samuel, ch. xv. and slain by Samuel, was, according to this writer, a shepherd of this kind. *Bruce's Trav.* v. i. 387.

AGA CRETENSIMUM, in botany, the Spanish milk-thistle.

AGABUS, *Αγαβος*, Gr. a grass-hopper, a prophet, who foretold the famine that happened in the reign of Claudius Caesar, A. D. 44, and the persecution of Paul by his countrymen at Jerusalem. See Acts xi. 28, and xxi. 10. He is said to have suffered martyrdom at Antioch.

AGADA, an Egyptian or Abyssinian wind instrument, of the flute species, but with a mouth-piece, like a clarionet.

AGADEER, the Gesert Ghessem of Leo Africanus, or SANTA CRUZ, a noble port, and once a very flourishing town of Morocco. No port of the empire has so fine and secure a road for vessels. The town stands on the summit of a mountain, and is defended with batteries. Its inhabitants were transferred by Seedy Mahomet to Mogodor, and the place has never since recovered its original constitution.

AGADES, (Audagost, of Edrissi,) a flourishing town of central Africa, on the caravan route from Tripoli and Fezzan to Cassina. It is forty-seven days journey from Mourzouk, and many of the merchants from that quarter stop at Agades, to change their commodities for those of Soudan, and the countries to the south of the Niger. The merchants of this place are the sole carriers of the salt which is found on the banks of the lake of Domboo, in the desert of Bilma, though that territory belongs to Bornou. Senna of a very superior quality grows in the neighbouring mountains. The African Association (1792) states Agades to be one of the cities of Kashna, but Horneman reports it to be the capital of an independent kingdom called Asben. It is the centre of the trade of the interior of Africa.

AGADEEP, a town of Bengal, on the Bhagatty, 14 miles south of Plassey. The word signifies 'The extreme Island,' and the Hindoos state that the sea originally reached this place.

AGAG, *אָגָג*, Heb. i. e. an upper room, a king of the Amalekites, equally cruel and effeminate, who was spared by Saul, notwithstanding the express command of the Almighty, and slain by Samuel, because 'his sword had made many women childless.' His cowardly dread of death, recorded in 1 Samuel, xv. affords one of numberless proofs recorded in history, that those monsters, who put no value on the lives of others, are generally most anxious to preserve their own.

AGAGITE, an epithet given to Haman, the proud prime minister of Persia, probably because he claimed, or deduced his descent from the ty-

rant mentioned in the last article; an ancestor, worthy of such a descendant.

AGAGEER, a name given in Abyssinia to those who hunt and kill the wild elephants. Their name is derived from the word Agar, which signifies to hough or ham-string with a sharp weapon. These persons dwell constantly in the woods, and live entirely on the flesh of the beasts which they kill, which are chiefly the elephant and rhinoceros. They are light and agile, both on horseback and on foot; of a swarthy complexion: and have European features. The manner in which they kill the elephant is as follows: two men, altogether naked, mount the same horse, which the foremost manages, and the hindmost has a broad sword, the handle of which he grasps with his left hand, whilst with his right he takes hold of a part of the blade, round which whip-cord is twisted. The edges of the sword are as sharp as a razor, and yet he carries it without a scabbard. When the elephant is found feeding, the horseman runs before him, making noises to irritate him; the animal incensed by this, attempts to seize the horse and rider with his trunk, instead of endeavouring to make his escape. The horseman after some evolutions of this kind, rides up to the elephant and drops his companion on the off side; and, whilst the rider engages the attention of the animal, the other person gives him a stroke above the heel, in that part which in the human subject is called the tendon of Achilles. After which, the horseman turns round and takes up his companion. Sometimes an expert Agageer will kill three out of one herd. The blow commonly separates the tendon, or at least wounds it to such a degree that the weight of the animal breaks it. In this state the horseman and his companion speedily dispatch the animal with their javelins and lances; when he is slain, the flesh is cut off the bones into strings, and these are hung on the branches of trees to dry, without salt; and, are then laid by for their stock of provision in the season of the rains.

AGAI. See AGIO.

AGAIN', *a.* *Sax. azen*, from *Onzegen*, AGAINST', *to meet*; to oppose; to en-

AGAIN'WARD, *counter*:—Tooke. Again,

AGAIN'SAY. *and its cognate words*, denote repetition, transition, opposition; in our earlier literature, we find ayen, ayenst, agane; agens, agen, still later.

—He gedere ys ost anon

To werre, and to stonde *ageyn* pe Romaynes ys fou.

R. Gloucester, p. 80.

whiche all your aduersaries schulen not mowe *agen-*
stone and *agenseye*. *Wiclf. Luke xxi.*

Not yeldinge yuel for yuel, neither cursyng for
cursyng, but *agenward* blesyng.

Wiclf. Peter iii.

And therfore is I come, and eke Alein,
To grind our corn, and carry it home *agein*:

I pray you spede us heuen that ye may.

Chaucer. The Reeve's Tale, v. i. p. 159.

T

Long was I, lady Lucke, your seruing man,
And now haue lost *agayne* all that I gat,
Wherfore when I thinke on you nowe and than,
And in my mynde remeber this and that,
Ye may not blame me though I beshrew your cat,
But in fayth I blesse you agayne a thousand times,
For lending me now some lasure to make rymes.

Sir T. More's Daye the Dyer.

How oft do they [angels] with golden pinions cleave
The sittin skies like flying pursuivant,
Against foul feinds to aid us militant. *Spenser.*

Thence she them brought into a stately hall,
Wherein were many tables fair dispred,
And ready dight with drapets festval,
Agayst the viands should be ministred.

Faerie Queene.

The like charge was given them *against* the time,
they should come to settle themselves in the land
promised unto their fathers. *Hooker.*

Some say, that ever, *'gainst* that season comes,
Wherein our Saviour's birth is celebrated,
The bird of dawning singeth all night long :
And then they say, no spirit walks abroad ;
The nights are wholesome ; then no planets strike ;
No fairies take, no witch hath power to charm ;
So hallow'd and so gracious is the time.

Shakespeare's Hamlet.

Hope is a lover's staff, walk hence with that,
And manage it *against* despairing thoughts.

Shakespeare's Two Gentlemen of Verona.

To that purpose he made haste to Bristol ; that all
things might be ready *against* the prince came thither. *Clarendon.*

Against the promis'd time provides with care,
And hastens in the woof the robes he was to wear. *Dryden.*

A little learning is a dang'rous thing :
Drink deep, or taste not the pierian spring ;
There shallow draughts intoxicate the brain ;
And drinking largely sobers us *again*. *Pope.*

All which, I grant to be reasonably and truly
said ; and only desire, they may be remembered
against another day. *Stillingfleet.*

AGALACTIA, AGALAXY, from *α* and *γαλα*,
Gr. Want of milk.

AGALLOCHUM, from *Αγαλλοχυτης*, I boast,
alluding to its excellent odour, a medicinal wood
imported from the East Indies, usually in small
pieces, and of a very fragrant scent. See XYL-
OLOES.

AGALMA, AGALMATA, Gr. *Αγαλμα*, in antiquity, a term originally used to signify any kind of ornament in a temple ; but afterwards for the statues only, as being most conspicuous ; or the temple itself.

AGAMA, in zoology, a species of the lacerta,
with a long and round tail, under the head and
above the neck aculeated with reverse scales.
It is the iguana cordylina.

ACAMA, in zoology, another variety, called
iguana salam andrina, is imbricated on the tail
with large scales.

AGAME. In game. See GAME.

For by my trouth, I say it not *in game*,
To wend as now, it were to me a shame.

Chaucer's Third Book of Troilus, fol. 170.

I am right glad with you to dwellen here,
I said but *agame* I would go. *Idem.*

AGAMEDES, in fabulous history, is said
along with his brother Trophonius, to have built

the chancel, or oracle, of the famous temple of Apollo, at Delphi, of five whole stones : and that when they had finished their work, they requested of the god that they might receive for their reward what he judged best : and within three days after, they were both found dead in bed !

AGAMEMNON, the son of Atreus and *Æ*rope, was captain-general of the Trojan expedition. It was foretold to him by Cassandra, that his wife Clytemnestra would be his death : yet he returned to her, and accordingly was murdered by *Æ*gisthus, who had corrupted his wife in his absence, and by her means usurped the government. Homer calls him *κρειων*, and *ανάρπων*.

AGAMENTICUS, a mountain of north America, in the province of Maine. Lat. 43°. 16'. It is about eight miles from the sea, and is a noted land-mark for mariners. Also a river of North America, in the centre of York county, and district of Maine. It receives its waters from the ocean through the bay of Pascataqua, and has only a scanty supply from streams of fresh water. Its mouth is about four miles south from Cape Neddic river, and admits small vessels.

AGAMESTER, the eleventh archon of Athens.

AGAMI, in ornithology, a name applied by Buffon to the psophia crepitans of Linnæus, the grus psophia of Pallas, the Phasianus Antillarum of Brisson, and the gold-breasted trumpeter of Latham ; the specific character of which is, that its head and breast are smooth, green, and shining. The bird is about twenty-two inches long.

AGAN, one of the Ladrone islands, where Magellan, in search of the Moluccas, was assassinated.

AGANA, a large town of Guam, one of the Ladrones, built by the Spaniards when they colonized the island. It is pleasantly situated on the western coast, 12 miles N. E. of the harbour. The houses, which stand on posts about three feet from the ground, are mostly composed of wood, and are laid out in straight and long streets. The Spaniards have a large government house, a royal magazine, and barracks for 500 men. These, together with a fine church in the Spanish style, and two convents or colleges, are of brick. The town has some beautiful gardens, and is very well defended. It stands in Lat. 13°. 26' N.

AGANIPPE, in antiquity, a fountain of Boeotia, at mount Helicon, on the frontier of Phocis and Boeotia, sacred to the Muses, and running into the river Permessus ; Ovid seems to make Aganippe and Hippoorene the same. Solinus distinguishes them, and ascribes the blending them to poetical license.

AGANIPPIDES, in ancient poetry, a designation given to the Muses, from Aganippe.

AGAOMA, or AGAMA, a district of Abyssinia, in the province of Tigré, to the south of Dixan. During the government of Ras Michael it paid a considerable tribute of gold and cattle ; but since Shum Woldo became master of it, it has yielded but a small revenue.

AGAPANTHIUS, *quasi αγαπητος αρθος*, plea-

sant flower, in botany, a genus of the hexandria monogynia class and order, of the natural order Liliaceæ, the Spathaceæ of Linnaeus, and the Narcissi of Jussieu. Its characters are, CAL. a spathe common gaping at the side; COR. one-petalled, funnel-shaped and regular; TUBE cornered, as if composed of six claws, border six-parted, with the parts oblong and spreading; STAM. six filaments inserted in the throat, shorter than the corolla, declinate; the anthers kidney-shaped and incumbent; PIST. a superior germ, oblong, three-cornered: the style filiform, of the length of the stamens and declinate; the stigma simple, or trifid; the pericarpium is an oblong capsule, three-sided, three-celled, three-valved: valves navicular, with contrary dissepiment; the seed numerous, oblong, compressed, and enlarged with a membrane. There is one species, viz. agapanthus umbellatus, the crinum Africanum of Linnaeus, or African blue lily. This is the African tuberose hyacinth, with a blue umbellated flower. The root of this plant is composed of thick fleshy fibres; from the same head arises a cluster of leaves, and a stalk supporting an umbel of blue flowers, each flower standing on a pedicle, about an inch long, which make a fine appearance. They come out at the end of August, or beginning of September, and frequently continue in beauty till spring. The flowers are those of the hemerocallis, but this genus is distinct from it in its spathe. It is a native of the Cape of Good Hope, from whence it was brought to Holland, and in 1692 it was cultivated at Hampton Court.

AGAPE'. See GAPE.

In himself was all his state;
More solemn than the tedious pomp, that waits
On princes; when their rich retinue long,
Of horses led, and grooms besmeir'd with gold,
Dazzles the crowd, and sets them all *agape*.

Paradise Lost.

Dazzle the crowd, and set them all *agape*. *Philipps.*

AGAPE, in ecclesiastical history, from Αγαπη, Gr. love, the love feast, or feast of charity, in use among the primitive Christians; when a liberal contribution was made by the rich to feed the poor. St. Chrysostom gives the following account of this feast, which he derives from the apostolical practice. He says, 'The first Christians had all things in common, as we read in the Acts of the Apostles; but, when that equality of possessions ceased, as it did even in the Apostle's time, the agape, or love feast, was substituted in the room of it. Upon certain days, after partaking of the Lord's supper, they met at a common feast; the rich bringing provisions, and the poor, who had nothing, being invited.' It was always attended with receiving the holy sacrament; but, there is some difference between the ancient and modern interpreters as to the circumstance of time, viz.—Whether this feast was held before, or after the communion. St. Chrysostom is of the latter opinion; the learned Dr. Cave of the former.—These love feasts, during the three first centuries, were held in the church without scandal or offence; but, in after times, the heathens began to tax them with impurity. This gave occasion to a reformation of the agapæ. The kiss of charity, with which the ceremony

used to end, was no longer given between different sexes; and it was expressly forbidden to have any beds or couches, for the conveniency of those who should be disposed to eat more at their ease. Notwithstanding these precautions, the abuses committed in them became so notorious, that the holding of them, (in churches at least,) was solemnly condemned, at the council of Carthage, in the year 397. Some modern sects, as the Wesleyans, Sandemanians, &c. have attempted to revive this feast.

AGAPETÆ, in ecclesiastical history, a name given to certain virgins and widows, who, in the ancient church, associated themselves with, and attended on, ecclesiastics, from motives of piety and charity. In the primitive days there were women instituted deaconesses; who, devoting themselves to the service of the church, took up their abode with the ministers, and assisted them in their functions. They afterwards degenerated into libertinism; insomuch, that St. Jerome asks, with indignation, unde agapetarum pestis in ecclesiis introit! This gave occasion to councils to suppress them.

AGAPIS, in natural history, a stone of a dusky yellow, or the colour of a lion's skin; held in great esteem in many nations, on account of its supposed virtues, as an anodyne and vulnerary.

AGAR, Abraham's concubine. See HAGAR.

AGARD, Arthur, a learned English antiquarian, born at Foston, in Derbyshire, in the year 1540. His fondness for English antiquities induced him to make many large collections; and his office as deputy chamberlain of the exchequer, which he held forty-five years, gave him great opportunity of acquiring skill in that study. Similarity of taste brought him acquainted with Sir Robert Cotton, and other learned men, who associated themselves under the name of The Society of Antiquaries; of which society Mr. Agard was a conspicuous member. He made the Doomsday book his peculiar study; and composed a work to explain it, under the title of Tractatus de usu et obscurioribus verbis libri de Domesday: he also compiled a book for the service of his successors in office, which he deposited with the officers of the king's receipt, as a proper index for succeeding officers. A selection of his Enquiries into the polity and constitution of England, was published after his death by Mr. Hearne in the papers of the Antiquarian Society. All the rest of his collections, consisting of at least twenty volumes, he bequeathed to Sir Robert Cotton: and died in 1615.

AGAREE, a station for caravans between Cassena and Gadanus, in the great Desert of Sahara, one hundred and thirty miles S. E. of Gadanus.

AGARENI, or AGARENANS, the followers of the religion of Mahomet. The word is derived from Agari, or Hagar, handmaid of Abraham and mother of Ishmael; and properly denotes the Arabs, called also Ishmaelites, and more lately Saracens.

AGARIC, in botany. See AGARICUS.

AGARIC, in pharmacy, a kind of fungous excrecence, growing on the trunks and large branches of several trees; but chiefly on the larch tree, and upon some kinds of oak, when

decayed. Three fourths of it consist of a resinous substance, and the remainder is a slimy mucilaginous earthy matter, so tenacious, as scarcely, by any method to be dissolved by water. It is easily cut with a knife, friable betwixt the fingers, and has no hard, gritty, or coloured veins. It is an ingredient in the theriaca Andromachi, where it is admitted in the quality of a cordial: though its cardiac virtue is excepted to as much as its purgative. It was in much esteem among the ancients, but has deservedly fallen into disrepute of later years, as it occasions insupportable nausea. Tournefort enumerates eighteen species of agaric. But it is more generally divided into three kinds; the male, the female, and the false or spurious agaric. The best comes from the Levant; that which comes from Savoy and Dauphiny being less esteemed. Holland also affords some, but that is reckoned the worst; because it is grated, and whitened at the top with chalk. By a chemical solution it passes almost wholly into oil; it yields no volatile salt, but abounds with a sort of flaky earth, and acid phlegm; as to texture, it seems much to resemble colocynth.

AGARIC, FALSE, or bastard, or oak agaric, is that which grows on those trees. It is commonly reddish, and very heavy, it is very little esteemed, which probably occasioned its being called the false agaric. The druggists look only upon that which grows on the larch tree to be the right sort.

AGARIC, FEMALE, is the most esteemed in medicine. To be good it ought to be white, large, brittle, and bright, so as to be easily pulverised; of a lively and penetrating scent, and of a bitter taste. This was thought efficacious as a styptic, to restrain not only venal, but arterial haemorrhages without the use of ligatures. Its reputation, however, did not long subsist; and after repeated trials, the surgeons of London were obliged to discontinue it as inefficacious and unsafe.

AGARIC, MALE, otherwise called the common or heavy agaric, is of a yellowish colour, and pretty solid. It is commonly used in dyeing black, and is reckoned among the non-colouring drugs, which the dyers of the best woollen cloth and serges are obliged to use in France. It is called non-colouring, because it can produce no colour of itself, without being mixed with other ingredients.

AGARIC, MINERAL, a kind of stone, or marle, which is found in the cliffs of rocks in different parts of Germany. It is very white and light, whence, it is called milk of the moon. It is also named marrow of stone, or lithomagra, and stenonagra. Some tell us that the calcination of this stone is performed by the vapours of the metals within the rocks where it is found. It is used internally against haemorrhages, the stranguary, gravel, and especially dysenteries; externally, to dry and heal old ulcers, stop refluxions of the eyes, &c.

AGARICON. See last and next articles.

AGARICUS, or MUSHROOM, a genus of the order of fungi, belonging to the cryptogamia class of plants. Only the esculent kinds of mushrooms are cultivated; and the following

method is used by the gardeners who raise them for sale.—If the young mushrooms cannot be procured from gardens, they must be looked for in rich pastures during August and September: the ground must be opened about their roots, where it is frequently found full of small white knots; which are the off-ssets, or young mushrooms. These must be carefully gathered in lumps, with the earth about them: but as this spawn cannot be found in the pasture, except at that season when the mushrooms are naturally produced, it may be searched for at any time in old dung-hills, especially where there has been much litter, and it hath not been penetrated by wet so as to rot; it may also be found very often in old hot-beds; or it may be procured by mixing some long dung from the stable, which has not been thrown on a heap to ferment, with strong earth, and put under cover to prevent wet getting to it. The spawn commonly appears in about two months after the mixture is made; but proportionably the sooner the more effectually the air is excluded, provided the mixture is not kept so close as to heat. Old thatch, or litter which has lain long abroad so as not to ferment, is the best covering. The spawn has the appearance of white mould shooting out into long strings, by which it may be easily known wherever it is met with.—The beds for receiving the spawn are now to be prepared. These should be made of dung in which there is plenty of litter, but which should not be thrown on a heap to ferment: that dung which has lain spread abroad for a month or longer is best. The beds should be made on dry ground, and the dung laid on the surface; the width at the bottom should be two and a half or three feet, the length in proportion to the quantity of mushrooms desired; then lay the dung about a foot thick, covering it with strong earth about four inches deep. Upon this lay more dung, about ten inches thick; then another layer of earth, still drawing in the sides of the bed, so as to form it like the roof of a house; which may be done by three layers of dung, and as many of earth. When the bed is finished, it must be covered with litter or old thatch, both to prevent its drying too fast and to keep out wet. In this situation it ought to remain eight or ten days, when it will be in proper temperature to receive the spawn; for this is destroyed by too much heat; though, before planting, it may be kept very dry, not only without detriment, but with considerable advantage.—The bed being in a proper temperature for the spawn, the covering of litter should be taken off, and the sides of the bed smoothed; then a covering of light rich earth, about an inch thick, should be laid all over the bed; but this should not be wet. Upon this the spawn must be thrust, laying the lumps two or three inches asunder: then gently cover this with the same light earth, above half an inch thick; and put the covering of litter over the bed, laying it so thick as to keep out wet, and prevent the bed from drying. In spring or autumn the mushrooms will begin to appear, perhaps in a month after making; but when the beds are

made in summer or winter, they are much longer before they produce. In any season, however, they ought not to be hastily destroyed; since mushroom beds have been known to produce very plentifully, even after the spawn has lain in them five or six months. When the beds are destroyed, the spawn should be carefully preserved, and laid up in a dry place, at least five or six weeks before it is again planted.—The difficulty of managing mushroom beds is, to keep them always in a proper degree of moisture. In the summer season they may be uncovered to receive gentle showers of rain at proper times; and in long dry seasons the beds should now and then be watered, but much wet ought by no means to be suffered to come to them. During the winter season they must be kept as dry as possible, and so closely covered as to keep out cold. In frosty or very cold weather, if some warm litter, shaken out of a dung heap, is laid on, the growth of the mushrooms will be promoted: but betwixt this and the bed, a covering of dry litter must be interposed; which should be renewed as it decays; and as the cold increases, the covering must be thickened. By attending to these directions, plenty of mushrooms may be produced all the year round. One bed will continue good for many months. For a particular, perhaps fabulous, method of producing mushrooms, see *Lyncarius*. Botanical writers enumerate fifty-five species belonging to this genus; of which the most remarkable are the following:

1. *AGARICUS CAMPESTRIS*, or common mushroom, which has the top or cap first of a dirty cream colour, convex, and if but just expanding, the under part, or what is called the gills, is of a bright flesh red. It is found in woods, old pastures, and by road sides; and is in the greatest perfection in September.

2. *AGARICUS CHANTARELLUS*, or chantarelle agaric, is rather a smaller fungus than the former. This plant broiled with salt and pepper has much the flavour of a roasted cockle; and is esteemed a delicacy by the French, as is the *Agaricus Pratensis*. It is found in woods and high pastures, and is in perfection about the end of September.

3. *AGARICUS CINNAMOMEUS*, or brown mushroom, has a cap the colour of fresh tanned hides. At first it is hemispherical, firm, even, and fleshy, with mostly a small rising in the centre; but when old is quite flat. The whole plant has a pleasant smell, and when broiled gives a good flavour. It is found in woods in September and October.

4. *AGARICUS CLYPEATUS*, or long-stalked mushroom, has a hemispherical hat tapering to a point, and clammy; the pillar is long, cylindrical, and white; the gills are white, and not concave, dusted with a fine powdery substance on each side; the root is bulbous, long, and hooked at the end. It is found in September, in woodlands and pastures.

5. *AGARICUS DELICIOSUS*, or orange agaric. This fungus, well seasoned and then broiled, has the exact flavour of a roasted muscle. Its prime time is September, and it is to be found in high dry woods.

6. *AGARICUS MUSCARIUS*, or reddish mush-

room. This is the *moucho-more* of the Russians, Kamtschadales, and Koriaes, who use it as an instrument of intoxication.

7. *AGARICUS PRATENSIS*, or champignon, very common upon heaths and dry pastures.

8. *AGARICUS QUERCINUS*, or agaric of the oak, as well as many other species of this genus, grow on dunghills, or rotten wood, in cellars, or on the trunks of trees. It was formerly an article in the *Materia Medica*; but is now deservedly rejected.

9. *AGARICUS VIOLACEUS*, or violet mushroom. It is found in woods in October. Hudson's *bulb sus* is only a variety of this plant.

AGARICUS. Medical men have differed about the qualities of mushrooms; some considering them as a rich nourishment and perfectly innocent, when properly chosen; and others asserting them to be extremely deleterious. Most of the fungi are indeed of a hurtful quality; and with respect to the whole tribe, the esculent are very few. But esculent mushrooms are very nutritive, very readily alkalescent, and more so without immediate acescency than any other vegetable: they are therefore a rich nourishment, and much akin to animal food; on which account they may be indulged in considerable quantity to strong persons. It requires, however, skill to distinguish this esculent kind; and very few, especially of those who are commonly employed to gather them, viz. the servants, have studied Clusius, or other authors who have been at the pains to distinguish them. Perhaps our esculent mushrooms, when old, acquire a dangerous acrimony; and for these reasons Dr. Cullen is of opinion, that it is for the most part prudent to avoid them. In the warmer climates they may be used as light food; but here it is preposterous to use them along with animal food, as they do not correct its alkaline tendency. The 1st, 2d, 3d, 5th, 7th, and 9th species above enumerated, are the only species that can be safely recommended as edible.

It is well known, that soil and situation have a great influence upon the properties of plants; and these being of a singular nature, and absolutely between that of an animal and vegetable, may be more powerfully affected than a complete species of either—because they have neither leaves nor branches to carry off the noxious damps and vapours of a stagnant soil, as a perfect vegetable has; nor have they any gross excremental discharges, like those of a living animal. The gills, no doubt, exhale some of their superfluous moisture; but their situation is such, that any thick steam from the earth may lodge in them, and by clogging their excretory ducts, render the plants morbid. Thus they soon run into a state of putrefaction, and become a prey to worms, flies, and other insects. The common mushroom, which is in general esteem, though we have several others better, is not safely eaten when produced from a moist soil. Those who gather mushrooms for sale, should therefore have particular regard to the lands they collect them from, especially if they know they are to be broiled; but if they be intended for catchup, perhaps they may be less cautious, as the salts and spices, with which the juice is boiled, may correct any evil disposition in the plants. But, even in this case,

catchup made of mushrooms taken from a dry soil, has a more aromatic and pleasant flavour, than that which is made from those taken from a moist one, and it will always keep a great deal better.

AGASI, or AGASSI, in Turkey, a title of honour, synonymous with AGA, which see.

AGAST', From A. S. *Leƿcan*, to see, to AGAZE', look at; or from the Gothic, *agyan*.

AGAZED'. To fear; in our usage, the two roots are apparently combined, as it signifies to gaze with terror; amazed; frightened to astonishment.

So com a tempest wilde his schip had alle ouer
ronnen.

þe maryner was agast, þat schip þat wild not go.
Lotes did þei kast, for whom þei had pat wo.

R. Brunne, p. 124.

And he pat cete of pat seed, sholdre beevene trywe
With God and nat agast, bote of gýle one.

Vision of Piers Plowman, p. 381.

So as they travell'd, so they 'gan espys
An armed knight toward them gallop fast;
That seemed from some feared fo'e to fly,
Or other grisly thing that him agast.

Faerie Queene.

Hundreds he sent to hell; and none durst stand
him:

Here, there, and every where, enrag'd he flew:
The French exclaim'd, 'The devil was in arms!'
All the whole army stood agazed on him.

Shakspeare's Henry VI.

Thus roving on,
In confus'd march forlorn, th' advent'rous bands
(With shudd'rung horror pale, and eyes agast)
View'd first their lamentable lot; and found
No rest.

Loud was the noise, agast was every guest,
The women shriek'd, the men forsook the feast.

Dryden's Theodore and Honoria.

Stout Glo'ster stood agast in speechless trance:
To arms! cried Mortimer, and couch'd his quivering
lance.

Gray's Bard.

The pilgrim oft,
At dead of night, mid his Oraison hears
Agast the voice of time, dispairing tow'r's
Tumbling all precipitate down dash'd,
Rattling around loud thund'r'ing to the moon.

Dyer's Ruins of Rome.

The church-bell tolls, deep sounding down the glade,
The solemn hour for walking spectre's made;
The simple plough-boy, wakening with the sound,
Listens agast, and turns him startled round,
Then stops his ears, and strives to close his eyes,
Lest at the sound some grisly ghost should rise.

Kirke White's Poems.

AGASYLLIS, in the *Materia Medica*, a name given by some of the ancient Greek writers to gum ammoniac; and by Dioscorides, to the tree which produced that gum. By their descriptions of this medicine, it appears not to have been the same which we know by this name.

AGATE, an instrument used by gold wire-drawers; so called from the agate in the middle of it, which forms its principal part. See the following article.

AGATE, in mineralogy, a species of precious stone, or rather a silicious mixture of jasper, amethyst, quartz, opal, heliotrope, and cornelian, blended in variable proportions with a base of chalcedony. Its combinations, however complex, are distinguished by a characteristic speciality, the component parts sliding into each other by such nice gradations, as show them to have been

all of simultaneous formation. In this respect it differs from *silicious Breccia*, in which angular fragments of silicious pebbles are cemented by a compost of quartz, chalcedony, or flint, of a constitution wholly distinct from that of the invested parts. Differing according to the appearance and transparency of its component substances, the agate is never wholly opaque like the jasper, nor transparent like the quartz crystal. Its most common colours are yellow, red, blue, milk-white, honey-orange, an ochre yellow, flesh-blood, reddish brown, brownish green, violet-blue, &c. through which the opaquer parts appear like dots, eyes, zones, bands, with various other ramifications, and are sometimes variegated with clouds and veins of various colours, figures, and dimensions. This species of mineral is found in the form of irregular rounded nodules, from the size of a pin's head, to more than a foot in diameter; sometimes in strata, and occasionally stalactitic. Several varieties of agate are distinguished by the lapidaries: the finer semi-transparent kinds, consisting principally of chalcedony, are called oriental: in the banded agates the colours are disposed in straight parallel lines or bands; while in the fortification agate, the most beautiful of all the varieties, they are arranged in waved and angular concentric zones: the landscape agate, by the name alone, sufficiently declares its irregular appearance: the moss agate, or Mochoa stone, is filled with dendritical crystallizations of iron ore, so nearly resembling some kinds of moss as to have been actually mistaken for real vegetables by Daubenton. These semipellucid gems were originally found on the banks of the river *Axarq̄n*, in Sicily, whence their name is derived. They are now, nevertheless, common in many parts of the world. The largest and most beautiful agates which this island produces are known by the name of *Scotch pebbles*, and are found chiefly in the neighbourhood of Dunbar.

We enumerate the following varieties of this mineral as the most remarkable, arranged according to the different colours of the ground. I. Of those with a white ground there are three species. 1. The dendrachates macoa stone, so called from that part of Arabia, whence it is derived, seems to be the same with what some authors call the achates with rosemary in the middle, and others achates with little branches of black leaves. It consists of translucent chalcedony. Its dark outline of arborization, like vegetable filaments were formerly attributed to deposits of iron, and manganese; but are now thought to arise from mineralized plants of the crypto gamus. 2. The dull milky-looking agate. This, though greatly inferior to the former, is a very beautiful stone. It is common on the shores of rivers in the East Indies and also in Germany and some other parts of Europe. Our lapidaries cut it into counters for card playing, and other toys of small value. 3. The lead-coloured agate, called the phassachates by the ancients. II. Of the agates with a reddish ground there are four species. 1. An impure one of a flesh coloured white, which is but of little beauty in comparison with other agates. The admixture of flesh-colour is but very slight; and it is often found without any clouds, veins, or other variega-

tions; but sometimes it is prettily veined or variegated with spots of irregular figures, having fibrinated edges. It is found in Germany, Italy, and some other parts of Europe; and is wrought into toys of small value, and into the German gun-flints. It has been sometimes found with evident specimens of the perfect mosses bedded deep in it. 2. That of a pure blood-colour, called haemachates, or the bloody agate, by the ancients. 3. The clouded and spotted agate, of a pale flesh-colour, called by the ancients the cornelian agate, or sardachates. 4. The red lead-coloured one, variegated with yellow, called the coral agate, or corolla achates, by the ancients. III. Of the agates with a *yellowish* ground, there are only two known species; the one of the colour of yellow wax, called cerachates by the ancients; the other a very elegant stone, of a yellow ground, variegated with white, black, and green, called the leonina, and leonteseres by the ancients. IV. Of the agates with a *greenish* ground, there is only one known species, called by the ancients jaspachates.

The *Ribbon agate*, which exhibits so elegant an appearance, occurs in porphyry and gneiss, and consists of alternate parallel layers of chalcedony with jasper, quartz, or amethyst. The *brecciated agate*, a beautiful variety containing fragments of the former, lies in a base of amethyst; of both the most beautiful specimens are found in Saxony and Siberia. *Fortification agate*, found in nodules of various imitative shapes, occurs at Oberstein, on the Rhine, and in Scotland. It is imbedded in amygdaloid, and on cutting it across the interior zig zag, parallel lines are found to resemble the plan of a modern fortification. Even the centre contains a splintery mass of quartz and amethyst, surrounded by a jasper and chalcedony. The *moss agate*, to which we have already referred, appears to consist of chalcedony, arborized after the form of vegetable filaments; and on some occasions irregularly traversed with veins of red jasper. According to the conjecture of Daubenton, Dr. McCulloch discovered in mocha and moss agates, aquatic conferva, coated with iron oxyde; but exhibiting their natural form and colours. Mosses and lichens have been also detected along with chlorite, in vegetations. In the possession of the earl of Powis, is an onyx agate set in a ring which contains the chrysalis of a moth. Hollow nodules of agate, called geodes, present interiorly crystals of colourless or amethystine quartz, scattered occasionally with crystals of stilbite, chabasie, and capillary mesotype. In the interior of those found among the hills of Dauria, on the right bank of the Chilca, M. Patrin occasionally detected bitumen. The geodes found in volcanic districts occasionally contain water in their cavities; These are chiefly found in insulated blocks of a lava, distinguished by an earthy fracture. When cracked the liquid escapes by evaporation, but may be restored by immersing them in hot water for a short time.

Agates are most prized when the internal figure nearly resembles some animal or plant; and these are more numerous than might be imagined, some containing natural representations of men, lions, tigers, &c. Velschius had in his

custody a flesh-coloured agate, on one side of which appeared a half moon in great perfection, represented by a milky semicircle; on the other side, the phases of vesper, or the evening star: whence he denominated it an aphrodisian agate. An agate is mentioned by Kircher, on which was the representation of a heroine armed; and one in the church of St. Mark in Venice, has the representation of a king's head adorned with a diadem. On another, in the museum of the prince of Gonzaga, was represented the body of a man, with all his clothes, in a running posture. A still more curious one is mentioned by De Boot, wherein appears a circle struck in brown, as exactly as if done with a pair of compasses, and in the middle of the circle the exact form of a bishop with a mitre on: but inverting the stone a little, another figure appears; and if it is turned yet further, two others appear, the one of a man, and the other of a woman. But the most celebrated agate of that kind is that of Pyrrhus, wherein were represented the nine muses, each with their proper attributes, and Apollo in the middle playing on the harp. In the emperor's cabinet is an oriental agate of a surprising bigness, being fashioned into a cup, whose diameter is an ell, abating two inches. In the cavity is found delineated in black specks, *b. axistor. s. xxx.* Other agates have also been found, representing the numbers 4191, 191; whence they are called arithmetical agates, as those representing men or women have obtained the name of anthropomorphous. Agates may be stained artificially with solution of silver in spirit of nitre, and afterwards exposing the part to the sun; and though these artificial colours disappear on laying the stone for a night in aquafortis, yet a knowledge of the practicability of thus staining agates, must render those curious figures above mentioned strongly suspected of being the work, not of nature but of art. The oriental agates are all said to be brought from the river Gambay. A mine of agates was sometime ago discovered in Transylvania, of divers colours, and some of a large size, weighing several pounds. Considerable quantities of these stones are still found near the river Achates in Sicily. There are found in some of these the surprising representations above mentioned, or others similar to them. By a dexterous management of these natural stains, medals have been produced, which seem master-pieces of nature: for this stone bears the graver well; and as pieces of all magnitudes are found of it, they make all sorts of work of it. The high altar of the cathedral of Messina is all over encrusted with it. The lapidaries pretend that the Indian agates are finer than the Sicilian; but father Labat informs us, that in the same quarries, and even in the same block, there are found pieces much finer than others, and these fine pieces are sold for Indian agates, in order to enhance their price. Antiquaries put no small value upon stones of this kind engraved by art. In this sense, agates make a species of antique gems, in the workmanship whereof we find eminent proofs of the great skill and dexterity of the sculptors. Several agates of exquisite beauty are preserved in the cabinets of the curious; but the facts re-

presented on these antique agates, however well executed, are now become so obscure, and their explanations so difficult, that several diverting mistakes and disputes have arisen among those who undertook to give their true meaning. The great agate of the apotheosis of Augustus, in the treasury of the holy chapel, when sent from Constantinople to St. Lewis, passed for a triumph of Joseph. An agate, in the late French king's cabinet, had been kept 700 years with great devotion, in the Benedictine abbey of St. Evre at Toul, where it passed for John the Evangelist carried away by an eagle, and crowned by an angel: but the heathenism of it having been fully detected, the religious would no longer give it a place among their relics, but presented it to the king. The antiquaries found it to be the apotheosis of Germanicus. In like manner the triumph of Joseph was found to be a representation of Germanicus and Agrippina, under the figures of Ceres and Triptolemus. Another was preserved, from time immemorial, in one of the ancient churches of France, where it had passed for a representation of paradise and the fall of man; there being on it two figures, representing Adam and Eve, with a tree, a serpent, and a Hebrew inscription round it, taken from the third chapter of Genesis, 'The woman saw that the tree was good,' &c. The French academists, instead of our first parents, found Jupiter and Minerva represented by the two figures: the inscription was of a modern date, written in a Rabbinical character, very incorrect, and poorly engraven. The prevailing opinion was, that this agate represented simply the worship of Jupiter and Minerva at Athens.

Some account for the phenomena observed in genuine agates from natural causes. Thus Kircher, who had seen a stone of this kind, in which were depicted the four letters usually inscribed on crucifixes, I. N. R. I. apprehends that some real crucifix had been buried under ground, among stones and other rubbish, where the inscription happening to be parted from the cross, and to be received among a soft mould or clay susceptible of the impression of the letters, came afterwards to be petrified! In the same manner he supposes the agate of Pyrrhus to have been formed. Others resolve much of the wonder into fancy, and suppose those stones formed in the same manner with the camieux or Florentine stones. See CAMIEUX.

The agate is used for making cups, rings, seals, handles for knives and forks, hilts for swords and hangers, beads to pray with, smelling boxes, patch boxes, &c. being cut or sawed with no great difficulty. Great medicinal virtues were formerly attributed to the agate, such as resisting poisons, especially those of the viper, scorpion, and spider; but they are now very justly rejected from medicinal practice.

AGATHIA, St. a town of Italy, in the ulterior principality of Naples, with a bishop's see. It is six miles south-east of Reggio; of great natural strength, and has the title of a principality. Also a town with the title of a duchy, on the coast of Capitanata.

AGATHARCHIDES, or AGATHARCIUS of Chnidus, in biography, a Greek historian, and

grammarian, mentioned by Josephus, and other ancient writers, was contemporary with Eratosthenes, and flourished under Ptolemy Philometer about 177 years before Christ. He was reader to Herachida, president of the Alexandrian Library, and wrote several historical treatises; of which Photius mentions forty-nine books, concerning the affairs of Europe, ten of Asia, five of the Red Sea, and an epitome of what had been written on this subject in one book. Some fragments of his writings may be found in Josephus and Photius. The testimony of Agatharchides is alleged to prove, that in the reign of Ptolemy Philometer, the Greek sovereigns of Egypt had not yet traded directly to India, but imported the commodities of India, from Saba, the capital of Yemen. This ancient writer's description of the western coast of the Red Sea closes at Ptolemais, as if there were no regular commerce beyond that point.

AGATHIAS, or AGATHIUS, surnamed Scholasticus, a Greek Byzantine historian, of the sixth century under Justinian. He was born at Myrina, in Asia the less, at the mouth of the river Pythicus. He was an advocate at Smyrna, had a taste for poetry, and wrote a history which begins with the twenty-sixth year of Justinian's reign, where Procopius ends, and terminating with the slaughter of the Huns, 559. It was printed in Greek and Latin, with Bonaventure Vulcanius's, at Leyden, 1594, in quarto; and at Paris, 1660, in folio.

AGATHO, a tragic and comic poet, disciple of Prodicus and Socrates, applauded in Plato's dialogues for his virtue and beauty. His first tragedy obtained the prize; and he was crowned in the presence of upwards of 30,000 spectators, in the fourth year of the ninetieth Olympiad. None of his works are extant, except a few quotations in Aristotle, Athenaeus, and others. Agatho delighted so much in antitheses, as to give him occasion for saying to a person, who wished him to expunge them, 'you do not consider that you would rend Agatho from himself.' Athenaeus (Deipnosophist, l. v. p. 211. ed. Ca-saub.) cites the following, 'If I tell you the truth, I shall not please you; and if I please you, I shall not tell you the truth.' And Aristotle gives us these, 'The only thing impossible to God, is to cause that not to be made that has been made;' 'fortune loves art, and art loves fortune;' 'it is probable, that a great many improbable things may happen to mortals.' There was also a pope of this name in the seventh century who was very active against the Monothelites.

AGATHOCLES, the famous tyrant of Sicily, was the son of a porter at Reggio. He was successively a common soldier, a centurion, a general, and a pirate. He defeated the Carthaginians several times in Sicily, and was once defeated himself. He first made himself tyrant of Syracuse, and then of all Sicily: after which he vanquished the Carthaginians again, both in Sicily and Africa. But at length having ill success, and being in arrears with his soldiers, they mutinied, forced him to fly to his camp, and cut the throats of his children, whom he left behind. Recovering himself again he relieved Corfu, besieged by Cassandra; burnt

the Macedonian fleet; returned to Sicily; murdered the wives and children of those who had murdered his; afterwards meeting with the soldiers themselves, he put them all to the sword; and ravaging the sea coast of Italy, took the city of Hippo-nium. He was at length poisoned by his grandson, Archagathus, in the seventy-second year of his age, 290 years before Christ, after having reigned twenty-eight years.

AGATHOCLES, the unfortunate son of Lysimachus king of Thrace and Macedon, who, after defeating and putting to flight Demetrius Poliorcetes, was murdered by his father's orders, at the instigation of his step-mother Arsinoe, who was also his wife's sister, A. A. C. 282.

AGATHODÆMON, from *ἄγαθος*, good, and *δαίμων* daemon, a beneficent genius. Among ancient writers, agathodæmon is a denomination given to a kind of serpents, bred up and revered by the Egyptians, from an opinion of some sanctity residing in them. They are also called dragons, and fabulously described as having wings.

AGATHOPOLIS, the city of Montpelier in France. See MONTPELIER.

AGATHYRNA, or **AGATHYRSA**, in ancient geography, a town of Sicily, now St. Marco; as old as the war of Troy.

AGATHYRNUS, in ancient history, the son of Aeolus, and founder of Agathyra.

AGATTON, a town of Africa, seated near the mouth of the river Formosa, on the coast of Guinea, eighty miles south of Benin. It was formerly a considerable place; and the neighbourhood is considered healthy; but frequent wars have depopulated it.

AGATTOO, one of the Aleutian islands, about sixteen miles long, with a lofty mountain in the middle. Distant from Attoo 20 miles. Long. 173°. E. Lat. 52°. 30' N.

AGATY, a Malabar tree, bearing a fruit in taste and shape like the kidney-bean.

AGAVE, the common American aloe: a genus of the monogynia order, belonging to the hexandra class of plants; and in the natural method ranking under the tenth order, coronariae. The characters are: there is no calyx; cor. monopetalous and funnel-shaped; the border six-parted, with lancet erect divisions: STAM. six erect filaments, longer than the corolla; the anthers are linear, shorter than the filaments, and versatile: PIST. an oblong germen; the stylus is filiform, the length of the stamina, and triangular; the stigma headed and triangular: PER. an oblong triangular capsule, trilocular, and three valved: the seeds are numerous. Of this genus, botanical writers enumerate eight species.

AGAVE AMERICANA, or the great American aloe: the stems generally rise upwards of twenty feet high, and branch out on every side towards the top, so as to form a kind of pyramid: the slender shoots being garnished with greenish yellow flowers, which stand erect, and come out in thick clusters at every joint: these make a fine appearance, and continue long in beauty; a succession of new flowers being produced for near three months in favourable seasons, if the plant is protected from the autumnal colds. The seeds do not ripen in England. It has been generally thought, that these plants do not

flower till they are 100 years old; but this is a mistake, for the time of their flowering depends on their growth; so that in hot countries, where they grow fast, and expand many leaves every season, they will flower in a few years; but in colder climates, where their growth is slow, it will be much longer before they shoot up their stem. There is a variety of this species with striped leaves, common in the English gardens. The other sorts are so tender, that they must constantly remain in the stove.

AGAUPE, in botany, a name used by some authors for the common white water-lily.

AGDE, a populous city of France, in Lower Languedoc, in the department of Hérault, and arrondissement of Béziers. It trades in fine wool, wine, oil, corn, and silk. It is seated on the river Hérault, a mile and a quarter from its mouth, where it falls into the gulf of Lyons, on which there is a fort built to guard its entrance. The houses are principally built of black stone, and there is an entrance into the city by four gates. The public buildings are not handsome. The city is extended along the river, where it forms a small port, which small craft may enter. There was formerly a great conourse of pilgrims here to the chapel of Notre Dame de Grace. It is a little without the city, between which and the chapel there are numerous oratories, which they used to visit with bare feet. Long. 3°. 33'. E. Lat. 43°. 19'. N. Population 7200.

AGDENAS, a district of Norway, in the territory of Drontheim, into which the bay runs.

AGE, n. } *Age*, Fr. deduced by Junius
A'GEN, } from *aa*, which in the Teutonic
A'GEDLY, } dialect signified long duration;
A. S. agan past: time in general, or a particular period; as human life, or any portion of it.

Fro þe by gynnng of þe world, to þe tyme þat now is,

Sene ages þer habbeþ y be, as sene tyme y wye.

R. Gloucester, p. 9.

**Suld thou not first think quhare thou left, but leis,
Thy wery fader the agit Anchises?**

Douglas' Æneid, b. ii. p. 58.

If the comparison do stand between man and man, the *aged* (for the most part) are best experienced, least subject to rash and unadvised passions.

Hooker.

Novelty is only in request: and it is as dangerous to be *aged* in any kind of course; as it is virtuous to be constant in any undertaking.

Shakespeare's Measure for Measure.

One man in his time plays many parts,

His acts being seven ages. *Shakespeare.*

And Jacob lived in the land of Egypt, seventeen years: so the whole *age* of Jacob was an hundred forty and seven years. *Genesis xlvi. 28.*

Hence lastly springs care of posterities;

For things, their kind would everlasting make:

Hence is it, that old men do plant young trees,
The fruit whereof another *age* shall take.

Sir J. Davier.

Next to the Son,

Destin'd Restorer of mankind, by whom

New heav'n and earth shall to the *ages* rise,

Or down from heav'n descend.

Milton's Paradise Lost

And on this forehead (where, your verse has said,
The loves delighted, and the graces play'd)

*Insulting age will trace his cruel way,
And leave sad marks of his destructive sway.*

Prior.

No longer now the golden age appears,
When patriarch wits surviv'd a thousand years.

Pope.

He feeds yon alms-house, neat, but void of state,
Where age and want sit smiling at the gate

Idem.

Immortal! age past, yet nothing gone!
Morn without eve! a race without a goal!
Unshorten'd by progression infinite!
Futurity for ever future! life
Beginning still, where computation ends!

Young.

The love of retirement has in all ages adhered
closely to those minds which have been most en-
larged by knowledge, or elevated by genius.

Rambler.

His house was known to all the vagrant train,
He chid their wand'rings, but relieved their pain;
The long-remembered beggar was his guest,
Whose beard descending swept his aged breast.

Goldsmith's Deserted Village.

And if no future age shall hear my name,
I lurk the more secure from fortune's blast,
And with more leisure feed this pious flame,
Whose rapture far transcends the fairest hopes of fame.

Beattie.

AGE, among the ancient poets, was used for the space of thirty years; in which sense, age amounts to much the same with generation. Thus, Nestor is said to have lived three ages when he was ninety years old. The interval since the first formation of man they divided into four ages, distinguished by the epithets of golden, silver, brazen, and iron. During the golden age, Saturn reigned in heaven, and justice and innocence in this lower world. The earth then yielded her productions without culture; men held all things in common, and lived in perfect friendship. This period was supposed to have lasted till the expulsion of Saturn from his kingdom. The silver age commenced when men began to deviate from the paths of virtue; and their lives became less happy. The brazen age commenced on a farther deviation, and the iron age took place in consequence of one still greater. The East Indian Brahmins seem to have adopted the idea of the Grecian poets, if the latter did not borrow it from them; or rather, if both were not indebted for it, to the Mosaic account of the original paradiseal state of man. The Brahmins seem evidently to have had at least a traditional account of the longevity of the antediluvian patriarchs, from the description they give of the four ages of the world.—The first, which they represent as a sort of golden age, lasted, according to them, 1,728,000 years; in this period, the god Brahma was born, and men were all giants; their manners were innocent; they were exempt from diseases, and lived 400 years.—In the second age, which lasted 1,296,000, their rajahs were born: vice now crept into the world; men's lives were fallen to 300 years, and their size retrenched proportionally.—Under the third age, which lasted 8,064,000 years, vice being more increased, men only attained to 200 years.—The last age is that wherein we now live, of which 4,027,213 years are already gone; and the life of man is sunk to one fourth of its original dura-

tion. A late author, however, reflecting on the barbarism of the first ages, will have the order which the poets assign to the four ages inverted; the first, being a time of rudeness and ignorance, would be more properly denominated an iron than a golden age. When cities and states were founded, the brazen age succeeded; when they began to improve, the silver age commenced; and since arts and sciences, navigation and commerce, have been cultivated, the golden age has taken place. The ingenious M. Mercier carries this idea still farther in his work entitled, *Memoirs of the year 2500*; and supposes, that mankind, when that period arrives, will be so much improved, that vice and folly of every kind will be totally extirpated from the earth.

AGE, in history, is used to express certain periods, or divisions of time. Thus, among the ancient Greek historians, the time elapsed since the beginning of the world was divided into three ages. The first reached from the creation to the deluge, which happened in Greece during the reign of Ogyges; this they called the obscure or uncertain age, because the history of mankind is altogether uncertain during that period. The second, they called the fabulous or heroic age, because it is the period in which the fabulous exploits of their gods and heroes are said to have been performed. It began with the Ogygian deluge, and continued to the first Olympiad; when the third, or historical age, commenced.—This division, however, it must be observed, holds good only with regard to the Greeks and Romans, who had no histories earlier than the first Olympiad: the Jews, Egyptians, Phoenicians, and Chaldeans, (not to mention the Indians and Chinese, who pretend to much higher antiquity,) are not included in it. Among the Jews, the duration of the world is divided into three ages. First, the *seculum inane*, or void age, is the space of time from the creation to Moses. Second, the present age, denotes all the space of time from Moses to the coming of the Messiah; and, third, the age to come, denotes the time from the coming of the Messiah to the end of the world. Various other divisions of the duration of the world into ages have been made by historians.—The Sibylline oracles, supposed to be written by Jews acquainted with the prophecies of the Old Testament, divide the duration of the world into ten ages; and according to Josephus, each age contained 600 years. It appears, by Virgil's fourth eclogue, and other testimonies, that the age of Augustus was reputed the end of those ten ages, consequently as the period of the world's duration.—By some modern historians, the space of time commencing from Constantine, and ending with the taking of Constantinople by the Turks in the fifteenth century, is called the middle age.—Others choose rather to date the middle age from the division of the empire made by Theodosius at the close of the fourth century, and extend it to the time of the emperor Maximilian I. in the beginning of the sixteenth century, when the empire was first divided into circles.—The middle is by some styled the barbarous age, and the latter part of it the lowest age. Others divide it into the non-academical and academi-

cal ages. The first includes the space of time from the sixth to the ninth centuries, during which schools or academies were lost in Europe. The second from the ninth century, when schools were restored, and universities established, chiefly by the care of Charlemagne. The several ages of the world may be reduced to three grand epochas, viz. the age of the law of nature, called by the Jews the void age, from Adam to Moses: the age of the Jewish law, from Moses to Christ: and the age of grace from Christ to the present year.

AGE OF HEBREW AND GREEK manuscripts of the scriptures. The Hebrew Bible is placed before us by critics as the most ancient book in the world. The truth of this pretension, involving its entire authority as an inspired book, is therefore a point of the last importance; and various criteria of the age of the Hebrew MSS. of the Old Testament have been given by different scholars. They may be divided into External Testimony and Internal Evidence. The former consisting of the subscriptions affixed by the transcribers, specifying the time when the manuscripts were copied, cannot always be depended upon, since cases have occurred in which the earliest dates have been superadded to the productions of modern copyists, to enhance the value of their labours. With respect to the latter, the marks are more decisive. Of these the following are stated by Dr. Kennicott and M. De Rossi as the principal.

1. The inelegance and rudeness of the character, although Jablonski lays down the simplicity and elegance of the character as a criterion of antiquity.
2. The yellow colour of the vellum.
3. The total absence or rare occurrence of the Masora and of the Keri and Ketib.
4. The writing of the Pentateuch throughout in one book without any greater mark of distinction appearing at the beginning of books, than at the beginning of sections.
5. The absence of critical emendations and corrections.
6. The absence of vowel points.
7. Obliterated letters being written and re-written with ink.
8. The frequent occurrence of the name Jehovah in lieu of Adonai.
9. The infrequency of capital and small letters.
10. The insertion of points to fill up blank spaces.
11. The non-division of some books of Psalms.
12. The poetical books not being distinguished from those in prose by dividing them into hemistichs.
13. Readings frequently differing from the Masoretic copies, but agreeing with the Samaritan text, with ancient versions, and with the quotations of the fathers. The conjunction of all or of several of these internal marks is said to afford certain evidence of the antiquity of Hebrew manuscripts.

The Greek manuscripts of the New Testament, which are extant, are written either on vellum or on paper, and their external form and condition vary like those of other ancient manuscripts. The vellum is either purple coloured, or of its natural hue; and is either thick or thin. Manuscripts on very thin vellum are held in the highest esteem. The paper also is either made of cotton, or the common sort manufactured from linen, and is either glazed or wire-marked, that is of the ordinary roughness. Not

more than six manuscript fragments on purple vellum are known to be extant. The Codex Claromontanus is written on very thin vellum. All manuscripts on paper are of much later date, those on cotton paper being subsequent to the ninth century; those on linen to the twelfth. If the paper be of a very ordinary quality, Wetstein pronounces them to have been written in Italy, in the fifteenth and sixteenth centuries. The letters again, especially the capitals, which in the time of St. Jerome were called *uncial* i. e. initial, are of two kinds, either unadorned and simple, and made with straight thin strokes; or thicker, uneven, and angular. Some of these letters are supported on a sort of base, whilst others are decorated, or rather burthened with various tops. As letters of the former kind are those for the most part seen in ancient Greek manuscripts, whilst those of the latter resemble the paintings of semi-barbarous times; manuscripts written with the former are supposed to be as ancient as the fifth century, whilst those in which the latter are employed are thought posterior to the ninth. Before the Seventh century, Greek manuscripts were usually written in capital letters, and most without any divisions of words. Capitals were also in great use in the eighth century, and even so late as the ninth, but there is a striking difference in the forms of the letters after the seventh century. Great alterations took place in the eight, ninth, and tenth centuries. The Greek letters copied in the ninth century by the Latins are by no means regular, the *a*, *s*, and *γ*, being inflected like the *a*, *e*, and *y*, of the Latin alphabet. Towards the close of the tenth century, small or cursive letters were adopted generally, and Greek manuscripts written in the eleventh century, and after it are in small letters, and greatly resemble each other with some few exceptions. In the Greek manuscripts of the thirteenth, fourteenth, and fifteenth centuries flourished letters occur but seldom. The most ancient manuscripts are written without accents, spirits, or any separation of the words; nor was it till after the ninth century that the copyists began to leave spaces between the words. Michaelis after Wetstein, ascribes the insertion of accents to Euthalius bishop of Sulca, in Egypt, A.D. 458.

Abbreviations are another evidence of the age of Greek manuscripts. See **ABBREVIATIONS**.

AGE, in law, that special time when men and women are enabled to do what, for want of years, they are prohibited doing: thus, twelve is the age for taking the oath of allegiance in a leet; fourteen, or for a woman twelve, the age of discretion, for consenting to a marriage, or choosing a guardian, twenty-one, the full age. A person under the age of twenty-one may make a purchase; but at his full age, he may agree or disagree to it. Fourteen is the age by law to be a witness, although a child of nine years of age has, in some cases, been admitted to give evidence. No one can be chosen member of parliament under the age of twenty-one; ordained a priest before the age of twenty-four; nor be a bishop before thirty. 1 Inst. 78.

AGE OF A HORSE. See **HORSE**.

AGE OF A TREE. Trees after a certain age waste. An oak at 100 years old ceases to grow. The usual rule for judging of the age of wood, is by the number of circles which appears in the substance of a trunk or stock cut perpendicularly, each circle being supposed the growth of a year; though some reject this method as precarious, alleging that a simple circle is sometimes the produce of several years; besides that, after a certain age, no new circles are formed.

AGE PRIOR, in law, is when an action being brought against a person under age, for lands descended to him, he, by motion or petition, shews the matter to the court, praying the action may be staid till his full age, which the court generally agrees to.

AGEDA, SYNOD of, in modern ecclesiastical history, an assembly of Jewish doctors, held A.D. 1650, so denominated from a plain on which they met, about thirty leagues distant from Buda in Hungary. On this occasion, no fewer than three hundred rabbies, with multitudes of other Jews of different nations, publicly convened, in order to examine and debate the question, whether the Messiah had appeared? R. Zacharia, of the tribe of Levi, was chosen president and speaker. The negative of the question was carried by a majority of voices, and it was agreed that the advent of the Messiah was delayed on account of their sins and impenitence. They agreed also in the circumstances that would attend his appearance; and were of opinion, that as a great conqueror, he would deliver them from every foreign yoke—that he would alter nothing in the Mosaic religion—that he was to be born of a virgin; and that his miraculous conception was to be a characteristic, by which he should be known to those who were strangers to the covenant. Some ecclesiastics, deputed from Rome, attended this meeting; and when they began to extol the worship, ceremonies, and authority of their church, a tumultuous outcry was excited of ‘No Christ! no intercession of saints! no worship of images! no prayers to the Virgin! accompanied with loud clamours, rending of clothes, &c. Thus the conference of that day terminated; but on the 8th day, they agreed to hold another council, three years after this, in Syria. Some of the Jewish doctors are said to have expressed a desire of conversing with protestant divines; but the interference of so many monks deterred them, and made them fear some tragical conclusion of the assembly.

AGELASTUS, of a priv. and γέλω, to laugh, in ancient history, a surname of the grandfather of Crassus, who is said to have laughed only once in his life, at the wonderful event of seeing an ass eat thistles. It was also a surname of Pluto Cicero de Fin. v. Plin. vii. 19, &c. **AGELASTIC,** is an adjective of similar signification, i. e. morose, sullen.

AGELNOTH, or **AETHELNOTH,** surnamed the Good, Abp. of Canterbury, under Canute the Great, succeeded to that see in 1020. He was son of earl Agilmer, and when elected, dean of Canterbury. In going to Rome, to receive his pall, he is said to have purchased St. Augustin's arm, which was kept at Pavia as a relic, and which he sent over to England as a present to

Leofric, earl of Coventry. He was much in favour with Canute, and Malmesbury observes, that this prince was excited to acts of piety, and restrained from excesses, by his regard for the Archbishop. He has also the reputation of manifesting a singular degree of British spirit on a memorable occasion: for when called upon to crown Canute's successor, Harold, in the absence of the legitimate claimant, Hardicanute, he altogether, according to some writers, refused to conduct the ceremony, alleging a promise which he had made to the late king, that he would place the crown only upon the head of the issue of queen Emma. Dr. Lingard represents him as appearing at the ceremonial, but refusing the episcopal benediction. He placed, according to this writer, the royal insignia on the altar; and addressing the king and his surrounding prelates, said, ‘These are the crown and sceptre which Canute entrusted to my charge. To you I neither give nor refuse them; you may take them if you please; but I strictly forbid any of my brother bishops to usurp an office, which is the prerogative of my see.’ Agelnoth wrote, 1. A panegyric on the Virgin Mary; 2. A letter to earl Leofric concerning St. Augustin; and other epistles. He died in 1038, in the 17th year of his archiepiscopate.

AGEM, in botany, a name sometimes given to the Persian lilac.

AGEMA, Αγέμα, vehemence, Gr. in Macedonian antiquity, was a body of soldiers, not unlike the Roman legion. Livy speaking of the army of Antiochus, says, ‘Addita his ala mille ferme equitum, agema eam vocabant,’ l. xxxvii. c. 40; and in another place, ‘Delecta deinde et viribus, et robore aetatis ex omni exercitorum numero duo erant agemata; hanc ipsi legi numeri vocabant,’ l. xlvi. c. 51. Some writers suppose it derived from αγεω, to lead, because the agema sometimes consisted of elephants, horse, and foot, who preceded generals and princes, as a sort of body guard. Arrian speaks of it as a wing of horse. *De Expedit. Alex.* l. vii. p. 217, Gronov.

AGEMOGLANS, or **AZANMOGLANS**, from ἀγέμη, agem, barbarous; and ἀζανμογλη, moglan, child; Arab. in the Turkish polity, are children purchased from the Tartars, or raised every third year, by way of tribute, from the Christians tolerated in the Turkish empire; who, after being circumcised and instructed in the religion and language of their tyrannical masters, are taught the exercises of war, till they are of proper age for carrying arms; and from this corps, the janissaries are recruited. Those who are thought unfit for the army, are employed in the lowest offices of the seraglio. The troops so raised, it is well known, become in their turn the real masters of the grand Seignior, and have frequently effected the most important revolutions in the state: an ‘even-handed’ justice in Providence, which thus seems to make the success of this tyranny its own punishment.

AGEN, a city of France, on the banks of the Garonne, formerly the capital of Agenois, now the chief town in the department of Lot and Garonne. Vestiges remain of very ancient fortifications, but prove that its former circuit was not so great as the present. The palace

formerly called the castle of Montravé, was seated beyond the walls of the old city, on the side of the fosse, near other ruins of a castle called La Sagne. The situation of Agen is very convenient for trade, which here consists principally of corn, wine, brandy, and hemp. Prunes are also a considerable article of commerce with the Dutch, who take great quantities for long voyages. The chief manufactures are linen, cambrics, serges, and sail cloths. The city was the residence of Julius Scaliger, and the birth-place of his celebrated son, Joseph. It is seated in a pleasant country; but, is itself rather a disagreeable place, the houses being ill-built, and the streets narrow, crooked, and dirty. It is 100 miles S. E. of Bourdeaux, and 408 S. S. E. from Paris.

AGENDA, among divines and philosophers, signifies the duties which a man lies under an obligation to perform: thus the phrase, the agenda of a Christian, or the duties he ought to perform; in opposition to the credenda, or things he is to believe.

AGENDA, among ecclesiastical writers, also denotes the service or offices of the church. We meet with agenda matutina and vespertina, 'morning and evening prayers,' agenda diei, 'the office of the day,' whether feast or fast day; agenda mortuorum, called also simply agenda, 'the service of the dead.' It is also applied to church books, compiled by public authority, prescribing the order to be observed by the ministers and people, in the ceremonies and devotions of the church. In which sense agenda amounts to the same with what is otherwise called ritual, liturgy, acalouthia, missal, formulary, &c.

AGENDA, among merchants, a term sometimes used for a memorandum book, in which is set down all the business to be transacted during the day, at home or abroad.

AGENDICUM, the classical name for Sens, in France. See **SENS**.

AGENFRIDA, or **AGENFRIGA**, in ancient customs, Saxon; from agen, own; and friga, lord; one who has the absolute property and dominion of a thing.

AGENHINE, in our old writers, signifies a guest that has lodged at an inn for three nights, after which time he was accounted one of the family; if he offended the king's peace, his host was answerable for him.

AGENOIS, a fertile district of France, in Guienne. It is twenty leagues long, and ten broad, and a portion of the department of the Lot and Garonne.

AGENOR, in fabulous history, a king of the Phoenicians, the son of Belus, and father of Cadmus and Europa.

AGENOR, in natural history, a species of papilio eques, with black wings, sanguineous at their base; the posterior having a white disc with black spots. It is found in China.

AGENORIA, in mythology, *αγνωρις*, Gr. strong, the goddess of courage and industry.

AGENT, *n. & adj.* { *Ago*, *agens*, from *αγω* to lead, or conduct;

AGENTS. } usually applied to one who conducts the affairs, or is entrusted with the commission of another.

The moral agency of the Supreme Being who acts

only as a Ruler towards his creatures, differs from the moral agency of created intelligent beings.

Edwards.

This success is oft truly ascribed unto the force of imagination upon the body *agent*; and then, by a secondary means, it may upon a diverse body; as, for example; if a man carry a ring on some part of a beast, believing strongly that it will help him to obtain his love; it may make him more industrious, and again more confident and persisting, than otherwise he would be.

Bacon's Nat. Hist.

So goodie *agent!* and you think there is no punishment due for your *agentship*.

Beaum. and Fl. Lover's Progress.

An *agent* is an acting being, some substance, not a manner of being. *Wollaston's Religion of Nat.*

It is the faculty of remembrance which may be said to place us in the class of moral *agents*. *Rambler.*

A few advances there are in the following papers, tending to assert the superintendence and *agency* of providence in the natural world.

Woodward's Preface to Nat. Hist.

Should God again,

As once in Gibeon, interrupt the race
Of the undeviating and punctual sun,
How would the world admire! but speaks it less
An *agency* divine, to make him know
His moment when to sink, and when to rise?

Couper's Task.

AGENT, AGENS, in physics, that whereby a thing is done or effected; or that which has a power to act on another thing or being; or by its action induces some change in it. It is used in contradistinction to patient. The schools divide agents into natural and free.

AGENTS, natural or physical, are those immediately determined by the author of nature, to produce one sort of effect; with an incapacity to produce the contrary. These are again divided into univocal, i. e. such as produce effects of the same kind and denomination with the agents themselves; and equivocal, whose effects are of a different kind, &c. from the agents. The schoolmen reckon it necessary to the being of an agent, that it be contiguous to the object, distinct from it, have a power over it, a sphere of activity, and a proportion or rate of acting.

AGENT, free or voluntary, in metaphysics, is he who may equally do any thing, or its opposite; as acting not from any pre-determination, but from choice. Such is the mind supposed to be, which has a spontaneous power of choosing or refusing.

Whether a man be a free, or necessary agent? is a celebrated question among philosophers and divines. It may be thus stated: man is a necessary agent, if all his actions are so determined by the cause preceding each action, that no one past action could possibly not have come to pass, or have been otherwise than it was; nor one future action can possibly not come to pass, or be otherwise than it shall be. On the contrary, man is a free agent, if he be able at any time, in certain circumstances, to do different things; or, in other words, if he is not ever unavoidably determined in every point of time, by the circumstances he is in, to do that one thing he does, and not possibly to do any other. See **LIBERTY**, **NECESSITY**, and **WILL**.

According to Dr. Price, the term *agent* evidently implies a power of self determination; and the epithet *necessary*, applied to *agent*,

forms a solecism, both in sense and language. *Price's Review*, &c. p. 315, &c.

An AGENT, in political affairs, is the minister of a prince or state, at another court. In which sense, agents are commonly reputed a species of public ministers, or ambassadors: but they differ from them essentially, as agents are not invested with any representative character, although entrusted with the affairs and interests of their princes. See ENVOY.

In the exchequer, there are four agents for taxes.

AGENTS, in medicine, powers which act upon the body, in contradistinction from alienments, which are supposed rather to be acted on than to act.

AGENTS, of Bank and Exchange, are public officers, established in the trading cities of France, to negotiate matters between merchants relating to bills of exchange, and the buying and selling of goods: the same with those who, among us, are called exchange-brokers.

AGENT, in military affairs, a person in the civil department of the army, between the paymaster-general, and the paymaster of a regiment, through whom every regimental concern of a pecuniary nature must be transacted. He gives security to government, or to the colonels of regiments, who are responsible to government, for all monies which may pass through his hands, in the capacity of an agent,—and by the mutiny act it is provided, that if an agent shall withhold the pay of officers or soldiers, for the space of one month, he shall be dismissed from his office, and forfeit £100. (39th Geo. III. sec. 69.)

AGENT, navy, is a person employed on shore to manage the pecuniary and other concerns of navy officers and seamen: particularly to receive their pay, prize-money, &c. and apply it to their use. By an act of parliament passed in the forty-ninth year of his late majesty, entitled an act to explain and amend an act made in the forty-fifth year of his late majesty, for the encouragement of seamen, and the more effectually manning his majesty's navy during the war, all agents, who act for petty officers, seamen, and others, serving in any of his majesty's ships, to receive their pay, wages, prize, and bounty money, are obliged to take out a license from the Navy Pay-office; which license is liable to be immediately withdrawn, on any grounds being produced that they have abused the trust reposed in them.

AGENTS of the victualling office, are officers under the commissioners appointed to buy and contract for provisions, &c. Some of these are settled in the ports, where they have much the same office and authority as the commissioners in London.

AGENT and patient in common law, is where a person does, or gives, something to himself; so that he is at the same time both the doer and giver, and the receiver or party it is done to. Such is a woman, when she endows herself with part of her husband's inheritance.

AGENT, in chemistry. Ancient chemists, regarded all substances as composed of active and passive principles; the latter of which received impressions from, and were modified by the former,

without exerting any reciprocal action. Spirits, oil, and salt, were active; earth and water, passive principles. This distinction evidently arose from the phenomena of solution, and the apparent energy which acids and other fluids exhibit in their combination with metals and solids in general. It is now however universally allowed, and indeed necessarily follows from the doctrine of affinity, that whenever two substances combine together, it is in consequence of a mutual attraction, which belongs as much to one element as to the other of a compound; this definition therefore of chemical agent is no longer adhered to, and though we still continue to use the expression of one body having a powerful action on any other, it is by no means intended to deny the equal reciprocity of chemical attraction. The general term agent signifies, therefore, in strictness, any substance capable of producing chemical action; and when, in explaining a process, the quality of agent is attributed to a body, it is only used as a designation of the substance whose presence determines the combination or decomposition; in which sense it is sometimes attributed to menstrua, or such bodies as in mixture have the greatest share of activity and motion: and it is sometimes also used for what we more usually call instrument. Thus fire, water, air, earth, and menstrua, are chemical agents.

AGENTE, in music, a term given by the Italians to the note of percussion that occasions and accompanies a prepared discord upon a binding note; which note was termed the patient.

In the preceding example, C is the patient, E prepares the discord, D is the moving note or agent, and B its resolution.

AGENTES in rebus, one of the ranks of officers, in the court of the Constantinopolitan emperors, whose business it was to collect and convey the corn both for the army and household; carry letters and messages from court to all parts of the empire; regulate couriers, and their vehicles; to make frequent journeys and expeditions through the provinces; inspect any motions, disturbances, machinations tending that way, and give early notice thereof to the emperor. Aquin. Lex. Mil. tom. i. Pitisc. Lex. Ant. tom. i. Cal. Lex. Jur. The agentes in rebus, are by some made synonymous with our post-masters, but their function was of great importance. They correspond to what the Greeks call *πυροφόροι*, and the Latins veredarii.

There were divers orders or degrees of agentes in rebus, as tribuni, primicerii, senatores, ducenarii, banchi, circitores, equites, tyrones, &c. through all which they rose gradatim. Their chief was denominated princeps, which was a post of great dignity, being reckoned on a level with that of proconsul.

The princeps agentium in rebus resided at Constantinople, others of them were settled in

every part of the empire; and are also said to have served as interpreters.

AGEMETRIA, a defect in point of geometry, or a deviation from the strict principles and conclusions of that science.

AGER *vectigalis privatus*, in Roman antiquity, that whose property was granted to private persons on the reserve of a certain rent, or tribute.

AGER *vectigalis publicus*, that whose property was reserved to the public, and being let out to farm, the rents or profits accrued to the public treasury.

AGER is also used for a certain portion or measure of land, anciently allowed in the division of grounds to each citizen. In the early days of the Roman state, the ager was only two jugera, amounting to one English acre and a quarter. After the expulsion of the kings, seven jugera were allowed to a plebeian.—Under the tribunate of C. Licinius Stolo, in the year of Rome 379, a law was made to limit estates to 500 jugera, or 330 English acres, and to decree the distribution of the surplus in the possession of any individual amongst those who had no land. Under Julius Caesar another Agrarian law was published, by which, those who enlarged their pittance of land, were to pay 50 aurei to the public.

AGER, or ACRE. See **ACRE**.

AGER NATURÆ, a name sometimes given to the womb.

AGER PICENUS, in ancient geography, a territory of Italy to the south-east of Umbria, reaching from the Apennine to the Adriatic: so called from the bird *picus*, under whose conduct the first settlers removed from the Sabines, of whom they were a colony.

AGERASY, from *a*, primitive, and *γέρας*, old age, a vigorous old age.

AGERATUM, from *a* primitive, and *γέρας*, old age because the flowers do not easily wither, *bastard hemp agrimony*: A genus of the polygamia *æqualis* order, belonging to the syngenesia class of plants; and in the natural method, ranking under the forty-ninth order, composita discoides. The characters are: common cal. oblong, with many scales: the compound cor. uniform; the corollas hermaphrodite, tubular, and numerous; the proper corolla is funnel-shaped; the border four-cleft, and expanded: stam. five capillary very short filaments; the anthera cylindric and tubular: pist. an oblong germen; with a filiform stylus, and two slender erect stigmata: there is no pericarpium; the calyx unchanged: the seeds are solitary, oblong, and angular: the receptaculum is naked, convex, and very small. Of this genus there are three species; viz. 1. *ageratum altissimum*; 2. *ageratum conyzoides*; 3. *ageratum houstonianum*; all natives of warm climates. The two last are annual plants, and consequently can be propagated only by seeds; which, however, come to perfection in this country. The first species will bear the severest cold of this country, but its seeds do not ripen in it.

AGERATUM, or MAUDLIN. See **ACHILLEA**.

AGERATUS lapis, in the ancient Materia Medica, a stone mentioned by Galen and others, said to be of the nature of the Phrygian stone, but more astringent; and as that was used in

dyeing, this was in dressing of leather. We have no account of its external appearance, but probably it contained vitriol, and perhaps alum. It is used by shoemakers to polish women's shoes.

AGERCITE, a sea-port town of Travancore, Hindostan, twenty miles north of Anjengo.

AGERIUM. See **AGISTMENT**.

AGESANDER, a sculptor of Rhodes, who lived about the fifth century, B.C. in the eighty-eighth Olympiad. In conjunction with his sons, Athenodorus and Polydoros, he executed the celebrated Laocoön, which was discovered in the sixteenth century in the baths of Titus, where it attracted admiration in Pliny's time. Julius II. handsomely rewarded the discoverer of this invaluable work, which was carried away from Rome by the French army, but afterwards was restored. Lessing, from the exquisite finishing of this group, thinks it was executed under the Caesars; but Borghini and Winkelmann deem it a production of the finest æra of Grecian art. In any case it has immortalized its sculptors. Agesander's name stands first on the plinth of the groupe.

AGESILAUS, I. king of Lacedæmon, of the family of Agidæ, and son of Dorysius, was contemporary with Lycurgus, the famous Spartan legislator. *Herod.* vii. 204.

AGESILAUS, II. king of the Lacedæmonians, the son of Archidamus II. was raised to the throne notwithstanding the superior claim of Leotychides. Upon his promotion, he advised the Lacedæmonians to anticipate the king of Persia, who was making great preparations for war, and to attack him in his own dominions. Being himself chosen to command this expedition, he gained so many advantages over the enemy, that if the league, which the Athenians and the Thebans formed against the Lacedæmonians, had not obliged him to return home, he would have carried his victorious arms into the heart of the Persian empire. He gave up, however, all these triumphs, to come to the succour of his country, which he happily relieved by his victory over the allies in Boeotia. He obtained another near Corinth: but to his great mortification, the Thebans afterwards gained several successive battles against the Lacedæmonians. These misfortunes at first raised some clamour against him. He had been sick during the first advantages which the enemy gained; but as soon as he was able to act in person, by his valour and prudence he prevented the Thebans from reaping the advantages of their victories; insomuch that it was generally believed, had he been in health at the beginning, the Lacedæmonians would have sustained no losses; and that all would have been lost had it not been for his assistance. It cannot be denied but that he loved war more than the interest of his country required; for if he could have lived in peace, he would have saved the Lacedæmonians several losses, and they would not have been engaged in many enterprises which in the end contributed much to weaken their power. In the decline of life, this prince accepted a command which reflected no credit on either himself or his country, i. e. that of the troops of Tachos, an adventurer who aspired to

the throne of Egypt: nor was his conduct in this expedition worthy of his previous fame. For on being refused the supreme command in Egypt, he joined Nectaneb, the rival of Tachos; and aided him in expelling his former associate. He died the third year of the 104th Olympiad, being the eighty-fourth year of his age, and forty-first of his reign. Agesilaus would never suffer any picture or sculpture to be made of him, and prohibited it also by his will: this he is supposed to have done from a consciousness of his own deformity; for he was of a short stature, and lame in one foot. His fame went before him into Egypt, where they had formed the highest idea of him. When he landed, the people ran in crowds to see him: but when they beheld an ill-dressed, slovenly, lame man lying upon the grass, they could not forbear laughing, and applied to him the fable of the mountain in labour. He was, however, the first to jest upon his own person; and such was the gaiety of his temper, and the strength with which he bore the roughest exercises, that these qualities made amends for his corporeal defects. He was remarkable for plainness and frugality in his dress and way of living. Cornelius Nepos says, that, 'although great presents were sent him by kings, governors, and states, he brought none of them to his own house; that he changed nothing of the diet, and apparel of the Lacedæmonians. He was contented with the same house in which Euristhenes, the founder of his family, had lived: and whoever entered there, could see no sign of debauchery, or luxury, but many of moderation and abstinence; for it was furnished in such a manner, that it differed in nothing from that of any poor or private person.' Upon his arrival in Egypt, all kinds of provisions were sent to him; but he chose only the most common, leaving the perfumes, the confections, and all that was esteemed most delicious, to his servants. Agesilaus was extremely fond of his children, and would often amuse himself by joining in their diversions: one day when he was surprised riding upon a stick with them, he said to the person who had seen him in this posture, 'Forbear talking of it till you are a father.'—Hearing the king of Persia spoken of as the great king, on one occasion, he is reported to have said, 'I cannot conceive wherein he is greater than I, unless he be more just.' His life and actions are the theme of Xenophon's praise; and are recorded also by Diodorus Siculus, Plutarch, and Nepos.

This was also the name of a brother of Themistocles, who, being sent as a spy into the Persian camp, stabbed Mardonius instead of Xerxes: and a surname of Pluto.

AGESIPOLIS I. and II. reigned in Sparta, after Agesilaus II., the former fourteen years, and the latter only one year.

AGESISTRATA, the wife of Eudamidas II. and mother of Agis III. kings of Sparta, who was murdered in prison, along with her son Agis and her mother, by the Ephori, about A. A. C. 300.

AGEUSTIA, or AGHEUSTIA, of a privative, and *γευομαι*, to taste, in medicine, a defect in the sense of taste. This disease may arise from an organic affection, or an atonic state of the organs;

from fur, mucus, apthæ, ulcers, &c. on the tongue; or from a diseased secretion of saliva; and the taste may be entirely abolished by injuries done to the nerves of the tongue or palate. When the taste is diminished or depraved by fur or mucus, as usually happens in fevers, it is rarely possible to restore it by any other means than those which subdue the fever; but the tongue, teeth, and fauces, should be washed with detergent gargles, of which the aqua ammonia, or common sal volatile, properly diluted with water, is the most effectual in dissolving the mucus. The tongue may also be gently scraped when moist, and the teeth brushed. When the taste is depraved by a diseased secretion of saliva, the cure depends on restoring the natural secretion. If bile, or any saburra in the stomach, disorder the natural taste, recourse must be had to emetics, or the proper correctors of the offending cause: acidity is removed by alkalies, chalk, magnesia, and even by other acids.

AGGA, AGONNA, or AGOONA, a country on the Gold Coast of Africa, extending about twenty miles from east to west, and fifteen north to south. The chief towns are Winnebah, Agoona, Beracoe, and Fettah. On the coast the ground is very light and sandy, but improves in the interior; and at six or eight miles inland, is fertile for a tropical region, and the climate is more healthy than on many other parts of the coast. Not a tenth part of the land is under cultivation; the rest is the property of any one who chooses to cultivate it. The population has suffered severely from the inroads of the Ashantees, and cannot at present be estimated at more than 10,000 souls, of whom 7000 are women and children. The chief object of exportation is gold; their mode of procuring which is not very exactly known. Gold and cowries form the medium of circulation; 32,000 cowries go to the ounce of gold, valued at £4. The district is divided into a number of petty states, which are variously governed.

AGGADA, in Jewish antiquity, an ingenious tale, of which there are many in the Talmud. Several books are extant among the Jews under this title. R. San Israel Ben Juda has published Novella Aggadarum, or new explanations of the stories in the Talmud, discovering their hidden meaning.

AGGELATION, n. Lat. ad: *gelu*, ice

It is round in hail, and figured in its guttulous descent from the air; growing greater or lesser, according to the accretion or pluvious aggelation about the fundamental atoms thereof.

Brown's Vulgar Errors.

AGGENERATION, n. Ad: *genero*, *genus*; *γενομαι*, to produce.

To make a perfect nutrition, there is required a transmutation of nutriment: now, where this conversion or aggeneration is made, there is also required, in the aliment, a similarity of matter.

Brown's Vulgar Errors.

AGGER, in ancient authors, denotes the middle part of a military road, raised into a ridge, with a gentle slope on either side, to make a drain for the water, and keep the way dry. The term was also used for the whole road, or military way. Where highways were to be made in low grounds, as between two hills, the Romans used

to raise them above the adjacent land, so as to make them level with the hills. These banks they called aggeres. Bergier mentions several in Gallia Belgica, which were thus raised, ten, fifteen, or twenty feet above ground.—They are sometimes also called aggeres calceati; and are now generally known by the name choussees, or causeways.

AGGER, in the ancient military art, a work of fortification, used both for the defence and the attack of towns, camps, &c. In which sense it is the same with what was otherwise called valum, and in latter times aggustum; and among the moderns, lines, cavaliers, terrasses, &c. The agger was usually a bank, or elevation of earth or other matter, bound and supported with timber; having sometimes turrets on the top, wherein the workmen, engineers, and soldiers, were placed. It was also accompanied with a ditch, which served as its chief defence. The usual materials of which it was made were earth, boughs, fascines, stakes, and even trunks of trees, ropes, &c. variously crossed, and interwoven somewhat in the figure of stars; whence they were called stellati axes. Where these were wanting, stones, bricks, or tiles, supplied the office: on some occasions, arms, utensils, pack-saddles, were thrown in to fill it up. We even read of aggers formed of the carcases of the slain; sometimes of dead bones mixed with lime; and even with the heads of slaughtered citizens. For want of the due binding of solid materials, aggers have occasionally given way, with infinite mischief to the men. The besiegers used to carry on a work of this kind, gradually approaching the place, till at length they reached the very wall. The methods taken, on the other side, to defeat them, were by fire, especially if the agger were of wood; by sapping and undermining, if of earth; and in some cases, by erecting a counter agger. The height of the agger was frequently equal to that of the wall of the place. Caesar tells us of one he made, which was thirty feet high and 330 feet broad. Besides the use of aggers before towns, the generals used to fortify their camps with such works; for want of this precaution, armies have often been surprised and ruined. There were vast aggers made in towns and places on the sea side, fortified with towers, castles, &c. Those made by Cæsar and Pompey at Brundusium, are famous. Sometimes aggers were even built across arms of the sea, lakes, and morasses; as was done by Alexander before Tyre, and by M. Antony and Cassius. The wall of Severus, in the north of England, may be considered as a grand agger, to which belonged several lesser ones. See SEVERUS'S WALL.

AGGER TARQUINII, Tarquin's agger, was a famous one built by Tarquin II. on the east side of Rome, to stop the incursions of the Latins. Criminals were thrown down from the top of this rampart. *Juv. Sat. vi. 288; and Sueton. in Cal.*

AGGER is also used for the earth dug out of a trench and thrown up on the brink of it. In which sense, Folard thinks the word to be understood, when used in the plural number, since we can hardly suppose they would raise a number of cavaliers, or terrasses. It is also used for

VOL. I.

a bank, or wall, erected against the sea, or some great river, to confine or keep within bounds; called also a tumulus and moles; the Dutch, dyke; we, dam, and sea-wall:

AGGER also denotes a heap of earth, raised over the graves of the ancients. In which sense, it amounts to the same with what is sometimes called aggustum.

AGGER, in geography, a river of the circle of Westphalia, which waters the county of Marck and the duchy of Berg. It falls into the Sieg, below Siegberg.

AGGERHUUUS, OR CHRISTIANIA, the largest diocese or general government in the south part of Norway; and the richest, as well as most considerable, in the whole kingdom. It was formerly called Hammerslift, and Opseloe. It is bounded on the north by Drontheim, on the west by Bergen and Christiansand, on the south by the Skager-Rack, and on the east by Sweden; and contains several towns, six royal bailiwicks, and the counties of Jarlsburg and Larwig. In 1769, the number of inhabitants amounted to 315,144; but they are now supposed to exceed 400,000. Excellent timber for ship-building is furnished here; and at Korsberg and Stroemsoe are some valuable silver mines; iron mines at Lariveg and Lassoe, and a copper mine at Quickul. Opseloe yields upwards of 500 tons of alum per annum, from a sort of black slate; and alundstones are found in several places.

This is also the name of a royal bailiwick, of several districts, and of a fortress in this diocese, on the west side of the bay, near which lies the city of Christiania. It is not known when it was built; but it has been repeatedly besieged by the Swedes, viz. in 1310, in 1567, and in 1717, by Charles XII., without success. The governor of Aggerhus is the chief governor of Norway: he presides in the high court of justice, called Overhofet, which judges, in the last resort, all civil causes above a certain value. In all causes surpassing that value, an appeal lies to the supreme court at Copenhagen. N. lat. 59°. 6'. E. long. 10°. 20'. The oldest church in this diocese, said to have been built about 700 years ago, and called Aggers, is situated about a quarter of a Norway mile north of the castle.

AGGERS-HERRED, a fief of Aggerhus, which comprises three districts, with as many courts of judicature, viz. Ascher, East and West Barum, and Ager. Christiania is situated in this district.

AGGEROUT, or AGGEROUD, supposed to be the ancient Arsinoe, is situated at the extremity of the Red Sea, about two leagues from the port of Suez. Here terminated the famous canal, begun by Necos and finished by Ptolemy Philadelphus, for joining the Nile to the Red Sea. Since the time of Ptolemy, the Red Sea has retired two leagues, which is the distance of Aggeroud from Suez.

AGGLESTONE, otherwise called Stone Barrow, and vulgarly the Devil's Cap, is a remarkable monument of antiquity, situated in the N.E. extremity of the isle of Purbeck. Its dimensions are sixty feet in circumference at the bottom, in the middle eighty, and at or near the top ninety; and it is computed to contain 407 tons of stone

U

The name seems, to have been derived from the Saxon halig, or hlyg, holy, and stoned, stan, stone, which expresses its ancient use; as it was probably a rock idol in the British age.

AGGLOM'ERATE, } Ad: *glomero*, to roll
AGGLOMERATION. } up thread. To gather together; to assemble in a mass.

An excessive *agglomeration* of turrets, with their fans, is one of the characteristick marks of the florid mode of architecture, which was now almost at its height.

Warton. History of English Poetry. ii. 223.
Besides, the hard *agglomerating* salts,
The spoil of ages, would impervious choke
Their secret channels.

Thomson's Autumn.
Worlds! systems! and creations!—And creations
In one *agglomerated* cluster, hung,
Great vine! on thee, on thee the cluster hangs.

Young. Night ix.

Thus we break the vast periods of time into centuries and years; and thus, if we would know the amount of moments, we must *agglomerate* them into days and weeks.

He seeks a favour'd spot; that where he builds
Th' *agglomerated* pile, his frame may front
The sun's meridian disk, and at the back
Enjoy close shelter, wall or reeds, or hedge
Impervious to the wind.

Couper's Task.

AGGLUTINATE, v. } Ad: *gluten*, glus,
AGGLUTINA'TION, } glue. To stick or ad-
AGGLU'TINANT, } here together.
AGGLU'TINATIVE.

To the nutrition of the body there are two essentials required, assumption and retention; then there follow two more, concoction and *agglutination*, or adhesion.

Howell's Letters. i. 5.

The body has got room enough to grow into its full dimensions; which is performed by the daily ingestion of food that is digested into blood; which, being diffused through the body, is *agglutinated* to those parts, that were immediately *agglutinated* to the foundation parts of the womb.

Harvey on Consumptions.
Rowl up the member, with the *agglutinative* rowler.

Wiseman.

AGGLUTINANTS, in pharmacy, more particularly comprehend that class of strengthening medicines, whose office and effect are to adhere to the solid parts of the body, and thus recruit and supply the place of what is wasted by the animal exertions. They are such as are easily formed into jellies, and the principal simples which come under this class, are isinglass, olibanum, gum Arabic, dragon's blood, cassia, sago, vermicelli, pulse, comfrey, plaintain, &c. If the term, says Dr. Cullen, has any foundation at all, it must have the same meaning with that of nutrient; and there is no propriety in using a doubtful theoretical term. Nor is the term less improperly applied to medicines that are suited to cement and reunite parts preternaturally separated, and therefore employed in wounds and ulcers. British surgeons neither know nor employ any such medicines: the business is the work of nature; and their concern is to remove impediments to its operation. *Mat. Med.* vol. i. 163.

AGGLUTINATION, in surgery, adhesion. The reunion of wounds was formerly supposed to be effected by means of certain applications,

named agglutinants; but these remedies are now known to act only by keeping the separated parts in exact apposition. See Bell's *Principles of Surgery*; and the article *WOUNDS*. An unnatural agglutination of the eyelids, constitutes the disease, anchyloblepharon.

AGGLUTINATION, in astronomy, the meeting of two or more stars in the same part of the zodiac; also the seeming coalition of several stars, so as to form a nebulous star.

AGGLUTINATIO PILORUM, a healing or reducing the hairs of the eye-lids that grow inwards, to their natural situation. This may be done by mastic applied with a probe, which bends the hairs back into their proper order. Bitumen, the slime of a snail taken off with a needle, the juice of hawk's weed, the liquor of agglutinants, or ammoniac, produce the same effect.

AGGRACE', v. & n. } Ad: *gratia*, to treat
AGGRATE'. } with favour.

So goodly purpose they together fond
Of kindnesse and of courteous aggrevate.

Spenser's Faerie Queene.

And in the midst thereof, upon the floor,
A lovely bevy of fair ladies sat,
Courted of many a jolly paramour,
The which them did in modest wise amate;
And each one sought his lady to aggreat.

Idem

AGGRAMMES, in ancient history, a cruel king of the Gangarides. His father was a hairdresser, of whom the queen was enamoured, and having been made governor of the king's children by the queen, (in order the more easily to gratify her passion,) he killed them all, that Agrammes, his son by the queen, might be raised to the throne.—*Curtius*, ix. 2.

AG'GRANDIZE, v. } Ad: *grandis*, *grandior*,

AC'GRANDIZEMENT. } to advance; to ascend,
Fr. *aggrandir*, to make greater; to increase the power, rank, wealth, or reputation.

If the king should use it no better than the pope did, only to *agrandize* covetous churchmen; it cannot be called a jewel in his crown.

Ayliffe's Parerga.

These furnish us with glorious springs and mediums; to raise and *agrandize* our conceptions, to warm our souls, to awaken the better passions; and to elevate them, even to a divine pitch, and that for devotional purposes.

Watts's Improvement of the Mind.

It is true greatness that constitutes glory; and virtue is the cause of both: but vice and ignorance taint the blood; and an unworthy behaviour degrades and disengobles a man, more than birth and fortune *agrandize* and exalt him.

Guardian.

AG'GRAVATE, v. } Ad: *gravis*; Fr. *ag-*
AGGRAVA'TION, } *grever*, to make heavy;
AGGREGATE'. } to increase trouble, pain, or sorrow. Agredge or aggregate are used by Chaucer and Douglas.

And up he sterdis in this ilk thraw,
With thir wourdis Turnus to ouer charge,

Douglas, b. xi. p. 374.

Agreeing on wraith and malice large.
She graunted; and that knight so much agreste
That she him taught celestial discipline.

Spenser's Faerie Queene, ix. 18.

I grant you, friends, if you should fright the ladies out of their wits, they would have no more discretion

but to hang us ; but I will *aggravate* my voice so, that I will roar you as gently as any sucking dove ; I will roar you an 'twere any nightingale.

Shakspeare's Midsummer Night's Dream.

Sins are so much the greater as they are universal ; so far is evil from being extenuated by the multitude of the guilty, that nothing can more *aggravate* it.

Hall's Contemplations.

Good turns *aggravate* unkindnesses, and our offences are increased with our obligations.

Idem.

Till over head a sheet

Of livid flame discloses wide ; then shuts,
And opens wider ; shuts and opens still
Expansive, wrapping ether in a blaze.
Follows the loosen'd *aggravated* roar,
Enlarging, deepening, mingling.

Thomson's Summer.

Oh ! friendship's generous ardour then suppress,
Nor hint the fatal cause of my distress ;
Nor let each horrid incident sustain
The lengthen'd tale to *aggravate* his pain.

Falconer's Shipwreck.

AGGRAVATION, in the Romish canon law, is particularly used for an ecclesiastical censure, threatening excommunication, after three admonitions used in vain. From aggravation they proceed to re-aggravation ; which is the last step to excommunication.

AG'GREGATE, v. & n.

AG'GREGATE, adj.

AGGREGATELY,

AGGREGA'TION,

AGGREGA'TIVE,

AGGREGA'TOR.

into a company, or assemblage ; to amass.

The reason of the far greatest part of mankind, is but an *aggregate* of mistakēn phantasms ; and, in things not sensible, a constant delusion.

Glanville's Scepsis Scientifica.

A great number of living and thinking particles could not possibly, by their mutual contact, and pressing, and striking, compose one greater individual animal, with one mind and understanding, and a vital conssencion of the whole body ; any more, than a swarm of bees, or a crowd of men and women, can be conceived to make up one particular living creature, compounded and constituted of the *aggregate* of them all.

Bentley.

The *aggregated* soil

Death, with his mace petrific, cold and dry,
As with a trident, smote.

Milton's Paradise Lost.

Their individual imperfections being great, they are moreover enlarged by their *aggregation* ; and, being erroneous in their single numbers, once huddled together, they will be error itself.

Brown's Vulgar Errors.

The water resident in the abyss, is (in all parts of it) stored with a considerable quantity of heat ; and more especially in those, where these extraordinary *aggregations* of this fire happen.

Woodward's Natural History.

They had, for a long time together, produced many other inept combinations, or *aggregate* forms of particular things, and nonsensical systems of the whole.

Ray on the Creation.

AGGREGATE, in botany, is a term used to express those flowers, which are composed of parts or florets, so united, by means either of the receptacle or calyx, that no one of them can be taken away, without destroying the form of the whole. They are opposed to simple flowers, which have no such common part, and are usually

divided into seven kinds, viz. the aggregate properly so called, whose receptacle is dilated, and whose florets are supported by foot-stalks ; such are the blue daisy, thrift, or sea spink, &c. the compound ; the umbellati ; the cymose ; the amentaceous ; the glumose ; and the spadiceous.

AGGREGATE GLANDULE, in anatomy, the small glands in the cellular, which is next to the villous coat of the intestines ; as these glands are not visible in an uninjected gut, many anatomists suspect them to be only little bits of separated wax.

AGGREGATE TERRE, in the Linnaean system of mineralogy, denotes the seventh order of earths, comprehending those that are formed of the aggregate earths of the preceding orders. To this order belong the six following genera, viz. granites, gneissum, porphyrias, amygdalites, breccia, and arenarius.

AGGREGATION, in physics, a species of union, whereby several things which have no natural dependence or connection with one another are collected together, so as in some sense to constitute one. Thus, a heap of sand, or a mass of ruins, are bodies by aggregation.

AGGRESS', } Ad : *gredior, gressus*, to step

AGGRES'SION, } or go to ; to advance against ;

AGGRES'SR. } to begin a quarrel ; to commence hostile proceedings, assault or fall upon.

The glorious pair advance,

With mingled anger and collected might ;

To turn the war and tell *aggressing* France,

How Britain's sons and Britain's friends can fight.

Prior.

There is no resisting of a common enemy, without an union for a mutual defence ; and there may be also, on the other hand, a conspiracy of common enemy and *aggression*.

L'Estrange.

Fly in nature's face !

But how if nature fly in my face first ?

Then nature's the *aggressor*. Let her look to't.

Dryden.

It is a very unlucky circumstance to be obliged to retaliatē the injuries of such authōrs ; whose works are so soon forgotten, that we are in danger already of appearing the first *aggressors*.

Pope and Swift.

AGGRESSES, in heraldry, pellets or balls.

AGGRESTEIN, in falconry, a disease of hawks.

AGGRIEVE, v. } Lat. *gravis*, heavy ; Fr.

AGGRIEVE'ANCE. } *agrever*, to weigh down with grief ; to depress ; to vex.

Grete was pat linage & many to pam cheued,
& of pat ilk outrage pe fest pam sore *agreed*.

R. Brune, p. 323.

For John, ther is a lowe that saith thus,

That if a man in o point be *agreed*

That in another he shall be releved.

Chaucer. *The Reeves Tale*, vol. i. p. 165.

The dredful figures gan appere to me

And great Gods eke *agreed* with our town.

Surrey's Aeneid.

I saw alas ! the gaping earth devour
The spring, the place, and all cleān out of sight :

Which yet *aggrieves* my heart, even to this hour.

Spenser.

Sewell, archbishop of York, much *aggrieved* with some practices of the pope's collectors, took all patiently.

Camden.

Of injured fame, and mighty wrongs received,

Chloe complains, and wondrously's *aggrieved*.

Granville.

AGGROUPE'. See **GROUPE.**

Bodies of divers natures, which are *aggronged* (or combined) together, are agreeable and pleasant to the sight. *Dryden.*

AGHABOE, a small town in Queen's County, Leinster, Ireland. Also a town in the county of Kerry, in Ireland.

AGHADES. See **AGADES.**

AGHAL GORI, a small city of Georgia, in the province of Kartel, situated in a narrow valley, in the neighbourhood of which are iron mines. The inhabitants are chiefly weavers of cotton and hemp, and they manufacture hand-kerchiefs, as also stufs that are rough on both sides. The neighbourhood is very fertile.

AGHER, a town of Ireland, in the southern part of Ulster, not far from Clogher, which sent two members to the Irish parliament.

AGHOGILL, or **AHOGILL**, a town of Ireland in the county of Antrim, and province of Ulster.

AGHRIM, a town of Ireland, in the county of Wicklow, and province of Leinster, situated about thirteen miles S.W. of Wicklow.

AHRIM, or **AUGHRIIM**, in Galway; a small village, distant seventy-five miles from Dublin, and rendered memorable by a decisive battle fought there, and at Kilcommoden hill, the 12th of July, 1691, between general Cinckel and Monsieur St. Ruth, the commanders under king William III. and James the II. when St. Ruth, the general of the Irish army, with 7000 of his men, were slain; but of the English only 600. The victory was the more considerable, as the English army consisted of not more than 18,000 men; whereas the Irish were computed at 20,000 foot, and 5000 horse and dragoons. They lost likewise nine pieces of brass cannon; and all their ammunition, tents, and baggage; most of their small arms, which they threw away to expedite their flight; with eleven standards, and thirty-two pairs of colours.

AGIADES, in the Turkish armies, a kind of pioneers employed in fortifying camps, smoothing roads, and the like offices.

AGIAHALID, in botany, an Egyptian tree, called also licio and lycium, which resembles the wild pear.

AGIASMA, from *ayyog*, *holy*, among ancient writers, is sometimes used for the whole church, sometimes for the bema, or more sacred part, wherein mass was said.

AGIDA', the elder branch of the royal family of Sparta, so called from Agis, their second king.

AGILD, or **AGILDE**, from the Gr. *a*, privative, and the Sax. *gildon*, to pay, in our ancient customs, a person so vile, that whoever kills him was to pay no mulct for his death.

AGILE, *adj.* { *Ago, agilis*, able to act; ac-
AGIL'ITY. { *tive, brisk, nimble.*

Yet God hathe suffered them [the fiendes] to keep their gyftes of nature styl, as wytte, betwey, strength, aglytie, and suche other lyke,

Sir Thos. More's Works, p. 863, col. 2.

He [the thief] was pursued close by fierce mastiff dog, and was forced to save himself by leaping over a hedge, which being of an *agile* body he effected.

Bacon's Apophthegms.

The immediate and *agile* subservience of the spirits to the empire of the mind or soul.

Hale's Origin of Mankind.

With that he gave his able horse the head;
And, bending forward, struck his *agile* heels
Against the panting sides of his poor jade,
Up to the rowel head. *Shakespeare's Henry IV.*

Once more, I said, once more I will inquire,
What is this little, *agile*, pervious fire,
This fluttering motion, which we call the mind?
How does she act? and where is she confined?

Prior's Solomon.

To guide its actions with informing care,
In peace to judge, to conquer in the war,
Render it *agile*, witty, valiant, sage;
As fits the various course of human age. *Idem.*

First he bids spread
Dry fern or littered hay, that may imbibe
Th' ascending damps; then leisurely impose,
And lightly, shaking it with *agile* hand,
From the full fork, the saturated straw.

Couper's Task.

AGILITY. Among the ancient Greeks, the improving of agility was one of the chief objects of the institution of games and exercises. The athletæ made particular profession of the science of cultivating and improving agility. Agility of body is often supposed peculiar to some people, yet it seems less owing to any thing peculiar in their frame and structure, than to practice.

AGILENSY, in botany, a name used by some writers for the common hazel.

AGILLARIUS, in ancient law books, a keeper of cattle in a common field. The agillarius, or keyward of a town, or village, was to supervise the cattle, and keep them within their due bounds; and was otherwise called bubulus, q. d. cow-wards, whence the reproachful term coward. If he was a cottager, or other servile tenant, he was exempted from the customary services, as being presumed to be always attending on his cattle, as a shepherd on his flock, who had therefore the like privileges. The agillarius of the lord of the manor, or a religious house, was an officer appointed to take care of the tillage and harvest-work, to pay the labourers, and see there were no encroachments made, or trespasses committed: the same in effect with what has been otherwise called fieldsman, and tithing-man; and among us bailiff.

AGIMERE, **AGMEER**, **AJMEER**, or **RAJPOOTANA**, an extensive province of Hindostan, bounded on the north by the provinces of Moultan and Delhi; on the south by Malwah and Gujrah; on the east by Delhi and Agra; and on the west by Sind. It lies between 25° and 30° N. lat. and is about 350 miles long, by 220 in breadth. The province of Ajmeer is occasionally named Marwar; but this appellation is properly restricted to the Joudpoor territories. The northern division, comprehending Bicaner, and neighbouring districts, is a barren plain, almost destitute of rivers and rivulets, and but very thinly inhabited; the central territory, which includes Joudpoor and Jyengar, is more hilly, and better supplied with water, yet not in sufficient quantities for wet crops: the soil is remarkably saline, containing salt lakes and springs, and producing salt and salt-petre spontaneously. The southern division is very hilly and of difficult access; but, in general, well co-

vered with trees and shrubs, and watered by many mountain streams, besides the Banass and Chumbul rivers.

The three great modern divisions of Ajmeer or Rajpootana, are, 1st, The state of Odeypoor, named also Mewar, or the Rana of Chitore; 2ndly, Joudpoor, named also Marwar, and its sovereign occasionally described as the Rhatore Rajah, being of that tribe; 3dly, Jyenagur, Jey-poor, or Amber.

The city of Ajmeer, and the forty-six surrounding pergunnahs, belong to Dowlet Row Sindia, the Mahratta chief, and the district of Tonk Rampaorah, to the Holcar family.

The eastern quarter of the central division is occupied by the Jyenagur Rajah; and the south-eastern division by the Rajahs of Kotah, Boonde, and other petty Rajpoot chiefs tributary to the Mahrattas, and engaged in a constant state of hostilities with each other.

The western parts of the central division are subject to the Rajah of Joudpoor, whose dominions are of great extent; and the south-western are possessed by the Rana of Odeypoor.

From these principalities the Malwah Mahrattas, when they are strong enough, levy annual contributions, which is the easier effected, on account of their disunion and unceasing internal warfare. The barren and desolate region to the north, is very little known, having, from its poverty, attracted but little attention.

The constitution of these countries is feudal; each district, town, and even village, being governed by petty chiefs, dignified with the title of thakoor, or lord, who frequently yield but a nominal obedience to the person who is reputed to be their superior or sovereign. The rents are very low; but every village is obliged to furnish a certain number of horsemen at the shortest notice. The Rajpoots are hardy and brave, and extremely attached to their respective chiefs; they are much addicted to the use of opium—this destructive drug being produced by them on all occasions, and presented to visitors as betel is in other parts of India. They are usually divided into two tribes—the Rhatore, and the Chohan Seesodya Rajpoots.

The inhabitants, who are principally of the Rajpoot or military tribes of Hindoos, though occupying a vast territory, do not exceed five millions. The principal towns are Jyenagur, Joudpoor, Odeypoor, Ajmeer, Kotah, Boondie, Rantamoor, Chitore, Amber, and Shahpoorah. Both lead and copper mines are found in this province, which contains also a large salt-water lake, that yields a good revenue to the government.

Ajmeer, though extending over the centre of Hindostan, (its eastern frontier is within ninety miles of Delhi,) was never thoroughly subjugated either by the Patan or Mogul emperors. The Rajahs are mentioned by Ferishta so early as A. D. 1008; at which period they joined a combination of Hindoo princes against Mahmood of Ghizni, and in 1193, it was conquered, or rather overrun by Mahomet, the first Gauride sovereign of India. From this period it continued tributary to the throne of Delhi; and, on account of the refractory conduct of its princes,

was frequently invaded by the emperors, who took and destroyed their chief towns. Yet the province never became a regular organized possession, like Delhi, Agra, and many much more remote countries, but remained in a sort of half-independent state, paying a tribute, and furnishing the imperial armies with a certain number of Rajpoot mercenaries, who were always held in high estimation, on account of their bravery and fidelity, and formed a counterpoise to the Moguls and Afghans. On Aurengzebe's death, in 1707, and the dissolution of the Mogul empire, which ensued, it continued for some time under a nominal subjection to the Delhi throne; but about 1748, assumed total independence. The interval since that period has been filled up by internal warfare, and invasions by the Mahrattas and other hordes of plunderers. During the latter part of the reign of Madhajee Sindia, and the commencement of that of Dowlet Row Sindia, they were very nearly subdued by the disciplined troops under generals Du Boigne and Perron in the pay of those chiefs. They have since recovered a little, not by any intrinsic addition to their own strength, but by the depression of their most dangerous adversary, Dowlet Row Sindia. In 1807, the Rajahs of Jyenagur and Joudpoor continued their mutual pretensions to marry the daughter of the Rana of Odeypoor, and engaged in hostilities, which were fermented and supported by Ameer Khan, Holkar, Sindia, and other depredators, who benefit by the dissensions among the Rajpoots. See *Abul Fazel, Rennel, Scott, Broughton, Maurice, MS. &c.*

AGIMEER, or AJMEER, the capital of the province of that name, is in Lat. 26°. 35'. N. Long. 74°. 48'. E. is situated in the centre of the Rajpoot states of Jyenagur, Joudpoor, and Odeypoor. In 1800 it was held by M. Perron. The boundary to the west is at the town of Meerta, which separates Ajmeer from Joudpoor. It is subject to Dowlet Row Sindia.

The fort of Ajmeer, named Taragur, (the house of the slaves,) is built on the north east end of a range of hills, and consists principally of a plain stone wall along the edge of the mountain, strengthened with a few round bastions. The city lies at the bottom of the hill, and is surrounded by a stone wall and ditch in bad repair. The streets are narrow and dirty, and most of the houses small, and in a state of decay. It possesses a palace, built in a garden by Shah Jehan; besides which, there are scarcely any remains of magnificence to be seen, either internally or externally.

The country round Ajmeer is a flat sandy amphitheatre, surrounded by low hills, in consequence of which the place is uncommonly sultry; but it is well supplied with water from two lakes, which are close under its walls. The most northern is six miles in circumference, and very deep; and, at particular seasons, both are covered with flocks of ducks and geese.

Ajmeer contains the tomb of Khaja Moyenud Deen, one of the greatest Mahomedan saints of Hindostan, who flourished about 600 years ago. It is of white marble, but remarkable neither for beauty nor style of architecture. Although the distance from this tomb to Agra be 230 miles,

yet the great and wise emperor Acer made a pilgrimage on foot to the tomb of this saint, to implore divine blessings on his family, which consisted only of daughters; but, after this pilgrimage received the addition of three sons. The peer zadas, or attendant priests, who subsist on the contributions at the tomb, exceed 1100 in number, and demand, or rather extort charity from all visitors. Madhajee and Dowlet Row Sindia, although Hindoos, were remarkable for their devotion to Mahomedan saints and customs. The latter bestowed a superb pall and canopy of cloth and gold on the tomb, and is particularly bountiful to the devotees and peer zadas. Four miles from the city is also a remarkable place of Hindoo pilgrimage, named Pooshkur, or Pokur. It is distant from Delhi 230 miles; from Bombay 680, and from Calcutta 1000 miles.

AGINCOURT, a village of the French Netherlands, in the department of the straits of Calais. Lon. 2°. 10'. E. Lat. 50°. 31'. N.; rendered famous by the battle fought near it in 1415, wherein Henry V. defeated the French, although the English army had to struggle with every disadvantage. After landing in France, it had been by various accidents reduced to 10,000 men, of whom not a few were sick, or slowly recovering from sickness;—they had to traverse a long tract of country, inhabited by exasperated enemies, from whom they were to procure provisions, lodgings, guides, intelligence, and every thing they wanted;—that country was defended by many strong towns, intersected by deep rivers, and defended by an army of 100,000, or (according to some contemporary writers,) 140,000 men. Henry, undaunted by all these dangers and difficulties, departed from Harfleur, marching his army in three lines, with bodies of cavalry on the wings. He proceeded by very easy journeys, that he might not fatigue his troops, or discourage them by the appearance of a flight; observing the strictest discipline, and paying generously for every thing he received; which induced the country people to bring provisions to his camp, in spite of all the commands they had received to the contrary. To keep his army from repining, the king fared as ill as the meanest soldier, always appearing with a cheerful countenance, and addressing them in the most friendly and encouraging language. They arrived at the village of Agincourt, in the county of St. Pol, on the evening of October 24th; and there beheld the whole French army, at a small distance, directly in their route. The king took an attentive view of it from an eminence; and being fully convinced, that it was impossible to proceed any further on his way to Calais without a battle, and equally impossible to return to Harfleur with so great an army in his rear, he resolved to hazard an action next morning, as the only means of preserving himself and his little army from destruction. The English army lodged that night in the villages of Agincourt, Maisoncelle, and some others; where they met with better accommodation than they had been accustomed to for some time past, and spent part of their time in mutual exhortations to fight bravely in the approaching battle. The king, overhearing some

of his nobles expressing a wish, that the many brave men, who were idle in England, were present to assist them, is said to have cried out —‘ No! I would not have one man more:—if we are defeated, we are too many—if it shall please God to give us the victory, as I trust he will, the smaller our number the greater our glory.’ The moon happening to shine very bright, Henry, with some of his best officers, carefully examined the ground, and pitched upon a field of battle, admirably calculated to preserve a small army from being surrounded by a great one. It was a gentle declivity from the village of Agincourt, of sufficient extent for his small army, defended on each side by hedges, trees, and brush-wood. Having placed guards, and kindled fires on all sides, the king and his army betook themselves to rest; except such as were of a more serious turn of mind, who, considering that as the last night of their lives, spent it in devotion. The French, exulting in their numbers, confident of victory, and abounding in provisions, spent the night in noisy festivity, and in forming fanciful schemes about the disposal of their prisoners and their booty. It was in general resolved to put all the English to the sword, except the king and the chief nobility, who were to be taken prisoners for the sake of their ransoms. On the morning of the 25th of October, A. D. 1415, the English and French armies were ranged in order of battle, each in three lines, with bodies of cavalry on each wing. The constable D’Albret, who commanded the French army, fell into the snare that was laid for him, by drawing up his army in the narrow plain between the two woods. This deprived him, in a great measure, of the advantage he should have derived from the prodigious superiority of his numbers; obliged him to make his lines unnecessarily deep, about thirty men in file; to crowd his troops, particularly his cavalry, so close together, that they could hardly move or use their arms; and, in a word, was the chief cause of all the disasters that followed. The French, it is said, had a considerable number of cannon of different sizes in the field: but, we do not hear that they did any execution, probably for want of room. The first line of the French army, which, consisting of 8000 men at arms on foot, mixed with 4000 archers, and 500 men at arms mounted on each wing, was commanded by the constable D’Albret, the dukes of Orleans and Bourbon, and many other nobles; the dukes of Alençon, Brabant, and Bar, &c. conducted the second line; and the earls of Marle, Damarthe, and Fauconberg, were at the head of the third line. The king of England employed various arts to supply his defect of numbers. He placed 200 of his best archers in ambush, in a low meadow, on the flank of the first line of the French. His own first line consisted wholly of archers, four in file; each of whom, besides his bow and arrows, had a battle-axe, a sword, and a stake pointed with iron at both ends, which he fixed before him in the ground, the point inclining outwards, to protect him from the cavalry; which was a new invention, and had a happy effect. That he might not be encumbered, he dismissed all his prisoners, on their word of honour to surrender themselves at Calais, if he

obtained the victory; and lodged all his baggage in the village of Agincourt, in his rear, under a slender guard. The command of the first line was, at his earnest request, committed to Edward, duke of York, assisted by the lords Beaumont, Willoughby, and Fanhope; the second was conducted by the king, with his younger brother Humphrey, duke of Gloucester, the earls of Oxford, Marshal, and Suffolk; and the third was led by the duke of Exeter, the king's uncle. The lines being formed, the king, in shining armour, with a crown of gold adorned with precious stones on his helmet, mounted on a fine white horse, rode along them, and addressed each corps with a cheerful countenance and animating speeches. To inflame their resentment against their enemies, he told them, that the French had determined to cut off three fingers of the right hand of every prisoner; and, to rouse their love of honour, he declared, that every soldier who behaved well, should henceforth be deemed a gentleman, and entitled to bear coat-armour. When the two armies were drawn up in this manner, they stood a considerable time gazing at one another in solemn silence. But the king, dreading the French would discover the danger of their situation, and decline a battle, commanded the charge to be sounded about ten o'clock in the forenoon. At that instant, the first line of the English kneeled down, and kissed the ground; and then starting up, discharged a flight of arrows, which did great execution among the crowded ranks of the French. Immediately after, upon a signal being given, the archers in ambush arose, and discharged their arrows on the flank of the French line, and threw it into some disorder. The battle now became general, and raged with uncommon fury. The English archers having expended all their arrows, threw away their bows, and, rushing forward, made dreadful havoc with their swords and battle-axes. The first line of the enemy was, by these means, defeated; its leaders being either killed, or taken prisoners. The second line, commanded by the duke D'Alençon, (who had vowed either to kill, or take the king of England, or to perish in the attempt,) now advanced to the charge, and was encountered by the second line of the English, conducted by the king. This conflict was more close and furious than the former. The duke of Gloucester, wounded and unhorsed, was protected by his royal brother till he was carried off the field. The duke D'Alençon forced his way to the king, and assaulted him with great fury; but that prince brought him to the ground, where he was instantly dispatched. Discouraged by this disaster, the second line made no more resistance; and, the third fled without striking a blow; yielding a complete and glorious victory to the English, after a violent struggle of three hours. The king did not permit his men to pursue the fugitives to a great distance, but encouraged them to take as many prisoners as they could on or near the field; in which they were so successful, that, in a little time, his captives were more numerous than his soldiers. A great proportion of these prisoners were men of rank and fortune; for many of the French noblesse being on foot, and loaded with their heavy armour,

could not make their escape. Among these, were the dukes of Orleans, and Bourbon, the martial Boucicaut, the counts D'Eu, Vendome, Richemont, and Harcourt, and 7000 barons, knights, and gentlemen. The French left dead on the field of battle, the constable D'Albret, the dukes of Alençon, Brabant, and Bar, the archbishop of Sens, one marshal, thirteen earls, ninety-two barons, 1500 knights, and a vast number of gentlemen, besides several thousands of common soldiers. Even the French historians acknowledge, that the loss of the English was inconsiderable: those of our own contemporary writers, who make it the greatest, affirm, that it did not exceed 100, and that the duke of York, and the earl of Suffolk, were the only great men who fell on that side, in this memorable action.

AGIO, in commerce, an Italian word, signifying aid, and used chiefly in Holland, and at Venice, for the difference between the value of bank money, and current money. So that if a merchant stipulates to be paid either 100 livres bank money, or 105 cash, or current money, in such case the agio, is said to be five per cent. The bank agio varies in almost every place, and is greater or smaller, according as the currency is supposed to be more or less degraded below the standard of the state. At Amsterdam it used to be generally about five per cent.; and by a resolution adopted not long before the late period of confusion, the bank sold bank-money for currency, at five per cent. agio, and bought it again at four per cent. agio. In consequence of this resolution, the agio could never either rise above five, or sink below four per cent.; and the proportion between the market-price of bank, and that of current money, was kept at all times very near to the proportion between their intrinsic values. One part of the profit of the bank accrued from selling bank-money at five per cent. agio, and buying it in at four. At Venice, the agio was twenty per cent. fixed; at Genoa, from fifteen to sixteen per cent. The agio of the bank of Hamburg, which is said to be commonly about fourteen per cent. is the supposed difference between the good standard money of the state, and the clipt, worn, and diminished currency poured into it from all the neighbouring states. See EXCHANGE.

AGIO is also used for the profit arising from discounting a note, bill, or the like. It is also used, though with some impropriety, for the rate of exchange of a sum negotiated, whether to profit or loss. It is also sometimes called AGAI.

AGIO of assurance is used, by some, for what we more usually call policy of assurance.

AGIOSYMANDRUM, from *αγιος*, holy; and *σημαντω*, to signify, or intimate; a wooden instrument used by the Greeks and other churches under the dominion of the Turks, to call together assemblies of the people. The agiosy-mandrum was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition.

AGIRU, a name by which some writers designate the western part of the island of Corfu, in the gulf of Venice. It contains twenty vil-

lages, and 8000 inhabitants. The most remarkable place in it is a convent, called Palleo Castrizza.

AGIS, the son of Eurystheus, the second king of Lacedæmon, of the race of the Heraclidæ, was cotemporary with David, king of Israel, and Medon the first archon of Athens.

Agis, I. of the Proclidæ race, the son of Archidamus II. and elder brother of Agesilaus II. kings of Sparta, reigned twenty-seven years, and was cotemporary with Alcibiades; who was suspected of being too familiar with his queen, Timæa, on which account her son Leotychides was set aside from the succession, and Agesilaus raised to the throne.

Agis II. king of Sparta, son of Archidamus III. and grandson of the famous Agesilaus, reigned only nine years, being defeated by Antipater, one of Alexander's generals, in the second year of his universal empire.

Agis III. king of Sparta, the son of Eudamidas II. and the fifth in the direct line from Agesilaus II. He was a patriotic prince, and attempted the reformation of his kingdom, by restoring the laws of Lycurgus: but fell under the weight of an enterprize that could not but be disagreeable to all who had great possessions, and had been long accustomed to a voluptuous life. Agis however, in the flower of his age, set the example to his subjects, by practising the ancient discipline first in his own person: his clothes and his table being conformed to the primitive manners; although he is said to have been brought up voluptuously. When he sounded the minds of the people, he found the younger classes opposed his plan less than those who had enjoyed a relaxation for several years. But the greatest difficulty was expected to arise from the women; and Agis's mother did not at all approve of a reformation, by which she was to lose part of her beloved riches. However Agesilaus her brother, whom Agis had engaged in his interests, obtained a promise from her to second the enterprize, and she endeavoured to gain the Spartan ladies. An opposing party then applied to Leonidas III. the other king of Lacedæmon, to frustrate the designs of his colleague. Leonidas durst not oppose it openly, for fear of irritating the people, with whom the reform was generally popular, because they found their account in it: but he countermined it by sowing suspicions, as if Agis had aspired to tyranny, by pulling down the rich and raising the poor. Agis proposed his new laws to the senate, upon the discharge of debts, and a new division of the lands. Leonidas, being supported by the rich, opposed the measure so strongly, that there was a majority of one against it. But Lysander, one of the ephori, who had been a principal promoter of the reform, called him to account; whereupon Leonidas took refuge in a temple, whither his daughter, Chilonis, wife of Cleombrotus, followed him. He was summoned, but not appearing, was degraded of his dignity, which was conferred on his son-in-law Cleombrotus, and Leonidas was banished to Tegea. The new ephori had Lysander and Mandroclidas tried for innovation; who persuaded the two kings to unite and turn out the ephori; which was brought about; but not without diffi-

culty. Agesilaus, one of the ephori that succeeded those who were just turned out, would have caused Leonidas to be killed on the way to Tegea, if Agis had not sent him a strong guard; a favour which was repaid with the most shocking ingratitude. The reformation might then have been established, if Agesilaus had not found means to elude the good intentions of the two kings. Whilst this was transacting, the Achæans asked assistance; which was given them, and Agis had the command of the troops. He acquired a good deal of reputation in this campaign, but upon his return, found his affairs so embroiled by the ill conduct of Agesilaus, that it was impossible for him to maintain himself. Leonidas was recalled to Lacedæmon: Agis retired into one temple and Cleombrotus into another. The wife of the latter behaved herself in such a manner that she became the admiration of every body. Leonidas was contented with banishing his son-in-law; but he applied himself entirely to the ruin of Agis. One of the ephori, who was unwilling to return what Agesistrata had lent him, was the diabolical instrument of the ruin of this family. Agis never went out of his sanctuary but to bathe. One day, as he was returning from thence to the temple, he was seized by the ephorus, and carried to prison, brought to his trial, condemned to death, and delivered to the executioner. His mother and grandmother used all possible importunity, that, as he was king of Lacedæmon, he might at least be permitted to plead his cause before the people. But the ephori were apprehensive lest his words might make too great an impression, and they ordered him to be strangled on the spot. The ephorus, who was the ungrateful debtor to Agesistrata, permitted that princess to go into the prison, as well as Agis's grandmother; but he gave orders to strangle them both. Agesistrata died in a manner that was extremely to her honour. Perceiving the fate of her son and mother, she kissed the corpse of Agis, and exclaimed, 'My son, thy too great moderation and humanity have ruined both us and thee.' Being told that, as she approved his actions, she must also die, she immediately prepared for death, exclaiming, 'May all this be for the good of Sparta!' The wife of Agis who was a princess of great fortune and prudence, one of the finest ladies in Greece, and was passionately fond of her husband, was forced away from her apartment by king Leonidas, and obliged to marry his son, Cleomenes, then very young, and was afterwards the last king of Sparta. Thus failed the final attempt to restore the primitive virtue of the Spartans; an evidence, amongst many others, how difficult it is to bring about a reform amongst a people, who are once enervated by luxury. Not long after this, Sparta became a Roman province; and the son and grand-children of Leonidas perished miserably in Egypt.

Agis, in anatomy, the thigh.

AGIST', v. A law term, supposed to be **AGIST'MENT**. derived from the old law Fr. *guste*, a lying place; the lying or pasturing of cattle in another man's ground, on paying a certain sum of money to the proprietor.

If a man take a horse or other cattle to graze and depasture his grounds, which the law calls *agistment*, he takes them upon implied contract to return them safe to the owner.

Blackstone.

A forest hath laws of her own, to take cognizance of all trespasses; she hath also her peculiar officers, foresters, verderers, regarders, *agisters*, &c. whereas a chase or park hath only keepers and woodwards.

Howell's Letters.

AGIST, in law, signifies to take in and feed the cattle of strangers in the king's forest, and to gather up the money due for the same. The officers appointed for this purpose are called agisters, or giskasters, and are made by the king's letters patent: there are four of them in every forest, wherein the king hath any pannage. The time for this is fifteen days before Michaelmas, and as many after, when the running of the cattle cannot prejudice the game. *Manw. For. Laws*, 8vo. *Chart. de Foresta*, 9 Henry, III. cap. 9.

AGISTMENT, from the French *giste*, a bed, or lying place: though Kennet derives it from *ager*, the field, or feeding-place for cattle; imagining agistment to have originally been the same with *agrarium*, *agerium*, or *agroticum*, the profit of feeding cattle on such a piece of ground. The term is applied to taking other men's cattle into any ground at a certain rate per week. It is so called, because the cattle are suffered agiser, that is, to be levant and couchant there; and many great farms are employed to this purpose, (2 Inst. 643.) Our graziers call cattle, which they thus take in to keep, *gisements*; and to gise, or juice, the ground, is when the occupier thereof feeds it not with his own flock, but takes in the cattle of others, to agist or pasture it. Agistment is likewise the profit of such feeding in a ground or field: and extends to the depasturing of barren cattle of the owner, for which tythes shall be paid to the parson.

AGISTMENT is also used metaphorically for a charge or burthen on any thing. In this sense we meet with *terra ad custodiam maris agistata*, i.e. charged with a tribute to keep out the sea.—So *terra agistatae*, are lands whose owners are bound to keep up the sea-banks. Agistment denotes likewise the duty or levy for repairing the banks and walls in Romney marsh, which was particularly called agistamentum: and the act of laying such a proportion of this duty on the several estates, was called agistatio. *Spelman.*

AGISYMBIA, in ancient geography, now Zanguebar, a district of Libia Interior, situated to the S.E. of the *Æthiopic Anthropophagi*; the parallel passing through which, at 16° S. of the equator, was the utmost extent of the geographical knowledge of the ancients to the south.

AGITATE, v. { *Agito*: *ago*, to act often; *Agitation*, } to move quickly, frequently, *Agitator*, and successively; to affect with a certain degree of violence; to disturb; to make a subject the matter of debate, and active examination; to discuss a point.

Putrefaction asketh rest; for the subtle motion, which putrefaction requireth, is disturbed by any agitation.

Bacon.

A great perturbation in nature! to receive at once the benefit of sleep, and do the effects of watching.

In this slumbray *agitation*, besides her walking, and other actual performances, what have you heard her say?

Shakespeare. Macbeth.

Though this controversy be revived, and hotly *agitated* among the moderns; yet I doubt, whether it be not, in a great part, a nominal dispute.

Boyle on Colours.

The project now in *agitation*, for repealing of the test act, and yet leaving the name of an establishment to the present national church, is inconsistent.

Swift's Miscellanies.

Where dwells this sov'reign arbitrary soul,
Which does the human animal controul,
Inform each part, and *agitate* the whole?

Blackmore.

A kind of school question is started in this fable, upon reason and instinct; this deliberative proceeding of the crow was rather a logical *agitation* of the matter.

L'Estrange's Fables.

AGITATION, in medicine, exercise, and more particularly applied to that of swinging. Maurice, prince of Orange, found this method a relief against the severe pains of the gout and stone. Bartholine mentions fits of the tooth-ach, deafness, &c. removed by vehement agitations of the body. Dr. Sydenham attributes the great benefits of riding to agitation, which is very efficacious in removing obstructions in the viscera.

AGITATION, in physics, is often used for an intestine commotion of the parts of a natural body. Fermentation and effervescence are attended with a brisk agitation of the particles; and it is one of the chief causes or instruments of mixtion. By the agitation of the parts of the blood and chyle, in their continual circulation, sanguification is in a good measure effected. Butter is made out of milk by the same means; in which operation, a separation is made of the oleous parts from the serous, and a conjunction of the oleous together. Digestion itself is only supposed to be an insensible kind of agitation. Agitation has been imputed as one of the symptoms of inspiration.

AGITATO, in music, agitated; with emotion.

AGITATOR, in antiquity, a term sometimes used for a charioteer, especially those who drove in the circus at the curule games.

AGITATORS, in English history, were officers appointed by the army in 1647, to take care of its interests. Each troop or company furnished two private men or inferior officers under this title, who represented the army whilst a council of the principal officers was appointed after the model of the house of peers; and thus a military parliament was formed in opposition to the parliament at Westminster. In their first institution Cromwell leagued himself with the agitators, whom he found to have greater interest than the council of war; and who undertook to make proposals relating to the reformation of religion and the state. The agitators as well as the council of officers were altogether moved by his direction, and conveyed his wish to the whole army. By means of these instruments he overawed the parliament, and reduced it to submission; and having gained possession of the king's person, to whom for some time he and his officers paid attention and respect, he contrived to terrify him by the menaces of the agitators,

and thus induced him to make his escape from Hampton-court, and to take refuge at Carisbrooke castle, in the Isle of Wight. Cromwell being entirely master of the parliament, and free from all anxiety with regard to the custody of the king's person, applied himself seriously to quell those disorders in the army, which he himself had artfully raised and successfully employed, against both king and parliament. With this view, besides other measures which he adopted, he issued orders for discontinuing the meetings of the agitators; and pretended to pay entire obedience to the parliament, whom, being now fully reduced to subjection, he proposed to make, for the future, the instruments of his authority. But the levellers, (for so that party was called, because they wished to abolish royalty and nobility, to level all ranks of men, to introduce an universal equality both of property and of power, and who maintained that the meanest sentinel, if enlightened by the Spirit, was entitled to equal regard with the greatest commander,) having tasted the sweets of dominion, would not easily be deprived of it. They secretly continued their meetings; they asserted, that their officers, as much as any part of the church or state, needed reformation; and several regiments joined in seditious remonstrances and petitions. Separate rendezvous were concerted; and every thing tended to anarchy and confusion. But this distemper was soon cured by the rough but dexterous hand of Cromwell. He chose the opportunity of a review, that he might display the greater boldness, and spread the terror the more widely. He seized the ring-leaders before their companions; held in the field a council of war; shot one mutineer instantly, and struck such dread into the rest, that they presently threw down the symbols of sedition, which they had displayed, and thenceforth returned to their discipline and obedience. *Hume's Hist.* vol. vii. p. 109. 8vo.

AGITATORS, MILIARIAN, were those who drove in the forum at Constantinople, a place adorned with statues, &c. after the manner of the circus at Rome, having a milium, or miliarium, in the middle.

AGLAIA, in mythology, the youngest of the three Graces.

AGLAIA, in botany, *αγλαια*, splendour and beauty, alluding to the shining verdure of the leaves, and elegance of the whole plant.—A genus of plants of the class and order, pentandria digynia, (rather perhaps pentandria monogynia.) Natural order trihilata, Linn. Meliae, Juss. General character: CAL. Perianth. inferior, of one leaf, with five notches, minute, permanent: cor. Petals five, ovate, concave, fleshy, converging almost closely into the form of a globe. Nectary tubular, with five plait, rather shorter than the petals: STAM. filaments none; anthers five, ovate, included in the folds of the nectary: PIST. Germen ovate, superior; style none; stigmas two, oblong, erect: PERIC. berry ovate, smooth, watery, of one cell. Seed solitary, ovate, slightly compressed, with four furrows. Essential character: CALYX inferior, five-toothed. Petals five, converging in the form of a globe.

Berry with one seed. It is a native of China and Cochin China.

AGLAURA, or AGLAUROS, in mythology, the daughter of Cecrops, founder and king of Athens, who had two sisters, Hersa, and Pandrosa. Minerva having concealed Erichthonius after his birth, in a basket, committed him to the custody of these three princesses, forbidding them to open it. Hersa and Pandrosa observed the order, but Aglaura unable to restrain her curiosity, opened the basket and found the infant with feet like serpents. Minerva punished her by means of Envy, who made her jealous of Hersa, the favourite of Mercury. When she attempted to prevent the access of this deity to his mistress, he struck her with his caduceus, and converted her into a rock.—Nevertheless she was honoured after her death in a temple at Salamis with a yearly sacrifice of a human victim; which Dephebus, king of Cyprus, in the time of Seleucus, changed into an ox.

AGLOPHOTIS, in botany, a name used for Piony.

AGLUAS, in mythology, a poor Arcadian, whom Apollo pronounced more happy than Gyges, because he had never travelled beyond his own ground.

AGLEED, among florists, the same as AGLET, The pendants at the ends of the chives of flowers, as in tulips.

AGLIA, among ancient physicians, a whitish cicatrice, or spot in the eye, formed by a congestion of humours.

AGLIBOLUS, in mythology, a title under which the Palmyrenes worshipped the sun.

AGLIONBY, (John,) an English divine, chaplain to king James I. a man of universal learning, who had a considerable share in translating the New Testament, in 1604.

AGLISH, a small town of Ireland, in the county of Waterford, where are the remains of an ancient fortification: the ruins of an abbey stand in the neighbourhood. Distant 101 miles from Dublin.

AGLITHES is used by Hippocrates for a clove of garlic.

AGMET, or AGMAT, a river, town, and district of Morocco, on the western declivity of the Atlas. The town is said to have been once considerable, and to have contained 6000 houses, but is now greatly declined; 18 miles S. E. of Morocco.

AGME, in surgery, a fracture.

AGMEN, in antiquity, a Roman army in march: in which sense, it stands contradistinguished from acies, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other. The Roman armies, in their marches, were divided into primum agmen, answering to our van-guard; medium agmen, our main battle; and postremum agmen, the rear-guard. The order of their march was thus: At the first signal with trumpets, &c. the tents were taken down, and the baggage packed up; at the second, the baggage was to be loaden on the horses and carriages; and at the third, they were to begin their march. First came the extraordinarii; then the auxiliaries of the first

wing, with their baggage; these were followed by the legions. The cavalry marched either on each side or behind.

AGMEN PILATUM, an army disposed in a narrow oblong form, or column; being withal close and compact; thus called, as resembling the figure of a pila or pier. This form was chiefly used in marching without their baggage, through bad ways, and close countries.

AGMEN QUADRATUM, an army arranged in a square form, the method ordinarily observed in the Roman armies. This was also called agmen grave, by the Greeks *τερπαγωνος τάξις*. The three columns, in which the army usually marched, were considerably more in length, or breadth, than in depth; but as the baggage marched in the same order, the whole approached to the figure of a square.

AGMONDESHAM. See AMERSHAM.

AGMONIA, or **ACMONIA**, in ancient geography, a town of Phrygia Minor, (Cic. pro. Flacco, c. xv.) Also a city of Dacia upon the Danube, according to Ptolemy. The former town appears on many medals both of gold and silver.

AGNACAT, in botany, a species of pear tree, that grows in America, beyond the Terra de Labrador; toward the isthmus of Darien. It is of the figure and size of a pear tree, always covered with leaves, and of an extraordinary lustre. It bears a fruit like a pear, but green even when it is ripe; the pulp is of the same colour, and tastes sweet and somewhat like butter.

AGNADELLO, or **AQUADELLO**, a town of Italy, in the duchy of Milan, district of Ghiera d'Adda, between Lodi and Bergamo, where Louis XII. of France obtained a victory over the Venetians in 1509, as did the duke of Vendome over Prince Eugene in 1706; it is twelve miles north of Lodi.

AGNAN, a town of France, in the department of the Cher, in the form of an amphitheatre, at the foot of which runs the Cher, sixty miles from Bourges. It is in the arrondissement of St. Amand.

AGNANO, a circular lake of Naples, in the Terra di Lavora, surrounded with mountains, and about a mile in circuit.

AGNANTHUS, from *αγνός*, chaste, and *ἄνθος*, a flower, in botany; a genus of plants, called by Linnaeus, cornutia.

AGNATE, adj. { Ad: *nascor*, *natus*, (originally *gnatus*;) born to; **AGNATICK**, } *agnatio* n. a kin by the father's side.

By an attentive examination of the peculiarities in enunciation which each people have, in the one way or other, by a fair reciprocal analysis of the *agnate* words they reciprocally use, I think a much greater *agnation* may be found amongst all the languages in the northern hemisphere of our globe.

Pownall on the Study of Antiquities, p. 168.

This I take to be the true reason of the constant preference of the *agnatick* succession, or issue derived from the male ancestors through all the stages of collateral inheritance.

Blackstone's Law of Descent.

AGNATE, in law, any male relation by the father's side.

AGNEL, an ancient French gold coin, first

struck in the reign of St. Louis, worth twelve sols, six deniers. The angel is also called sometimes mouton d'or, and agnel d'or. The denomination is supposed to have arisen from the figure of a lamb, struck on one side.

AGNELET, an ancient French silver coin, first struck under Philip the Fair, worth about twenty sols.

AGNEILLUS, an archbishop of Ravenna, in the ninth century, who wrote the history of his predecessors in that see. This biography contains many curious facts, but is erroneous in regard to dates. It was published by Bacchini in 1708, and reprinted by Muratori in his collection of Italian historians. *Moreri*.

AGNEREINS, a small place in France, formerly the seat of a castellan, in the government of Dombes, now in the department of the Ain, arrondissement of Trevoux, from which it is distant 3 leagues to the N. E.

AGNES, St. one of the most considerable, and perhaps, the most fertile, of the Scilly Islands, lying in N. lat. $49^{\circ} 53'$. and W. long. $6^{\circ} 20'$. It is about three miles S. E. of St. Mary's, and nine leagues W. S. W. from the Land's End. The whole island contains about 300 acres of land, well cultivated both in corn and grass, but badly watered; and from 250 to 300 regular inhabitants.

The light-house, after which it is sometimes called Light-house Island, is its most important feature, and is a noble column of stone, fifty-one feet from the foundation to the lantern, standing on an eminence. The gallery is four feet high; and the lights rise eleven feet and a half above it. Twenty-one Argand lamps are placed in the respective centres of as many parabolic reflectors of copper, disposed in three clusters of seven each, on a frame standing perpendicularly to the horizon; and so constructed as to turn round on a common shaft or centre every two minutes; by which motion all parts of the horizon receive in succession, the benefit of these brilliant lights. This comparatively recent disposition of them was suggested by Mr. Adam Walker, a well known lecturer on natural philosophy. Prior to this the light was that of a stationary fire, emitted through sixteen large sashed windows. Its white appearance by day, and its well-regulated fire at night, make this light-house an invaluable sea mark. The care of it is vested in the Trinity House, who appear to have erected the original light in 1680. The present was completed in 1790.

Leland mentions a chapel here, dedicated to St. Warna, an Irish saint, who is said to have come here in a wicker-boat covered with hides. There is a well called after her name, which was formerly much resorted to. He also mentions the destruction of all the inhabitants of the island in his time, amounting to five thousand individuals, who were drowned in returning from a feast at St. Mary's. At present there is a small church here, where divine service is performed at irregular intervals, by a clergyman appointed by the Society for promoting Christian Knowledge. Other benevolent societies among the Dissenters also occasionally

send a minister here. On the east is the inlet of Gue, which is only divided from St. Agnes by the flowing of the tide.

AGNES, St. a parish and market town in the hundred of Pydar, Cornwall, five miles N. W. from Truro, 167 from London. It stands on the Bristol Channel, and is accessible only to fishing-boats. In the neighbourhood are some of the richest mines in Cornwall. It was formerly famous for St. Agnes's well, said to be of great sanative and restorative power. Market, Thursday.

AGNESI, (Maria Gaetana,) a lady of extraordinary genius, and most extensive acquirements, was born at Milan on the 16th of May, 1718. Her father, Pietro Agnesi of Milan, was royal feudatory of Monteviglio and its dependencies; and being a man of some rank and consequence, he was disposed, from paternal affection, to provide suitably for the education of his infant daughter, who gave the most striking indications of talent. From her tenderest years she discovered a wonderful aptness, and a vehement desire, for acquiring languages. Under the direction of proper masters, she studied at the same time the Latin and Greek, the French and German; and while the rapidity of her progress excited astonishment, such were the prodigious powers of her memory, that she could easily pursue those diversified objects without feeling the smallest degree of confusion. When yet scarcely nine years old, this surprising child delivered a Latin oration, to prove that the cultivation of letters is not inconsistent with the female character, before an assembly of learned persons, invited to her father's house. At the age of eleven, the young Agnesi could not only read Greek, and translate it instantly into Latin, but could even speak that refined language, and with the same apparent ease and fluency as if it had been her native tongue. Nor did these acquisitions absorb her whole attention; a nobler field was opened to the exercise of her mental faculties. She now began to read Euclid's Elements, and proceeded in algebra as far as quadratic equations. Thus prepared, she advanced with ardour to the study of natural philosophy; but not content with the sober truths there unfolded, she soared to the heights of metaphysics, and engaged in the most abstruse and intricate disquisitions of that contentious science. After this young lady had attained the age of fourteen, her father, anxious to forward her ardour for improvement, and willing to gratify her ambition for literary distinction, invited occasionally to his house a number of persons, the most respectable in Milan by their rank and learning. In the midst of this grave auditory, Donna Agnesi made her appearance, and without resigning the native delicacy of her sex, she maintained a succession of new theses on various difficult parts of philosophy, and handled the arguments with such dexterity and commanding eloquence, as singly to vanquish every opponent that entered the field of controversy. These disquisitions were all of them carried on in the Latin language, which she spoke with the utmost ease, purity, and copious elegance. Every thing conspired to heighten the impression produced on

the admiring spectators. In the full bloom of youth, her person agreeable, her manner graceful, an air of gentleness and modesty gave irresistible charms to her whole demeanour. Such, for several years, was the great theatre of her glory. But having nearly completed the circle of philosophy, and exhausted the chief topics of discussion, she resolved at length to close that career with a solemnity suitable to the occasion. In the year 1738, Agnesi made her last brilliant display, before an august assembly, composed of the most learned and illustrious of the Milanese nobility, the senators, and foreign ministers, with the most distinguished professors in all the branches of science and literature. The substance of these philosophical conferences was afterwards published in a quarto volume, entitled *Propositiones Philosophicae, quas, crebris Disputationibus domi habitis, coram clarissimis viis, explicabat extempore, et ab objectis vindicabat Maria Cajetana de Agnesi Mediolanensis.* Agnesi now bent her whole attention to the culture of mathematics; and without guide or assistance, she composed a very useful commentary on L'Hopital's Conic Sections, which is said to exist still in manuscript. In the sublimer departments of that science, her studies were directed by the matured experience of Rampinelli, professor of mathematics in the university of Pisa; but she soon gave proofs of her amazing proficiency, in digesting a complete body of the modern calculus. This excellent work, entitled, *Analytical Institutions, for the use of the Italian Youth,* appeared in 1748, in two volumes quarto, and was highly esteemed by the best judges, and justly regarded as exhibiting the fullest and clearest view of the state of the science at that period. She was, in consequence, elected by acclamation, a member of the Institute of Sciences of Bologna; and the Pope farther conferred on her the title of Professor of Mathematics in the university of that city. But Agnesi was already sated with literary fame. That sun, which in its ascent had shone forth with such dazzling radiance, was, through the rest of its course, shrouded in clouds and darkness. The fever of genius had preyed on her mind, and the high fit of excitement was quickly succeeded by a hopeless depression of spirits. She repelled the seductions of human learning, and abandoned for ever her favourite mathematical pursuits. Renouncing the vanities of this world, she withdrew from society, embraced a life of rigid seclusion, and sunk by degrees into the languor of religious melancholy. She studied nothing but Hebrew, and the rhapsodies of the Greek fathers of the church. For upwards of twenty years she denied all access to strangers. The famous La Lande complains, in his *Travels through Italy,* that he was not allowed the honour of visiting this prodigy; and Father Boscovich himself, whose religious principles must have been unexceptionable, experienced, notwithstanding his repeated importunities, a similar refusal. Indulging that gloomy temper, she retired into a convent, and assumed the habit of a Blue Nun. She sought to forget the world, and wash herself forgotten. She died about the year 1770, but we have not been able to discover the precise period of her

demise. The *Instituzioni Analytiche* of Agnesi were translated into English many years ago, by Mr. Colson, Lucasian professor of mathematics at Cambridge. The translation was discovered among the papers of that ingenious mathematician, by the learned Baron Maseres, who put the manuscript into the hands of Mr. Hellins, as editor, and generously defrayed the expenses attending the publication.

AGNIFER, from agnus, a lamb, and ferre, to bring, an appellation applied, by some ecclesiastical writers, to John the Baptist, and used, in the same sense with precursor, or fore-runner.

AGNIL. See INDICUM.

AGNINA, in botany, lamb's tongue or plantain.

AGNINA LACTUTA. See LACTUTA.

AGNINA MEMBRANA, the same as the Amnios.

AGNO, a river of Naples, which, taking its rise in the mountainous parts of Terra di Lavora, washes the town of Acerra; and, passing between Capua and Aversa, falls into the Mediterranean, about seven miles north of Puzzuoli.

AGNODICE, in biography, an Athenian lady, who attended the lectures of Herophilus, in the disguise of a man, and acquired so much knowledge of the treatment of diseases, as to be in great request among her own sex; particularly in the practice of midwifery. At length the physicians, jealous of her fame, it is said, and ignorant of her sex, accused her of introducing herself to the women under the pretence of assisting them in their labours and complaints, but in reality from views of incontinence. Being cited to the arcopagus, she made herself known: and the judges were so well satisfied with her conduct, and perhaps with the women for patronizing her, that they repealed a law then existing prohibiting women to practice any branch of medicine, and decreed that women of the rank of citizens might be allowed that liberty. A physician, M. Hecque, Eloy says, published a volume in the year 1708, entitled, *De l'Indépendance aux Hommes d'accoucher des Femmes*, written with much ingenuity; in which he attributes the looseness in the morals of the present age, to the custom of admitting men to the general practice of midwifery, for in particular cases he acknowledges their assistance to be necessary. The argument against admitting men into the general practice is, that in ordinary cases, women are perfectly competent; but this is fully answered by the fact, that cases do, and must for ever occur, in which kind of assistance is required that women are incapable of giving, if men were not to attend in ordinary cases, they would not acquire the expertness that is necessary to enable them to deliver in difficult ones.

AGNOETÆ, from *ayyosw*, to be ignorant of; in church history, a set of ancient heretics, who maintained that Christ, considered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment. Eulogius, patriarch of Alexandria, ascribes this heresy to certain solitaries in the neighbourhood of Jerusalem, who built their opinion upon the text, Mark xiii. 32. ‘Of that day and hour knoweth no man, no not the angels that are in

heaven, neither the Son, but the Father only.’—The same passage was made use of by the Arians; and hence the orthodox divines of those days were induced to give various explications of it. Some alleging that our Saviour here had no regard to his divine nature, but only spoke of his human: others, that the knowledge of the day of judgment does not concern our Saviour considered in his quality of Messiah, but as God only.

AGNOIA, in medicine, a word used by physicians, when a person in a fever does not know his acquaintance. When a rigour accompanies this symptom, Hippocrates says, it is dangerous.

AGNOITES. See AGNOETÆ.

AG'NOMEN, { Ad: *nomen*, Lat. a name

AGNOM'INATE, v. } in addition. A name given

AGNOMINA'TION. } by the Romans in consequence of adoption, some great action, or a particular adventure; as Lucius Cornelius, Scipio Africanus. It came last in the order of names. Agnomination is applied to the repetition of words of similar sound; or to allusions founded on some other fanciful resemblance.

The British continueth yet in Wales, and some villages of Cornwall, intermingled with provincial Latin; being very significative, copious, and pleasantly running upon *agnominations*, although harsh in aspirations.

Camden.

White is there usurpt for her brow; her forehead; and then sleek, as the parallel to smooth, that went before. A kind of paranomasee, or *agnomination*: do you conceive, sir? Ben Jonson's *Poetaster*, iii. 1.

Our bards hold *agnominations*, and enforcing of consonant words or syllables one upon the other, to be the greatest elegance: as for examples, in Welsh, Tewgeis, to dyrris, ty'r derryn, gwilt, &c. So have I seen divers old rhymes in Italian running so: Donne, Odenco, che Felo affronto affronta: In selva salvo a me: Piu caro cuore, &c.

Howell's *Letters*, ii. 40.

AGNOMEN, in antiquity, an epithet given to a person, either by way of praise or dispraise, or from some remarkable event, which became, as it were, an additional name, but peculiar to the person, and not descendible to his issue.—Thus, one of the Scipios obtained the agnomen of Africanus, and the other of Asiaticus, from the brave achievements which the one performed in Africa, and the other in Asia. The agnomen was generally the third in order, and sometimes the fourth of the Roman names; but it was always ranked last, even when there were more of them. Thus, in Marcus Tullius Cicero, Marcus is the praenomen, Tullius the nomen, and Cicero the agnomen. But in the case of the Scipios, who had previously three names each, viz. Publius Cornelius Scipio, the agnomen was the fourth, and the third, Scipio, was styled the cognomen, and was hereditary, like the nomen or family name. The emperor Antoninus, not to multiply instances, had five names, viz. Marcus Ælius Aurelius Antoninus Boionius; of which, he received the second by adoption, from his predecessor Adrian; the third and fourth, by descent; and the fifth, was the agnomen, obtained by a victory over the Boionii.

AGNON, the Clanus of the ancients, a river of Campania, in Italy.

AGNOS, in ichthyology, a name given by

Athenaeus, and other Greek writers, to the fish called calyonymus, or uranoscopus. It is a species of the trachynus, and is distinguished by Aredi, from the rest of that genus, by the name of the trachinus, with a great number of beards growing from the lower jaw.

AGNONA, a market-town of Italy, in Piedmont, with 1100 inhabitants.

AGNOUE, a small town of Naples, in the province of Abruzzo Citra, nine miles S. S. E. of Civita Borella.

AGNUS, a lamb, in zoology, the young of the ovis, or sheep. See OVIS.

AGNUS CASTUS, in botany, the trivial name of a species of the vitex. See VITEX. The Greeks call it *ayrog*, chaste; to which, has since been added the reduplicative castus. The Athenian ladies, who made profession of chastity, lay upon leaves of agnus castus during the feasts of Ceres.

AGNUS DEI, in the church of Rome, a cake of wax, stamped with the figure of a lamb, supporting the banner of the cross. These being consecrated by the pope with great solemnity, and distributed among the people, are supposed to have great virtues; such as, to preserve those who carry them worthily, and with faith, from all manner of accidents; to expel evil spirits, &c. The name literally signifies Lamb of God; this being supposed an image, or representation of the Lamb of God, who took away the sins of the world. They cover it with a piece of stuff cut in form of a heart, and carry it very devoutly in their processions.—The Romish priests and religious, derive considerable pecuniary advantages from selling these agnus dei's to some, and presenting them to others. The pope provides a regular supply, by consecrating them once in seven years; they are distributed by the master of the wardrobe, and received by the cardinals and other prelates, with great reverence, in their caps and mitres.—This ceremony they pretend to derive from an ancient custom of the church, wherein part of the paschal taper, consecrated on Holy Thursday, was distributed among the people, to perfume their houses, fields, &c.; in order to drive away devils, and to preserve them from storms and tempests. The agnus dei is forbidden to be brought into England, under pain of incurring a premunire; 13th Elizabeth, cap. 2.—Agnus dei is also a popular name for that part of the mass wherein the priest, striking his breast three times, rehearses, with a loud voice, a prayer beginning with the words agnus dei.—The masses of Giovanni Pietro Aloisio da Palestrina, are still the admiration of the world, although composed in the sixteenth century. The agnus dei is said to have been first brought into the missal, by pope Sergius I.

AGNUS SCYTHICUS, in natural history, a kind of zoophite, or plant-animal, said to grow in Tartary, resembling the figure and structure of a lamb. See ZOOPHYTON. The Scythian lamb is also called agnus vegetabilis, agnus tartaricus, and by the people of the country, borometz, borumetz, or boranetz.—The usual account given of this extraordinary production is, that the Tatars sow in their ground a seed resembling that of a melon, but less oblong; from whence arises a

plant called by them borometz, i. e. lamb, growing almost to the height of three feet, and having feet, hoofs, ears, and the whole head, excepting horns, resembling that animal. In lieu of horns, it has a peculiar sort of hair, not unlike horns; it is covered with a fine thin skin, which being pulled off, is worn by the natives as a cover for the head. The pulp within resembles that of the gammarus; and when wounded, a liquor oozes out like blood. It lives as long as there is grass and herbage around it; but when these are consumed, it wastes and dies. They add that wolves are fond of it, while no other beasts will feed on it. Deusingius seems to have been the first who suspected this account to be fabulous; and Kempfer, when in the country, made diligent enquiry concerning it, but could hear of nothing like it. As to the plants shewn under this denomination, in some repositories of rarities, they appear to be originally the roots, or stalks of certain vegetables, probably of the capillary kind, covered with a woolly moss, which, naturally bearing resemblance to the figure of a lamb, have been helped out and brought near to it by art, and the addition of new parts. Sir Hans Sloane, and Breynius, give us the figures and descriptions of such borometzes in their collections. It is from these plants that the Indian moss is gathered, famous for its use in staunching blood. Brynius and Libavius have written expressly on the agnus scythicus.

AGO, *a.*

AGON', } Participles more or less corrupted
AGONE', } of the verb, to go. Those now used
YCON', } are employed adverbially.
AGOING.

For in swiche cas wimmen have swiche sorwe,
Whan that hir housbons ben fro hem ago.

Chaucer. *The Knights Tale*, v. i.

Hast thou not heard, how I haue ordeyned, soch a thye a great whyle a goo, and haue prepared it from the beginnyngne. Bible. 1539. 4 Kings xix.

For news the world is here turn'd upside down,
and it hath been long a going so. Howell's Letters.

This, both by others and myself, I know:

For I have serv'd their sovereign, long ago;

Oft have been caught, within the winding train.

Dryden's Fables.

I shall set down an account of a discourse, I chanced to have with one of them some time ago.

Addison's Freeholder.

AGOG', *v.* supposed to be derived from the Ang. Sax. *gangan*, to gang, or go, and signifies alart, eager, elate.

And worst of all, the women that doe go with them,
set them *agog* that doe tarrie. Golden Book, y. 5.

Neither am I come to please thee, or set thee *agog* with a vain salutacion, but I am come vnto thee as a messenger of a mater bothe passing ioyful, & also verai great. Udall. Luke, c. i. fol. 9. c. 2.

As for the sense and reason of it, that has little or nothing to do here: only let it sound full and round, and chime right to the humour, which is at present *agog*; just as a big, long, rattling name is said to command even adoration from a Spaniard: and no doubt, with this powerful senseless engine, the rabble-driver shall be able to carry all before him.

South's Sermons.

The gawdy gossip, when she's set *agog*,
In jewels drest, and at each ear a bob,

Goer flaunting out ; and, in her trim of pride,
Thinks, all she says or does is justify'd.

Dryd. Juv. Sat. vi.

This maggot has no sooner set him *agog*, but he
gets him a ship ; freights her, builds castles in the
air, and concits both the Indies in his coffers.

L'Estrange.

So three doors off the chaise was stay'd,
Where they did all get in ;

Six precious souls, and all *agog*

To dash thro' thick and thin.

Couper's John Gilpin.

AGOGA, a ditch or drain for carrying off the
water from a mine.

AGOGE, ductus, guide ; in music, one of the
sub-divisions of the ancient Melopæia which pre-
scribed rules respecting the progress of a melody,
by disjointed, or conjoint degrees, alternately,
whether ascending or descending ; it also served
to denote the degree of movement, as well as the
character of the piece executed.

AGOGE RYTHMICA, the Greeks denoted by this
term, what we now understand by tempo, time
or measure.

AGOMPIASIS, or GOMPHIASIS, in medicine,
a distemper in the teeth, consisting in their
being loose in the sockets.

AGON, *n.* Gr. *aywv*, conflict, en-
AGONISTICAL, counter. A combat among
AGONISTICK, the ancients, particularly ap-
AGONIZE, plied to wrestlers and prize-
AG'ONY, fighters. Agonize and agony
apply to mental suffering accompanied with ex-
cessive pain.

And he was maad in *agonye*, and preide the lenger,
and his swoot was maad as dropis of blood rennyng
doun into the erthe. *Wiclit. Luke xxii.*

Betwixt them both, they have me done to dy,
Thro' wounds, and strokes, and stubborn handeling ;
That death were better, than such *agony*,
As grief and fury unto me did bring.

Faerie Queene.

Thec I have misscd, and thought it long deprived
Thy presence ; *agony* of love ? till now
Not feit, nor shall be twice.

Milton. Paradise Lost.

Never was there more pity in saving any, than in
ending me ; because therein my *agony* shall end.

Sidney.

Thou, who for me didst feel such pain,
Whose precious blood the cross did stain,
Let not those *agonies* be vain. *Roscommon.*

To propose our desires, which cannot take such
effect as we specify, shall (notwithstanding) otherwise
procure us his heavenly grace ; even as this very
prayer of Christ obtained angels to be sent him, as
comforters in his *agony*. *Hooker.*

Dost thou behold my poor distracted heart,
Thus rent with *agonizing* love and rage ;
And ask me what it means ? Art thou not false ?

Rowe's Jane Shore.

Or touch, if tremblingly alive all o'er,
To smart and *agonize* at every pore ?

Pope's Essay on Man.

The lifted axe, the *agonizing* wheel,
Luke's iron crown, and Damion's bed of steel
To men remote from power but rarely known,
Leave reason, faith, and conscience, all our own.

Goldsmith.

I see before me the gladiator lie ;
He leans upon his hand—his manly brow
Consents to death, but conquers *agony*.

Lord Byron's Childe Harold.

AGON, among the ancients, implied any dis-
pute or contest either in bodily exercises, or the
accomplishments of the mind ; and therefore
poets, musicians, painters, &c. had their agones,
as well as the athleteæ. Games of this kind were
celebrated at most of the heathen festivals, with
great solemnity, either annually, or at certain pe-
riods of years. Among the latter were celebrated
at Athens, the agon gymnicus, agon Nemæus, in-
stituted by the Argives in the 43d Olympiad, and
the agon Olympius, instituted by Hercules 430
years before the 1st Olympiad. The Romans also,
in imitation of the Greeks, instituted contests of
this kind. The emperor Aurelian established one
under the name of agon solis, the contest of the
sun ; Dioclesian another, which he called agon
Capitolinus, which was celebrated every fourth
year after the manner of the Olympic games.—
Hence the years, instead of lustra, are sometimes
numbered by agones.

AGON also signified one of the ministers em-
ployed in the heathen sacrifices, and whose
business it was to strike the victim. The name
is supposed to have been derived from hence,
that, when standing ready to give the stroke, he
asked, Agon ? or Agone ? Shall I strike ?

AGON, among physicians, the struggle of death.
See AGONY OF DEATH.

AGONALIS, in heathen mythology, an epi-
thet given to the Sallii, or priests of Mars.

AGONALIA, in Roman antiquity, festivals
celebrated in honour of Janus, or Agonius, three
times a year.

AGONALIS CIRCUS, now La Piazza Navona,
a long, large, and beautiful street in the heart
of Rome, adorned with fountains, and the
obelisk of Caracalla, still retaining the form of
that circus. The reason of the name Agonalis
is doubtful. Ovid seems to derive it from the
agones, or solemn games, there celebrated ;
supposed to have been the Ludi Apollinares, or
Actiaci, instituted by Augustus : whence the cir-
cus was called Apollinaris : also Alexandrinus
from the emperor Alexander Severus, who either
enclosed or repaired the circus.

AGONATA, in entomology, the fourth class of
insects in the system of Fabricius : comprehending
the cancer, the pagurus, the hippa, the
scillarus, the astacus, the squilla, and the gam-
marus. Linnaeus has included this class under
the genus Cancer.

AGONICHE, a river of Nova Scotia, British
North America, which enters the bay of Fundy,
in a south-east course, between the river Me-
chicor and St. John.

AGONISMA, in antiquity, the prize given
the victor in a game or combat.

AGONISTARCHA, from *aywv*, combat, and
apxoc, chief, in antiquity, seems to have been
much the same with agonotheta : though some
suggest a difference, making it the office of the
former to preside at and direct the private ex-
ercises of the athlete, which they went through by
way of practice, before they made their appear-
ance on the public theatres or amphitheatres.

AGONISTIC, ACONISTICA, the science of
what relates to the combats or agones of the
ancients. In which sense, agonistic amounts to
much the same with athletic, and makes a
branch of gymnastics

AGONISTICI, in church history, a name given by Donatus to such of his disciples as he sent to fairs, markets, and other public places, to propagate his doctrine; for which reason they were also called Circuitores, Circelliones, Catropitae, Coropitae, and at Rome Montenses. They were called Agonistici, from the Gr. *αγονία*, combat, in regard they were sent as it were to fight and subdue the people to their opinions.

AGONIUM, in Roman antiquity, was used for the day on which the rex sacrorum sacrificed a victim, as well as for the place where the games were celebrated, otherwise called agon.

AGONIUS, a god whom the Romans invoked before they undertook any enterprize of importance.

AGONIZANTS, Roman friars, who assist those who are in agony.

AGONNA. See AGGA.

AGONOS, in physic, barren. Hippocrates applies it to women who have no children, though they might have them, if the impediments were removed.

AGONUS, in ichthyology, the fish called by some sarrachus, by others, chalecis and sardella. It is in many particulars very like the alausa, or shad, called the mother of herrings, but smaller, never arriving at more than a foot in length; and is always lean and lank in spring, and fat in autumn. But the distinctions between it and the alausa, if real, are so very small, that Mr. Ray, and many of the most accurate naturalists, have suspected it to be the same fish, only in a different state.

AGONOTHETA, or AGONOTHETES, in Grecian antiquity, was the president or superintendent of the sacred games; who not only defrayed the expences attending them, but inspected the manners and discipline of the athletæ, and adjudged the prizes to the victors.

AGONY OF DEATH. Much of the terror of death arises from the pangs and convulsions wherewith the agony seems attended; though we have reason to believe that the pain in such cases is not extremely acute; a course of pain and sickness having usually stupefied and indisposed the nerves for any quick sensations. However, various means have been thought of for mitigating the agony of death. Lord Bacon considers this as part of the province of a physician; and that not only when such a mitigation may tend to a recovery, but also when, there being no further hopes, it can only tend to make the passage out of life more calm and easy. Complacency in death, which Augustus so much desired, is certainly no small part of happiness. Accordingly the author last cited ranks euthanasia, or the art of dying easily, among the desiderata of science; and does not even seem to disapprove of the course Epicurus took for that end:

—Hinc stygias ebrius hausit aquas.

Opium has been applied for this purpose, with the approbation of some, but the condemnation of more.

The agony of Jesus Christ in the garden of Gethsemane has perplexed several commentators; and some learned persons seem studiously to have avoided the term agony in their transla-

tions, as Beza, Le Clerc, and Lenfant: in the translations of the Syriac version by Tremellius, Trostius, and others, we have timor, or fear, for agony. Lardner suggests that γενομένος ἀγωνία, (Luke xxii. 44.) might be translated, being under great concern. The effect of this agony has been differently explained. Many expositors have thought with M. Le Clerc, that the expression διπτήσις αὐτοῦ ὁστεούσιοι αὐτορος, only implies, that the drops of sweat were large and clammy, like clots of gore. Grotius understands the expression metaphorically, as denoting excessive sweat; but Dr. Whitby (in loc.) observes, that Aristotle (Hist. Anim. lib. iii. c. 19. Oper. tom. i. p. 809. De part. An. lib. iii. c. 5. Oper. tom. i. p. 1008.) and Diodorus Siculus (lib. xvii. Oper. tom. ii. p. 230.) mention bloody sweats, as attending some extraordinary agony of mind. Leti also, in his life of pope Sextus V. p. 200. and sir John Chardin, in his History of Persia, vol. i. p. 126, mention a similar phenomenon; to which Dr. Jackson (Works, vol. ii. p. 819.) adds another from Thuanus, lib. x. p. 221. See Doddridge's Family Expositor, vol. ii. p. 517. Bartholinus (de Cruce, p. 184. 193.) produces examples of sweats that have been actually mixed with blood. So does Maldonat in Mat. xxvi. 37. The possibility of this circumstance is ascertained by a fact well known in history, viz. that Charles IX. of France died of a malady, in which his blood gushed out of all the pores of his body. Voltaire (Univ. Hist. chap. 142.) describes it thus: 'Charles IX. died in his twenty-fifth year, the malady being very extraordinary, the blood gushing out of all his pores.'

AGONYCLITÆ, or AGONYCLITES, from *α*, privative, *γόνος* knee, and *κλίω*, to bend, in church history, a sect of Christians, in the seventh century, who prayed always standing, as thinking it unlawful to kneel.

AGOODY, *a.* In good. See Goop.

At that time I made her weep *agoody*,
For I did play a lamentable part.

Shakespeare's Two Gent. of Verona.

AGOONA, or ACONNA. See AGGA.

AGORÆUS, from *ἀγορά*, a market, in heathen antiquity, an appellation given to such deities as had statues in the market places; particularly Mercury, whose statue was to be seen in almost every public place.

AGORANOMUS, from *ἀγορά*, a market, and *νομός*, law, in Grecian antiquity, a magistrate of Athens, who had the regulation of weights and measures, the prices of provisions, &c. The agoranomi, at Athens, were ten in number, five belonging to the city, and as many to the Piræus; though others make them fifteen in all, of whom they assign ten to the city. To these a certain tribute was paid by all who brought any thing to sell in the market.

AGOSTA, or AUGUSTA, a maritime town on the south-east coast of the island of Sicily, on a peninsula at the bottom of a gulf, eighteen miles north of Syracuse. It was built originally by the emperor Frederic II. and was a place of considerable opulence previous to the earthquake of 1693, which spread havoc and devastation throughout its whole extent. The subterraneous

vapours, and the rapid motion of the earth, set fire to the powder magazine in the citadel, split the water-side forts to their foundation, and precipitated the light-house into the sea. It has since been rebuilt on a regular plan, with low houses, in order to prevent such dreadful consequences on the recurrence of a similar calamity. The harbour also is now cleared, and forms one of the safest ports in the island. Number of houses 1835; population 15,000. Long. $15^{\circ} 14'.$ E. Lat. $37^{\circ} 16'.$ N.

AGOT, an island in the English channel, near the coast of France. Long. $2^{\circ} 4'.$ W. Lat. $48^{\circ} 38'.$ N.

AGOU, or AGOEN, a small island of Sweden, in the province of Helsingland, with a good harbour. Long. $17^{\circ} 14'.$ E. Lat. $61^{\circ} 32'.$ N.

Agou, a town and territory of Whydah, on the Slave Coast of Guinea.

AGOSTUS, *ἀγοτός*, in anatomy, the arm from the fingers to the elbow; also the palm or hollow of the hand.

AGOUTI, or AGUTI. See Mus.

AGOWS, in geography, the inhabitants of a province of Abyssinia, which is bounded by the mountains of Amid Amid on the east; by Buré and Umbarma, and the country of the Gongas, on the west; by Damot and Gafat on the south; and by Dingleber on the north. They consist of two nations; the one near the fountains of the Nile, called the Agows of Damot, from their vicinity to that province, the other near the head of the Tacazzé, in the province of Lasta, called the Tcheretz Agows, from Tchera, a principal town, tribe, and district, near Lasta and Begemder. They are described by Mr. Bruce as one of the most considerable people in Abyssinia.

The country of the Agows is in a very elevated situation, and forms a kind of amphitheatre of lofty mountains; the climate is temperate and wholesome. In the shade, or in a house, the air is cool, as there is a constant breeze which mitigates the scorching heat of the sun, even at noon day, though the latitude is not much greater than 10° . But notwithstanding the exceeding temperature of the climate, the Agows do not live to any great age, which is probably owing to the oppression they suffer. Their country abounds with all the necessaries of life; and yet their taxes, tributes, and services, are so numerous, and their dependent condition so distressing, that they are only the manufacturers of the commodities they sell, in order to satisfy the exorbitant demands of their oppressors; and are constrained to live in a state of penury and misery, that is scarcely conceivable. Mr. Bruce informs us, that he saw a number of women, wrinkled and sun-burnt so as hardly to appear human, wandering about under a burning sun, each of whom had one and sometimes two children upon their back, and gathering the seeds of bent grass to make a kind of bread.

The Agows are said to be able to bring into the field 4000 horse, and a great number of foot; but their power has been much reduced by the incursions of the Gallas. Their riches, however, are still greater than their power; for though their province is hardly 60 miles long, and 30 miles broad, yet Gondar and the whole neigh-

bouring country, depend for the necessities of life, cattle, honey, butter, wheat, hides, wax, and a number of such articles, upon the Agows, who frequent the capital to the amount of 1000 and 1500 at a time, in order to dispose of these commodities. The Abyssinian princes have therefore compounded with them for an increase of tribute, in lieu of military service; but when they have deviated from this prudent practice, the Agows have been great sufferers. The butter which they carry to a great distance in this hot climate, is prevented from putrefaction by a root called moc-moco, resembling a carrot; which they bruise and mix with it, and thus they preserve it fresh for a considerable time. This root answers the purpose more certainly than salt, which could not be conveniently appropriated to this use, as it serves for money, and is used instead of silver coin as change for gold. Brides paint their feet, the palms of their hands, and their nails, with this drug. Mr. Bruce brought a considerable quantity of the seed, resembling that of coriander, into Europe. The Agows dispose of their commodities, not only at the market of Gondar, but to the neighbouring black savages, the woolly-headed Shangalla, and receive in exchange elephants' teeth, horns of the rhinoceros, gold, and fine cotton. This trade, which might be materially beneficial, is very much interrupted by the barbarity and fraud of both nations. Besides what they sell, and what they pay to the governor of Damot, the Agows present a tribute to the king of 1000 dabra of honey, each dabra containing about 60lb. weight: 1500 oxen, and 1000 ounces of gold. The clothing of the Agows consists of hides, which they soften and manufacture in a manner peculiar to themselves. Of these they form a kind of skirt, which reaches down to their feet, and is girded with a belt about their middle. The lower part resembles a large double petticoat, one fold of which they turn back over their shoulders, fastening it with a skewer across their breast before, and the married women carry their children in it behind. The younger sort are generally naked. The women are commonly thin, and, like the men, below the middle size. Barrenness is unknown among them. They are marriageable at nine years of age; at eleven they actually marry and bear children; and continue child-bearing to the age of thirty, and in some instances beyond that period.

The Agows are grossly idolatrous and superstitious. The Nile, or the spirit residing in that river, is the object of their worship; whom they address under the titles of 'the everlasting God, light of the world, eye of the world, God of peace, their Saviour, and father of the universe.' To this deity they present their supplications for seasonable rain, plenty of grass, and the preservation of a particular kind of serpents; at the same time deprecating thunder; and their prayers are pronounced very pathetically with a kind of tone or song. The shum or priest of the river, with whom Mr. Bruce conversed, pretended to have intercourse with a spirit which occasionally appeared to him, and revealed to him future events. This spirit, he said, was of the river, God, the father of mankind. Thunder was de-

preached, as the priest informed him, because it was hurtful to the bees, and their chief revenue was honey and wax. They prayed for serpents, because they taught the approach of good or evil. Serpents are kept in some of their houses; and they are fed with butter and milk, before they undertake a journey, or any affair of consequence; and if they do not eat, this is considered as a bad omen. Before an invasion of the Gallas, they say these serpents disappear, and are no where to be found. Fasil, a sagacious governor of the country, who was addicted to this species of divination, would never mount his horse, or go from home, if an animal of this kind, which he had in his custody, refused to eat. Once a year, on the first appearance of the dog-star, or, as others say, eleven days after, their devotion is attended with circumstances of peculiar solemnity; on which occasion, they sacrifice a black heifer, distribute parts of it to several clans, eat the carcase raw, and drink the water of the Nile. The bones are then burned to ashes; and the head is carried into a cavern, which they say reaches below the fountains of the river, and there they perform their secret worship, which no one is allowed to divulge. The Agows of Damot worship the Nile; and those of Lasta pay nearly the same worship to the Siris or Tacazze. These last have a separate language, and are Troglodytes, who live in caverns. Mr. Bruce apprehends that Agow is a compound of two words, Ag-hoa, q. d. the shepherds of the river; and that the species of idolatry introduced by them is a proof that they originally came from Canaan, where they imbibed materialism instead of the pure Sabean worship of the shepherds of Agaazi, which was, at an early period, the only religion of this part of Africa. The mountains in all the districts or clans of Agows are perforated in caves of a very large size, which some suppose were their ancient habitations when they were Troglodytes, or places of retreat when they were alarmed by the approach of their most formidable enemies, the Gallas. Others think it not improbable, that these caverns were used for religious purposes; that of Geesh, in particular, was without doubt, a place of secret worship paid to the river, as it is still appropriated to that use, not only by the inhabitants of the village, but by the assembly of the clans in general, who retire for the celebration of those rites, to which none but the heads of families in the Agows country are ever admitted. *Bruce's Trav.* vol. i. 401. vol. iii. 527.

AGRA, a kind of sweet scented wood, found in the island of Hainan, on the coast of China.

AGRA CARAMBA, another sweet scented wood, which also comes from the island of Hainan.

AGR, a province of Hindostan Proper, situated between the twenty-fifth and twenty-eighth degrees of north latitude, whose capital, **Agra**, is in the possession of the British, together with a small tract in the vicinity, and all the country east of the Jumna. Several rajahs, allies of the British, possess the western and north-western districts. That portion of the province which is south of the Chumbul, is under the dominion of the Mahrattas.

The whole province, thus important to British

interests, is one of the largest of the old divisions of Hindostan; being 250 miles in length, and 180 in its average breadth. It is bounded on the north by Delhi, on the south by Malwah, on the west by Ajmeer, and on the east by Oude and Allahabad. It is watered by branches of the Ganges, the Jumna, and the Chumbul, and contains, besides Agra, the strong fortresses of Bhurtpoor and Deeg, and the towns of Canoge, Kalpy, and Narwar. Bhurtpoor resisted the whole force of the British, under Lord Lake, in the last Mahratta war: and the siege is said to have cost our army a greater loss of men than it ever sustained in three of our greatest battles in India. The rajah is independent. Doeg, or Deeg, was defended by Holkar, at the same period, with ranges of batteries extending over two miles of ground; but it fell before the British attack. The portions of Agra, finally ceded to our arms, are part of the Bengal presidency.

No part of Hindostan contains a richer soil, or one that has been better cultivated, than portions of this province. The devastations of war, and its being divided among so many hostile masters, has much checked its general prosperity; but grain of all kinds, sugar, indigo, and cotton, are yielded, with little labour, in all the British districts. At Futtehpore and Sikri, are marble quarries, and some inferior copper mines are said to have been opened in the same neighbourhood; but they were never worked with any success. The province was formerly celebrated for its silks. It yields superior horses, and contains about 6,000,000 of inhabitants.

AGRA, the chief city of the above province, is situated on the S.W. bank of the Jumna, in N. lat. 27°. 12'. and E. long. 77°. 56'. This place is connected with the whole of the modern history of India, during which it has passed into the hands of various masters. In 1509 it was first brought into notice, by the emperor of Hindostan, Secunder, the son of Balloli, transferring to this place, from Delhi, the seat of his government. In the reign of his successor, the nobles of Agra invited hither Baber, a Mogul prince of the house of Timur Beg, to take possession of the throne, and Ibrahim, their monarch, was killed on the plain of Paniput, with 16,000 of his followers. Acber, the grandson of Baber, was the ablest and most prosperous prince in the history of the Mahomedan empire in India. He divided Hindostan into soubahs, circars, and pergannahs, and possessed an army of 600,000 men, horse and foot, with an annual revenue of upwards of £30,000,000 sterling. After him, this capital was for a while called Akbarabad, and to this prince it was indebted for a noble castle, which is said to have cost him 2,000,500 rupees. The Ayeen Acberry was a compendium of jurisprudence, compiled at Agra by the enlightened minister of Acber, Abul Fazul, under whose auspices it became the most considerable city of India, for extent and magnificence. The mausoleum of Acber is still to be seen here; but the chief ornament of the town is the Taje Mahal, or Crown of Edifices, an unrivalled tomb to the memory of the empress of Shah Jehan, her grandson, who died in

the year 1632. This is wholly built of the finest white marble, inlaid with precious stones, and is said to have cost the emperor 60 lacks of rupees, or about £750,000 sterling. Just before this period, Sir Thomas Roe, the first English ambassador that was sent to the emperor of Hindostan, appeared at Agra; and shortly after we read of a college of Jesuits, which was protected and patronized here by the father of Aurengzebe. This monarch converted the castle of Agra into a prison for his father, and transferred the seat of empire to its ancient capital, Delhi. During his reign, the Mogul empire reached its utmost limits of prosperity; and Agra has ever since been on the decline. The city is a long and narrow crescent, surrounded by the ruins of a strong wall of red stone, and a ditch one hundred feet wide. The houses are lofty, and well built of stone; but the streets are so narrow, as to admit of no two carriages passing. Its whole appearance is that of an empire which has been. From Agra to Lahore, a distance of 500 miles, the road was completely shaded by lofty trees.

In 1784, Agra finally passed from the dominion of the Moguls to that of the Mahrattas, from whom it was taken, in 1803, by general lord Lake. But our possession of it will ever be uncertain in the neighbourhood of the many rival states that divide the province, and particularly while the Bhurtpoor rajah is so very equivocally inclined, as at present, toward the British interests. Agra is 137 miles from Delhi, and 830 from Calcutta.

AGRARIÆ NAVES, was used for vessels placed to keep watch, or guard.

AGRARIÆ STATIONES, in the ancient military art, corps of guards posted in the fields, and in the open air

AGRARIAN, *adj.* { *Agrarius, agrestes*, from **AGRESTICK.** } *ager*, a field.

Agrarian, relating to the fields, especially applied to the division of conquered lands; agrestes, growing in the country, hence rural, rustic; unpolished; a word of doubtful authority.

He [Nimrod] was called a hunter, because he was so indeed; but not so only, but an oppressor too; his continual conversation with brute beasts, changed his humane disposition into a barbarous and *agrestick* behaviour.

Gregory, Postuma, p. 222.

It appears that the jubilee could not be intended for an *agrarian* law.

Wren's Monarchy Asserted, p. 137.

AGRARIAN LAWS, among the Romans, those relating to the division and distribution of lands; of which there was a great number; but the principal are, the *lex Cassia*, in the year of Rome 268; the *lex Licinia*, in 386; the *lex Flaminia*, in 525; two *Sempronian laws*, in the year 620; the *lex Apuleia*, in the year 653; the *lex Baebia*; the *lex Cornelia*, in 673; the *lex Servilia*, in 690; the *lex Flavia*; the *lex Julia*, in the year 691; the *lex Aelia Licinia*, the *lex Livia*, the *lex Marcia*, the *lex Roscia*, made after the taking of Carthage; the *lex Floria*, and the *lex Titia*. See *AGER*.

That called the agrarian law, by way of eminence, was published by Spurius Cassius, about

the year of Rome 268, for dividing the conquered lands equally among all the citizens, and limiting the number of acres which each citizen might enjoy.—The Roman lands were of several kinds; some conquered from the enemies, and not yet brought to the public account; others brought indeed to the public, but clandestinely usurped by private great men; lastly, others purchased with the public money in order to be divided. Agrarian laws, either for dividing lands from the enemy, or the public lands, or those purchased with the public money, were easily passed without disturbance; but those whereby private rich men were to be deprived of their lands, and the common people put in possession of what had been held by the nobility, were never attempted without great commotions.

The agrarian law alluded to originated in the ambitious views of Cassius, who thus intrigued for gaining the favour of the people, and for attaining absolute power. The law has the appearance of equity, and could not fail to be agreeable to the people, whose misery it relieved. But as the lands, which Cassius wished to have distributed among the poorer citizens, had been unjustly usurped by the rich, the proposal alarmed the senators, partly because they were personally interested in it, and partly because they apprehended its dangerous consequences. The people were at first pleased; but when they understood that the Latins were to partake with them of the advantage, they were disgusted. To conciliate the Latins, and to engage their concurrence in his favour, were the objects which Cassius had in view; but the jealousy and dissatisfaction of the Roman people disappointed his hopes, and terminated in his death. As soon as he was found guilty of aspiring to the sovereignty, and sentence was passed upon him, he was carried by the questors to the Tarpeian rock, which fronted the forum, and thrown down from the top to the bottom in the presence of the people; such was the customary punishment of this crime amongst the Romans. His house was also demolished, and his estate sold by auction. With the money arising from it a statue of brass was erected to Ceres. The plebeians, when they afterwards found that the decree of the senate, for the distribution of lands, was not executed, nor any measures adopted for this purpose, reproached themselves with the condemnation of Cassius, as an act of imprudence, and even of injustice. In the year of Rome 299, the subject of the agrarian laws, which had been suspended for thirty years, was revived by the tribunes; and the people demanded, that as they shared with the patricians in the labours and dangers of the commonwealth, they might also share with them in the benefits accruing from them. But a new partition would have been attended with great difficulties; and it seemed impossible to proceed in this business, without manifest injustice to many persons in actual possession of the lands to be distributed, who had really bought them, and without occasioning great and universal commotions in the commonwealth. For these reasons the senate firmly opposed the establishment of the agrarian law.

About the year 377, C. Licinius Stilo, a rich

plebeian, and tribune of the people, attempted to restrain the overgrown power and wealth of the patricians, by proposing a law, which should restrict every Roman citizen to the possession of 500 acres, and oblige him to surrender the overplus, in order to be divided among the poorer citizens. His motion, though enforced by the influence of his colleague in the tribuneship, L. Sextius, was over-ruled; and new commotions occasioned by the approach of the Gauls, having engaged the public attention, the business of the agrarian law was deferred for nine years; and about the end of that time it was again revived, and the law was established: this was called the Licinian law; and the mover of it was soon afterwards condemned by his own law. Having been found to possess more than 1000 acres, 500 of them were distributed among the poor citizens, and he was compelled to pay the fine, which he had annexed to the violation of the law. In consequence of this abuse, the law itself was abolished. In process of time, however, the great and rich possessed themselves of almost all the lands that belonged originally to the state, either by purchase, or by paying a greater quit-rent, or by violence. Several regulations had been proposed for restraining these usurpations. At length, other measures having been found ineffectual, (A. U. C. 620 B. C. 134,) Tiberius Gracchus, urged by his mother Cornelia, proposed the revival of the Licinian law; and that the rich should quit the lands which they held contrary to the laws, after having received from the public the value of them; and that the citizens, whose circumstances required relief, should take possession of them. Many objections were urged against this mild and humane regulation, as Plutarch calls it: and the prosecution of it brought the commonwealth to the brink of destruction, and cost the two illustrious brothers, the Gracchi, their lives. Their efforts were of little avail, as the laws they laboured to introduce were gradually abolished after their death. Cicero, in speaking of the partition of lands and the remittance of debts, says (Off. l. 2. n. 78.) 'that to undertake to discharge debtors by the authority of the magistrate, or to pass the law so often proposed for the distribution of lands, is to sap the two principal foundations of the commonwealth: of which the one is peace between the citizens, which could not subsist, if creditors were to lose their fortunes by the discharging of debtors; and the other justice, which is entirely subverted, from the instant no one can assure himself of continuing peaceable possessor of his right.' The agrarian law of the tribune Saturninus, which was carried with violence A. U. C. 652, was of very short duration, and that of Rullus in the year 689, which was more exorbitant than any other; and gave up to a small number of citizens, under the pretext of relieving the poor, almost all the revenues of the commonwealth, afforded Cicero an admirable opportunity of displaying his eloquence in exposing it, and inducing the people to resist it. The exordium of his oration on this occasion has been much admired. Cic. II. in Rull. The

agrarian law of Caesar was presented to the senate in the beginning of his consulship, A. U. 693; and he urged in its favour, that a distribution of lands among the poor citizens was altogether useful, and necessary to deliver the city from a multitude of people with which it was overburdened, and often gave rise to seditions; to re-people and cultivate several parts of Italy, which were abandoned; to recompense the soldiers who had served the commonwealth, and to give subsistence to many citizens who wanted it. He proposed the execution of it in the mildest and most moderate manner; and that twenty commissioners should preside at the distribution of the lands, excepting himself out of the number. Notwithstanding these specious pleas, Cato inveighed loudly against the project of Caesar, alleging that he did not so much apprehend the division of the lands, as the wages that would be required of the people by those who sought to inveigle them by this present. Cato was imprisoned for his opposition; and when another senator was asked by Caesar why he departed before the senate broke up, he replied, 'because I had rather be with Cato in a prison, than with you in the senate.' Caesar appealed to the people; and having engaged the concurrence of Pompey and Crassus, the resistance of Bibulus, Caesar's colleague in the consulship, and the vehement opposition of Cato were ineffectual. The law was authorised by the suffrages of the people. Cicero acquiesced in this measure, by observing a kind of neutrality; and argues to this purpose: 'Let us remain neuter, as if buried in a house in the country. Caesar hopes that I will second him and invites me to it. See the advantages I shall gain by taking this party; the friendship of Pompey, and even that of Caesar, if I desired it; a reconciliation with my enemies; the peace of the multitude; and the assurance of quiet in my old age; but after the conduct I have maintained in my consulship, and the principles which I have maintained in my writings, ought not my rule to be this maxim of Homer (Il. M. 243), "the best of all counsels is, to defend one's country?" Cicero ad Attic. ii. 3. In persuading Cato to give up his resistance to this measure, he conjures him to consider, 'that if Cato has no need of Rome, Rome has need of Cato.' *Civ. pro. Sext.* p. 61.

Several have pleaded for the necessity of agrarian laws among us: but no author has entered so deeply into the subject as Mr. Harrington in his *Oceana*; which the reader who chooses may consult.

AGRARIUM. See **AGISTMENT.**

AGREABLE, an isle in the river of Fez, in Africa.

AGREDA, a frontier town of Spain, in Old Castile, near the borders of Arragon, and eight miles south-west of Tarazona. It is enclosed with a good wall.

AGREDULA, is a name given to a species of the frog. Also, a city of South America in the province of Popayan, forty-two leagues from Quito, and thirty-seven from the South Sea. It was founded in 1561.

AGREE', v.
AGREE'ABILITIE,
AGREE'ABLE,
AGREE'ABLENESS,
AGREE'ABLY,
AGREE'D,
AGREE'ING,
AGREE'INGLY,
AGREE'MENT.

Fr. *agrément*, *grē*, from *gratuum*, to maintain friendship, sociability, or consistency; to reconcile, suit, approve, allow, accept, consent, concur. A favourable and pleasing signification characterizes the root and its derivatives.

Whom I ne finde froward ne fell.
 But toke *agree* all whole my plaine.

Chaucer. *R. of R.* fol. 136, col. 3.
 All fortune is blisful to a man, by the *agreability*,
 or by the equality of hym that suffereth it.

Idem. *Bocetus*, b. ii. fol. 218, col. 1.

Than ilk man smertlic tastis the wyne at tabil,
 Pray and thare Goddis to be *aggreable*.

Douglas, b. viii. p. 250.

And thus the covenant that ye made w^t death shall
 be disannulled: and your *agreemente* that ye made with
 hell, shall not stande. *Bible*, 1539. *Isaiah xxviii.*

What *agreement* is there between the hyena and
 the dog? and what peace, between the rich and the
 poor?

Eccles. xiii. 18.

The delight, which men have in popularity; fame,
 submission, and subjection of other men's minds;
 seemeth to be a thing (in itself, without contemplation
 of consequence) *agreeable* and grateful, to the
 nature of man.

Bacon's Nat. Hist.

What you do, is not at all *agreeable*, either with so
 good a Christian, or so reasonable and so great
 a person.

Temple.

It is a peculiar excellency of our religion, that it
 doth not much employ men's care, pains, and time,
 about matters of ceremonial observance; but doth
 chiefly (and in a manner wholly) exercise them in
 works of substantial duty, *agreeable* to reason, per-
 fective of man's nature, productive of true glory to
 God, and solid benefit to men.

Barrow.

Must the whole man (amazing thought!) return
 To the cold marble and contracted urn?

And never shall those particles *agree*,
 That were in life this individual he?

Prior.

It is very much an image of that author's writing;
 who has an *agreeableness* that charms us, without cor-
 rectness; like a mistress, whose faults we see, but
 love her with them all.

Pope.

No object is more pleasing to the eye than the sight
 of a man whom you have obliged; nor any music so
agreeable to the ear, as the voice of one that owns you
 for his benefactor.

Spectator.

AGREGAN, or **AGRIGAN**, or island of St. Xavier, one of the Ladrones or Marianne islands, in the South Pacific ocean, situated between Pagon and Assonsong. It is forty-eight miles in circuit, very mountainous, and contains several volcanoes. North lat. 19°. 4'. East long. 14°. 6'.

AGREVE, Sr., a town of France, in the Vivarais. It is the head of a canton in the department of the Ardèche, arrondissement of Tournon, and contains 2540 inhabitants. Seven leagues and a half north-west of Privas.

AGRESSES. See **AGGRESSES**.

AGRESTA, a name that has been sometimes given to the juice of unripe grapes.

AGRESTI DA FORLI, (*Livio*,) an historical painter, the disciple of Pierino del Vaga. He is commended for the richness of his invention, the goodness of his colouring, and the correctness of his design. Many of his works, both in fresco and oil, are in the Vatican, where he

was employed by Gregory XIII. There are also at Rome, several altar-pieces of his hand. He died in that city, in 1580.

AGRIA, a river in Upper Hungary, on the banks of which is a town of that name.

AGRIA, called by the Germans Eger, a small but strong town in Upper Hungary, with a bishop's see: is situated on the Agria, forty-seven miles, north-east of Buda, and fifty-five, west of Cossavia, has a citadel called Eriow. In 1552 it was besieged by the Turks, with 70,000 men: but they lost 8000 in one day; and were obliged to raise the siege, though the garrison consisted only of 2000 Hungarians, assisted by the women, who performed wonders on this occasion. However, it was afterwards taken by Mahomet III. in 1596; but, was retaken by the emperor, in 1689; since which time, it has continued under the dominion of the house of Austria. Lon. 20°. 10'. E. Lat. 48°. 10'. N.

AGRIA, in botany, holly.

AGRIA, in medicine, a malignant pustule, of which there are two sorts. The one is small, with a roughness, redness, and slight corrosion of the skin; it is of a round figure, its centre is smooth, and it spreads slowly. The other sort ulcerates with a violent redness and corrosion, so as to make the hair fall off; it is of an unequal form, and turns leprous. It is cured by poultices of pelitory of the wall.

AGRILÆ, in natural history, an order of quadrupeds, which have no teeth, but have a very long cylindric tongue. Of this order, there are only two known genera, the myrmecophaga, and the manis.

AGRIAMPELOS, from *αγριος*, wild, and *απελος*, vine, the wild vine; and, according to Gerard, the black briony.

AGRICOLA, (*Cneius Junius*.) born at Frejus Province, was, in Vespasian's time, made lieutenant to Vettius Bolanus, in Britain; and, upon his return, was ranked by that emperor among the patricians, and made governor of Aquitania. This post he held three years; was afterwards chosen consul, and at last appointed governor of Britain, where he greatly distinguished himself. He reformed many abuses occasioned by the avarice of former governors, put a stop to extortion, and caused justice to be impartially administered. Vespasian dying about this time, his son Titus, knowing the great merit of Agricola, continued him in the government. In the spring he marched towards the north, where he made some new conquests, and ordered forts to be built for the Romans to winter in. He spent the following winter in concerting schemes to bring the Britons to conform to the Roman customs. He considered that the best way of diverting them from rising and taking arms, was to soften their rough manners, by proposing to them new kinds of pleasure, and inspiring them with a desire of imitating the Roman manners.

Accordingly, he adorned the country with magnificent temples, and many other fine buildings. The British nobles at length sought education for their sons; and those, who before had the utmost aversion to Roman language, now began to study it with great assiduity: they wore likewise the Roman habit; and, as Tacitus observes,

they were brought to consider those things as marks of politeness, which were only so many badges of slavery. Agricola, in his third campaign, advanced as far as the Tweed; and in his fourth, he subdued the nations betwixt the Tweed and the friths of Edinburgh and Dumbrition, into which the rivers Glotta and Bodotria, (the Clyde and the Forth,) discharge themselves; and here he built fortresses to shut up the nations yet unconquered. In his fifth, he marched beyond the friths; whence he made some new acquisitions, and fixed garrisons along the western coasts, over against Ireland. In his sixth campaign, he passed the river Bodotria, ordering his fleet (the first which the Romans ever had in those parts,) to row along the coasts, and take a view of the northern parts. In the following spring, the Britons raised an army of 30,000 men; and the command was given to Galgacus, who, according to Tacitus, made an excellent speech to his countrymen on this occasion. Agricola likewise addressed his men in strong and eloquent terms. The Romans gained the victory, and 10,000 of the Britons are said to have been killed. This happened in the reign of the emperor Domitian, who growing jealous of the glory of Agricola, recalled him, under pretence of making him governor of Syria. Agricola died soon after; and his death was suspected to have been occasioned by poison given him by that emperor. Tacitus, the historian, married his daughter, wrote his life, and laments his death in the most pathetic manner.

AGRICOLA, (George,) a German physician famous for his skill in metals, was born at Glaucha, in Misnia, in 1494. The discoveries which he made in the mountains of Bohemia, gave him so great a desire of investigating every thing relating to metals, that though he had engaged in the

practice of physic at Joachimsthal, he still prosecuted his study of fossils with great assiduity; and at length removed to Chemnitz, where he entirely devoted himself to it, and spent in pursuit of it, the pension he had received from Maurice, duke of Saxony, and part of his own estate; so that he reaped more reputation than profit from his labours. He wrote several pieces on this and other subjects; and died at Chemnitz, in 1555, a firm papist. In his younger years, he seemed not averse to the Protestant doctrine; and he highly disapproved of the scandalous traffic of indulgences, and other corruptions of the church of Rome; but in the latter part of his life he attacked the Protestant religion; which rendered him so odious to the Lutherans, that they suffered his body to remain unburied for five days together; so that it was obliged to be removed from Chemnitz to Zeits, to be interred.

AGRICOLA, (John,) a Saxon divine, born at Eisleben in 1492. He was chaplain to count Mansfield, when he attended the elector of Saxony to the diet of Spire, in 1526, and that of Augsburg, in 1530. But he was of a restless ambitious temper, rivalled, and wrote against Melancthon, and gave count Mansfield occasion to reproach him severely. He obtained a professorship at Wittenberg, where he became founder of the sect of Antinomians; which occasioned warm disputes between him and Luther, who had before been his friend. Though he was never able to recover the favour either of the elector of Saxony, or of Luther, he acquired great fame at Berlin, where he became a preacher at court; and was chosen in 1548, in conjunction with Julius Phlug and Michael Heldingus, to compose the famous Interim, which made so much noise in the world. He died at Berlin, in 1566.

A G R I C U L T U R E.

AGRICULTURE, *n.* } *Ager*, a field, *colo*,
AGRICULTURAL, } *cultum*, to till; the
AGRICULTURIST. } culture of the fields.

He strictly adviseth not to begin to sow before the setting of the stars; which notwithstanding, without injury to agriculture, cannot be observed in England.

Brown's Vulgar Errors.

The disposition of Ulysses inclined him to war, rather than the more lucrative, but more secure, method of life, by agriculture and husbandry.

Broome. Notes on the Odyssey.

1. AGRICULTURE, properly defined, is the art of cultivating and improving the territorial surface so as to render it fertile and productive. Viewed in its most extensive sense, it divides itself into two great branches, TERRITORIAL ECONOMY, and HUSBANDRY; the former including the improvement and general management of landed property; the latter in a more limited sense, the manual practice of agriculture. Combining both these divisions, which are in themselves collateral, agriculture is the most important science to which the human intellect can be directed—the parent of all other science

and art—alike interesting all nations and all ages—born with the birth of time—given to man in the primeval state of his being, and spreading an influence over the whole circle of his wants, comforts, pleasures, passions, luxuries, arts, manufactures, commerce; together with his physical peculiarities of constitution, his natural, moral, political, and civil relations. From this view of its importance, we cannot wonder that it should have attracted the attention of mankind, in the earliest periods of the world, and have furnished employment for the highest classes of society; since this alone preserved them from all the miseries of famine, and afforded a more permanent subsistence than either the bow or the chase. When God created man, and placed him in the garden to till the ground, it seemed to imply that the resources of animal life were treasured up in the soil; all nations have acted upon this general principle instinctively; and the rich harvests that waved over the ancient site of Chaldea and Phoenicia, or adorned the rich and fertile vale of Egypt, evinced that the soil, when cherished by cultivation, was capable of producing in great abundance, not only the

necessaries, but the luxuries of life. The Chaldeans and Phœnicians carried this valuable art to a pitch of improvement little short of excellence. The Chinese consider it as the most noble and honourable of all employments; and have placed it from time immemorial, under the protection of their princes and nobility. The Egyptians were so sensible of its importance, that they worshipped even the animals that laboured in it. The Greeks thanked the gods for so unexpected a present; and those of Athens, withdrawing their subjects from war, employed them solely in cultivation. Hesiod, contemporary with Homer, was the first who wrote on the subject, in his poem, entitled ‘Weeks and Days;’ besides whom Democritus of Abdera, Xenophon, Tarenthinus, Architas, Aristotle, Theophrastus, and other eminent Greek writers have successively employed themselves upon the same interesting topic. So assiduous were the Carthaginians in the study of agriculture, that their general Mago wrote no fewer than twenty-eight books upon it, which, being translated, at the command of the senate, into the Roman language, are said to have been the model on which Virgil composed his Georgics. The estimation in which this art was held in Rome, is known to most of our readers; the most illustrious citizens deeming it their most honourable employment. Generals, who put themselves at the head of her armies, pushed her conquests, and carried her eagles round the world, could handle the plough as well as the sword; they retired from the conquest of kingdoms to the cultivation of their farms; and thought it a reward for their labours, when they could obtain a manumission from the service of the state to enjoy the rural pleasures of the country. M. Cato, that illustrious censor, general, lawyer, orator, and politician, devoted to this subject a Latin volume, dedicated to his son. Varro composed an agricultural treatise, replete with Greek and Latin erudition, and his example was followed by other illustrious Romans. Virgil adorned the subject with the language of the Muses; and in the majesty of his verse, finely embellished those first principles of husbandry, which were laid down in the writings of Hesiod and Mago. Agriculture stood upon the Roman capitol in the robes of Ceres, and overlooked a considerable portion of the civilized world.

2. In modern times, however, agriculture has been carried to the greatest perfection, and assumes an aspect decidedly superior to what it did in Rome. The political advantages enjoyed by all classes in our free and commercial country; the recent discoveries in geology, chemistry, botany, &c.; the establishment of agricultural societies in many of the most important parts of Europe; the endowment of professorships of rural economy, in many celebrated universities; and the numerous publications that have issued from the press—all combining their influence, have awakened an unparalleled spirit of inquiry in all classes, have given a tone to the public mind, and directed it from science to art; from objects purely intellectual, to their bearings upon other subjects of practical utility. The preparation of land for tillage by means of enclosure, drainage, embanking, &c. requiring, as it does,

scientific investigation, have called into existence a new profession of artist agriculturists, under the name of land-surveyors, and land-engineers. The changes in occupancy, successive valuation, and transfer of landed property, have given birth to the professions of land valuers, and land agents. From the frequent wide dimensions of landed property, especially by estates which descend by right of primogeniture, have arisen the lower orders of agriculturists, as hinds, land-stewards, bailiffs, &c. under whom are placed the inferior or working classes, as ploughmen, carters, spades-men, shepherds, &c.

3. In this article we shall confine ourselves to three topics. First, a sketch of those sciences that are connected with agriculture; a knowledge of which is necessary to every farmer who would conduct his operations on the surest and most advantageous principles; these are, botany, mineralogy, meteorology, physiology, &c. referring our readers to these respective articles for complete treatises on them. Secondly, a general view of soil, and of the principles on which the farmer ought to proceed in ameliorating them by ploughing, manures, &c. and by a proper rotation of crops, in order to raise the fertility of his land to the highest pitch: and here we add a slight sketch of those general principles of animal nature with which the scientific farmer will become acquainted. Thirdly, a brief history of agriculture, ancient and modern, with a rapid sketch of its present state.

4. With respect to the practical rules and details of agriculture, they will be found under the article **HUSBANDRY**. By far the largest portion of the territorial surface of the British empire is cultivated under, first, the arable system; secondly the grazing, for rearing and fattening cattle and sheep; thirdly, the dairy for butter and cheese; or fourthly, the modern and most improved system, called the convertible, in which the arable and grazing alternate. Under the article **HUSBANDRY**, all the rules and details necessary to carry on these respective systems in the best manner, and to the greatest advantage, will be given. There are, however, other products of the soil, which in some particular parts of the kingdom are the objects of the agriculturist; these, as not interesting to farmers in general, we shall notice, not under husbandry, but under their own heads; such as orchards, including the manufacture of cider and perry; cherry, filbert, &c. orchards:—hops, including their preparation for the market, as well as their culture; caraway, coriander seed, &c. and woods and plantations.

5. In the present article, agriculture, and those we have just enumerated, the cultivator of the soil will learn all he requires to know. The proprietors of the soil we refer to the article **LANDED PROPERTY** for information respecting the valuation, sale, and purchase of estates; the laws regarding them; the duties of a land steward; leases, &c.: and to the article **LANDSCAPE GARDENING** for information regarding the ornamental laying out of ground. The articles **LAND-SURVEYING** and **RURAL ARCHITECTURE**, will complete the circle of agricultural information in all its branches.

6. SECT. I. SKETCH OF THE SCIENCES CON-

NECTED WITH AGRICULTURE.—The object of agriculture in that view of it which we are now presenting to the reader, is to augment the quantity, and to improve the quality of vegetable and animal substances, with the least possible expenditure. To do this effectually, the student ought to have a scientific initiation into the leading principles on which his art is founded, with all their collateral branches and relations. He ought to have acquired mensuration and algebra, a rapidity of sketching objects both animal and vegetable; also of taking off and forming geometrical plans, especially he ought to have studied chemistry, hydraulics, and other sciences; without which he cannot proceed in the prosecution of his object on the basis of any fixed and established principles. It is true, agriculture in common with other arts, may be pursued without any philosophical knowledge of its theory; established practices may be imitated: but the mere routine practitioner cannot derive advantage from favourable occurrences, nor guard against the recurrence of others that are unfavourable; for unforeseen events he will have no resource but ordinary expedients, no grammar but his own observations; while the man of science, referring events to their true causes, has recourse to general principles, and meets every accident with scientific and appropriate remedies.

7. A due acquaintance with systematical botany, vegetable and animal anatomy, chemistry, physiology, and pathology, if united with practical knowledge in the art of agriculture, will enable the farmer to derive the greatest advantages from his profession.

With respect to the first of these, viz. systematic botany.

8. **CLASSIFICATION.**—The vegetable kingdom is divided into classes, orders, genera, species, and varieties. A class is an assemblage of plants distinguished by some common peculiarity; an order is a division of a class known by some character; a genus is formed by a still more limited coincidence; and each individual which remains unchanged when raised from seed, is called a species; any accidental deviation from which, forms a variety, and returns by seed to its original specific character.

9. **VEGETABLE ANATOMY** forms another leading branch of botany necessary to be understood by every intelligent agriculturist, before he can carry on cultivation upon any fixed and scientific principle. The structure of plants has commonly been considered as **EXTERNAL** and **INTERNAL**. With respect to the former, the organs of perfect plants are **CONSERVATIVE** and **PRODUCTIVE**.

10. **CONSERVATIVE ORGANS.**—The conservative organs are those parts of a plant which are absolutely requisite to its growth; as, the root which absorbs the alimentary juices of the soil; the trunk, which springing immediately from the root, ascends in a vertical position above it; the branches or divisions of the trunk, diverging mostly from its upper extremity; the leaf generally issuing from numerous points toward the extremities of the branches or the stem, and presenting besides an upper and under surface,

a base, apex, midrib, and lateral nerves; and the frond, a compound incorporation of the leaf, leaf-stalk, and branch or stem, apparently forming one organ, the parts of which do not separate from each other by means of the fracture of any natural joint, but adhere together even in a state of decay, as is the case in ferns and palms.

11. **CONSERVATIVE APPENDAGES.**—Accessory or supernumerary appendages, as gems, glands, tendrils, stipulae, ramenta, armature, and pubescence, form an accompaniment to the conservative organs, although not invariably; they are however permanent wherever they are found, and vary in different species. Gems or bulbs are organized substances; the rudiments of new individuals detaching themselves from the parent plant, and fixing themselves in the soil. Glands are small and minute substances of various forms, protruding mostly from the leaf and petiole, and supposed to be the organs of secretion. The tendril is generally a thread-shaped spiral process, issuing from the stem, branch, or petiole; and occasionally from the expansion of the leaf, by which plants of climbing disposition adhere to other plants, or adjacent substances, for their support. Stipulae are foliaceous appendages accompanying the leaves, of which they seem to present a new miniature species. Ramenta are oblong appendages issuing from the surface of the plant, strongly resembling the stipulae, although not necessarily accompanying the leaves. The armature consists of auxiliary parts adapted by nature to defend the plant. The pubescence includes all sorts of vegetable down, surrounding the surface of the plant.

12. **RE-PRODUCTIVE ORGANS.**—The re-productive organs including the flower, flower-stalk, receptacle, inflorescence, and ovary, are those parts necessary to the propagation of the species by terminating the old individual, and beginning the new. The flower, distinguished by the beauty of its colouring and odiferous excellence of its perfume, emerges from the extremity of the branches, root, stem, and occasionally the leaves; and forms the apparatus destined by nature for the production of the fruit. The flower-stalk is a partial trunk or stem, supporting the flower or flowers, if they are not sessile. The receptacle, the seat of the flower, is the point of union between its different parts, or between the flower and the plant, whether it be sessile or mediate. The inflorescence is the mode of aggregation, arrangement, or distribution of the flowers upon the plant. The ovary or fruit is the seed vessel that succeeds the flower. The appendages to the re-productive organs, besides being of a finer and more delicate texture than those proper to the parts conservative, are many of them peculiar, as the involucle, spathe, bracte, &c. proper to the flower, and others, as the persisting calyx, exemplified in the pomegranate, to the fruit.

13. **IMPERFECT PLANTS, EXTERNAL STRUCTURE OF.**—Imperfect plants are those that are defective in some of the more conspicuous organs; and are commonly distributed into *filices*, *equisitaceæ*, *lycopodiæ*, *musci*, *hepaticæ*, *algæ*, *lichenæ*, and *fungi*. Of these the three former

die down to the ground in winter; but are furnished with a perennial root, from which issues annually a frond, producing fructification. The moss tribe are for the most part perennial, and herbaceous plants, approaching to shrubby, consisting of a root surmounted with a tuft of minute leaves, furnished with a stem and branches, on which the leaves are closely imbricated; and the fructification terminal or lateral. The hepaticæ resemble the mosses; but chiefly constituting fronds, and producing their fruit in a capsule that splits into longitudinal valves. The algæ, commonly called sea weeds, include many plants that are not even aquatic; whose herbage is nevertheless frondose, rarely admitting the distinction of root, stem, and leaf. This tribe with that of the lichenæ, are important to agriculture. The fungi, forming the connecting link between the vegetable and animal kingdoms, are a tribe of plants whose herbage is a frond of a fleshy, pulpy texture, rapid in growth, and short lived in duration, producing seeds in an exposed membrane, or interspersed throughout its whole mass.

14. INTERNAL STRUCTURE.—The internal structure of plants, without a knowledge of which the agriculturist will neither understand well the process of vegetation, nor be able to apply remedies in cases of vegetable sickness, are reducible into component parts, which are again resolved into constituent and primary organs. These are subject to the three following divisions, the *decomposite*, *composite*, and *elementary*.

15. DECOMPOSITE ORGANS.—The decomposite organs, constituting the elementary parts of the individual are, 1. The *seed*, distinguished into two primary divisions, viz. the integuments, and nucleus or embryo, and envelopes. The integuments are exterior and interior; the former of which, the original cuticle of the nucleus, is detachable on the maturity of the fruit; the latter lining the exterior testa, immediately envelopes the nucleus, and in the ripe walnut, for instance, forms a fine net-like membrane. The nucleus within the tegument consists, for the most part, of the albumen, an organ like the white of an egg forming its exterior portion; the vitellus, an organ of a fleshy, firm contexture, situate, when present, immediately within the albumen and the embryo, or germ of the future plant, occupying the centre of the seed, of which it forms the most essential part. Of the embryo, the cotyledon, or seed lobe, is that portion which incloses and protects the plantlet, and springs up in the germinating process into what is called the seminal leaf, if the lobe is solitary, and the seed monocotyledonous; and into seminal leaves, in the case of a plurality of lobes, and a dicotyledonous seed, (exemplified in the garden bean), or a polycotyledonous seed, as in *lepidium sativum*, and genus *pinus*. The plantlet, or miniature of the future plant is the interior and essential part of the embryo, and the seat of vegetable life. 2. The *pericarp*, by a diversity of modification, rather than of substance, assumes numerous varieties of contexture in different species. The valves of the capsule, but particularly the partitions which divide it into cells,

are composed of a skinny membrane, or epidermis, covering a pulp, indurated, and covered with longitudinal fibres. The pome is composed of a fine double epidermis, enclosing a soft fleshy pulp, with numerous longitudinal fibres, passing through it in the direction of its longitudinal axis. The valves of the legume consist of an epidermis inclosing a pulp lined with a fine membrane, and of numerous longitudinal fibres, forming the seam. The nut-shell is composed of an indurated pulp, covered with an epidermis, and interspersed with longitudinal fibres. The drupe consists of an epidermis, surrounding a fleshy pulp, occasionally so interwoven with longitudinal fibres, as in the case of the cocoanut, to consist wholly of threads: the berry is an epidermis, which is a soft pulp. The scales of the strobile are a tough epidermis, with an interior pulp, spongy, and often highly indurated, interspersed with longitudinal fibres, pervading the axis. 3. The *flower-stalk* is a prolongation of the stem, for the support of the flower; or it is a partial stem, striking out from the parent, and consists of an external envelope or epidermis, a soft pulpy mass, or parenchyma, and a contexture of longitudinal threads, originating in the stem, and passing along the interior of the parenchyma. The organs of the flower are in reality a prolongation of the elementary parts of the stem on which it diverges and spreads its beauty under different modifications, although the longitudinal fibres are seldom found except in the calyx and corolla. 4. The *leaf-stalk*, or *petiole*, with respect to the leaf answers the same purpose as the former, with respect to the flower, exhibits the same organization and component divisions. 5. Of *germs* there exists four species, the bud and bulb, peculiar to perfect plants; the propago and gongylus to those which are imperfect; the former of which are denominated compound germs, being furnished with a single envelope, the latter simple germs, because provided with a plurality. The bud consists of scales, overlapping each other, and converging towards a point in the apex, cemented often by a mucilaginous substance, exuding from their surface. These scales, by dissection, under the microscope, consist, like the divisions of the calyx, of an epidermis enclosing a pulp, interspersed with a net-work of fibres, unaccompanied, however, with longitudinal threads. On stripping off the scales of a leaf bud, the remaining part will be found to consist of the rudiments of a young branch, terminated by a bunch of incipient leaves, imbedded in a white species of down, complete in all their proportions, and curiously folded in the bud. Bulbs are either radical or caulinary, and exhibit several distinct varieties, solid, coated, or sealy; protruding, after the natural order of their species, the stem, leaf, and flower. The propago, peculiar to certain genera of imperfect plants, consists, as exemplified in the lichens, of a pulpy mass, forming an irregular granule, either naked or enveloped with a fine epidermis. The gongylus simple like the former, and peculiar to certain genera of imperfect plants, consists, as exemplified in the fuci of a pulp slightly indurated, and moulded into a small globular granule of a firm contexture, surrounded with an epidermis, or envelope.

6. The *caudex* includes the whole body of both the trunk and root; and is, with respect to its inward modification and external appearance, exceedingly different in different tribes. The first general mode for its internal structure, is that in which an epidermis encloses an homogeneous pulp or mass of fibres, as exemplified particularly in the algae and fungi. The second is that in which it encloses several heterogeneous substances. This mode is divided into several varieties; as first, when an epidermis incloses a soft pulpy mass, interspersed with longitudinal nerves and fibres, extending from the base to the apex, and disposed in a manner peculiar to a tribe or genus. Another variety, when a strong bark surrounds a circular layer, or layers of longitudinal fibres, interwoven with divergent layers of pulp; thus forming a substance concentrating a certain medulla, or pith.

16. COMPOSITE ORGANS.—The composite organs are the epidermis, pith, pulp, layers, cortical and ligneous, vegetable fibre, &c. The epidermis is the envelope of the whole plant, exhibiting a different appearance and texture in proportion to the solidity of the parts which it encloses. The pulp is a soft juicy substance, forming the principal mass of the succulent parts, and has been compared to an accumulation of hexagonal cells formed of the doublings and foldings of a fine delicate membrane. The pith is a spongy substance, enclosed within the centre of the root, stem, and branches, in the direction of their longitudinal axis, forming the substance of the bark. The cortical layers lie immediately under the cellular integument, and, where that member is wanting, beneath the epidermis. In some cases they are themselves external. They are composed of two elementary bundles of longitudinal fibres, constituting a network, and the meshes are supplied by a mass of pulp more or less indurated. The innermost of these layers, denominated the fibre, is extremely fine and delicate, and in some cases, beautifully reticulated and varied by bundles of longitudinal fibres. It was used by the ancients to write upon before the invention of paper; that of the daphne lagetto is said to be as beautiful and delicate as the finest lace, and to be used by the inhabitants of the countries where the tree is native, in the place of neck-cloths. On a right knowledge of these layers depends the agriculturist's success, in grafting, which is effected by uniting the liber of the graft and stock. The ligneous layers concentric and divergent, constitute the wood, and are seated in the intermediate portion between the bark and the pith.

17. VEGETABLE CHEMISTRY.—For vegetable chemistry, including the various products of vegetables, whether simple, as carbon, oxygen, hydrogen, nitrogen and other elementary principles, forming by their modifications, the peculiar character and properties of plants; or compound, as gluten, gum, tannin, acids, oils, resins, balsams, alkalies, earths, metallic oxides, camphor, charcoal, &c. which are capable of still further decompositions, we must refer to the article Chemistry; also to Dr. Thomson's Chemistry, &c.

18. GERMINATION OF THE SEED.—With respect to germination, the first part of vegetation,

it may be premised that all plants spring originally from seed, on the internal state, or outward circumstances of which the conditions of germination depend. Seeds to germinate must be mature. There are, nevertheless, some seeds whose germination commences in the seed vessels, while attached to the parent plant, and before the fruit is ripe, as the garden-radish, pea, lemon, agave vivipara of East Florida, the cyamus nelumbo, or sacred bean of India, &c. In general, seeds will retain the productive faculty for years, if properly taken care of; and when sown are properly defended from the immediate action of the rays of the sun. Warmth is a capital principle in germination. Seeds, though sown in winter, do not germinate till the return of spring, when the temperature has been raised to a proper degree; which, however, varies in different seeds, as is evident from observing the different periods at which they germinate as the summer progressively advances. Germination is accelerated in proportion to the degree of heat: seeds that will germinate in a cool climate in a given time, on being removed nearer the tropics, have their germination accelerated; and seeds removed from a warmer to a colder climate, have their germination proportionably contracted. Seeds that usually require twelve hours to germinate in our ordinary degree of heat, by increasing the temperature, may be made to germinate in three; but too powerful a degree of heat destroys the vital principle. Moisture is a necessary condition to germination, but there may be too much water or too little; if too little, the seed dies for want of moisture; if too much, it rots in the earth. Different degrees of moisture are, however, necessary in different plants. The access of atmospheric air is a capital consideration in the germination of seed, which is evident from the fact, that no seeds will germinate in a vacuum, although after lying in a vacuum they will vivify on the admission of air. It appears from experiments made by Achard, that no seed will germinate in nitrogen, hydrogen, or carbonic acid, gas, except when mixed with oxygen; whence it appears that oxygen is the only constituent part of the atmosphere really essential to the vegetating process. Humboldt found that seed, previously steeped in water, impregnated with the oxymuriatic acid, exhibits a more rapid germination. Cress-seed, the ordinary period of which is thirty-two hours, treated after this manner, germinated in three.

19. PERIOD OF GERMINATION.—In germination, generally speaking, grasses are the most rapid; next to these, cruciform plants; then leguminous plants; then labiate plants; then umbelliferous plants; to which succeed the last and slowest in the series, viz. rosaceous plants. Of the periods which the most common seeds require, the following may, for general purposes, be sufficient:—

Wheat, millet-seed	1 day
Barley	7 days
Orache	8
Spinage	3
Beans	3
Mustard	3
Lettuce	4

Aniseed	4 days
Melon	5
Cress-seed	5
Cucumber	5
Radish, beet-root	6
Purslain	9
Cabbage	10
Farsley	40
and sometimes	50
Iyssop	30
Almond	1 year
Chesnut	1
Peach	1
Rose	2
Filbert	2
Hawthorn	2

20. The first symptom of germination is the prolongation of the radicle, bursting through its integuments, and shooting downwards in the soil. Some persons account for this on the principle of gravitation; others from a sort of vegetable instinct, directing infallibly to that situation best suited to the acquisition of nutriment. The next stage of the process exhibits the evolution of the cotyledon or cotyledons, unless the seed is acotyledonous or the cotyledons hypogean, as in the acorn. In the case of seeds furnished with cotyledons, the next visible step is the extrication of the plumelet, or first real leaf from cotyledons, and its expansion in the open air, after which, if congenial to the nature of the species, are developed the rudiments of a stem, and the plant is complete—the radicle descending into the earth, the plumelet ascending into the air. For the philosophy of germination, we must refer the reader to *BOTANY*.

21. NOURISHMENT OF PLANTS.—The future nourishment of the plant may be considered as derived from the following sources, water, gases, vegetable extracts, salts, earths, manures.

22. WATER.—If plants are deprived of water the leaves become flaccid, and assume a withered appearance; but if the roots are again supplied with water, the weight of the plant is increased and its freshness restored. And since many plants, as tulips, hyacinths, marine plants, and others, will thrive if the root be fixed in the water independent of the soil, it cannot be doubted but that water answers the purpose of a vegetable aliment. But it does not follow that water is the sole food of plants, as Van Helmont, Boyle, and others supposed, or that it is sufficient to form all the substances contained in vegetables, without any other auxiliary. Overflowing the ground with water greatly increases the fertility of any soil. It is well known how much Egypt owes to the annual overflowing of the Nile; and even in this country the overflowing of any ground is found to be attended with great advantage. This was practised by Mr. Bakewell of Leicestershire, famous for his improvements in the breed of cattle; and he found it fully answer an annual manuring of any other sort. It is also recommended by Dr. Anderson of Monkshill, in his *Essays on Agriculture*. The fertilizing quality of water will easily be accounted for on the same principles. When grown vegetables are covered with water, their growth, however vigorous before, is immediately

stopt, unless they be of the aquatic kind; they die, are dissolved, and putrified; in which case their finer parts are undoubtedly absorbed by the earth; and thus the floating, as it is called, of fields with water, answers the purpose of fallowing with very little trouble. This is not all; for stagnate water always deposits a sediment, which, mixing with the dissolved parts of the vegetables all over the field, forms an excellent manure; and when the water is allowed to run off, the heat of the sun soon brings the highest degree of putrefaction on the dead vegetables: the effluvia of which mixing with the mud deposited from the water, makes it exceedingly rich.

23. GASES.—That atmospheric air is necessary to the life and vigour of the plant, may be seen by looking at the different appearance of those plants which are exposed to a free circulation of air, from those which are deprived of it. If a plant is placed even under a glass, to which no new supply of air can have access, it withers and dies. Of the component parts of air required by the plant, may be enumerated a portion of carbonic acid gas, especially in the higher stages of vegetation; and oxygen, which is of capital importance in every stage of the process. The flower-bud will not expand if confined in an atmosphere deprived of oxygen, nor will the fruit ripen; nitrogen, though it constitutes by far the greater proportion of atmospheric air, is incapable of affording any nutriment to plants. Seeds will not germinate, neither will plants vegetate in it, except for a very limited time. Hydrogen gas is also unfavourable to vegetation, notwithstanding the opinion of Dr. Priestley, that it not only serves for vegetable food, but constitutes the true and proper pabulum of the plant. Although both these gases are found in the constitution of plants, by chemical analysis, they are derived in some other form than air, the former, nitrogen, perhaps on the extractive principles of vegetable mould, and hydrogen as an element of water.

24. VEGETABLE EXTRACT.—Another part of food for plants consists of vegetable extract or mould. When plants have attained the maturity of their species, they begin to decay: and after their dissolution, are converted into vegetable dust, with a probability of its being again converted into vegetable nourishment, and entering the plant. The whole of it however, cannot enter the plant, because not soluble in water; but the portion that is soluble, and therefore capable of being absorbed by the root, is what is called vegetable extract. There are two ways in which decayed animal and vegetable substances communicate nourishment to the plant. By the first, floating in the atmosphere, they attach themselves and enter the plant in solution imbibed by the pores; by the second, they enter the root by means of the soil.

25. SALTS.—Salts form a considerable part of the food of plants, different salts being requisite in different species; trefoil, lucerne, and clover, have their growth much accelerated by sulphate of lime, (gypsum) wheat by phosphate of lime; barley by nitrate of soda, or potash. Salts, as nitrate, muriate, and sulphate of potash or soda,

are found in most plants. It is not however, determined in what way salts assist vegetation, whether by hastening the putrefaction of animal substances contained in the soil, or by attracting the humidity of the atmosphere.

26. EARTHS.—Earths, as they are found in different proportions in plants, are derived chiefly from the soil, probably by solution in water, especially as all earths hitherto found in plants are known to be in a slight degree soluble. The experiments of Woodward tend to prove that they are absorbed by the root. Giobert mixed lime, alumina, silica, and magnesia in the same proportions as they are commonly found in fertile soils; and after moistening them with water, sowed different grains in them. These, although they germinated, did not thrive; and perished when the nourishment of the cotyledons was exhausted. This, in his opinion, established the fact that though beneficial to the growth of some species, and requisite to the health of others, earths are not capable of affording any considerable nourishment to the plant. The supply of food received from the earth depends upon the mechanical or chemical constitution of the soils. The former may be altered by pulverization, consolidation, watering, draining, &c.: the latter by the addition of earths, and other substances, the supply of manures liquid and solid, by irrigation, distribution of dungs, &c. On the whole therefore, we may conclude that although vegetables will grow in any kind of earth, and flourish vigorously, if plentifully supplied with water, yet some kinds of soil are found much more proper for supplying them with nourishment than others. The inference which some would draw from experiments on plants set in mere sand, &c. are not quite fair: viz. that the earth is of no other use to vegetation, than to afford a proper support to the plant, that it be not easily moved out of its place; because the experiments made on single vegetables are always performed in, or very near houses, where the air is not so pure as in the open fields, and consequently where they have an opportunity of receiving as much nourishment from the air, as may compensate the want of what they would have derived from the earth, if planted in a rich soil.

27. Lord Kames, in the Gentleman Farmer, mentions an experiment wherein a pea was planted in some cotton spread on water, in a phial. It sprang up, and pushed roots through the cotton into the water. The plant grew vigorously, and, at the time of his writing, the experiment carried large pods full of ripe seed. From this experiment, or others of a similar kind, however, a farmer would not be thought to act very judiciously, who should conclude that nothing more was requisite to produce a plentiful crop, than to keep his fields constantly soaking with water, and apply his labour only for that purpose, without regarding either tillage, manure, or the difference of soils. Experience has shown, that by certain operations performed on the earth itself, it is rendered much more capable of supplying vegetables with plenty of nourishment, than if such operations were omitted; and, that some kinds of soil cannot, without certain additions,

be rendered so fit for this purpose as others; and this is what constitutes the difference between a rich, and a poor soil.

28. That species of earth which is capable of supplying the vegetable kingdom with nourishment in the greatest plenty, is found best in well cultivated gardens. It is not, however, even in these, found in perfect purity; being constantly mixed with greater or less proportions of sand, small stones, &c. It can be had by itself, and entirely separated from all other substances, only by suffering vegetable or animal bodies to putrefy. By undergoing this operation, they are at last resolved into a kind of earth, which appears perfectly the same, from whatever substance it is produced. Of this earth, Dr. Lewis gives us the following characters. It is indissoluble in acids, somewhat tenacious when moistened with water, friable when dry, and acquires no additional hardness in the fire.—The chemistry of nature, and that of art, however, are so very dissimilar, that an account of the chemical properties of this earth, can be but of very little service to the practice of agriculture; however, to those above-mentioned we may add, that when it is distilled with a violent fire, a volatile alkaline spirit, and fetid oil, similar to those of hartshorn, or other animal substances, are obtained.

29. As the volatile alkali is produced in great plenty by distilling putrid substances, either animal or vegetable: the obtaining an alkaline spirit from this kind of earth, is a strong argument of its being much impregnated with the putrid effluvia, mentioned above, as the proper vegetable food contained in the air and water. Indeed, considering that this kind of earth is produced by putrefaction, it is next to an impossibility that it should not be impregnated with putrid steams, as much as earth can be; and, if the earth which is most impregnated with these steams, is found to afford the greatest quantity of nourishment to vegetables, we have thence an additional proof, that they live on the putrid matter emitted from dead animals and vegetables like themselves.

30. That we may be the more ascertained of this, it must be considered, that the earth, which is the greatest source of nourishment to vegetables, is capable of absorbing putrid effluvia in much greater quantity, before it is saturated, than either the air or water. The burying of dead bodies affords a proof of this. They are laid but a small depth under ground; yet the abominable stench emitted by the carcase, is retained in the earth, and never penetrates so as to become offensive. That earth may be saturated with this putrid matter, as well as air or water, is certain; and, in case of such a saturation, either of these will take up the superfluous quantity, and become noxious; but unless the earth is fully saturated, both will deposit part of what they contain in the earth, and thus become more salutary than before.

31. That earth is capable of attracting putrid effluvia from the air, perhaps, may not be readily granted; but, if we consider the exceeding great salubrity of the air in the country, and the healthiness of those who follow the plough, or are employed in digging the ground, we must

allow, that when the ground is turned up, it communicates no kind of noxious quality to the air; which it would certainly do, if it emitted a putrid effluvium. So far from this, the smell of moist earth is always agreeable and wholesome; and here our theory is confirmed, by the celebrated Baron Van Swieten, late physician to the empress of Hungary. ‘Physicians,’ says he, ‘usually advise their patients to rustication, not only that they may enjoy a pure and freely circulating air, but that, as their strength increases, they may, disengaged from all care, exercise their body by the slighter labour of agriculture, and other country amusements.’

32. There may, perhaps, be another cause why rustication will be of benefit in consumptions. It is well known, that, after some days drought, on the falling of rain that moistens the earth, there arises a grateful smell, which we all are sensible of; and, this is commonly attributed to the vegetables, which, before sapless, but now refreshed by rain, perspire more copiously. Reaumur observed, that a like fragrance is also perceptible after rain, when the corn has been cut down in the fields, where there only remains dry stubble. He further observed, that this fragrance does not diffuse itself to any thing at a great distance, without being much diminished, and soon entirely gone.

33. This property of emitting a fragrant smell is likewise taken notice of by Dr. Home, in his Principles of Agriculture and Vegetation. Some physicians have prescribed a bath of earth for the cure of consumptive patients; and Dr. Solano de Luque was of opinion, that the earth had the property of absorbing contagious miasmata into it: but whether it can absorb these miasmata from living bodies or not, it certainly can absorb them from dead ones; for a piece of putrid meat will be much sweetened by lying for a short time in the ground.

34. From all this we cannot indeed infer that ‘putrid air’ is sweetened by mere earth; but we discover what is more important, viz. that though earth is the common receptacle of all putrid matters, both animal and vegetable, there is a change made on both of them when in it, which cannot be made either by air or water. Thus, if the carcase of a small animal is left to putrefy in the air, it becomes exceedingly offensive, and continues so from first to last. The same thing happens if it is left to putrefy in water. But, in earth, the case is quite different. After the carcase is consumed, the earth which has imbibed all the putrid steams, instead of exhaling an offensive odour, diffuses an agreeable one; and thus we may see that it is endowed with a power no less remarkable than that of attraction or repulsion, and which we may call transmutation. With regard to water, the case is more evident; for the most putrid water will be sweetened by percolation through earth, or even running in a channel for some time on its surface; but, if it contains any impurities of the saline kind, they will not be separated.

35. We must admit the existence of this power of transmutation, whatever we imagine the vegetable food to consist of; for it is impossible to solve the phenomena of vegetation by attractions

and repulsions. If we suppose the vegetable food to be salt, let us attract and repel salt as we will, it remains salt from first to last. Let us suppose it water, the case is the same; and, by mere attraction, nothing but masses of salt, or pools of water, could be produced. The case is the same on our own hypothesis; for, supposing plants composed of the putrid effluvia of others, and of dead animals, if nature was endued with no other power than attraction or repulsion, the vegetable would be a corrupted mass like that of which it was composed.—This power resides only in the earth and vegetables: air and water can indeed act as powerful solvents, but cannot transform or compound.

36. PROCESS OF VEGETABLE NUTRITION. With regard to the process of vegetable nutrition we perceive a great similarity to what is observed in the animal economy; the food whether imbibed from the atmosphere or taken up from the soil, in the form of gases, or other fluids, passes into the body of the plant and forms what is, in popular language, called the sap. This ascending into the leaves is elaborated, like the blood of animals in the lungs, after which it enters the general circulation of the plant, and becomes the great instrument of circulation. The intro-susception (as it has been called) of plants is by absorption or inhalation, as chyle into the animal lacteals, or air into the lungs: the former expresses the reception of non-elastic fluids, the latter those which are gaseous. Non-elastic fluids are absorbed by the epidermis. That leaves inhale air has been demonstrated; and the inhaling power which, according to Saussure, is the effect of their organization, in the opinion of Dr. Priestley is performed chiefly by the upper surface. It has also been thought that other parts of the plant absorb moisture and inhale gases, by means of pores in the epidermis.

37. DIFFUSION OF THE SAP.—The fluids absorbed from the soil, as we have already shown, are called sap; a lymph which before it can distribute nourishment to the different parts of the plant must either be conveyed to some viscus by which its elaboration shall be propelled upon some mechanical principle; or be immediately diffused over the whole body of the plant. The sap is in motion at all seasons of the year more or less, even the severity of the winter not entirely suspending its operations. Buds receive a gradual development throughout the whole winter; roots follow the same process; evergreens retain their leaves; and many of them, as the laurustinus, arbatus, and the tribe of the mosses protrude their blossoms, thus affording infallible evidence that the motion of the sap is not wholly suspended. Various opinions have been entertained with respect to the medium through which the sap ascends from the lower to the upper extremity; some imagining it to be by the bark, wood, and pith indiscriminately; others by the intervening medium between the bark and the wood. By steeping the extremities of branches of the fig, elder, honeysuckle, and filbert, in coloured infusions, the fact is now ascertained that the sap

ascends through the vessels of the longitudinal fibres, and constitutes the woody part of herbaceous plants. With respect to the manner in which the sap enters into the leaves, it was found, by means of the coloured infusion, that its medium is through the centre of the bundles of tubes or fibres extending in a longitudinal direction along the interior of the leaf-stem, extending upwards to the extremity of the leaves and in their direction downwards, penetrating the bark and alburnum, the tubes of which they join, still proceeding obliquely till they reach the pith. In case of the fruit-stalk, the central vessels were detected as before; but the colouring infusion was found to have penetrated the fruit also, diverging round the cone, afterwards converging in the eye of the fruit, and terminating in the stamen. Thus was discovered the mystery of the sap's course in the nourishment of vegetable life. It is received by the pores of the epidermis into the longitudinal vessels of the root. It is conducted thence to the collar, conveyed by the longitudinal vessels of the alburnum to the base of the leaf, stalk, and peduncle, from which it receives its final transmission to the extremities of the leaves, flower, and fruit. It appears also from the fact of a branch continuing to live, when the tubes directly leading to it, were cut in the trunk; that the sap, though propelled most copiously in the direct line of ascent, is at the same time circulated in a transverse direction. For the various theories respecting the cause of the sap's motion, see *VEGETABLE PHYSIOLOGY*.

38. ELABORATION OF THE SAP.—On boring a tree in the proper season, the sap that issues being different from the moisture of the soil, proves that the latter in its absorption has undergone a change, either in passing through the glands of the cellular tissue, which it reaches through the medium of a lateral communication; or in mingling with the juices contained in the cells, and being in its passage impregnated with a portion of them. The incipient stage of this elaboration effected within the interior of the plant, must remain a mystery, although its future progress and change may be more evident. The process of elaboration is chiefly in the leaf, when the sap exhaling a light fluid on the principle of perspiration, parts with some of its substance, thus altering its proportions and consequently its properties. The glutinous exudation found on the leaves of the maple, poplar, and lime tree, together with clear watery fluid, in a high state of elaboration, conglomerating into large drops and trickling down the leaves of the poplar and willow in hot calm weather, afford sufficient evidence of sensible perspiration. For further information on the subject of elaboration we must refer the reader to *BOTANY*.

39. DESCENT OF THE JUICE. When the sap has been duly elaborated in the leaf it assumes the appellation of the cambium, or proper juice of the plant; and in this state is found in the bark, or between the bark and the wood. It may be frequently distinguished by a peculiar colour, and was regarded by Malpighi as being

to the plant what the blood is to the body, the immediate principle of nourishment and life; in which state it is supposed to be conveyed to all parts of the plant by an appropriate set of vessels. The most scientific experiment on this subject is that of Dr. Darwin. A perfect stalk of the euphorbia helioscopia, with its leaves and seed-vessels, was placed in a decoction of madder-root. After remaining so for several days, the colour of the decoction was distinctly seen passing through each leaf. Many of the ramifications going from the mid-rib towards the circumference on the upper side of the leaf, were observed to be tinged with red, and on the under side was observed a system of branching vessels, originating in the extremities of the leaf, and carrying, not a red, but a pale milky fluid. These, after uniting in two sets on each side of the mid-rib, descended with it into the leaf-stalk, and were the proper vessels for returning the elaborated sap, distinguished by the appellation of veins, as those on the upper surface by that of arteries. Knight, in his subsequent experiments, detected in the leaf-stalk, besides the vessels, which he calls central tubes, through which, together with their appendages, the spiral tubes, the coloured infusion ascended, another set of vessels surrounding the former, which conveyed in one direction or other, a fluid that was not coloured, and which proved eventually to be the descending juice. These vessels extended upwards to the summit of the leaf, and downwards to the base of the leaf-stalk, penetrating the inner bark, whence the sap descends through the channel of the bark, or rather between the bark and alburnum, by means of the longitudinal vessels of the inner bark, down to the root. The descent of the juice has been ascribed to gravitation. Gravitation certainly has its influence, as is evident in the practice of gardeners; who to prevent the descent of sap in young shoots of trees which have grown upright, bend them down after being fully grown, by which means they produce larger buds, and often blossoms instead of leaf-buds.

40. ORDER OF DEVELOPMENT.—The production of the different parts or organs is not the same in herbaceous and annual plants as it is in woody and perennial plants, the former comprising apparently but one act of the vital principle, the parts being unfolded in immediate succession; whereas in the latter, the process is carried on by gradual and definite stages, from the opening of the spring, to the approach of winter, when the functions of vitality are in a great measure suspended, till the spring next succeeding, rouses them again to action. The embryo of the plant, when it first emerges from the seed, consists of a root, plumelet, and incipient stem; and in dissection exhibits an epidermis enveloping a soft pulpy substance, furnished perhaps with a central longitudinal fibre or perhaps an accumulation of them.

41. UNFOLDING OF COMPOSITE ORGANS.—The unfolding of the composite organs requires to be separately considered in reference to the annual plant, and the perennial. With respect to the organization of the former plant, and the

original shoot of the latter, both proceed the first year on the same general principle. A perennial of one year's growth, taken up in the beginning of winter, when the leaves have fallen away, is found to consist of root and trunk, the extremity of which is spotted with one or two buds. By being cut in two transversely, the trunk is found to consist of bark, wood, and pith. The pith seems merely a modification of the original pulp, but the pith and pulp are afterwards subject to a more complete conversion of their parts, and are organized in the several ramifications and divisions of the future plant. A perennial of two years is found to have increased in height by the addition of a perpendicular shoot, consisting like the former one, of bark, pith, and wood; and in circumference to have received the augment of a new layer of wood and bark, formed between the wood and bark of the former year. This covering of the original cone has excited considerable difference as to its origin. The same difficulty occurs each succeeding year, as long as the plant continues to live; a new layer being formed exterior to the one preceding it, increasing the diameter of the parent stock, the outermost layer of bark and innermost layer of wood originally tangent, being the growth of the first year, the second layer of bark and second layer of wood, the produce of the second year, &c. The tree also insinuates itself in height by means of an additional shoot, or branch every year after the manner of the first. Malpighi supposed the new layer of wood was formed from the fibre of the preceding year; but it appears from the discoveries and experiments of Knight, that the leaf gives the elaboration requisite to the formation of new parts. The medullary canal is filled with an interior layer, formed by a sort of cambium, deposited by the medullary tubes. These layers from the periods at which they are deposited, are of different degrees of solidity. The conversion of the albumen into perfect wood, is attributed by some to the loss of sap which the tree sustains after it has exceeded the bounds of maturity: by Knight and others its induration in the winter is attributed to a deposit left in the preceding summer, consisting of the proper juice of the tree in a state of conge-
lation. Whether there be a circulation of vegetable juices in plants, analogous to that of the blood, is a question that has been repeatedly agitated, but has met with many supporters and many opposers.

42. DECOMPOSITE ORGANS.—The progress and development of the decomposite organs, as the root, stem, branch, bud, leaf, flower, and fruit, comes next under consideration. The root, like the upper surface, is augmented annually by the addition of a new layer; and by the accession of a new shoot, emerging from the extremity of the preceding fibre. The root, provided it meets no obstacle, descends perpendicularly to a considerable depth. The root of some young oak trees taken up by Du Hamel, was found to be four feet, while the upper part did not exceed six inches. If the root in its descent meets with an obstacle, it takes an horizontal direction, by sending out lateral shoots.

When a root ceases to elongate itself, it shoots out lateral fibres, which are the more vigorous as they are nearer the trunk, which is attributed to the easy access of oxygen in the upper division; although the reverse of this is the case, provided the roots are horizontal, owing, as has been thought, to the more ample supply of nutriment it receives from the earth. Roots when injured send out lateral branches; and where the soil has been loosened, extend themselves to a considerable length. The strength acquired by roots, where difficulties are to be overcome, almost exceeds belief; they will penetrate through the hardest soil, to reach a soil that is more nutritive; they will insinuate their fibres into crevices of walls and rocks, which they have been known to burst and overturn.

43. The stem, as we have already observed, receives an augment of an additional layer, and a new shoot annually; not produced like the increment of the root, by the super-addition of vegetable particles to the extremity; but by the principle of intro-susception. The extension of the shoot is also rapid during the period it remains herbaceous; but slow after the time of its induration; and the small cone, rising during the first year, increases no more after the first winter, when it is perfectly consolidated. Palms, however, are to be regarded as an exception.

44. Branches, which in their development assume all the varieties of position, originate in a bud, and form a cone consisting of pith, wood, and bark. The lower branches are parallel to the earth; even though the tree itself stand obliquely on the slope of a hill; a circumstance which, for the most part, has been attributed to the forming of a greater proportion of buds on the side forming the obtuse angle with the base, from its greater exposure to the action of the atmosphere.

45. The bud is not common to all plants, nor to plants of all climates; numerous shrubs, and all annuals being destitute of them; also plants growing within the tropics, the leaf protruding immediately from the bark. But to the woody plants in cold climates, no new part is added but what emerges out of a pre-existent bud itself, clothed with new buds, each of which, surrounded with glutinous scales, forms the cradle of a new infant shoot, to burst its way the following spring. Of the natural origin of the bud much uncertainty of opinion seems to exist; but its development is by the action of the proper juice of the plant elaborated in the preceding buds, and originally in those of the plumelet.

46. The leaves, before they diverge from the expanding bud, are complete in all their parts, which proves that the infant individual, like the shoot itself, effects its final development by the intro-susception of new particles, augmenting at once the whole of its dimensions; though this rule is not without exception, as in the case of the liliaceous plants, &c.

47. The flower, which, according to Knight, is a prolongation of the wood, pith, and bark, is complete in all its parts, like the leaves. Interesting anomalies, connecting themselves with all the above considerations, present an interesting

and instructive field of research to the practical agriculturist; but, referring the reader for the consideration of them to the science of agriculture, we shall proceed to make some observations on the sexuality of vegetables.

48. VEGETABLE SEXUALITY, AND IMPREGNATION OF THE SEED.—The sexuality of plants was well known to the Greeks, from their mode of cultivating palms and figs. Aristotle, Theophrastus, Pliny, Galen, and Dioscorides, appear to have had some indistinct notions of the same subject. Pliny investigated all the various facts and evidences connected with this intricate subject, and at length established it upon the basis of logical induction. The male and female organs of vegetable generation are the stamens and pistils; and the substance, by which the impregnation of the seed is effected, is the pollen. This, when the above organs are near to each other, is dispersed by the elastic spring with which the anthera flies open. In many cases it is, however, conveyed from the anther to the stigma, by the instrumentality of insects, who, in their search for honey, settling upon a male flower, become covered with pollen, and afterwards fly to other plants of the same species; by which, females, though remote, form plants of the opposite sex. The fecundation of the ovary has, nevertheless, given rise to a great diversity of opinion. One class of experimentors imagined that the embryo, pre-existent in the ovary, is quickened by the pollen, or transmitted through the stylus. Others, observing that the embryo never makes its appearance till after fecundation, imagined that it must pre-exist in the pollen of the anther, from which it passes through the styli into the ovary. Others consider the embryo exists neither in the pollen nor ovary; but is produced by the generating union of the male and female organs; the fecundating virtue of the former consisting in a fluid which issues from the pollen when it explodes; and that of the latter, a fluid exuding from the surface of the stigma. Hybrid productions unite the properties of both the male and female, from which they originate. On impregnation, the flower declines; the stamens, petals, and calyx, for the most part, decay; whilst the ovary swells, and advances to perfection; its colour is deepened and enriched, its appendages are added, and its figure ultimately conformed according to its respective species.

49. PROPAGATION.—Propagation is carried on by means of the seed, which when it has reached maturity, detaches itself from its parent plant; and dropping into the earth originates the germinating process of a new individual. Sometimes by the elasticity of the pericarp, which opens with a sudden spring, it is thrown to a distance from the plant, after the seed has been discharged from the original stem; some species, as barley and wild oats, are provided with instruments for their dispersion, the awn of barley, with its little teeth, by mere contraction and distension, the effects of drought and moisture, often travels many feet from the stalk on which it grew. Winds, birds, and animals, together with the streams, rivers, and currents of the ocean—all become instrumental in effecting a still wider dispersion of the ger-

minating principle replenishing the earth with the numerous variety of plants for the perpetuating of the vegetable kingdom. The propagating of plants by means of germs, including bulbs and buds, also by leaves, slips runners, layers, offsets or suckers, together with the scientific application of grafting and budding, belong properly to the science of horticulture.

50. PATHOLOGY.—Pathology, the next thing requisite for an extensive cultivator to understand, includes the injuries, diseases, and that natural decay to which plants are liable. Injuries, wounds, and accidents, may be considered in the following order: 1. *Incision*; this, if it merely affects the epidermis, heals up without leaving a scar; if it penetrates the interior of the bark it heals, but leaves a scar; but if it penetrates into the wood, it never heals properly; but new wood and bark are formed. Incisions are often requisite for the vigour of the plant. 2. *Boring*, which is done to make them part with their sap; and, like the former, closes up by the formation of new bark and wood. 3. *Girdling*; a practice common in North America, especially when the farmer wishes to clear his land of timber. It is the practice of making parallel and horizontal notches in the trunk of the tree, penetrating through the alburnum; and afterwards scooping out the intervening portion. 4. *Fracture*, which happens when a tree is bent far back by storms, hurricanes, or any other means. If bark only of the cortical, or woody fibres, are affected, and the stem but small, the parts will reunite by being put back in their natural position, and propped up; but if the stem is large, and the fracture attended with contusion, a cure is not to be expected, the herbaceous substance exuding from between the wood and fibre, seldom sufficiently insinuating itself into the interstices to produce induration. 5. *Pruning* may be mentioned; the only precaution necessary to which, is, that of cutting the branch in a sloping direction, so as to prevent the rain from lodging on the exposed surface of the section. For more particulars upon which, as also upon grafting, which is a wound both of the stock and graft, uniting to each other by means of an herbaceous substance, exuding in the ordinary manner, we refer to HORTICULTURE. The destruction of buds and leaves, inflorescence, failure in the produce of flowers, seeds, &c premature inflorescence, and decorticitation, are the effects of those general accidents to which trees are liable.

51. DISEASES OF PLANTS.—The common diseases of plants are; 1. *Blight*, arising from various causes, exceedingly detrimental to the interest of the farmer. It is often occasioned by the cold easterly winds of spring, which kill the infant shoots of the plant, by stopping the circulation of the juices. The juices thus stopped in their passage, swell and burst the vessels; and supply nutriment to the numerous tribes of insects that make their speedy appearance, and are generated in them. These are commonly supposed to be the cause of the disease, and in the farmer's opinion are wasted on the east wind. In the spring the blossoms, that so delight the be-

holder by their premature protrusion, are commonly subject to a similar disease, by means of the spring frosts. Another species of blight originates in pestilential vapours, and commonly occurs in the middle of the summer, after heavy showers, succeeded by immediate sunshine. In hop grounds, the centre is the point at which it originates. It was this species which damaged the vineyards of ancient Italy, and at present greatly injures our agricultural produce. Wheat crops are often entirely destroyed by this means. Blight often arises from fungi; and for the most part attacks our grains and grasses: this blight assumes the appearance of a rusty-looking powder, and soils the finger. The blades of some wheat attacked in 1807, exhibited the appearance of a number of rusty looking patches, dispersed over the surface, containing thousands of small globules collected in groups under the epidermis. Sir J. Banks ascertained these to be patches of a small fungus, the seeds of which, floating in the air, enter the pores of the leafy envelope, or exist in the manure, and pass into the root by means of the pores. This blight, which the farmer calls red-rust, generally confines its attack to the stalk and the blade. It is, however, to be distinguished from another species called red-gum, which attacks the ear only. 2. Smut; the next disease converts the farina of the grain with its integuments and a portion of the husk, into a species of fine sooty dust. It is seldom general in a crop; and it is said may be prevented by steeping the seed, before it is sown, in a weak solution of arsenic. The disease called bags, or smut-balls is prevented in the same way. 3. Mildew, is a thin whitish coating, covering the leaves of vegetables, and causing their decay and death. On wheat it assumes the shape of a glutinous exudation; and is found particularly when the days are hot, and the nights without dew. Mildew is said, in cases of cultivated crops, to be prevented by manuring with soot; and sulphur was found by J. Robertson, the only specific cure. 4. Honey-dew is a sweet clammy substance, coagulating on the surface of leaves during hot weather. With respect to its origin, agriculturists are not agreed. 5. From long continued rain, or too much watering, plants and vegetables are subject to a disease called the dropsy, which is generally incurable. It consists of a preternatural swelling of particular parts, gives fruits a watery taste, and occasioning an immoderate protrusion of roots from the stem, prevents the ripening of seed. 6. Flux of juices is another disease to which vegetables are liable, as the tears of the vine, or spontaneous extravasation of sap, exudation of gum, chillblains, &c. 7. Gangrene, etiolation, contortion, suffocation, and consumption, are calamities, incident to vegetables, to meet which every agriculturist should be prepared. But although the plants should be subject to none of the before mentioned accidents and diseases, decay after a few years, according to the vigour of its species, is nevertheless certain. Many vegetable subjects die annually, others which are as to their composite organs perennial, are subject to a decay of the temporary organs. The falling of the leaves, the fall of the flower, and the fall of the

fruit are sufficiently familiar, and are frequently compared in the animal economy to the moulting of birds, &c., because after shedding its foliage, by the powerful blasts of winter, the tree clothes itself as fresh as ever by the warmth of the succeeding spring. The temporary organs at last decay, old age creeps upon the system, the root no longer receives nourishment from the soil, or what it receives is feebly propelled; elaboration is difficult, the descent of the juice is almost totally obstructed, the bark becomes thick, and covered with lichens, or moss, the shoots decay first, then the branches, the trunk, and last of all the root; and nature hastens their decomposition till it crumbles away to mould.

52. As the subject of the diseases of plants is one of the utmost importance to the farmer, we shall add to this scientific arrangement of their nature, some miscellaneous remarks and facts.

53. Tournefort divides the diseases of plants into five classes: first, those which arise from too great an abundance of juice; second, from too little; third, from its bad qualities; fourth, from its unequal distribution; and fifth from external accidents.

54. Too great an abundance of juices causes at first a prodigiously luxuriant growth of the vegetable, so that it does not come to the requisite perfection in a due time. Wheat is subject, in some climates, to a disease of this kind; it vegetates excessively, without ever carrying ripe grain; and the same disease may be artificially produced in any grain, by planting it in too rich a soil. Too much rain is apt likewise to do the same. When a vegetable is supplied too abundantly with juices, it is very apt to rot; one part overshadowing another in such a manner as to prevent the access of fresh air; upon which putrefaction soon ensues, as has been already observed.

55. In grass, or any herbaceous plant, where the leaves only are wanted, this over-luxuriance cannot be called a disease, but is a very desirable property; but in any kind of grain it is quite otherwise. Dr. Home, in his Principles of Agriculture and Vegetation, classes the smut in grain among the diseases arising from this cause. He says that too great an abundance of juices in a vegetable will produce diseases similar to those occasioned by repletion in animal bodies; viz. stagnations, corruptions, varices, cariosities, &c. along with the too great luxuriance just mentioned, which he expresses by too great an abundance of water shoots. Hence he is induced to class the smut among diseases arising from this cause; it being a corruption happening most in rainy seasons, and to weak grain.—Like other contagious diseases, he says, the smut may be communicated from the infected to healthful grain. As a preventative, he recommends steeping the grain in a strong pickle of sea-salt. Besides the effect which this has upon the grain itself, it is useful for separating the good from the bad; the best seed falling to the bottom, and the faulty swimming on the top of the liquor.

56. Dr. Home says, dung is a preventative of diseases arising from too great moisture; in proof of which he relates the following experi-

ment. ‘Two acres of poor ground, which had never got any manure, were fallowed, to be sown with wheat; but the scheme being altered, some dung was laid on a small part of it, and the whole sowed, after it had got five furrows, with barley. A great quantity of rain fell. The barley on that part which was dunged was very good; but what was on the rest of the field turned yellow after the rains, and when ripe was not worth the reaping.’

57. The want of nourishment in plants may be easily known by their decay. The only remedy is, to supply them with food, according to the methods above directed, or to remove from their neighbourhood such other plants as may draw off the nourishment from them. In the Memoirs of the Academy of Sciences for 1728, M. Du Hamel mentions a disease, which he calls le mort, that attacks saffron in the spring. It is owing to another plant, a species of trefoil, fixing some violet-coloured threads, which are roots, to the roots of the saffron, and sucking out its juice. This disease is prevented by digging a trench, which saves all the unaffected.

58. The bad qualities or unequal distributions of the juices of plants, are the occasion of so few of the diseases to which vegetables in this country are subject, that we need not mention them. Most of the diseases of our plants are owing to external accidents, particularly to the depredations of insects. The insects by which the greatest devastations are committed in this country are, snails, caterpillars, grubs, and flies. The snails and caterpillars feed on the leaves and young shoots, whereby they often totally destroy the vegetable. Where the plants are of easy access, these vermin may be destroyed by sprinkling the vegetable with lime-water; for quicklime is a mortal poison to these creatures, and throws them into the greatest agonies the moment they are touched with it. On trees, however, where this method cannot so well be followed, fumigation is the most proper; and for this purpose nothing is better than the smoke of vegetables not perfectly dry. In some cases the eggs of these destroying creatures may be observed, and ought immediately to be taken away. On fruit trees, as apples, pears, medlars; on some forest-trees, the oak and dwarf-maple especially, and the white and black thorn in hedges, a kind of little tufts are to be observed, resembling, at first sight, withered leaves twisted by a cobweb about the uppermost twigs or branches. These contain a vast number of little black eggs, that in the spring produce swarms of caterpillars which devour every thing. To prevent this, all the twigs on which these cobwebs appear should be taken off and burnt as soon as possible. This ought to be done before the end of March, that none of the eggs be allowed sufficient time for hatching.

59. The grubs are a kind of worms which destroy the corn by feeding upon its roots; they are transformed every fourth year into the beetles called cock-chaffers, may-bugs, &c. They are very destructive when in their vermicular state, and cannot then be destroyed, because they go deep in the ground. When become beetles, they conceal themselves under the leaves of trees, where they seem asleep till near sun-set, when

they take their flight. It is only then that they can be destroyed, and by a very laborious method, namely, by spreading pack-sheets below the trees in the day-time, when the beetles are in their torpid state, then shaking them off and burning them. Some time ago they made such devastations in the county of Norfolk, that several farmers were entirely ruined by them; one gathered eighty bushels of these insects from the trees on his farm. In 1574, there fell such a multitude of these insects into the Severn, that they stopped and clogged the wheels of the water-mills.

60. Turnips, when young, are apt to be totally destroyed by a multitude of little black flies, thence called the turnip-fly. As a preventative of these, some advise the seed to be mixed with brimstone; but this is improper, as brimstone is poisonous to vegetables. The best method seems to be the fumigation of the fields with smoke of half-dried vegetables. For this purpose weeds will answer. This fumigation must be often repeated, to drive away the innumerable multitudes of these insects which are capable of destroying a large field of turnips. Some suppose that the fly is either engendered in new dung, or enticed by it; and therefore advise the manure to be laid on in the autumn preceding, by which it loses all its noxious qualities, while its nutritive ones are retained, not being exhaled by the sun. This method is ascertained by experiments; and another material advantage accruing from autumn manuring for turnips is, that all the seeds contained in the dung, and which, being carried on the land with it, vegetate almost immediately, are mostly killed by the cold of winter, and the few that remain seldom escape destruction by the plough-share.

61. The following method of sowing has also been recommended as a preventative of the fly:—‘About midsummer, when it rains, or there is an apparent certainty of rain approaching, sow your turnip-seed; if about the full moon, the better. In this case, neither harrow, brush, nor roll, after sowing. The natural heat of the ground at that season, and the consequent fermentation occasioned by copious rain, will give an astonishingly quick vegetation to the seed, which in a few days will be up and out of all danger from the fly. At all events, sow not till it rains; it is better to wait a month, or even longer, for rain, than to sow (merely for the sake of sowing about the usual time) when the ground is parched with heat. By the scorching of the sun, the oil and vegetative quality of the seed are exhausted; and the few weak plants that come up will be destroyed by the fly before they can attain strength to put forth their rough leaves. The fly infests the ground abundantly in dry hot weather, but does no injury in rain. The falling rain will sufficiently wash the turnip-seed into the ground without harrowing it in; which, instead of merely covering, too often buries this small seed at so great a depth, as never afterwards to get above ground.’

62. The following remedies are also recommended as having often proved successful. A small quantity of soot sown over the land at their first appearance. Branches of elder, with

the leaves bruised, drawn in a gate over them. Musk mixed with the seed before it is sown. And sulphur burnt, under it, after moistening it with water in which tobacco has been steeped. But showers on the plants as soon as they appear above ground are esteemed the best preservatives. They enfeeble and kill the fly, and hasten the plants into the rough leaf, when they are out of danger. The sweet smell of turnip has been thought to attract the fly; upon which supposition, the remedy appeared to consist in overpowering that smell by one which is strong, fetid, and disagreeable. Hence it has been recommended, that upon an acre of turnips sown in the usual way, a peck or more of dry soot be thrown after the ground is finished, and in as regular a way as the seed is sown.

63. Some years ago, an insect, called the corn butterfly, committed such ravages while in its vernacular state, in France, that upwards of 200 parishes were ruined by it; and the ministry offered a reward to the discoverer of an effectual remedy against this destroying worm. The cure which was at last discovered, was, to heat the corn in an oven so much as not to destroy its vegetative power, but sufficiently to destroy the small worms which made their nest in the substance of the grain, and at last ate the substance completely. Though insects can bear a great deal of cold, they are easily destroyed by a slight degree of heat; nor is the vegetative power of corn easily destroyed, even kept for a long time in a pretty strong heat. This method must therefore be effectual for destroying all kinds of insects with which grain is infested: but care must be taken not to apply too great a heat; and the adjusting of the precise degree necessary to destroy the insect, without hurting the corn, will require attention.

64. The curled disease in potatoes has long been a subject of investigation and experiment among farmers; and the knowledge of its cause and cure seem yet to remain a desideratum. See POTATOES. The 'Agriculture Society' at Manchester, a few years ago, offered a premium for discovering by actual experiment the cause of the disease in question; and many letters were, in consequence, addressed to them upon the subject. As these contain some interesting remarks, though very little decisive on the subject, we shall give a short extract from them.

LETTER I. The writer of the first letter ascribes this disease to an insect produced by frost or bad keeping before setting. In autumn 1776, he got up a bed of potatoes to lay by in winter, leaving plenty in the ground as regular as possible; and, before the severity of winter came on, covered part of the bed with straw and peas-haulm, and left the other part of the bed uncovered. That part of the bed which was covered was quite free from curled ones; but the uncovered part produced many curled, owing, as the writer says, to frost.

II. This writer had about a quarter of an acre of potatoes, well manured with cow and horse dung, and took great care in picking the fine smooth-skinned potatoes for sets; yet nine out of ten were curled. He attributes the cause of this disease to a white grub which he found near the

root, about half an inch long, with eight or ten legs, its head brown and hard; as, upon examining a number of the curled roots, he found them all bitten, from the surface to the root, which stopped the progress of the sap, and threw the leaf into a curl. The uncurled were not bitten. First, he put soot to the insects in the rows for two days; and after that, he put lime to them for the same time, but they still kept lively; next he put a little salt, which destroyed them in a few hours. From which he infers, that if coarse salt were put into the ground at the time the land is preparing for potatoes, it would cure this distemper.

III. In this letter, the cause of the disease is attributed to the method of earthing the stems while in cultivation; and it is recommended to take the sets from those potatoes that have not bared any from the branch covered.

IV. According to this writer, the disorder proceeds from potatoes being set in old tilled or worn-out ground. Hence he says, that no sets ought to be used from such land; and that, to have good sets, they should be procured from land that was purposely fallowed for them; from fresh ley land, where they are not curled; or from ley land that was burnt the preceding spring. To make certain of getting good sets, he recommends crabs to be gathered from potatoes growing on fresh land free from curl, and the next spring to sow them on fresh ley land; and continue to sow them on fresh ley land yearly. All the good potatoes he saw, either on fresh ley land or on old tilled land, were raised from sets that grew upon fresh ley land last year; and where he has seen curled potatoes, he found, upon enquiry, that the potatoe sets grew upon old tilled and worn-out land last year.

V. In 1772, this writer planted some potatoes by accident full nine inches deep; when taken up, many of the plants were rotten, and a few curled. He kept the whole produce for seed, and planted two acres with it in 1773, not quite six inches deep. The crop was amazingly great; and he did not observe any curled plants among them. In 1774, many of these were planted in different soils; yet they were so infected with the curled disease, that not one in twenty escaped. In 1775, the disease became general. In 1776, it occurred to him that the good crop of 1773 was owing to the accidental deep setting of 1772; and that the reason why the same seed became curled in 1774, was their being set so near the surface in 1773. In 1777, he took some potatoes from a crop that was curled the year before, and after cutting the sets, left them in a dry room for a month. Half were planted in ground dug fourteen days before; the other half having been steeped in a brine made of whitesters ashes for two hours, were also planted in the same land at the same time. The steeped ones came up ten days before the others, and hardly any missed or were curled. The unsteeped ones generally failed, and those few that came up were mostly curled. He therefore advised,

First, that the potatoes intended for next year's sets be planted nine inches deep. Secondly, that they remain in the ground as long as the season will permit. Thirdly, That these sets be well defended from frost till the beginning of

March. Fourthly, that the sets be cut a fortnight before planting. Fifthly, that they be steeped, as above, two hours in brine or ley. Sixthly, that the dung be put over the sets. And, seventhly, that fresh sets be got up every year from sandy soils near the coast, or on the shore. At planting, the hard dry sets should be cast aside, for they will probably be curled. Curled potatoes always proceed from sets which do not putrefy in the ground.

VI. This writer had five drills of the old red potatoes, and four of the winter whites, growing at the same time in the same field. The drills were prepared exactly alike. Among the red not one was curled. The winter whites were nearly all curled. He says he has found by experience, that the red never curl.

VII. Two of this writer's neighbours had their sets out of one heap of potatoes. They both set with the plough, the one early and the other late, in the season. Most of those set early proved curled, and most of those set late smooth; the latter on clay land. A few rods of land were also planted with small potatoes, which had lain spread on a chamber floor all the winter and spring till the middle of May. They were soft and withered; they proved smooth and a good crop. Middle sized potatoes, withered and soft, which had been kept in a large dry cellar, and the sprouts of which had been broken off three times, produced a smooth and good crop. Hence he was led to think a superfluity of sap, occasioned by the seed being unripe, might cause the disease. To be satisfied of this he asked the farmer whether he had set any of the same potatoes this year, and what was the nature of his land? He told him, he had; that they had been set on his farm fourteen years without ever curling; that the soil was a poor whitish sand of little depth; that he let those he designed for keeping grow till they were fully ripe. Hence he concludes, the only sure way to prevent the curl, is to let the potatoes intended for seed stand till they are fully ripe, and to keep them dry all the winter.

VIII. This writer set a quantity of red potatoes, without having a curled one amongst them. His method is, when the sets are cut, to pick out such as are reddest in the inside. On digging them up at Michaelmas, he mixes none of the curled seed among the others. The curled are easily distinguished by their stalks withering two months before the rest of the crop. The cause of the curled disease he attributes to potatoes being of late years produced from seed instead of roots, as formerly. Such will not stand good more than two or three years, use what method you please. Last spring he set the old red and white russets, and had not a curled potatoe amongst them. On the lime-stone land about Denbigh, in North Wales, they have no curled potatoes. If this be owing to the nature of that land, perhaps lime might prevent the disease.

IX. According to this writer all sorts of grain wear out and turn wild if sown too long on the same land; the same will hold good in all sorts of pulse, peas, beans, and potatoes. Those who have most curled potatoes generally plant very small sets. Eleven years ago he bought a parcel

of fresh sets, of the golden dun kind, and has used them without change to the present year, without any being curled. This he principally attributes to his having always planted good large sets. To prevent the evil, cut the sets from clear and middle sized potatoes, gathered from places as clear of the curl as possible; preserve them till spring; if any are harder, or crash more in cutting than usual, cast them aside. He also recommends the raising a fresh sort from the crab produced on the sorts least affected, which in Lancashire are the long duns.

X. Set potatoes with the sprits broke off, and they will (says the writer of this letter) be curled ones; if set with the sprits on, they will not be curled. Again, take a potatoe which is sprit, and cut an off-set, with two sprits; break one sprit off, and let the other stay on, and set it; the former will be curled, and the latter will not. When the potatoes are holed, take them out before they sprit, and lay them dry until you set or sow them, and you will have none curled.

XI. This writer was at the expence of procuring sets from fifty miles distance, and where this disease was not known. The first year's trial was successful; the year following he procured sets from the same place, but one fifth of his crop was infected. By way of experiment, he planted sets from roots which had been infected the year before, and some of these produced healthy plants, free from all infection. He supposed the cause to be some insect, which, living on the leaves, gave them that curled and sickly appearance, as is the case in the leaves of many shrubs and trees; he made the following experiments. On a piece of ground that had not been dug for twenty years, he planted four rows of sets, which he knew to be perfectly clear; the drills were two feet distant, the sets one foot distant in each drill. He then planted on the same ground four rows with sets from curled potatoes, at equal distances; in each row were about twenty sets. Lot I. the curled state. No. 1. Without manure; 2. In salt; 3. In soot; 4. In quicklime. Lot II. the clear sets. No. 1. Without manure; 2. In salt; 3. In soot; 4. In lime. Those planted in salt and soot in both lots were destroyed. In Lot I., No. 1. and 4., all curled. Lot II., No. 1. and 4., quite clear. This experiment was made on a supposition that the insect lodged in the set, and must be destroyed on planting. But of that he is not satisfied. He repeated salt, soot, and quicklime, on the branches of several curled potatoes. Salt destroyed all he touched with it. Lime and soot had a partial effect on the plants. After some time, they appeared almost as healthy as the rest. Thus, although he has done little towards the cure, he flatters himself he has pointed out the cause, the insects on the curled plants being not only very numerous, but visible to the naked eye.

XII. This writer ascribes the cause of the disease to the frost, and bad keeping in winter and spring before setting. They are liable to be damaged by frost after they are set, but this may be prevented by covering. If it be asked, why frost did not injure them formerly; he answers, it is only the *new* kinds which are apt to curl, and less care is now taken of the seed

than formerly. Let them remain in the ground covered with haulm or litter till they are wanted for setting; and, if no frost touches them afterwards, they will be free from the disease.

XIII. This writer says, the red potatoe was as generally planted as the winter white and the Lincolnshire kidney are now. The first, being a later potatoe, did not sprout so early as the others. The white sprout very early, and therefore should first be moved out of the place where they have been preserved in winter. Instead of that, they often remain till their roots and sprouts are matted together. On separating them, the sprouts are generally rubbed off, and they are laid by till the ground is ready; during which interval they sprout again; but these second sprouts, being weak and languid, shrink, sicken, and die; and the fruit at the roots will be small, hard, ill-shaped, and of a brown colour. Now, if pulling off the sprouts once or more, before the sets are put in the ground, be the cause (as he believes it is) of the curled disease, an easy remedy is at hand. When the potatoes intended for sets are dug up, lay them in a west aspect as dry as possible; in such a situation they will not sprout so soon. The best time for removing most sorts is the first fine day after the 24th of February. Cut them into sets, and let them remain covered with dry sand till the ground is prepared, which should be a winter fallow. Lay the sets in without breaking off any of the sprouts, for the second will not be so vigorous. This accounts for one sprout out of three from the same set being curled. The two stems not curled rose from two later eyes, and were first sprouts. The sprout curled was a second, the first having been rubbed off.

XIV. This writer says, that, last spring, one of his neighbours cut and set, by drilling, some loads of the largest potatoes he could procure; and more than half of them proved curled. Being a few sets short of the quantity wanted, he planted some very small potatoes which he had laid by for the pigs. These being fully ripe and solid, there was not a curled plant among them. He thinks the others being curled was owing to their not being fully ripe. A crop of potatoes, set in rows on ground that had borne a crop of them the preceding year, were mostly curled; but many plants came up from seed left in the ground the former season, and there was not a curled one among them.

XV. Of late years, this writer says, great improvements have been made in setting potatoes and cutting the sets. The ground is dressed cleaner and dunged stronger. Many people, in drilling, wrap up the sets entirely in the dung; by which means, though their potatoes are larger, the disease seems to be increased. They also cut their sets out of the richest and largest potatoes, which is perhaps another cause of this evil. In cold countries, where they set their own seed, which has grown on poor land, with less dung, they have no curled plants. On the contrary, when they bought rich and large potatoes for seed, they have been curled in great quantities. He believes the richness and largeness of the seed to be the cause of the evil; for he does not

remember to have seen a curled stem which did not spring from a set of a large potatoe.

XVI. This writer apprehends the curled disease in potatoes to proceed from a defect in the *planta seminalis*, or seed-plant; and from comparing curled ones with others, there appeared to be a want of, or inability in the powers of expanding or unfolding the parts of the former; which, from this defect, forms shrivelled, starved, curled stems. On examining some of the sets at the time of getting the crop, he found them hard and undecayed; so hard, indeed, that some of them would not be soft with long boiling. Some have thought that the fermentation is occasioned by too great quantities being heaped together; but this writer has seen an instance, wherein a single potatoe, preserved by itself, when set, produced stems of the curled kind. He thinks the disease is occasioned by the potatoes being taken from the ground before the stamen, or miniature plant, is properly matured and ripened. For the potatoe, being a native of a warm climate, has there more sun, and a longer continuance in the ground, than in its exotic state; consequently, it has not the same natural causes to mature the seed-plant as in its native state. We ought, therefore, to give all the opportunities our climate will admit for nature to complete her work, and fit the stamen for the next state of vegetation, especially in those intended for seed. But if the potatoe be taken up before the seed plant be fully matured, or the air and sap vessels have acquired a proper degree of firmness or hardness, it must, when thus robbed of further nutrition, shrivel up; and when the vessels, in this immature state, come to act again in the second state of vegetation, they may produce plants which are curled. Before the present mode of setting them took place, people covered them, while in the ground, with straw, to protect them from frost. If it be asked, why one set produces both curled and smooth stems? he answers, we suppose every eye to contain a *planta seminalis*; that all the embryos or seed plants, contained in one potatoe, are nourished by one root; that, as in ears of corn, some of these seed plants may be nourished before others. One of his neighbours, last year, set two rows of potatoes, which proving all curled, he did not take them up; and this year there is not a curled one among them. Such potatoes, therefore, as are designed for seed, should be preserved as long in the ground as possible.

XVII. This writer advises such sets to be planted as grow in moss land; and, he says, there will not be a single curled one the first year. This is affirmed by the inhabitants of two townships, where they raise amazing quantities. A medical gentleman sowed the one year two bushels of sets from one of the above places; and had not one curled; but on sowing them again the following year he had a few.

65. Although there seems to be a diversity of opinions among the above writers, occasioned by the different appearances of their crops, and respecting the means proper to prevent or cure the disease, the following general propositions may be fairly drawn from the whole: 1. That some

kinds of potatoes are (*cæteris paribus*) more liable to be affected by the disease than the rest; and that the old red, the golden dun, and the long dun, are the most free from it. 2. That the disease is occasioned by one or more of the following causes, either singly or combined: First, by frost, either before or after the sets are planted: Second, From planting sets out of large unripe potatoes: Third, From planting too near the surface, and in old worn-out ground: Fourth, From the first shoots of the sets being broken off before planting; whence there is an incapacity in the *planta seminalis* to send forth others sufficiently vigorous to expand so fully as they ought. 3. That the most successful methods of preventing the disease are, cutting the sets from smooth middle-sized potatoes, that were fully ripe, and had been kept dry after they were taken out of the ground; and, without rubbing off their first shoots, planting them pretty deep in fresh earth, with a mixture of quicklime, or on lime-stone land.

66. A correspondent of the Bath Society is convinced, that, whatever may be its cause, the fault itself is inherent in the seed; and has communicated the following method of avoiding it: 'I made a hot bed in the following manner, which method I have used ever since: I laid horse dung, &c. as in making hot beds, about eighteen inches thick; over which I spread a layer of fine rich mould about four or five inches thick; upon the top of this I laid, in different divisions, a certain number of potatoes of various sorts, some of my own growth, and others brought from different parts, and covered these lightly over with more mould; they soon came up. I then observed which was freest from the blight or curl; for if there were not more than one defective in forty or fifty, I concluded I might set of that sort with safety. This method I have now practised near twelve years, and never lost my crop, or any part thereof worth mentioning; whilst my neighbours, who followed the old method, were frequently disappointed in their crops; and to the best of my knowledge, all those of my neighbours who have of late been persuaded to take the trouble of using the same means as myself, have never failed of success in one instance; nor do I ever think it will fail, if duly attended to; the fault being some hidden cause in the seed, unknown at present, and I believe incurable by any means, at least which have yet come to my knowledge. My reason for planting my hot bed so soon is, that if the frost hinders the first experiment, or they all prove bad, I may have time to make a second or third with different sorts of seed, before the proper season arrives for planting in the fields and grounds appointed for the great and general crop.'

67. The principles of agriculture may be reduced to a very small compass, viz. imitating the native habitations and propagating the species of the several plants. To improve their qualities, as also to increase their number, the chief thing requisite is, to facilitate their mode of nutrition, by removing all obstacles, by draining, and numerous other operations above and below

the soil; also by supplying food, as by manuring, &c. The manure best adapted is decayed plants of their own species; some containing peculiar substances in their composition, as wheat for instance, which contains gluten and phosphate of lime. It is also important to ameliorate the climate, by increasing or diminishing its temperature, according to the nature of the plant; to shelter and shade some species of vegetables by means of walls, hedges, banks, or sloping surfaces, to receive more directly or indirectly the solar rays, with numerous other iota, which a slight practice of agriculture will suggest; as thinning away the leaves immediately overshadowing fruits and flowers, blanching, shading, cuttings, seeds, &c.; imitating, by artificial applications of water, the dews and showers of heaven; cutting ridges for surface drainage, conduits, &c. To improve the quality, and increase the number of particular parts of vegetables, it is needful frequently to amputate all other parts that are unnecessary, as in pruning the vine; and to form new varieties, we must take advantage of their sexual difference, and imitate the example of animal nature in crossing the breed.

68. PRESERVATION OF FRUITS.—In the preservation of the fruits, when produced, considerable judgment is necessary. The great object is to prevent, as long as possible, the process of chemical de-composition. The air around depriving them of their carbon, the moisture within enfeebling the affinity of their component elements; and together with heat tending greatly to promote their de-composition; potatoes, turnips, &c. are best preserved by drying them in the sun, and burying them in a dry soil, a few degrees above the freezing point of temperature. By drying in the sun, and afterwards burying in dry cool pits, closed, so as to shut out the air, some may be effectually preserved for many years; the internal air becoming carbonic acid gas, in which no animal can live, and in which, without oxygen, no seed will vegetate.

69. Drying in ovens answers the same purpose as drying in the sun, and is one of the most obvious modes of preserving vegetables for use: it destroys, however, in most cases, the principle of life in seeds, as also in the roots and sections of the shoots of ligneous plants, and thus prevents the possibility of future germination. It is of capital importance in preservation, after the vegetables are thoroughly dried, so to bury them, as effectually to exclude the atmospheric air, by which means, not only decomposition is prevented, but the ravages of insects, vermin, and 'even vegetation. It was no proof of the skill of our ancestors, when they changed this practice of the ancients, for the less successful mode of enclosing in granaries and store-houses. The Romans preserved their corn in chambers hewn out of dry rock, a practice, the advantages of which, set forth by their most valuable writers, are justified by modern experience. The Moors, from time immemorial, have been accustomed to bury their corn in the sides of hills, by which famines have been frequently prevented, and supplies readily obtained after the

most deleterious seasons. The Chinese at the present time bury their store-grain in deep pits in dry soil, a practice which has distinguished them from the earliest history. The origin of these expedients, are all obvious imitations of what commonly takes place in nature: they are applications of natural principles of which the whole circle of sciences, with all the numerous modifications and practises founded upon them, are but a varied development, and as such, may be satisfactorily explained by chemistry and physiology. The instinct of animals has guided men of genius in many cases to the discovery of them; as in the winter store of the hedge-hog, in the repository of the ant, whilst the successful preservation of vegetable substances on this inferior scale, has demonstrated their practical importance more effectually than a thousand arguments.

70. MINERALOGY.—Our next object in the present article, will be to exhibit the science of agriculture in its immediate connexion with the mineral kingdom, including all the primary elements concerned in vegetation. Earths are the production of rocks, exposed on the earth's surface; and soils are earths mixed with certain proportions of the de-composed matter, arising from the bodies of dead plants and animals. With respect to its geological structure, the under surface of the earth presents four distinct species of rocky substances. The first, consisting chiefly of granite and marble, are called primitive; and are supposed to be co-eval with the formation of the world. The second series, sometimes called transition rocks, appear to be of more recent formation; and are probably the result of some great catastrophe. Of these, clay-slate is the most remarkable, to which may be added, trap or whinstone, sandstone, &c. Secondary rocks, as sandstones, limestones, conglomerations of fragments of other rocks, &c. form a third series. They probably owe their formation to local revolutions, and are indicated by their soft fragile texture, superincumbent situation, and horizontal position. The fourth and last series consists of irregular strata, of alluvial or earthy depositions from water assuming the modification of immense beds of clays, sands, or marls. Earths are variously composed according to the rocks or strata from which their elementary particles have been derived. Those formed from slate-rocks commonly assume the modification of blue clays; those from sandstones are called siliceous throughout their several varieties. The additions made by the decay of animal and vegetable substances, have given rise to the appellation of soils, which differ from earths inasmuch as they contain a greater or less portion of animal or vegetable matter. They are also distinguished by their friable texture, dark colour, and by the presence of some vegetable fibre or carbonaceous matter. The depth of soil upon cultivated grounds is only a few inches below the surface,

unless in crevices where they have been carried by the rains.

71. SECT. II.—A GENERAL VIEW OF SOILS, AND THEIR CULTIVATION. Soils are divided into two grand classes, primitive and secondary; the former consisting chiefly of inorganic matter, the latter of both organic and inorganic in mixtures. These two classes may be subdivided into orders depending on the presence or absence of saline, metallic, and carbonic matter. These orders form certain genera, calculated from the prevailing metals, earths, salts, carbon, &c. The species, the next inferior to the genera, is founded on their various mixtures. Varieties dependent upon colour or texture form component divisions of the species and sub-varieties of the varieties, according to the relative dryness, richness, brightness, moisture, &c. To determine the genera of soil, the first thing is to ascertain the prevailing earth or earths, as clay, sand, lime, &c. or the particular rocks from which the soil has been produced, as basalt, granite, &c. The earths that prevail supply the generic name of the soil, as the calcareous soil, clayey soil, &c., but when two prevail equally, the names of both must be conjoined, basalt and sand, clay and sand, &c. Precision in the application of the terms greatly facilitates a knowledge of the subject. No soil should be called sandy that does not contain seven-eighths of sand, and if effervesces with acids should be called calcareous sandy soil, in opposition to that which is siliceous. Clayey soil should denominate land containing not less than one-sixth of impalpable earthy matter, freely effervesing with acids. Peaty soil should contain one-half or more of vegetable matter. When the soil is composed of the decomposed matter from one particular rock, the name of that rock may be applied. On this principle fine red earth, found above decomposing basalt, may be called basaltic soil; that in which quartz, and mica are abundant, may be denominated granitic soil, &c. Alluvial soil, or those formed by the depositions of rivers, are commonly the most difficult to define, but may be for the most part designated by the terms siliceous, calcareous, argillaceous, &c., in some cases saline. The species of soil is determined by the mixture of matters rather than by the colour or texture, the latter being the characteristic distinctions of varieties. A clayey soil, with sand, is denominated a sandy, clayey species; if yellow, it might be called a yellow sandy clay, which would express the genus, species, and variety. A soil containing equal parts of clay, lime, and sand entire; or to express at the same time its varieties, it might be called a brown, stiff, free, fine, or coarse entire clay, lime, and sand. The common genera, species, and varieties of soils, are enumerated in the following table.

Class.	Order	Genus.	Species.	Variety.	Sub-variety.	
EARTHS.	PRIMITIVE SOILS.	Clay . . .	Entire	Black	Wet—dry—rich—poor—sterile:	
		Earths . . .	Lime . . .	Entire	Red and yellow	Wet, dry, &c.
			Sand . . .	Entire	Coarse and fine	Wet, dry, &c.
				Cupreous	Black, red, yellow, fine, &c.	Wet, dry, rich, &c.
				Ferruginous	Black, red, yellow, fine, &c.	Wet, dry, &c.
				Clay . . .	Black, red, &c.	Wet, dry, &c.
				Saline	Black, red, yellow, fine, &c.	Wet, dry, &c.
				Cupreous and ferruginous	Black, red	Wet, dry, &c.
				Lime . . .	Black, red, yellow, fine, &c.	Wet, dry, rich, &c.
				Sand . . .	Black	Wet.
SECONDARY SOILS.	Earths with organic remains.	Clay . . .	Ferruginous	Black, red, yellow, fine, &c.	Wet, dry, rich, &c.	
			Saline	Black	Wet, dry, &c.	
			Lime . . .	Limy	Black	Wet.
				Loamy	Black, red, yellow, &c.	Wet.
				Mouldy	Black, red, yellow, &c.	Wet.
				Peaty and sandy	Black	Wet.
				Clayey	Black, red, yellow, &c.	Wet.
				Lime . . .	Black	Wet.
				Peaty and sandy	Black	Wet.
				Clayey and limy	Black	Wet.
Earths with organic remains, metals, salts, and rocks.	Basalt . . .	Sand . . .	Loamy	Black	Wet.	
			Mouldy and peaty	Black	Wet.	
			Columnar	Black	Wet.	
			Ferruginous	Black, red, yellow, &c.	Wet, dry, &c.	
			Whinstone	Black	Wet.	
			Cinerous, loamy, &c.	Black	Wet.	
			Cupreous, loamy, &c.	Black	Wet.	
			Ferruginous, limy, &c.	Black	Wet.	
			Ferruginous, loamy, &c.	Black	Wet.	
			Ferruginous, mouldy, &c.	Black	Wet.	
Earths with organic remains, metals, salts, and rocks.	Clay . . .	Coal	Ferruginous, peaty, &c.	Black	Wet.	
			Ferruginous, sandy, &c.	Black	Wet.	
			Saline, loamy, &c.	Black	Wet.	
			Pyritic, &c.	Black	Wet.	
			Slaty, &c.	Black, red, yellow, &c.	Wet, dry, rich, &c.	
			Stony, woody, &c.	Black	Wet.	
			Granite . . .	Ferruginous, &c.	Black, red, yellow, &c.	Wet, dry, &c.
				Quartzose, &c.	Black	Wet.
				Cinerous, limy, &c.	Black	Wet.
				Cinerous, loamy, &c.	Black	Wet.
Earths with organic remains, metals, salts, and rocks.	Limestone . . .	Lime . . .	Cupreous, loamy, &c.	Black	Wet.	
			Cupreous, sandy, &c.	Black	Wet.	
			Ferruginous, loamy, &c.	Black	Wet.	
			Ferruginous, sandy, &c.	Black	Wet.	
			Saline, loamy, &c.	Black	Wet.	
			Saline, sandy, &c.	Black	Wet.	
			Chalky, &c.	Black, red, &c.	Wet, dry, &c.	
			Cupreous, &c.	Black	Wet.	
			Argillaceous, &c.	Black	Wet.	
			Ferruginous, &c.	Black	Wet.	
Earths with organic remains, metals, salts, and rocks.	Sand . . .	Magnesian, &c.	Black	Wet.		
			Marble, &c.	Black	Wet.	
			Shelly, &c.	Black	Wet.	
			Siliceous, &c.	Black	Wet.	
			Sulphuric, &c.	Black	Wet.	
			Cinerous, limy, &c.	Black	Wet.	
			Cinerous, loamy, &c.	Black	Wet.	
			Cupreous, limy, &c.	Black	Wet.	
			Cupreous, loamy, &c.	Black	Wet.	
			Ferruginous, limy, &c.	Black	Wet.	
Earths with organic remains, metals, salts, and rocks.	Sandstone . . .	Ferruginous, loamy, &c.	Black	Wet.		
			Saline, limy, &c.	Black	Wet.	
			Saline, loamy, &c.	Black	Wet.	
			Argillaceous, &c.	Black	Wet.	
			Calcareous, &c.	Black	Wet.	
Earths with organic remains, metals, salts, and rocks.	Schist . . .	Cupreous, &c.	Black	Wet.		
			Ferruginous, &c.	Black, &c.	Wet, &c.	
			Chlorite, &c.	Black	Wet.	
			Ferruginous, &c.	Black, red, yellow, &c.	Wet, &c.	
			Micaceous, &c.	Black	Wet.	

73. DISCOVERING QUALITIES OF SOILS.—The different qualities of soils and the consequent value to the cultivator, are discovered botanically by the natural plants produced upon them; chemically by analysis; and mechanically by handling them.

74. The plants that grow upon the soil decide, in the opinion of the farmer, its agricultural value with more popular certainty than even chemical analysis. The most valuable soils for the farmer distinguished by their several plants are the following: *Argillaceous*, distinguished by *thalictrum flavum*, *carex*, many species; *juncus*, various species; *tussilago farfara*, *potentilla anserina*, *argentea*, *reptans*, and others. The *tussilago farfara* is an universal symptom of an argillaceous soil. *Calcareous soil* produces *galium pusillum*, *veronica spicata*, *lithospermum officinale*, *purpuro-ceruleum*, *campanula glomerata*, and *hybrida*, *cistus helianthemum*, *clematis vita alba*, &c. *Silicious soil* bears the *veronica triphyllus*, and *verna*, *arenaria rubra*, &c. *silena anglica*, and other species. *Ferruginous soil* produces the *rumex acetosa*, and *acetosella*. *Peaty soil* bears *vaccinium myrtillus*, *uliginosum* and *oxycoleucus*: *erica* four species, *tormentilla officinalis*. *Saline soil* produces the *zostera marina*, *pulmonaria maritima*, *convolvulus soldanella*, *arenaria maritima*, &c. *Aquatic soil* bears *caltha palustris*, *hippuris vulgaris*, *lythrum salicaria*, *sunomus valerandi*, &c. *Dry soils* are distinguished by the *rumex acetosella*, *trifolium arvense*, *acinos vulgaris*, *thymus serpyllum*, *arenaria rubra*, &c. Some of these plants afford, it is to be confessed, an evidence not always to be depended upon; but the *saintfoin* is an evidence of a calcareous soil; coltsfoot (*Tussilago farfara*) of blue clay; *arenaria rubra* of poor sand; the small wood-sorrell of the presence of iron and peat; *arundo phragmites* (*the common reed grass*), *polygonum amphibium* (*the common pond weed*), grow in good alluvial soil; whilst the *equisetum arvense* (*field horse tail*), indicates a cold retentive subsoil. *Anagallis arvensis*, *sharrdia arvensis*, *lithospermum arvense*, and *fedia olitoria*, i. e. *field pimpernell*, *field madder*, *corn gromwell*, and *lambs lettuce*, grow in cultivated black loamy soil, on a dry bottom. Soil of this description, when wet, produces the *stachys palustris*, or (*clown's all heal*). The presence of the red dead nettle (*lamium purpureum*) evinces a light sandy soil, as also the shepherd's purse, (*thalpi bursa pastoris*.) Where the parsley pierce, (*aphanes arvensis*) is found, the soil is unproductive; where the corn spurry (*spergula arvensis*) grows thick, the ground has been too much harrowed. Where the common ragwort and the cornthistle (*senecio jacobaea*, and *scrratula arvensis*) grow freely, the soil generally is fertile consisting of light strong loams. It is, however, the whitlow grass, and the common knawell, (*draba muralis*, and *oleranthus annuus*) which indicate extremely poor, dry, and sandy soil. The common rest harrow, (*ononis hircina*) is often found on dry pasture, and where the soil is incumbent on rotten rock. Considerable dependence is to be placed on those plants which are common to aquatic, peaty, and saline soils, as indicating their several qualities.

75. QUALITY OF SOIL EVINCED BY CHEMICAL ANALYSIS.—The discovery of the qualities of soils by chemical analysis is extremely difficult, and is seldom performed successfully by the cultivator. In selecting specimens, care should be taken to procure them from different situations. When the field is in one part calcareous, and in another silicious, the portions should be separately submitted to experiment. From two to four hundred grains is the proper quantity for a perfect analysis, which should be taken in fair weather, and when perfectly dry, preserved in phials, closed with ground glass stoppers, till the period of examination. The soil best for culture according to the analysis of Bergman, contains four parts of clay, three of sand, two of calcareous earth, and one of magnesia. Kirwan observes, that the fertility of the soil depends much upon its capacity for retaining water. The ingredients of the soil, however, do not always correspond to the nature of the climate; the quantity of rain that fertilizes a wet soil, cannot be equally suited to a dry one. Silica in the soil exists under the modification of sand, alumina under that of clay. Soils in which the sand preponderates, are called dry, retaining the least moisture: those in which clay preponderates, retaining the greatest portion, are called wet. Before either of them are capable of culture, the excess must be retrenched, or the defect supplied. Besides the above, the properties of soil may be ascertained mechanically. Its specific gravity may be ascertained by introducing into a phial known to contain a certain weight of water, equal volumes of water, and of soil; to do which, it is necessary to pour in the water first, till the vessel is half full, and then put in earth till it reaches the brim. The difference between the weight of the soil and water will be the result. Thus, if a bottle which holds 400 grains of water, gains 200 grains when half filled with water, and half with soil; the specific gravity of the soil is 2; that is, it will be twice as heavy as water. Clay in any soil may be known by its tenacity; sand by its roughness. Calcareous matter in soil is known by its effervescently upon meeting with an acid. The presence of organized matter in soil, may be ascertained by weighing it when it is perfectly dry; and after having subjected it to a red heat, weighing it again, which will give the proportion of organic matter. Metallic oxydes in soil may in general be known by their colour. Ferruginous soils are red and yellow; cupreous soils are interspersed with greenish streaks; salt, coals, sulphur, &c. may be known by the appearance of the water in such soils, and also by the peculiarity of vegetation.

76. USES OF SOIL.—Earths are of no further service to plants than providing them with medium by which they fix themselves to the globe; and even the portions of earth taken up into them by vegetation, are not convertible to any other substance; and are supposed to afford the plant nothing but firmness of organization, as wheat, oats, and many hollow stalked grasses, have an epidermis of earth to defend them from the attacks of insects and parasitical plants. Plants are nourished exclusively by means of water and
